The nerves of the small intestine are derived from the splanic ganglia; they form networks adhering very closely to the arteries. The animal sensitiveness of the intestine is probably very slight under ordinary circumstances; the functions of these parts are performed without our consciousness. Difease, however, develops a most acute animal sensitiveness. Animal contractility is entirely deficient; no exertion of the will can either accelerate or retard the action of the intestine. But the most striking phenomena of the intestinal functions are derived from their organic sensitive contractility, which resides in their muscular coat; these may be witnessed in living animals by exposing the abdomen, or in those recently dead, and sometimes in the intestines exposed by accident or surgical operations. The volval canal is observed to be in motion, and this is called peristalsis, which term signifieis merely contractile. One part of the tube is seen to be contracted, while another is dilated; one ascends, while another descends; one is extended, another rendered shorter: thus a general twisting and creeping is produced, compared to the motion of worms, and hence called vermicular. Touch a part of the gut with a sharp instrument, or with any chemical stimulant, and it will be so contracted as to close the canal. Another effect follows the application of these stimuli, such as air, or other fluid, to the intestinal surface. This is not confined to the mere gut, but extends to the neighbouring parts partake of the action. This sensitiveness continues some time after death, and is manifested even in the intestine when removed from the body.

The ordinary and natural stimuli, by which the organic contractility of the intestine is excited, are, the chyme or aliment as it comes from the stomach, the air mixed with and accompanying this, and the bile. The artificial and unusual ones are purgative medicines, worms, cold applied to the abdomen. Cold to the feet, and terror sometimes act sympathetically.

Physiologicalists have distinguished three kinds of motion in the intestine: the descending or regular one, proceeding from the ileum to the large intestine; the ascending or inverted, the reverse of the former; and the mixed, which partakes of both these.

The following phenomena may be observed in the motion of the intestine. Parts of the canal are alternately distended, and contracted; moved in various directions; rendered tense and loose to the touch; diffused with air or chyme; incurvated or extended; appear longer or shorter according as the longitudinal or circular fibres act; are filled or emptied; in short, they are alternately at rest and in motion.

The longitudinal fibres shorten the canal lengthwise: the circular ones produce an opposite effect. The latter admit of dilatation, until the gut exceeds an inch in diameter; they contract it again to half a line, or even close the canal entirely.

The antiperistaltic action seems just sufficient in degree, in a healthy animal, to retain the chyle for the action of the absorbing vessels. In diseased, or when an insipid digestive exists to the natural passage of the aliment, this inverted motion is carried to a great degree, so that the contents of the small and even large intestine are conveyed into the ileum, and expelled by vomiting.

The large intestine is that portion of the alimentary canal which extends from the end of the small intestine to the anus, and is so named because its diameter considerabiy exceeds that of the small. It is distinguished from the latter, not merely by its situation, connections, external form and functions, but also in its minute structure, so that a very small portion of it might be distinguished from a fragment of the ileum or small intestine.

Its situation is more defined and constant than that of the small intestine. Beginning in the right iliac region, it rises in front of the right ilium, goes backwards under the liver, and then turns forwards and towards the left (the first or hepatic flexure of the colon). It continues in a straighter direction, from right to left, under the gall-bladder, the ileum, and the notch of the ileum below and behind, which it turns again, and forms a large angle (the second or splenic flexure). It descends on the left side of the abdomen, in front of the left kidney, forms in the left iliac region of a large
a large and loose fold, resembling in its form the letter S; plics over the left sacro-iliac synphyses into the pelvis, runs along the concave surface of the sacrum and os coccygis, and ends a little beyond the anterior extremity of that bone, at the anus.

We may distinguish six portions of the large intestine:

1, the cæcum, which is commonly named merely the cæcum; 2, the vermiform, ordinarily called processus or appendix vermiformis cæci; 3, the right part of the colon, or the ascending portion; 4, the transverse part, or the arch; 5, the left part, including the descending colon and the sigmoid or ileal flexure of the gut; 6, the rectum. Very commonly the tube is divided into the three parts, cæcum, colon, and rectum. These different names, as in the small intestine, have led to the employment of the phrase large intestine in the plural, as if there were more than one tube.

We cannot assign any exact limits to these divisions, as the position of the intestine, on which they are founded, varies in its different plates of division or epimeta. The right colon descends lower, and appears longer when it is full than when empty. The transverse portion, when filled, may descend, from the loofeness of its attachment, to the umbilicus or pelvis; if it be longer than usual, it forms an arch with the concavity upwards, or it may make one or two turns. When removed from the body, all distinction of particular divisions is lost, and the gut forms a straight uninterrupted tube. It is from three to five times shorter than the small intestine, and they are to each other nearly as five to twenty-five. In individuals of good proportions it measures about seven feet. The connections of the intestine are more firm in some situations, and more loose in others. In many parts the peritoneum does not entirely surround the tube, but covers its anterior portion only, leaving the posterior part to be affixed by cellular substance to the continuous organs. The term meocolon is applied generally to the peritoneum covering the large intestine.

The meocolon dextrum passes from the under and back part of the liver, from the apex of the lait rib, from the right quadratus lumbarum, and iliacus internus, in front of the right colon and cæcum. Thus these parts, which are only covered on their anterior surface, are firmly bound to the iliac muscle, the kidney, liver, and duodenum, and constantly held in this situation. The appendix has its peculiar small and faliform mesentery.

The transverse meocolon is a broad and loose fold, by which the transverse part of the intestine is uniformly covered, except just at the separation of its two laminae. The left meocolon is injected towards the right, nearly at a right angle, and is then continued behind and below the stomach and liver, in a transverse direction to the left kidney, under the name of meocolon transversum. Together with the arch of the colon, it forms a kind of transverse partition or diaphragm, loose at the anterior edge, and separating the stomach, duodenum, spleen, and liver from the other abdominal contents. It is generally horizontal, as its name denotes; but it is sometimes so broad and long as to descend with the intestines into the pelvis. It is made up of two laminae of peritoneum, including between them, besides the blood-vessels, the absorbents with their glands, and the nerves of the intestines, connected and covered by more or less fat, the duodenum, and pancreas. The latter parts are placed quite at the root of the fold.

The upper lamina descends from the splenic fold of the peritoneum, the pancreas, the upper lumbar vertebra, the external covering of the duodenum, and the neighbourhood of the kidney and vena cava. The inferior lamina, which is more ample and strong, comes on the left from the situation under the spleen, where it surrounds the duodenum by a kind of semilunar fold; then from the right kidney, and from a fold placed between the liver and kidney. The breadth of this meocolon leaves the arch of the intestine quite movable, so that its situation is by no means constant; the distended stomach pushes it downwards, and the repletion of the small intestine has the contrary effect. The great omentum covers the front of the transverse colon, and pales between this and the stomach; but does not tend at all to fix it.

The meocolon sinistrum is continued over the intestine, from the iliac vessels and ploas magnus to the left kidney: covering only the anterior surface. The back of the intestine is connected by cellular substance to the diaphragm, the ploas, and the kidney, so that its situation is very fixed. Sometimes, however, there is something like a memerity belonging to this part of the tube.

The meorectum is a duplicature, varying in breadth, produced from the side of the pelvis to the ileocolic flexure of the colon, and the commencement of the rectum. It is broadest above, where it is continuous with the meocolon sinistrum, and ends in an acute point below. It is made up, like the meocolon, of two laminae of peritoneum, including between them the blood-vessels, &c. of the intestine, and fat, and separating to cover the rectum. It allows the intestine a considerable liberty of motion. Below the termination of the meorectum, the gut has no peritoneal coat; but is united by cellular substance to the surrounding organs: that is, to the sacrum and os coccygis, to the vagina in the female, to the bladder and prostate in the male. Its extremity is still further fixed by the attachment of the muscles of the anus, and by its continuity with the common intestines.

The diameter of the tube, when moderately distended, is about two inches or two and a half.

The ileum descends gently to the right iliacus internus muscle, and is inserted obliquely into the left and posterior side of the large intestine, between the cæcum and right colon, having its mucous and mucous coats continuous with those of the large intestine. This extremity of the small intestine forms an acute angle with the cæcum, and a right angle with the colon: its upper half is placed transversely, the lower ascends. On opening the large intestine, we find the communication to be of a valvular nature, and composed of two folds (ale or taba), a superior and an inferior one; it is prominent, soft, and of course movable. Each of these folds is composed of a smaller internal lamina, which is the mucous lining of the small intestine, and an external larger one, composed by the corresponding coat of the large. These laminae, connected by cellular substance, and continuous with each other at the sides of the opening, form the valvula coli (valvula ili, or ileo-colica, or ileo-cæcalia). The superior fold, placed nearly transversely, is shorter and narrower than the inferior, which rises the highest of the two. A kind of fracture or fold of the large intestine bounds the valve on each side. Between the two folds composing this valve, the orifice of the small intestine opens transversely; its figure is an oblong oval, and its dimensions are much less than the diameter of the ileum. The length and breadth of the folds, and consequently the size of the interposed aperture, vary greatly. Sometimes the lower fold is very long and broad, the upper short and narrow, so that the intestine opens obliquely by a very small aperture. This structure admits of the opening being very completely closed. Sometimes both folds are but slightly prominent, and their distinction not clearly marked. Here the opening is more nearly circular, and cannot be so perfectly shut.

The external or peritoneal coat: plics over the communication.
**INTESTINES.**

...tion between the two intinelines, with a smooth surface, making no fold, and confining the parts in their relative situation to each other. The muccous and mucous coats, and the cellular substance of the two intinelines, are continuous, and this continuity retains the folds of the valve in their situation. When the peritoneum and muccous parts are cut through, the mucous lining which forms the valve is no longer retained; the ileum may be withdrawn from the colon, the two folds being destroyed, the communication has a circular appearance, and its dimensions are equal to those of the small intestine.

The structure of this part is most advantageously observed by deflecting it under water. When the intineline is inflated and dried, the general figure and direction of the two folds, and of the aperture between them, can be distinctly seen; but they are rendered rigid, smooth, and shorter than is natural, and their margins are too far separated.

As the two folds, which compose the valvula coli, represent two oblique planes, converging in such a manner as to form a convexity towards the large, and a concavity towards the small intineline, whatever pressure against them in the concave surface will separate them, and open more widely the interval between them; whatever comes against them on their convex aspect will approximate them, and tend to deflory the opening. The contents of the ileum, passing in their natural course, are in the former case; and those of the colon in the latter. Hence they prevent the admission of feces into the small intineline; as we can generally prove by difling the large intineline with air or water; those fluids do not escape by the ileum. Yet this experiment does not always succeed perfectly: and probably under particular circumjances in the living body, a retrograde passage takes place; hence vomiting of feces and of matters thrown up in eructations. We must recollect, in arguing from the result of trials with air or water, that the feces, of which the return is prevented, possess usually considerable viscidness.

The large intineline is composed of three coats or layers of the large nature, and distinguished by the fame names as those of the small.

The external, or serous covering, according to what we have said concerning the connections of the organs, is a partial one in some divisions of the tube. This is elevated at intervals into small procifces, containing fat, and completely resembling portions of omentum. For an account of these parts, which are called appendices epiploicae, and are peculiar to the large intineline, see **EPIPLOON**.

The muccous covering of the intineline is made up of two orders of fibres: those of the interior intinulum are circular, and uniformly extended over the mucous membrane, as in the small intineline; they are connected to that coat by a similar copious cellular substance, described often as a nervous coat. The longitudinal fibres are collected into three bands having the appearance of trabes, and running at equal distances from each other on the surface of the tube. These bands are much shorter than the other coverings, which are therefore packed up and form cells between them. The three commence at one point above the appendix vermiformis, diverge and grow broader as they ascend over the cecum: are continued through the whole length of the colon; grow broader and stronger on the rectum, and are united into a continuous muccous sheath, including about the fix last inches of the gut. One band is on the unattached part of the intineline: another is covered on the arch by the omentum; and the third is found at the attachment of the mesocolon. The surface is level, tenue, and rather depressed in the situations occupied by these bands; in their intervals the surface consists of a series of elevations, separated by transverse folds, the cells being so placed as to cut the long axis of the gut at right angles: therefore, the tube seems made up of a triple series of hemispherical elevations, internally of the same number of rows of cells. This appearance is peculiar to the large intineline: it exists no longer in the rectum, where the bands are united into an uniform intinulum.

The muccous and mucous coats with the circular fibres are so pliable in consequence of the arrangement just described, as to form on the inside very considerable transverse folds; these are largest at the beginning of the tube, become smaller, and are entirely lost in the rectum. The folds are of different sizes, and variously intermixed: between two of them a cell is formed of an elliptical figure, narrower at its oblong sides, and larger about the middle. If the intineline is inflated, and the longitudinal bands cut through in several parts, the whole intineline may be extended into a much greater length, the folds and cells disappear, and the tube becomes nearly cylindrical.

The muccous coat forms various folds in the cells of the intinelines when in its contracted state, similar to the folds occurring in the stomach: they disappear on dilatation. Its soft and pulpy surface is covered with a tenacious mucous. It differs from that of the small intineline in possessing no villi. Numerous single mucous glands are found over the whole large intineline: they lie on the outer surface of the mucous coat, which is penetrated by their ducts.

The arteries of the large intineline come from the superior and inferior mesenteric trunks; the veins join the inferior mesenteric branch of the vena portorum. The absorbents, both superficial and deepseated, pass through glands which lie close to the intineline: these are smaller than the mesenteric glands, and fewer in number, being reckoned from 25 to 50, and are nearer to the gut. After passing through several of them, the absorbents terminate, near the kidneys, in inferior mesenteric artery and pancreas, in the fame glands at which the lucent veiilets of the small intineline arrive. They are, on the whole, much fewer and smaller than those of the small intineline.

The nerves come from the plexus of the great sympathetics, and from the several branches, and are connected to the arteries. The end of the large intineline is a point at which the organic and animal lives are united; here we have very obvious animal sensibility, and the muscular actions are considerably influenced by the will. Where the small intineline joins the large, the latter is produced, below the opening of communication, into an obtufely conical process, two or three inches in length, having the same unequal surface as the rest of the tube, and terminating in a blind extremity: this is the part called the cecum. Usually this is larger in size than the continuation of the tube, and has been therefore called caput coli. It is covered almost entirely by peritoneum, but is connected on its right side, for a small extent, by the mesenteric, by cellular substance. It varies much in size, form, and position; sometimes it is scarcely one inch, sometimes nearly four in length. It may be larger or smaller, more or less irregular on the surface, &c.

From the posterior part of the cecum, a small intineline, about the size of a quill, cylindrical in its figure, and terminating after one or two turns in a rounded and blind extremity, is continued obliquely towards the left. This is the appendix vermiformis. It is rather larger at its commencement than in its progress, and is held by a small fold of peritoneum, like a meleterry. Its coats contain numerous mucous glands, and its cavity, which communicates freely with that of the cecum, is generally filled with a thick mucous...
INTESTINES.

It seldom contains feces in the adult. Its length, size, figure, and direction vary greatly; it may be from one to six long, and from one to three lines broad. It very frequently adheres to the surrounding parts.

The rectum descends in an arch over course, of which the convexity is turned downwards and backwards, from the last lumbar vertebra to the anus. Its curve is most clearly observed when the part is considered in a lateral view. In the infant, on account of the small size of the pelvis, it is continued for the greatest part in the abdomen. Its external surface is uniform. The peritoneal covering is a partial one, and belongs only to the sides and posterior part of the intestine; and it is continued to the pelvis by cellular substance. This membrane forms two lateral folds, continued, in the male sex, to the sides of the bladder, and in the female to the vagina and the pellorium surface of the broad ligaments of the uterus. From the anterior part of the intestine the peritoneum pales in men to the pellorium and inferior part of the bladder, and in women to the under surface of the vagina. Beyond this point the intestine is continued, fill in a curved course, with the convexity downwards, for an inch or more, united by cellular substance in the male subject to the vehicile femenmes, urinary bladder and prostrate, in the female to the vagina. The serous coat has appendices epiploicae.

The muscular covering consists of a thick and strong layer of longitudinal fibres, and a strong stratum of circular ones: the latter form an oval twisted ring at the end of the gut, called the sphincter ani internus.

The cellular substance is continued, at the end of the gut, into the general subcutaneous stratum; and the mucous lining is gradually, and in the European imperceptibly, lost in the common integuments. But in the negro the boundary is more clearly marked by the cellation of the black rete mucosa.

The mucous coat is marked with longitudinal serpentine folds, and covered with a copious viscid mucous: the latter is secreted by glands, whose ducts perforate the membrane, and the largest of which are near the termination of the gut.

The extremity of the intestine is provided with certain muscles concerned in the motions performed for the expulsion of the feces: these are the levatores ani, sphincter ani, transversi perini, and coccygei.

The levator ani is a thin, broad, and flat muscular plane, of an irregular quadrilateral figure, rather curved in its inner surface, and forming a seatum, which closes the pelvis below, and completes the abdominal cavity. Its origin extends from the pubes to the spine of the ischium: it commences by short aponeurotic fibres, just behind the arch of the former bone, and continues its origin from a broad and thin aponeurosis which covers the obturator internus. The anterior firm fibres pass obliquely downwards, backwards, and inwards, and are lost on the prostate and sides of the rectum, where they are intermingled with the sphincter. The larger portion, which is behind these, passes downwards in the same direction, is partly united to the opposite muscle, by an aponeurotic expansion, between the rectum and coccyx, and partly fixed to the side of that bone. The external surface of the levator is in contact with the obturator internus, the glutæus magnus, the transversus perini, and lower down with a large quantity of cellular and adipose tissue. The inner surface corresponds to the prostate, bladder, and rectum. For the description of the coccygei, see Coccyx.

The sphincter ani surrounds the termination of the intestine just under the integuments, and is commonly divided into the sphincter cutaneus, or externus, and the internus. The latter, as we have already mentioned, is to be regarded rather as the termination of the circular muscular fibres of the gut, than as a distinct muscle. It is a pretty thick muscular ring, about half an inch in breadth. Externally, the longitudinal muscular fibres of the rectum cover it: on the inside it covers the mucous membrane of the intestine. The superior margin is continuous with the circular fibres of the gut: the inferior is placed between the opening of the external sphincter and the membrane of the intestine.

The sphincter externus, or cutaneus, is placed more superficially than the former, and extends from the apex of the coccyx to the posterior part of the perineum. It is flattened, elliptical, with its long axis inclined from behind forwards, and perforated in the middle. We distinguish it in a superficial and an inferior surface, a right and left edge, and an anterior and posterior extremity. The thin skin surrounding the anus covers the under surface: the upper corresponds to the levator ani, being at first separated from it by cellular tissue, but having its fibres completely blended with those of that muscle on the rectum. The front end forms a sharp point, extending more or less under the back edge of the accelerator urina, to which, as well as to the transversalis perians, it is closely connected. The posterior extremity is also pointed, and attached to the coccyx by a dense cellular matter approaching to the nature of ligament. The margins are partly covered by the skin, and partly by a mass of cellular and adipous substance.

The sphincter consists wholly of fleecy fibres, which describe concentric arcs of circles; those of the two sides are united at acute angles before and behind the anus.

The front end of the muscle is less elongated and acute in the female than in the male subject. In both its fibres are intimately blended with those of the internal sphincter.

The transversus perinis is situated towards the back part of the perineum, between the tuberousity and ramus of the ischium, and the middle of the space comprised between the bulb of the urethra and the anus. It is thin, flattened, and somewhat triangular. The anterior surface is inclined downwards, and corresponds to the rectus penis and accelerator, and to the fat which fills the intervals between these. The posterior, inclined upwards, lies against the levator ani: cellular tissue, and the deepseated branch of the internal pudic artery, separate them. The outer edge is attached to the inner surface of the tuberousity and ramus of the ischium, above the rectus penis and the root of the crus penis. The inner edge is united to that of the opposite muscle, to the front of the sphincter ani, and to the back edge of the accelerator. The transversus is separated from the skin in front by a considerable quantity of fat: behind it is confounded with the reddish cellular tissue found in the angle between the bulb of the urethra, and the root of the corpus cavernosum. The origin is aponeurotic; and the termination is usually in a tendinous line.

The transversus perinis alter is not constantly found. It is a slender elongated fasciculus, running parallel to the ischium, on the inner edge of the rectus penis. The origin is derived from the tuberousity of the bone, near to that of the rectus; it terminates above in a thin aponeurosis connected to the bulb of the urethra, or corpus cavernosum.

Movements performed by these Muscles.—The muscular organs just described have two principal offices: 1. They move the whole pelvic viscerâ together. 2. They act on the rectum in particular. The levator and coccygei are principally concerned in the former case. They represent muscular plane capable of elevation and depression, and of moving
moving the organs which it supports in various directions. This plane is opposed in situation and action to that of the diaphragm; thus two strata, concave in opposite directions, and capable of contracting or enlarging, at the will of the animal, the perpendicular diameter of the abdomen, are placed at the opposite ends of this diameter. The most signal contraction is observed in the violent efforts employed for expelling the feces, urine, &c.; and the most marked enlargement in strong expirations, as in coughing, sneezing, &c. But these effects are produced much more by the depredation of the diaphragm contracting the abdomen from above downwards, than by the elevation of the other muscles. The latter support the parts, and enable them to resist the efforts of the former; the impulse may be felt very plainly by placing the hand on the perineum during any strong exertion of the abdominal parietes. The power of resistance is much less in these parts than in the sides of the abdomen, because the bony sides of the pelvis, and the contained viscera, support great part of the effort. The action of the sphincter ani has the effect of contracting the opening of the rectum; it is constantly exerted for the purpose of maintaining the aperture permanently closed. Other openings furnished with sphincters, such as those of the mouth and eyelids, are often open for a considerable time, because there are various muscles which antagonize the sphincters; no such muscles exit about the anus. The only antagonistic power is in the longitudinal fibres of the rectum, and in the contraction of the abdominal parietes; and these are only exerted when the feces are evacuated. An obvious advantage arises from the permanent contraction of the rectum, in preventing the escape of its contents; they are retained in the large intestine until their quantity produces irritation. When the sphincter is paralyzed, they escape involuntarily as they arrive in the rectum. This permanent action of the sphincter resembles that of parts belonging to the organic life, as it is completely independent of the will; yet we have the power, by means of volition, of contriving the opening more completely. The feces are evacuated in opposition to the resistance of the sphincter, which is overcome by an exertion of the abdominal parietes. The harder they are, the greater dilatation is required, and the greater difficulty is consequently experienced; and vice versa. When they are very fluid, they may escape in a slight degree by the longitudinal plats into which their contraction collects the flux of the anus.

The action of the longitudinal fibres of the rectum, and the preflure of the abdominal viscera, urged downwards by the respiratory muscles, occasion the intestine to descend slightly when the feces are voided. The levatores ani, coccygei, and transversi perinei, support the parts under this effort, limit the descent, and then reëfuse them to their former situation. The levatores probably may be concerned in the functions of the generative organs by controlling the vesicular femalae and prostatic; and the transversi, by fixing the posterior end of the accelerator, may concur with that muscle in the expulsion of the feces.

The large intestine of the fetus is rounder and smaller than in the adult, hardly marked by any cells in young embryos, and not exceeding the small in diameter. The cæcum is gradually diminished into the appendix vermiciformis, which is considerably larger than in the adults, and dispensed by its mefenery into a special arrangement. It is much more considerable in size compared to the cæcum. This is the appearance of the part at birth, when it usually contains fecal matter. Soon after, the distinction between the cæcum and appendix is more strongly marked; the latter, instead of coming from the middle of the former, is produced from its left side; and as it is not increased while the cæcum is growing in size, the proportions of the adult are gradually established.

After what we have observed concerning the action of the small intestine, the reader will immediately perceive how the muscular fibres of the large mufl act.

**Intestines.** Inflammation of. See Enteritis.

**Intestines.** Protrusions of. See Hernia.

**Intestines.** Wounds of. See Wounds.

**Intestines of Birds.** See Anatomy of Birds.

**Intestines of Fish.** See Fish.

**INTIRE TENANCY.** See Tenancy.

**INTONARE.** To touch in the cathedral service a single key on the organ, to pitch for the priest, the choir, and the congregation, the reprioters.

**INTONATION, in certain forms, implies an ecclesiastical tone or mode.**

**INTONAZIONE, Ital.** Intonation, a found or tone. A vocal performer who sings in tune, is said to have a good intonation, the first of all vocal virtues. Singing out of tune, false intimations, the Italians call intonations perfetti.

**INTOUR, in Geography, a town of Hindostan, in the circle of Cudlapa; 35 miles N.W. of Gaudiocotta.**

**INTOXICATION.** See Drunkenness.

**INTRADA, INTRE, or Entrea, Ital.** An entry, introduction, preamble. In the 17th century, an overture in France was termed entrée.

**INTRANSITIVE VERBS, in Grammar, such whose action does not (transfere) pass on an object, or subject.** See Verb Neuter.

**INTRENCHEMENT, in the Art of War, all forts of works made to fortify a post against an enemy.** See Retrenchment.

They usually consist only of a bank of earth and a ditch, and are of two sorts; such as the trenches carried on in a siege, where the bank is between the ditch and the enemy or town; and where the earth is thrown up against the town; and such as serve to inclose a town or camp, secure a pass, cover the entrance into a country or other places, &c. In these the ditch is between the bank and the enemy. The first sort are usually called trenches or approaches; and the second are generally called lines.

It was a maxim amongst the Romans, that even in their most haughty marches they intrenched every night.

**INTRESSIN, in Geography, a town of the duchy of Warsaw; 40 miles S. of Posen.**

**INTRIGUE, or INTRIGUE, an assemblage of events, or circumstances occurring in an affair, and perplexing the persons concerned in it.**

The word is French, intrigue, formed from the Latin intricar, entanglements; which, according to Nonius, comes from tres, entanglements; and that from the Greek τρέχων, bair: quod puellas gallinas intundere et limping capellat. Which conjecture is adopted by Tripaud, who will have the word intrigue to be primarily and properly understood of chickens, which have the feet entangle in hair; and to be derived from the Greek τρέψαν, τρέψαν, bair.

**Intrigue** is more particularly used to signify the plot of a play, or romance; or that point wherein the principal characters are the most embarrased, through the artifice and opposition of certain persons, or the unfortunate falling out of certain accidents and circumstances.

In a tragedy, comedy, or epic poem, there are always two designs; the first and principal is that of the hero of the piece; the second contains the designs of all those who oppose him. These opposite causes produce opposite effects.
to wit, the efforts of the hero for the execution of his design, and the efforts of those who thwart it. As those causes and designs are the beginning of the action, so those efforts are in the middle, and there form a knot or difficulty, which we call an intrigue, that makes the greatest part of the poem. It lasts as long as the mind of the reader or hearer is suspended about the event of these opposite efforts; the solution or catastrophe commences when the knot begins to unravel, and the difficulties and doubts begin to clear up.

The intrigue or plot of the Iliad is two-fold; the first comprehends the three days fighting in Achilles's absence, and conflicts, on the one side, in the resistance of Agamemnon and the Greeks, and on the other, in the inexorable temper of Achilles. The death of Patroclus unravels this intrigue, and makes the beginning of a second. Achilles resolves to be revenged, but Hector opposes his design; and this forms the second intrigue, which is the last day's battle. See Iliad.

In the Æneid there are also two intrigues: the first is taken up in the voyage and landing of Æneas in Italy; the second in his establishment there. The opposition he met with from Juno, in both those undertakings, forms the intrigue. See Æneid.

As to the choice of the intrigue and the manner of unravelling it, it is certain they ought both to spring naturally from the ground and subject of the poem. Boffu gives us three manners of forming the intrigue of a poem; the first is that already mentioned; the second is taken from the fable, and design of the poet; in the third, the intrigue is so laid, as that the solution follows from it of course.

INTRIGUE, in common language, is used to denote a plot; a private transaction in which several parties are engaged, and usually an affair of love. Johnson.

INTRINSIC, a term applied to the inner, real, and genuine values, properties, &c. of any thing; in opposition to their extrinsic, apparent, or popular values, &c. See EXTRINSIC.

INTROBIO, in Geography, a town of Italy, in the department of the Montagna; 7 miles N. of Lecco.

INTRODUCTION, in Rhetoric, is the first part of an oration or discourse, designed to prepare the minds of the hearers for the suitable reception of the succeeding parts: and for this purpose it is necessary that the orator gain the good opinion of his hearers, secure their attention, and give them some general notion of his subject. In order to gain the good opinion of his hearers, the orator, when he introduces the discourse with his own person, will be careful to do it with modesty, and seem rather to extenuate his virtues and abilities, than to magnify them: when he lets out with the perfections of those to whom the discourse is addressed, it is not usual to commend them for their virtues, and those especially which have a more immediate relation to the present subject. The other topics which are to be infixed upon for gaining esteem, are principally taken from the subject, as its justice, importance, advantage, or pleasure. In speaking of gaining the attention of the hearers, Cicero says, we shall be heard attentively by one of these three things; if we propose what is great, necessary, or for the interest of those to whom the discourse is addressed. Some account of the subject should always make part of the introduction. As to the composition of this part of a discourse, it should appear easy and natural, and connected with the rest of the discourse; it should be suited to its length: the language of it should be just, easy, and pleasant: it ought neither to be wholly without passion, nor too violent and impetuous. It ought not to be too general. The introduction, however, is not an essential part of a discourse, and is sometimes omitted by the best orators. Ward's Or. vol. i lec. 12.

INTRODUCTOR, in Antiquity, was particularly used for an officer, who introduced the athletes to the stadium, or place where they were to contend.

INTROITUS, in the Roman Ritual, as settled by St. Gregory, is an introduction to high mass on great festivals, preceding the usual psalms.

INTROMISSION, in Natural History, is a term relating to the petrifaction of organic substanctes, in which mineral substitution takes place, during the removal of the organic particles, (the mineral being gradually introduced into the animal or vegetable body,) supplying the place, and taking the form of the matter lost. By this mode of petrifaction the internal fabric, as well as the external figure of the original is preserved. Petrified wood has usually partaken of this kind of change. See W. Martin's Outlines, p. 55. Petrifactions formed by intromission, are sometimes said to be ingenerate. Oult. p. 67.

INTRONATI, the name of an academy at Sienna, in Italy.

The members of this academy contented themselves, at their first institution, with establishing the following six short laws: 1. To pray. 2. To study. 3. To be merry. 4. To offend nobody. 5. Not to credit too lightly. 6. To let the world talk.

INTROUSCEPTION, in Surgery. See INTUSCESSION.

INTRUSION, in the Canon Law, signifies the enjoyment of a benefice, or exercice of an office, without a good title to it.

The word is derived from intrudere, to thrust in, or enter by force.

Intrusion disqualifies the party from ever holding the benefice.

INTRUSION, Information of, in Law, is a method of suit, by information on behalf of the crown, filed in the exchequer by the king's attorney-general, for any trespass committed on the lands of the crown, as by entering thereon without title, holding over after a lease is determined, taking the profits, cutting down timber, or the like. See INFORMATION.

INTRUSION also denotes the entry of a stranger, after a particular estate of freehold is determined, before him in remainader or reversion. This entry and interposition of the stranger, if it differ from an abatement in this, that an abatement is always to the prejudice of the heir, or immediate devisee; an intrusion is always to the prejudice of him in remainader or reversion. An intrusion is always immediately consequent upon the determination of a particular estate; an abatement is always consequent upon the defect or devise of an estate in fee-simple. And in either case the injury is equally great to him whose possession is defeated by this unlawful occupation. See QUINTEA.

INTRUSIONE, a writ brought against an intruder, by him that hath fee-simple, &c. See Writ of ENTRY.

INTUITION, among Logicians, the act whereby the mind perceives the agreement or disagreement of two ideas, immediately by themselves, without the intervention of any other: in which case the mind perceives the truth, as the eye doth the light, only by being directed toward it. Thus the mind perceives that white is not black, that three are more than two, and equal to one and two. See IDEA.

This part of knowledge, says Mr. Locke, is infallible, and, like the sun's light, forces itself immediately to be perceived, as soon as the mind turns its view that way. It is on this intuition that all the certainty and evidence of our other
INT
other knowledge depends: this certainty every one finds to be so great, that he cannot imagine, and therefore cannot require, a greater. See Judgment, Knowledge, Demonstration, &c.

INTUITIONAL Evidence, is that which results from intuition. Dr. Campbell distinguishes different sorts of intuitive evidence: one resulting purely from intuition, or that faculty which others have called intuition; another kind arising from consciousness; and a third from that new-named faculty common sense, which this ingenious writer, as well as several others, contend to be a distinct original source of knowledge; whilst others refer its supposed office to the intuitive power of the understanding. Campbell's Rhetoric, vol. 1, book i. chap. 5.

INTURKI, in Geography, a town of Lithuania, in the patrimony of Wilna; 18 miles N. of Wilna.

INTURN, among Horsemen, is when one puts his thigh between those of his adversary, and lifts up his thigh.

INTUSUSCEPTION, or INTRUSION, a term in Surgery, expressive of a very dangerous disease, which arises from the passage of a portion of an intestine into another. The word is derived from intern, within, and sub, to receive. The disorder is also frequently named a constrictio. It happens most commonly in the first fifteen years of life, older persons not being so subject to this affection.

When the upper part of an intestine passed into the lower, that is to say, when the intussusception was downwards (as generally happens), Mr. Hunter called the case progressive; but when the disease arose from the passage of a lower portion of bowel into an upper one, he named this example retrograde.

Intussusceptions are probably far more frequent cases than many suppose, and numerous infants and young subjects, no doubt, are victims to the disease, without its existence being in the least suspected. The affection may indeed be less severe; and we are informed, that the greatest part of three hundred children who died, either of worms, or during detention, at the Hopital de la Salpêtrière, and were examined by M. Louis, had two, three, four, and even more volvuli, without any inflammation of the parts, or any circumstances leading to a supposition that these affections had been injurious during life. M. Louis thought such cases proved that an intussusception might be formed, and destroyed again, by the mere action of the bowels; an opinion which is confirmed by the observation of Dr. Baillie, that in opening bodies, particularly of infants, an intususception is not unfrequently found, which had been attended with no mischief; the parts appear perfectly free from inflammation; and they would probably have been easily disentangled from each other by their natural peristaltic motion. See Mem. de l'Acad. de Chirurgie, 1786, edit. tom iv. p. 222, and Baillie's Morbid Anatomy, 2d edit. p. 162.

Mr. Hunter thought that the manner in which an intussusception may be formed, is, by one portion of a loose intestine being contracted, and the part immediately below relaxed and dilated; under which circumstances the contracted portion slips a little way into that which is dilated. He inferred, that this change was not the effect of any action in either portion of intestine, but might be the consequence of some additional weight in the upper part of the bowel. How far the peristaltic motion, by pulling the contents on to the contracted parts, might force them into the relaxed ones, Mr. Hunter was unable to determine, though he was inclined to think that nothing of the kind could happen.

Supposing the foregoing explanation to be true, an acci-
dental intussusception may take place either upwards or downwards; but if a continuance or an increase of the disease really arises from the action of the intestine, it can only be when the case is downwards. Yet this does not explain those instances in which a considerable portion of intestine is carried into the gut below. In order to understand these, the different parts which form the intussusception must be considered. We must recollect that every intussusception is composed of three folds of intestine; viz. the inner, which passes down, and being reflected upwards, forms the second, or inverted portion, which, being reflected down again, makes the third, or containing part. This latter is the outermost, and is always in its natural position.

According to Mr. Hunter, the outward fold is the only one which is active, the inverted portion being perfectly passive, and squeezed down by the outer, which inverts more of itself, so that the angle of inversion, in the case, is always at the angle of reflection of the outer into the middle, or inverted fold, while the innermost is drawn in. Hence we may see how an intussusception, once begun, may have any length of gut drawn into it.

The external portion acting upon the other folds in the same way as upon any extraneous matter, will, by its peristaltic motion, urge them further; and if any extraneous substance is detained in the cavity of the inner portion, that part will become a fixed point for the outer, or containing intestine to act upon. Thus it will be squeezed on, till at last the meconium, preventing more of the innermost part from being drawn in, will act as a kind of stay; yet, without entirely hindering the inverted outer fold from going still further. For since it is the middle fold which is acted upon by the outer, and this action continues after the inner portion becomes fixed, the gut is thrown into folds upon itself; so that a foot of intestine may not form an intussusception longer than three inches long.

The outer portion of intestine is alone active in increasing the disease when once begun; but if the inner one were capable of equal action in its natural direction, the effect would be the same, viz. that of endeavouring to invert itself, as, indeed, happens in a prolapsus ani. The outer and inner portions would then tend to draw in more of the gut, while the intermediate portion only would, by its action, have a contrary tendency.

Although capable of producing a prolapsus ani, the action of the abdominal muscles cannot admit, either in forming or continuing this disease, since the effect of it must be to make equal compression both above and below.

The manner in which the intestines are connected with the meconium, would lead one to consider it impossible for any portion of the bowels to pass far within another, particularly as the increasing quantity of meconium, that is drawn into the intussuscepted part, must render the further passage of intestine more and more difficult. The large intestines, being also more closely confined in their natural situations, would seem to be far less liable to the disease. One of the largest intussusceptions ever known, however, was in the colon, as related by Mr. Whitely in the Phall Trans. vol. i. p. 223. The intussusception appeared to have begun at the intestine of the ileum into the colon, and to have carried in the cæcum with its appendix. The ileum passed on into the colon, till the whole of the ascending colon, the transverse arch, and descending colon, were carried into the sigmoid flexure and rectum. The valve of the colon being the leading part, it at last got as low as the anus; and when the person went to stool, he only expelled the ileum, for one-half of the large intestines being filled up by the other, the ileum alone, which passed through the centre, discharged its contents.
The disease, when it thus begins at the termination of the small intestines in the large, is particularly apt to proceed to a considerable extent, and mortally proves fatal. Many instances of this kind are upon record. In the Edinburgh Medical and Surgical Journal, vol. iii. p. 263, Mr. Langstaff has published an interesting case. The cafe is that of a child three months old, where, upon examination after death, there was an extensive intussusception in the usual direction, together with a smaller one of the retrograde description, similar to what occurred in the instance related by Mr. Spry in the Med. and Physical Journal, No. 111.

Retrograde intussusceptions are found less common than such as are named progressively. In the Medical and Chirurgical Transactions, vol. i. Mr. Home has inferred the account of a retrograde intussusception, which happened in a cabin boy, who had previouslly swallowed arsenic. The case was also rendered remarkable by a small worm, which was found coiled up round the intussuspected portion of the intestines.

A prolapsus ani is, in some respects, similar to an intussusception, and may possibly begin in the same way; but it is always continued by the action of the abdominal muscles, and never by that of the bowel itself. It differs from an intussusception in not being included in an intussusception; for instead of having a containing bowel, inverting itself by its own action, there is an included intussusception protruded by the action of the abdominal muscles, while the passage of the feces through it, and the point of inversion, are at the extremity of the protrusion; and as it becomes inverted, it projects out of the body. Med. and Chir. Trans. vol. i. p. 112.

With regard to the symptoms of intussusception, they are very much alike those attendant on inflammation of the intestines, herein, and any obstruction in the alimentary canal. In several of the cases upon record, the feat of the disease was plainly indicated by a hard tumour upon the left side of the abdomen. Sometimes it has been found impossible to inject more than a trivial quantity of fluid as a clyster, a circumstance which would strengthen the suspicion of what the disorder really is. If, also, (oberves Mr. Langstaff,) the invaginated portion defended so long as to form a protrusion at the anus, and we could ascertain, that it was not an inversion of the rectum itself, the cause might be considered as clear, and we should have no hesitation in delivering a prognosis, which, by preparing the friends for the fatal termination, would exonerate us from all blame on its occurrence.

Intussusception, like most other diseases, which are farthest from the reach of medical and surgical assistance, has been treated in a great number of different ways. Former practitioners very commonly exhibited for its relief, a large quantity of crude mercury; a plan which certainly could never have accomplished the desirable object of disentangling the affected part of the bowels.

It has even been proposed to perform gastrotomy, and M. Hevin, in his "Recherches Historiques sur la Gastrotome dans le Cas du Volvulus," has examined, with much ability, the question concerning the prudence and propriety of such a proceeding. After many interesting observations, he expresses his decided condemnation of the proposal. The operation, indeed, is rendered quite unavailing by the great uncertainty and obscurity which almost constantly prevail in regard to the actual nature of the disease; but even were the existence of the disease positively known, the project would not be allowable. In the first place, cutting into the abdomen, with a view of disentangling a portion of the bowels, would be of itself a source of the most dangerous and probably fatal consequences. And in the second place, the scheme of disentangling the bowels would generally be altogether impracticable, by reason of the different folds of the intussusception having become inseparably agglutinated to each other. This connection, in fact, is so strong, that the contained parts can hardly be withdrawn after death. In other instances, the structure on the intussuscepted part causes it to inflame and even mortify, in either of which it appears gastrotomy would be quite inadmissible.

The forcible injection of clysters was tried by Dr. Morro, without any beneficial effect.

Others have suggested the introduction of long bougies and pieces of whalebone within the anus, for the purpose of mechanically pushing back the intussuscepted portion of the bowels. But it is known that adhesions are formed in the manner already described, what success can be expected from any plan of this kind? And what instrument could be invented, which would follow the windings of the bowels, a considerable way, without piercing their coats, and doing the most fatal mischief?

The manner in which the parts are agglutinated, explains why none of the methods hitherto devised for the relief of an intussusception, can be of any material service. Were a case to be submitted to some kind of treatment, before adhesions had taken place, perhaps the forcible injection of clysters, and the exhibition of emits to invert the peristaltic action of the containing bowel, as proposed by Mr. Hunter, would be as rational steps as any which could be pursued.

We must reluctantly acknowledge, however, with Mr. Langstaff, that, in general, all the modes of treatment, hitherto proposed, will be found utterly insufficient. "Yet here, as in many other instances, the resources of nature are exhibited in a most wonderful and astonishing manner, while those of art completely fail. The invaginated portion of intestine sometimes thongs, and is discharged per anum, while the agglutination of the parts preserves the continuity of the intestinal canal. The annals of medicine furnish numerous instances, where long pieces of gut have been discharged in this manner, and the patient has quite recovered. At the same time that we recognize the inefficacy of art, these cases will teach us to repose a just confidence in the powers of nature, and to retain some hope of a favourable event, under the most unpromising circumstances." Langstaff in Edin. Med. and Surgical Journal, vol. iii. p. 267, 268.

This gentleman has greatly enriched his paper by numerous references which will be deemed exceedingly valuable by any person desirous of being more particularly acquainted with the preceding subject.

INVADIATUS, in our Old Writers, a person accused of any crime, which not being fully proved, he was put judiciarii falsarii, and called invadatus.

INVALID, a person wounded, maimed, or disabled by action of body.

At Chelsea and Greenwich are magnificent hospitals, or rather colleges, built for the reception and accommodation of invalids, or soldiers and seamen worn out in the service. See HOSPITAL.

We have also several independent companies of invalids, dispersed in the several forts and garrisons.

Of these a regiment was composed in 1719, but it has since been put upon the same footing with the other regiments of the line. In 1771 there were likewise 26 independent companies, forming the garrisons of Jersev, Guernsey, Scilly, Portsmouth, Plymouth, Chester, Hull, and other forts and castles; and there were also ten independent companies of invalids in Ireland. Invalids have been known in this kingdom ever since the restoration of Charles II. The invalids
IN V

invalids are armed like other regiments of infantry; their uniform red, faced with blue, and plain button holes.

At Paris is a college of the fame kind, called les invas-duced, which is accounted one of the finest buildings in that city.

INVASION, in War, the entrance or attack of an enemy in the dominions of another sovereign.

INVENTED, in Heraldry, denotes a thing slanted, or

Invented is the reverse of engraved, in which the points are turned outward to the field; whereas in inverted they are turned inward to the ordinary.

INVENTIVE, in Rhetoric, differs from reproof, as the latter proceeds from a friend, and is intended for the good of the person reproved; whereas inventive is the work of an enemy, and entirely designed to vex and give uneasiness to the persons against whom it is directed.

INVENTION denotes the act of finding any thing new; or even the thing found.

Thus we say, the invention of gunpowder, of printing, &c. The above is a modern invention owing to the Moors.

The Doric, Ionic, and Corinthian orders are of Greek invention; the Tuscan and Composite of Latin invention.

Jan fon ab Alme'ovien has written an Onomastic of inventions, wherein are shown, in an alphabetical order, the names of the inventors, and the time, place, &c. where they are made. Pannicollus has a treatise of old inventions that are lost, and new ones that have been made; Polydore Virgil has also published eight books of the inventors of things. (De Inventoribus Rerum.) Beckman has also published a "History of Inventions and Discoveries."

INVENTION is also used for the discovery of any thing hidden.

The Romish church celebrates a feast on the fourth of May, under the title of "Invention of the Holy Cross."

Invention is also used for subtlety of mind, or somewhat peculiar to a man's genius, which leads him to a discovery of things new.

In which sense we say a man of invention: Wollius has made some essays towards an art of invention.

INVENTION, in the Arts of Design, is that peculiar quality, which, being of all others the most rare, is also the most estimable in an artist. Without it the painter or sculptor will not above the ordinary beautiful mechanic, nor are his productions so useful to mankind.

Whether the power of invention be an immediate gift of God, or the offspring of cultivation, has been questioned by philosophers; and while some have traced its origin, or fancied they could, to a continued series of acquirements, begun at an early age, and carefully stored in the mind, others have regarded it as not attainable by any exertions of man, and no other than a direct impulse imparted by the omnipotent Creator to his more favoured children.

Whichsoever of these abstruse opinions be correct, one thing none will be inclined to dispute, viz. that, be the power of imagination, which is the basis of invention, as vivid as possible in the mind of an artist, it must have materials to work upon; and if the power of combining ideas be originally given, they must first be collected: that power can never operate if the possessor does not lay by a store of observations upon the nature of things as they pass before his eyes. Invention is not creation, except as far as relates to the fancies and perceptions of man. To him new combinations effectively create new objects; but in fact, it is only the power of combining, in new and previously unknown forms, things known individually before.

It grasps within its range whatever is possible, probable, or already certain; and the artist is at liberty to apply and combine whatever appertains to either of these qualities in any manner, which, producing novelty, still bears the appearance of truth, and does not wound the common perception of propriety; that is, the propriety which belongs to the nature of the subject treated of.

The exercise of invention will be more or less productive accordingly as the native vigour of fancy or imagination be accompanied by a conflagrant and lively observation of nature, and a strong remembrance of her various productions under all the different circumstances in which they are found. A vivid imagination, being thus stored with images, requires only the slightest hint to call forth the most brilliant effects, and by contrast or combination produce new images. Sir Joshua Reynolds, in his 6th discourse, has observed, that "there can be no doubt, but that he who has the most materials has the greatest means of invention; and if he has not the power of using them, it must proceed from a feebleness of intellect, or from the confused manner in which they have been laid up in his mind;" and again, "it is vain for painters or poets to endeavour to invent without materials on which the mind may work, and from which inventions must originate. Nothing can come of nothing."

In the same lecture he remarks, that "the mind or genius has been compared to a spark of fire, which is smothered by a heap of fuel, and prevented from blazing into a flame. This simile, which is made use of by the younger Pliny, may be easily mistaken for argument or proof; but there is no danger of the mind's being over-burthened with knowledge, or the genius extinguished, by any addition of images. On the contrary, these acquisitions may as well, perhaps, be compared, if comparisons signified any thing in reasoning, to the supply of living embers, which will contribute to strengthen the spark, that, without the association of more fuel, would have died. The truth is, he whose feebleness is such as to make other men's thoughts an incumbrance to him, can have no very great strength of mind or genius of his own to be destroyed."

These excellent remarks are made by Sir Joshua when treating of imitation; of the assistance an artist may acquire in his progress by studying the productions of other men; and to prove, that no source of information, either in nature or art, should be neglected by him who covets the title of a great inventor, or, as it is usually called, an original genius. He will find it requisite to be a constant observer of nature in all her shapes, whether of the grand, the beautiful, the dreadful, expressive and interlacing, or common-place; the varieties of character among men, their modes of action, the powers of their passions, and the various ways in which they exhibit the impulse derived from them. In short, no object whatever should escape his eye without notice; no moral sentiment or feeling, his mind; and he will thus be best qualified to embody and illustrate whatever subject he may be called upon to represent.

This doctrine holds equally true of poetry, and indeed of all pursuits by which men are led, in which their necessities or their pleasures call for the exertion of their talents. But such art or science, having its peculiar end to answer, requires the observance of peculiar details. In painting, invention requires the mind of the artist to be occupied in calling forth recollections of those circumstances in which he may have been in nature, or in works of art, of a character consonant with that of the subject under treatment, to be represented, and endeavouring to inspire every part of the composition with an union of effect. If, for instance, the subject be pathetic, the painter will
Invention.

will recall to his memory those scenes and varied actions and combinations of heads and figures, and that distribution and degree of light and shade which he may have observed in nature to be most affecting; and, placing them in situations proper for his purpose, he will endeavour to carry their effect to the highest point of perfection. His principal difficulty will be, as far as relates to the invention, to clear his work of whatever is not necessary to display its character effectively; to seize upon the most just and powerfully descriptive moment in the occurrence, and, calling together only what justly belongs to it, impart to those materials he selects the utmost degree of interest possible within the boundary of his art.

He who tells his story in the most natural, and at the same time, dignified method; who brings forth images at once intelligent and correct; and, combining them in an agreeable manner, impresses the mind of an observer with the full scope of his intention, without evidently exhibiting the art he has employed, is certainly entitled to the praise of the greatest inventor: not he, who, to be striking and imposing, compiles attitudes for passion, instead of allowing feeling and nature to govern him; and fancies, when he has surprised by strong contrast or brilliant colouring, that he has effected the purposes of art.

Sometimes, indeed, the painter is called upon, like the poet, to tread in fairy ground, and illustrate his subject by images of beings found only in the regions of imagination; but he is not at liberty to indulge his fancy so freely as the poet. Forms described do not make strong impressions on the senses as those presented to the eye by lines and colours; and many a high-flown indulgence of the inventive faculty which passes current, nay, is even allowable in poetry, would dwindle into pure grotesque if laid upon canvas, or wrought in sculpture; and would more disgust and disappoynt than gratify a sensible mind. Such is Milton’s description of Death. The obscurity of the language in which this description of the all-fudging sun and paramour of Sin is enveloped, alone renders it effective in the poem. In painting, it is idle waste of time to attempt it.

"The other shape, If shape it might be called that shape had none Distinguishing in member, joint or limb, Or subsistance might be called, that shadow seemed, For each seemed either,

is language sublimely effective of the intention of the poet, and conveys in its no meaning (when strictly examined) an indistinct and vague idea of the nature of the monster, just as the description itself is contradictory and indistinct. Still the mind of the reader is filled with figure and idea sufficient for the poet’s purpose, and the degree of interest excited by the appalling tremendous circumstances of the moment and in succession, draws off his attention from dwelling long enough to discover the illusion. But once embody the idea it is made to portray in a picture, where every image remains for examination, and meets the eye, not vaguely, for then it would be no image, but apart and distinct, and it becomes absurd: the shadow, substantial, or sublimity is overpowered by obscurity.

The inventor is at liberty to combine all that is possible or probable with all that is real; or dwell in possibilities or probabilities alone. There is a limit, however, to his exertions, which is, that whatever be the nature of his subject, it should have such a degree of union with our ideas of existence, convey such an air of real semblance, or be so compounded in its parts, as not to shock us with an apparent violation of the laws of nature, or the appearance of total impossibility. Mr. Opie, in his Discourse on Invention delivered in the Royal Academy, lays upon the same point, that in the exercise of invention in the imitative arts, all possible licence may be granted, and any degree of the extraordinary be indulged, which does not incur the charge of being extravagant; provided that the work be perfectly connected, and the whole confident with itself; that there be nothing that interferes which checks the progress of the imagination, exposes the contrivance or illusions, and recalls a different set of principles to the mind.

To the verge of this limit the artist may indulge his fancy, and exert his powers. When he goes beyond it, and launches forth into a world of mere fanciful imagery, he may flatter himself that he is working wonders, but in fact he will be regarded as a dealer in legedemair, as one satisfying his intellectual powers; and will only excite ridicule and mere surpise, instead of that admiration which men of found sense can alone enjoy. The true inventor will seek only for the most natural and direct means of disclosing his ideas, of imparting that information he wishes to convey, be it of what nature it may. Thus Hogarth ranks with the very first among the poiffors of this almost god-like quality; notwithstanding his subjects were of a low and frequently vulgar cast. How admirably simple, and yet how completely effective, is his figure of a Woman setting fire to the Map of the World in the Bagnio Scene in the Rake’s Progress! He evidently meant to convey the idea of the mischievous power of female beauty when the poiffor of it is fordlid, selfish, treacherous, and base! Can words convey it more explicitly? It would be almost needless, and certainly needless, to point out the numerous instances with which his works abound of the same effective simplicity and truth of imagery, which render them so admirably attractive and useful. Sir Joshua Reynolds, in his picture of the death of cardinal Beaufort, has been equally successful. Shakespeare informs us that he died in the utmost agonies of confidence without any trust in God, any hope of salvation; the tortures of his mind convulsing him more than the agonies of body. The painter would only represent a man writhing with violent pain; and therefore, to give another character and sentiment to the representation, having effected the appearance of suffering, he introduced the fiend, “grinning horribly a ghastly smile,” which at once informs the observer of the agony under which the dying man is tortured. Without this figure, which has been so loudly reproved by many who probably regarded beauty rather than sentiment, the work would have been merely a representation of a sick man dying in pain, and an assemblage of beautiful colours. The fiend decidedly stamps its character with his own; and perhaps by a similar figure alone, we can be informed of the nature of the torments the cardinal endured, without referring to the original Gothic mode, of introducing a label from the mouth or over the head of the figure.

In every branch of the art invention is demanded, and without it, tameness and indigity will be the result of the artist’s labours. In drawing, in colouring, and in chiaro-scuro, selection, or that ideal beauty of form, force and effect on which all lovers of the arts alone delight to dwell, is entirely an effort of invention. To it we owe the beautiful and sublime forms of the statues of the heathen gods, and the grand style of design of which Michael Angelo and Leonardo da Vinci are the parents: the rich, deep, and harmonious style of colouring of Titian, Giorgione, and Rubens; the magic sweetness of effect, or chiaro-scuro, in Correggio, and the force and brilliancy of it in Rembrandt. To Raphael, however, it is that the art is indebted for the noblest use of invention. His object always appears to have been the illustration
illustication of his subject, not the exhibition of his art. Of
this none ever appear to have been so capable, none so
fully the whole force of it, entered so immediately into
the very heart, and throwing all trifling or indifferent occurrences
aside, applied his force to strengthen what was so useful, so
feeling, so eagerly worked for, in expediency so fully,
and by its deficiency. We have mentioned one instance under
the article Energy, in Painting, which exhibits forcibly the/native
vigour of the mind of Raphael, &c. The Cartoon
of Ananias struck dead: wherein we have shewn his invention
not only to have been capable of delineating the fact, but also of
informing us in some measure of the preceding and subsequent
circumstances connected with it. The same power may be
pointed out in others of his works, particularly in the cartoon
of the sarcifice to St. Paul and Barnabas at Lybra. The
great perfection of the inventive faculty in the mind of this
extraordinary man is exhibited in the purity, simplicity,
and truth of the images he feeleth. It is very seldom indeed
that his ideas require explanation, he never appears to have
wandered from the subject of his work in search of something
absurd or rare, but truils to the growth of ideas
which appear naturally to have sprung up in his mind
upon consideration of the nature and object of it. Yet
so well stored was he with nature and art, that he is rarely
infipid or deficient of illustration, either as relates to beauty,
and grace of composition, or expression and sentiment.

Invention in the works of Michael Angelo Buonarotti is
exhibited in a very different mode. Instead of treading in
the beaten path of common life, or adopting the labours of
others, he, breathing the spirit of the epic poet, invents his
subject; and clothes it with the ideal grandeur which breadth
of form, flowing lines, and bold and difficult actions can give it.
Takins his own conception of the generic character of the
human body for his model, he perfected, if not invented, a
style of design entirely new, of a sublime and dignified nature,
though bordering upon the extravagant, and rendered truly
so by moli of his imitators. Of this Ryle Lionardo da Vinci
is perhaps properly the parent, but he had not the full force
of M. Angelo, and his invention in art was engaged in a
middle way between those of the two great men we have
mentioned.

In Titian we find the same faculty operating in a manner
totally different. To him it was most grateful to seek after
and develop the power of colours in brilliancy, depth, and
clearness: and maintaining their full powers, to unite them
by arrangement or contrail, in a manner harmonious and
agreeable to the eye. Add to this application of his invention,
a very extraordinary degree of perception of grandeur and
dignity in design and effect, and he will be found to have
extended the boundaries of art in no inferior degree.

To this talent in Correggio and Parmeggiano we are indebted
for whatever is grateful, left, and amiable in the art of painting;
and to Rembrandt for bold vivid effects of the chiaro-
scuro; whilst Rubens, endowed by providence with almost
super-human powers, revelled in the utmost luxury of imagination,
and produced works representative of almost all the
varied objects of creation, with a gaiety of action and a splen-
dour of colouring and effect unknown, in fo extensive a com-
bination, to any artist before or after him.

It is only by a conrtul study of the works of nature and
of art that a mind possessed with the power of invention can
ever be enabled to exert itself either extensively or usefully.
The impressions made upon it by the common intercourse of
life, without a precise direction of study, would be soon ex-
hausted; and one poorly gifted by nature with the fire of
imagination, but anxiously and steadily pursuing the studies
recommended, would soon surpass the former, he never so
richly endowed if he neglected the necessary cultivation.

Invention, in Music. Having no objects, melody, or
harmony in nature to copy, except the common chord aris-
ing from the division of a string or sounding body into its
harmonics, a musician has more to invent than the professor
of any other art. Every passage, every combination, every
motivo or subject, that has not been used before, is invention.

There is so little invention in some compositions, that who-
ever has heard or seen much music, could point out the pro-
totype of every bar. There is, on the contrary, such an
ambition in some authors of being new, that the ear is teased
and disapppointed by the convidt struggle and labour to
be unnatural. Haydn's invention, which is so unbounded, is
never pushed to such excess. There is in his most original
and capricious movements and passages, a mixture of natu-
ral, graceful, ingenious or spirited connecting traits, which
relieve the hand of the player, and the attention of the
hearer.

There is no infallible receipt for invention; all a matter
can do is to recommend to his disciples to avoid excedises of
every kind: too easy and common, too hard and uncommon;
complaints of pieces being too long are more frequently
made than of their being too short, which would be more
flattering to a composer. When fertility is wanting, passages
are frequently repeated alla tantta Rosalina, to a degree which
now cannot escape remark and censure. A matter cannot,
or ought if he could, tell his pupil in composition what to
adopt; he can only tell him what to avoid. See Composition,
and Counterpoint, to which this article may serve as a
supplement.

Invention, in Poetry, is applied to whatever the poet
adds to the history of the subject he has chosen; as well as
to the new turn he gives it.

Invention, in Rhetoric, signifies the finding out, and
choosing of certain arguments which the orator is to use for
the proving or illustrating his point, moving the passions,
or conciliating the minds of his hearers.

Invention, according to Cicero, is the principal part of
oratory: he wrote four books De Inventions, of which
we have but two remaining.

This invention of the orators cannot, according to lord
Bacon, be properly called invention: to invent, is to dis-
cover things not yet known, not to recollect those that are;
whereas the use and office of this rhetorical invention are
only, out of the flock of knowledge laid up in the mind, to
select such articles as make for the purpose.

The same author divides this faculty of invention into
two parts, the one topica, the other praepigraph: the first
points out the way in which we are to pursue the argument;
the latter only lays up and disposing things, for which we have
frequent occasion, in the mind.

Invention furnishes the orator with those different kinds
of arguments and motives which are adapted to the various
purposes he has in view. The helps of invention are a lively
imagination and readiness of thought, great learning and ex-
tenlive knowledge, previous consideration, and clear enlarged
apprehensions of the subject. See Arguments, Common
Places, and Topics, &c.

INVENTORY, in Law, a catalogue, or schedule or-
derly made of all a deceased person's goods and chattels, at
the time of his death, with their value appraised by indifferent
persons, which every executor or administrator is oblig[:d
to exhibit to the ordinary upon oath, if thereunto lawfully
required.

By 21 Hen. VIII. c. 5. executors and administrators are
to deliver in upon oath to the ordinary, intended inventories.
one part of which is to remain with the ordinary, and the other part with the executor or administrator: this is required for the benefit of the creditors and legatees, that the executor or administrator may not conceal any part of the personal estate from them. The statute ordains that the inventory shall be exhibited within three months after the person's decease; yet it may be done afterwards, for the ordinary may dispense with the time, and even with its being ever exhibited, as in cases where the creditors are paid, and the will is executed.

The use of the inventory is borrowed from the civil law; for whereas by the law of the ancient Romans the heir was obliged to answer all the tenant's debts; by which means, inheritance sometimes became rather prejudicial than profitable; to obviate this inconvenience, Justinian ordained that if the heir would first exhibit a true inventory of all the tenant's effects, he should be no farther charged than to the value of the inventory.

In the British army, when any commissioned officer happens to die, or is killed on service, it is directed by the articles of war, that the major of the regiment, or the officer doing the major's duty in his absence, shall immediately secure all his effects or equipage then in camp or quarters; and shall before the next regimental court-martial make an inventory thereof, and forthwith transmit the same to the office of our secretary at war, to the end, that the executors of such officer may, after payment of his regimental debts and quarters, and the expenses attending his interment, receive the overplus, if any be, to his or their use.

When any non-commissioned officer, or private soldier, happens to die, or is killed on service, the then commanding officer of the troop or company, shall, in the presence of two other commissioned officers, take an account of whatever effects he dies possessed of, above his regimental clothing, arms and accoutrements, and transmit the same to the office of the secretary at war. These effects are to be accounted for and paid to the representative of such deceased non-commissioned officer or soldier; and in cases any of the officers, so authorized to take care of the effects of dead officers and soldiers, should, before they have accounted to their representatives for the same, have occasion to leave the regiment by preferment or otherwise, they are ordered, before they be permitted to quit the same, to deposit in the hands of the commanding officer, or of the agent of the regiment, all the effects of such deceased non-commissioned officers and soldiers, in order that the same may be secured for, and paid to, their respective representatives. See Articles of War, section XIX.

INVENTORY, in Trade, is a list, or particular valuation of goods, &c. See VALUE, APPRAISMENT, &c.

INVER, in Geography, a small river of the county of Donegal, Ireland, which is discharged into a small bay, to which it gives name. Inver bay may be considered as a part of Donegal bay, and has good anchorage. The parish is also called Inver, and there was formerly an abbey there. There is also a village called Inver in the county of Mayo, on the estuary side of Broadhaven, and in the wild barony of Erris.

INVERARY, a royal burgh, and the county town of Argyllshire, Scotland, is situated on the southern bank of Loch Fyne, where the river Aray, or Aorridh, falls into the sea. It consists chiefly of one row of commodious houses, built with great uniformity, and covered with slate. The old town was situated on the north side of the bay. It seems probable, that, prior to the fourteenth century, Inverary was little more than a small village for fishermen, who subsisted by their occupation, and erected their huts here. About that period, the family of Argyll fixed on this site as their place of residence; and as the hereditary jurisdictions of judicature and sheriff were vested in them, Inverary became the seat of the courts and the county town. The circuit court of judicature is held here twice a year for the trial of offences in the counties of Argyll and Bute, and the minor courts are those of the sheriff, magistrates, and Justices of the Peace. It was created a royal burgh by charter from King Charles I., and is governed by a provost, two bailiffs, and a council, nominated by the duke of Argyll. Its only revenue, about 360l. a year, is derived from the petty customs and the rent of a common, on which, on the erection of the borough, was bestowed on it by the Argyll family. About the middle of the last century, Archibald, duke of Argyll, feeling how inadequate the revenue was to the occasions of the borough, added to it a perpetual annuity of 250l. secured on his estate.

Inverary is situate in the Highlands, that as many of the inhabitants speak English as Gaelic, and two ministers officiate in those dialects. For which purpose, two new churches, under one roof, have been recently built, from a design by Mr. Milne. Inverary seems tolerably well situated for manufactories, yet none are carried on to any great extent. About the year 1748, duke Archibald introduced the linen manufacture, which has been attended with beneficial consequences. The late duke established a woollen manufacture; and erected proper buildings and machinery, which he gave to the town; but the business has not been conducted with any adequate advantage.

Inverary derives its chief source of profit from the hering fishery in Loch Fyne. This lake, which extends more than 30 miles from the Western ocean into the country, has been, from time immemorial, noted for its herrings, which are said to be superior in quality to any found in the Western seas. The fishery generally commences in July, and sometimes continues till the end of the year. During this season, the lake is frequented by innumerable boats. The country people express the quantities of herrings abounding here, in very strong language: "At these feasons, say they, "the lake contains one part of water and two parts of hils." In this single bay five or six hundred boats are sometimes employed in the fishery; and it is estimated, that in some feasons, upwards of 20,000 barrels of herrings have been caught and cured; each barrel containing, at a medium, seven hundred hils. Part of each boat is covered with a kind of sail-cloth, to shelter the four men who compose the crew, and who seldom quit their boat during the whole feason. The inhabitants of Inverary, and of the banks of the loch, do indeed spend Sunday at home; but as many of the boats come from more distant parts, the crews take up their abode entirely in them, suitable chiefly on herrings. The night is the time of fishing; the day is employed in gutting the hils, in leaping, or in ringing Celtic longs to thefound of the bagpipe. Each boat clears, on an average, from 40 to 50l., and, in very productive feasons, 100l. The parish of Inverary extends about 18 miles in length, and about three in breadth, on an average. The number of houses in the late return to parliament was 275, of inhabitants 2045.

At a small distance from the town, is the house, or castle, of Inverary, the principal seat of the duke of Argyll, and the chief ornament of the Western Highlands. It is situate on a gentle rie, on the western side of Loch Fyne; and is surrounded by an amphitheatre of mountains, some of which are rugged and broken, and others entirely covered.
covered with wood. The loch from this place appears like a large bay, round which are ranged plantations, covering the ground to a break, from the lake to the summit of the highest mountains. The caille, rearing its towers above the woods, has a very picturesque effect; to the southeast of which, close to the bay, appears the town of Inverary in its uniform line of handsome buildings. On the right is a fine view of Duncluth, a steep hill, 700 feet in height, covered with wood almost to the summit. Inverary House, though by no means an old structure, is built in the form of a castle, upon the plan of the mansions of some of the German nobility. The hall, which is very spacious, is huge round, with arms and other ornaments adapted to the style of a Highland castle. In the election of a representative to parliament, Inverary is classed with Ayr, Irvine, Rohn, and Campbell-town. Sinclair’s Statistical Account of Scotland, vol. v.

INVERKEITHING, a royal borough and sea-port town in Fifeshire, Scotland, is situated on an eminence at the head of the bay which bears its name on the north coast of the Frith of Forth. It consists of one principal street of considerable length, with a smaller one branching from the middle of the former, and a few lanes. The houses have an ancient appearance, and almost every one has a piece of garden ground annexed to it. The return to parliament in the year 1831, stated the number of houses to be 359; of inhabitants 2228. The borough received its first charter from king William, fornamed the Lion; since whose time several kings of Scotland have granted other charters, all of which were ratified and confirmed by king James VI. in a writ bearing date May 4th 1598. The civil government is vested in a provost, two bailiffs, a dean of guild, and a treasurer, all of whom are annually elected by the counsellors and deacons of trades. The latter, five in number, are also elected yearly; but the counsellors hold their office during life and relinquish; these must not be fewer than twenty, but are not limited to any number. The town-house, a neat structure, built in 1770, contains a prison, and rooms for the town-clerk, and for public meetings and entertainments. The bay of Inverkeithing is large and safe, and affords anchorage to vessels of any burthen in all winds. Here ships of war from the Leith roads seek shelter from the winter storms, and merchant ships from the Mediterranean used to perform quarantine. The harbour itself is a small bay; at the mouth of which, on the west side, lies a large Dutch built vessel in a lazaretto; where, instead of detaining ships from foreign parts, the particular goods supposed to be infected are immediately received, aired under the inspection of a proper officer, and delivered within a limited time to the owners. At the head of the bay is the quay, the place for landing and receiving goods; the depth of water at spring-tides is thirteen and sometimes fifteen feet. The chief employment of the vessels arises from the exportation of coal and salt. The coal is brought to the shore by a waggonoad three miles in length; and 25,900 tons are annually shipped on an average: the demand is greater than can be answered; and vessels, to the number of forty or fifty, are sometimes obliged to wait several weeks for their cargo. The quantity of salt annually made is from twelve to fifteen thousand bushels. Inverkeithing was a royal residence in the time of king David I; vestiges of his house were visible within the last fifty years. This borough joins with those of Culrofs, Queensferry, Stirling, and Dunfermline, in sending a member to parliament.

On the top of Lethen-hill, near the town, are several upright stones, placed in a circular form, said to have been a Druidical temple; and in the northern part of the parish is a stone ten feet high, called the Standing stone, on which are hallow relieves of several rude figures of men and horses. Within the parish is also the castle of Rolyth, a ruinous edifice, built upon a rock, and at high water surrounded by the sea; it was one of the seats of the Stuart family, and is now the property of the earl of Hopetoun. The celebrated admiral Craig, commander in chief of the Russian navy, was a native of this parish. Sinclair’s Statistical Account of Scotland, vol. x.

INVERNESS, a royal borough, and the county town of Inverness-shire, Scotland, is situated on the shore of Moray Frith, and is divided into two unequal parts by the river Ness, over which is a stone bridge of seven arches. It is a borough of great antiquity; and according to the belief authority obtained its first charter from king Malcolm Canmore. In ancient times the townsfolk maintained many desperate conflicts with the neighbouring rebellious chieftains and their clans. Traces of this state of hostility are still extant, on the west side, where irritations were commonly made. At a small distance from the town, is a place called Pfollyaire, that is, “the Watch-Town,” also a hill, named Tonnaisaire, “the Watch-Hill;” and a large stone, called Glabnaissaire, “the Watch-Stone.” The last charter in favour of the borough was granted by king James VI. From that period to the revolution, the inhabitants were an industrious and thriving people; carried on a considerable commerce in corn and flax; and brought the malt-yielding trade to great extent; a considerable part of the town consisting of kilns and granaries. From the revolution to the year 1746, the borough suffered a gradual decline; so that, at that period, and for several years after, the town appeared little better than the ruins of its former state. In the revolution in 1745, which commenced among the chiefs in the western part of this county, Inverness became the centre of all the military operations, and other works carried on by government. Hence it began to revive, and commerce was gradually restored. The principal manufactures now are those of hemp and flax. The flax has been established about forty years; and at present employs above a thousand persons in spinning, dreifing, and weaving: The raw material is imported from the Baltic, and manufactured into linen-cloth and flaxing; which are sent to various parts of Britain, and the East and West Indies. A white thread manufactury has been established nearly twenty years; and employs in its various branches of hecking, spinning, twisting, bleaching, and dyeing, not less than ten thousand individuals in the town and surrounding country. The company have, in this and the neighbouring countries, several agents for the management of the spinning departments. The flax is also chiefly imported from the Baltic, and the greatest part of the thread sent to London, whence it is dispersed to different parts of the world. The cotton manufactury has been introduced here with success. Inverness possesses peculiar advantages for manufactures; the raw material being early imported, and the manufactured goods readily exported. Deernef is the greatest obstacle, coal being imported from England. The situation of the town is highly favourable. Ships of four or five hundred tons can ride at anchor within a mile of it; and at springtides vessels of half that burthen can come up to the quay close to the town. The principal part of the vessels belonging to Inverness, is employed in conveying to London the produce of the manufacture, also the fish caught in the river Ness, and the kilns of otters, rabbits, hares, foxes, goats, roes, &c. In return, materials are brought back both for use and luxury; particularly hardware and haberdashery; with which the traders of this town supply the extensive fur-
INVERNESS.

Inverness, a town of America, in the state of Georgia, situated on the river Altamaha, and built by a company of emigrants from the Hi-lands of Scotland, 130 of whom were taken over by Gen. Oglethorpe in 1734. It is about 20 miles from Frederica.

Inverness and Fort William Canal, was the parliamentary name first given, in the act of 1792, to an important line of canal for the passage of large ships across Scotland, principally in Invernesshire, of the design for which we gave a full account, under that head, in our article Canal, and have since added, under the topographical articles Clachnacharry and Corrach, villages at the extremities of the line, such particulars as had occurred to the time of putting these articles to the press, respecting the progress of the works: in the present article we shall have the pleasure of stating the further and successful progress, to the present time, of this very large and important undertaking, now more commonly known by the name of the Caledonian Canal. Seven annual reports have now been made by the commissioners appointed to manage this great national work, and printed by order of the house of commons; which reports contain the greatest body of minute information, satisfactorily arranged, by John Rickman, esq. the secretary to the commissioners, which has, perhaps, ever been given to the public, and shewed strongly the merit which is due to Mr. Jefferys, William Jefferys and Thomas Telford the engineers, for the correctness of their original designs and estimates, and to the latter gentleman in particular, for carrying the whole into effect by himself and his resident officers. From the last of these reports (ordered to be printed the 31st of May 1810), it appears, that about six miles in length at the Clachnacharry, north-calforn, or Inverness end of the line, were in hand or finished; and about the same length, at the Corrach, at Morgan or Port-William end, were also in progress, except some particular parts, presenting no material difficulties. We shall first mention those important and expensive works, the entrance fee-locks in Loch Beaulieu, and in Loch Eil.

At Clachnacharry two fee-locks, or parallel banks for inclining the canal, have been extended more than 350 yards into the sea beyond high-water-mark, and have been secured by a wall of puddled earth carried up from the bottom: and as the shore here is found to consist of wet muddy sands, capable of considerable compaction by the weight of these artificial banks, the fame have been extended higher than would otherwise have been necessary, and at the further extremity they have been joined into a solid mass, by filling up the space in which the fee-lock is to be constructed, and allowing time for this great weight of earth to act, in compressing the soft bottom, before the digging therein for the lock is commenced; by which the great expense and risk of a coffer-dam is to be avoided. The fee-locks of earth, three hundred and fifty yards beyond high-water-mark, and the coffer-dam for the fee-lock at Corrach, had been some months made and erected and stood firm, and at the time of making the 7th report the steam-engine and drains thereto from the estate of the lock were completed ready for commencing the excavation. The second lock at the south-east end of Clachnacharry village had been completed, except the gates, ever since 1805; the masonry of the four connected locks (Nos. 3, 4, 5, 6) at Muirtown, N. of Inverness, were also completed, and their joints pointed with Parker's cement, prepared from the Ludus homburia, or clay-balls of the London clay strata. The two locks at the N.W. end of Corrach village were long finished, all but their gates, and the masonry of the fixed outlet of the principal chain of eight locks near Corrach-mofs were about completed. In the next most important head, that of aqueduct bridges, road arches, and culverts under the canal, one, only a small culvert, had been found necessary in the Clachnacharry district, and was finished in the lands of Kinnimich: in the Corrach district, five considerable aqueducts had been completed.
long time, *viz.* at Lower Banavie, Upper Banavie, Shangan, Muirhearich, and Loy, all of which had their arches enlarged and paved at the bottom, or side arches constructed, in order to serve as road arches under the canal, and supercede the expense and great inconvenience of many communication living bridges over the canal: for which they have been found very complete substitutes. A large job of mason's work had also been completed in swelling the intended wharfs, 113 yards in length, at the south-end of the large basin intended for holding the ships which trade to Inverness, such wharfs being situate within less than a mile of the town. In the Clachnacharry district the masonry of the road bridge at Muirtown had been completed, and a temporary timber bridge laid upon it; the masonry of Dught bridge was very nearly completed, and a temporary wooden bridge had been laid over the middle of the eight Corpach-mofs locks, for the road to Lochie-ferry and Fort-William, where the masonry for a living bridge had been prepared.

Of the earth works, the stupendous embankments for the sea-locks at the extremities of the canal have been mentioned; in Kimnylies lands, W. of Inverness, a considerabel embankment, across some low ground, had been very nearly completed: a more considerable and difficult embankment along the whole course of the Nes river, extends near half a mile in length, under the deep bank of Torvaine; a new channel for the river being formed south of this, and the new bank canal effectually faced with loose rubble stone to protect it from the floods: at Molindour a similar embankment along the bed of the old Nes, and the making of a new channel for it for a quarter of a mile in length, has been completed, under Torremore, a steep bank. In the lands of Doughgarroch, near the Smithy, another embankment for the canal across a loop of the river, and enlarging its channel on the further side of a gravel island were in hand. In the Corpach district, embankments of earth have been completed over each of the five aqueduct bridges mentioned above, and many smaller ones, particularly in the rugged tract between Upper Banavie and Shangan aqueducts. The principal extra cutting, or removing of earth, has been on the S.E. of Clachnacharry, where a bason of 20 acres extent, being more than one-third of a mile long, has been completed; the principal deep-cutting, partly executed in this district, being nine feet deep, for about half a mile in length, through the lands of Doughgarroch. The principal work of extra cutting in the Corpach division, has been the basin next the sea-lock, great part of which is hard rock-cutting, and was partly completed, waiting for the steam-engine to dig it; considerable deep cuttings occur on either side of the rivulet of Moy, and near several others of the aqueducts for softening the course of the canal, and finding stuff for adjacent embankments, all of which were completed. Having thus enumerated all the principal works which had been entered on or completed, we shall present an account of the total expenditure from the commencement of the 20th of October 1815, to the third of May 1816, *viz.*

The British public are but little used, we are persuaded, to see such effectual checks established on the expenditure of their money, more real economy exercised, or more minute and satisfactory accounts produced, than the series of valuable reports furnish, from which we have principally extracted our accounts of this truly great national undertaking. From a careful re-examinate of what remained to be done by Mr. Jeffry and Mr. Telford, a well-grounded hope is held out that the whole undertaking will be entirely completed, when the sum of 553,000£ is expended, except, perhaps, some purchases of land in the middle district, where no works had yet been commenced. Our inquiries further enable us to state, that at the present time (April, 1811) the excavation in hard rock for the Corpach sea-lock has been completed to 20 feet beneath high-water of neap tides, and a great proportion of the masonry of the tide-lock completed; the masonry of the great chain of eight locks near Corpachmofs is completed, and the regulating lock near Lochie began; that plan, adopted for avoiding a coffer-dam to the tide lock at Clachnacharry has succeeded, a part of the space for it had been excavated, and the water which sprang in easily commanded by a fixed-hoist engine; and the regulating lock near Lochie has been laid.
INVERNESS-SHIRE.

fent employed exceeding 1200. Mr. John Telford, the brother of the engineer, re-sided and superintended the works with great ability and integrity until his death, in June 1824; since which the works have been superintended by Mr. Matthew Davidson.

INVERNESS-SHIRE, one of the largest counties of Scotland, is situated on the western side of that part of the kingdom, having numerous bays of the Atlantic ocean to the west, the counties of Perth and Argyle on the south, Ross-shire and part of Moray Frith on the north, and the shires of Moray, Elgin, and Aberdeen on the east. The area thus included comprises a variety of districts, respectively named Badenoch, Lochabar, Glenelg, Glengary, Glen-Moriston, Glenfiddich, &c. These are again divided into 31 parishes, and comprehended, in the year 1801, a population of 74,292 persons. A considerable proportion of the Hebrides or Western isles is also annexed to it; particularly the isles of Skye, Harris, North and South Uist, Benbecula, Barra, and Eigg, and the smaller islets which are situated on its coasts. The mainland, excluding the isles, extends in length, from the point of Artafaig on the west to that of Ardlerfeet on the east, where Fort George is built, about ninety-two miles, and its greatest breadth is nearly fifty. The county is divided into two almost equal parts by a valley running from south-west to north-east, parallel to the Grampians. This valley is called Glen-more-na-h' Alabin, or the "Great Glen of Albion;" and appears to be a deep fissure between the chains of enormous mountains which run in the same direction. The glen is, in the greatest part of its length, filled with water; or is rather a long chain of lakes succeeding each other, and rising but little above the level of the sea; a circumstance which has suggested the propriety of taking advantage of this valley to form the canal which is now executing across the island, viz. the Caledonian canal.

The fresh water lakes which form the chain from Inverness on the Moray Frith to the Sound of Mull below Fort William, are Loch Nefs, Loch Oich, and Loch Lochie. The distance, in a direct line, is less than fourteen miles, of which nearly thirty-six are occupied by these three lakes.

The salt-water lochs, or arms of the sea, which occupy the two extremities of the valley, are the Limhe Lochs, which advances from the Sound of Mull, on the west, to Fort William at the mouth of the Lochie, and the Moray Frith on the east. The dimensions of the canal are, in depth 20 feet, in width, at the bottom, 50 feet, at the top 110; the locks are 20 feet deep, 170 long, and 40 broad; frigates of 32 guns may be admitted.

Loch Lochie, the most western of the fresh water lakes, is a fine piece of water, in length about fourteen miles, and from one to two in breadth. The mountains on each side are very steep, and in some parts covered with wood. The waters of this loch are chiefly derived from another to the northward, called Loch Arkaig, which runs in a northern direction, sixteen miles in length, and one in breadth. From it flows the river Arkaig, which, after running about a mile, falls into the north side of Loch Lochie. The river Lochie, which takes its rise from the loch, flows westward, and falls into the sea at Fort William; its length being about ten miles, and its medium breadth about two hundred feet. It is navigable by small boats. Next to Loch Lochie, on the southward, is Loch Oich, which is about three miles; its banks form a number of small bays, and include some beautiful little islands. It gives rise to the river Oich, which flows southward, and soon falls into Loch Nefs. This lake is twenty-two miles long, and from one to two and a half broad; its depth in the middle being from sixty to one hundred and thirty-five fathoms. It sometimes, especially after long-continued rains, rises eight or ten feet perpendicularly above low-water mark. The water posesses a peculiar quality; it never freezes in the severest winter, and in frosty weather is covered with a thick mist, which has the appearance of smoke. At the time of the great earthquake at Lisbon, Nov. 1, 1755, the water of Loch Nefs was agitated in an extraordinary manner. It rose rapidly, and flowed up the lake from east to west with amazing impetuosity; the waves being carried more than two hundred yards up the river Oich, breaking on its banks five feet above the level of the river. It continued ebbing and flowing for about an hour; when a wave, much greater than the preceding, terminated the commotion, overflowing the north bank of the lake to the extent of thirty feet. From the eastern extremity of Loch Nefs, rises the river of that name, which, running in an easterly direction for six miles, falls into the Moray Frith at the town of Inverness, of which its delta forms the harbour. This chain of rivers and lakes was made the track of a series of forts, when the English government was endeavouring to subdue the aristocracy of the Highlands, and to reduce this mountainous territory under the dominion of law. The waters which fall into the eastern part of the chain of lakes, that is, below the head of Loch Oich, come chiefly from the south; the Tarff, the Errick, and the Foyers, and a variety of other torrents, which descend from the mountains, where great numbers of lakes are found. The Foyers is remarkable for its celebrated falls. This river takes its rise among the lofty mountains of Dolekline and Abertarf, and pouring through the vale of Foyers, falls into Loch Nefs nearly mid-way between the caerl and western extremities of that lake. The falls of Foyers are accurately described by Dr. Garnet in his Tour through Scotland. Respecting the upper fall, he states that "from the arch of the bridge to the surface of the water, after the lowest part of the fall, is 200 feet. Height of the fall 70 feet." Of the lower fall, distant from the former nearly half a mile, he says, "its height, in one continued stream, is 207 feet. Down this precipice the river rushes, with a noise like thunder, into the abyss below, forming an unbroken stream as white as snow. Burns has given a beautiful description of this fall. It is undoubtedly one of the highest in the world, and the quantity of water is sufficient to give it consequence. The scene is awfully grand; the celebrated cascade of Niagara in North America is not much more than half the height of this." The waters which fall into the eastern part of the lakes from the north, are chiefly the Garry, the Morrill, the Emeric, and Coalte. The lakes may be considered as two rivers, which receive the waters of the greatest part of Inverness-shire, and convey them to the eastern and western oceans. It is said that pikes are not found in those lochs in the Highlands whose waters descend into the Atlantic; whereas they are found in those lakes whose waters flow eastward into the German ocean. The other principal rivers in this county are the Beauly on the north, and the Spey on the south. The first, which is chiefly composed of three larger streams, runs about eight miles before it enters the Frith of Beauly. The river Spey rises towards the south-western part of the county out of a small lake of the same name. It receives in its course a great variety of mountain torrents; and passes through the great fir-woods of Glenmore and Strathpey; the trees of which are conveyed to the ocean by means of its waters. To the south of Loch Spey is Loch Laggan, which is fifteen miles in length, and, with its environs, forms a large district in Badenoch. On the fourth side is the Coill More, or Great Wood, the most considerable remnant of the great Caledonian forest. Several arms of the sea advance into the western shore of Inverness-shire;
verness-shire; such as the found of Sky, on which are the bar- 
racks of Bernera; Loch Hourn, Loch Nevis, Loch Mor-
ven, Loch Avlert, Loch Shiel, and Loch Eil; the two laf 
form part of the boundary between this county and Argyles-
shire. Our limits will not admit a particular description of 
the scenery to be met with in this extensive county; conflit-
ing, as the whole surface of it does, of lofty mountains, 
which, especially towards the west, are piled above each 
other in towering magnificence; and between which are 
deep gles of a boundless variety of forms, each of which 
hits its stream and its lake, and many of which abound in 
winds. In this county flands the celebrated Ben Nevis, 
the highest mountain in the island of Great Britain; the alti-
tude being no less than 4370 feet. The summit of this 
mountain affords a wide extent of view, from the horizon 
of the sea at the Moray Frith on the north-east to the island 
of Colonsay on the south-west. (See Ben-Nevis.) In the 
eastern part of the parish of Kilmannavig a singular curiosity 
appears, viz. the remarkable parallel roads of Glenroy, 
which are to be seen on the declivities of lofty mountains 
extending for seven or eight miles on each side of the water of 
Roy. Dr. Anderfon, in his View of the Agriculture of 
Aberdeen, says, "these roads are carried forward along 
the sides of the hills in a direction every where perfectly 
horizontal. Wherever they come to a vault in the hill, 
there they bend inwards till they find the natural level; 
and where they come to a river, instead of sinking down to 
the level of its bottom, or requiring to have a bridge directly 
aeross it, to raise the ground to its proper level, they turn 
up the bank of the river, keeping still their horizontal di-
rection, till they thus gradually reach the bottom of the 
stream, when, crofing it, and altering their direction once 
more, they pursue the course of the stream on the opposite 
bank till they reach theirth, when they proceed forward 
in the fame horizontal direction as before." These parallel 
terraces, however, are not works of art, but natural phe-
nomena, as suggested by Mr. Jamieson, professor of natu-
ral history in the university of Edinburgh, in his Account of 
the Mineralogy of Dumfrieshire. Glenroy mull, at a former 
period, have been a lake, the surface of whose waters 
food some fathom above the highest of the parallel roads. When 
the river was in flood, great quantities of mud came down into 
the lake, but chiefly at the sides, where the current was lower 
than in the middle. At the lower part of the glen, however, 
the lake, after a lapse of ages, mill have built its barriers, 
55 as to reduce the surface of the waters to the level of some 
fathoms above the second terrace. The mud formerly de-
pofited would now become the uppermost terraces. This 
operation must have been three repeated, to produce the 
three parallel roads or terraces; and at last the river has 
hurt for itself the channel which it now occupies, and 
has converted this ancient lake into a gem or deep valley. About 
eight miles from the mouth of the river Nevis is a remark-
able cavern, known by the name of Haigh't-Hovie, or 
"Samuel's Cave:" that being the patronymic of the fa-
mily of Glenavis. This cave is in the heart of a rock, which 
appears to be about 70 feet high, and nearly as broad, lean-
ing to the fide of a mount south of the river, and not far 
distant from it. The cave appears to have been formed 
by one part of the rock inclining towards the other, and 
forming between them an arched, irregular, shapeles 
kind of grotto, from six to twelve or fourteen feet in height, 
thirty in length, and eleven in breadth. Opposite the rock 
which the cave is formed, on the other side of the river, 
is a beautiful cascade, falling by a gradual slope from Ben-
Nevis, upwards of half a mile before it reaches the bottom of 
the valley, where it unites its streams with those of the Nevis. About two miles farther up the Nevis, on the cave 
side, is another cascade, which, after forcing its way through 
hills and rocks, has a fall 500 feet perpendicularly. The 
whole vicinity, as may be expected from the number of 
mountains, abound with cascades, which produce variety of 
picturesque scenery.

Such is the rude wildness of the mountains, rocks, and 
glens, that it is not wonderful the mountain chiefs and in-
habitants of this country do long retained their independence. 
Not more than twenty years ago, a formidable banditti in-
filed Inverness-shire. They confiited of defectors and rob-
bers, leagued together for the annoyance of the country; 
but the military from the forts on the lakes being sent against 
them, the leaders were taken, the association was broken, 
and tranquility restored.

The north-eastern corner of this county, adjacent to the 
Moray frith, is to be confidered as a part of the Lowlands of 
Scotland; but all the rest of the county belongs to the 
Highlands. The low country contiguous to Inverness is, 
upon the whole, well cultivated. The rift of the caftem 
coast enjoys a drier climate than is to be found in the welt. 
Considerable quantities of wheat are fown here, together 
with barley, oats, and peas. Potatoes are raised in great 
abundance, and constitute the principal food of the poorer 
clas of inhabitants. Some rye is fown, generally mixed 
with oats, which gives a softness to the oat-bread of this 
country. In the upper parts, and in every quarter where 
pooffions remain on the ancient small fcale, agriculture is 
in a miferable state. In the remoted districts, the barrows 
of a horfe till confiits of a bridle made of the twined twigs 
of birch; with a ftick put under the horfe's tail, and tied with 
twigs, for a crupper: the faddle is a pad made of coarse 
fackling, fattered with twined birch twigs, or hair ropes. The 
mountains and forefts are inhabited by immense herds 
of red and roe deer, which roam in fafety, in receails almost 
impeneetable to man; the alpine and common hare, and other 
game, are alfo abundant. The fir woods in Glenmore and 
Strathpey, the property of the duke of Gordon and the 
former Grant, are fuppofed to be more extensive than all the 
other natural woods in Scotland together. Indeed, in every 
quarter are confiderable forefts; and there are natural plant-
ations of great extent near the feats of the different pro-
priets, on the sea-coal or lakes. In the parish of Kil-
malie alone, near Fort William, the wood-lands are estimated 
at about 14,000 acres. The trees that grow naturally are 
och, fir, birch, ash, mountain-ash, holly, elm, wild 
gen, hazle, and the Scotch poplar: these planted are larch, 
france, fir, beech, plane, and fir trees. Lime-
foone, approaching to the nature of marble, is found in every 
district of the county. In Lochaber, near the farm-houses 
of Ballachulish, is a lime-foone or marble rock of an affen-
grey colour, and of a fine regular grain or texture, capable 
of being raised in blocks or slabs of any size, and sufpeble 
of a fine polish. This fingular rock is sprinkled throughout 
with grains and specks of bright munde or pyrites, and of 
lead-ore of a fine texture, which appears to be rich in fiver. In 
the farm of Blaracuikdlaich, belonging to the duke of 
Gordon, about three miles to the south of Fort William, in 
the bed of a river, is a very peculiar kind of marble, con-
fiting of a black ground, flowered with white. This foone 
is of a fine clofe grain, but not very hard; the flowering is 
light and elegant, like fine needle-work. Many of the 
mountains are composed of reddish granite. In the parish of 
Kingurie a rich vein of fiver was difcovered, but could 
never be successfully wrought; and in other places, veins of 
lead,
lead, with silver intermixed, have been found. Iron ore has also been discovered, but not in sufficient quantity to make it an object of manufacture.

This county contains many vestiges of antiquity. In various parts are to be seen remains of Druidical temples. At Corymony, in the northern part of the county, is one in which the middle of the circle is occupied by a cairn of large stones, on the summit of which is one very large stone. Such temples are also found in the southern parts. Sometimes each great standing stone is supported by two other large stones buried under ground; so that there is a single circle above, there is a double one beneath.

In the parish of Kilmanavaig is the ruined castle of Inverlochy. There was, at one time, a thriving borough of the same name adjacent to this building, which some of the old Scottish historians call the emporium of the weft of Scotland; but of this borough there are no other indications than some pavement in different places, which were probably the streets of it. The castle has survived the borough, and now stands alone, a monument of ancient magnificence. It is a quadrangular building, with round towers at the angles, measuring thirty yards every way within the walls. The towers and ramparts are built of stone and lime, nine feet thick at the bottom, and eight feet above. It was surrounded by a ditch, from thirty to forty feet in breadth, which was supplied with water from the river. The whole building, including the towers, covers about 1650 square yards; and within the outside of the ditch are contained nearly 7000 square yards. At the great gate, between the south and east towers, are some remains of a drawbridge. This gate is nine feet wide, and arched to the same height, with abutments of fourteen feet at each side. Directly opposite was another gate, of nearly the same size, which probably was designed as a water gate. Besides these two principal entries, three of the towers were provided with sally ports; one from each, well contrived, and close to the arrow-holes, which also flanked and defended them. There is a tradition that this castle was once a royal residence; and that the league between Charles the Great of France and Achaius king of the Scots was signed there on the part of the Scottish monarch, about the end of the eighth century. Within sight of Inverlochy castle float that of Duindar, on the summit of a hill about 400 yards in height. The traces of the building are still visible; and the part now remaining runs round the whole top of the hill, the compass of which is 150 yards. The part of the hall that now remains is no more than from two to four feet high, and is vitrified all round. On the northern banks of the river Lochie are the remains of an ancient castle, which, before the invention of fire-arms, was certainly a very strong place. It stands on the brink of a frightful precipice, at the bottom of which the river forces its passage through rocks, and has been secured on the land-side by a ditch and drawbridge. The traces of the ditch are still visible. The castle of Urquhart, now fallen to decay, stands on a rocky promontory, on the west side of Loch Ness, of which it commands a view from one end to the other. The loch washes the east side of the building, and the other three sides were fortified with a strong rampart, a ditch, and a drawbridge. Within the walls were accommodations for five or six hundred men. This castle was a royal fort, and was granted by king James IV. in 1509, with the estate and lordship of Urquhart, to the laird of Grant, in whose family they still continue. Along the chain of lochs are three forts, or military stations, designed to keep the Highlanders in subjection, Fort George, Fort Augustus, and Fort William. The first is placed at the eastern extremity of the lakes, and prevents all entrance up the Moray frith; it is a regular fortification, and covers ten Scottish acres. Fort Augustus is situated in the middle of the chain; it has four bastions, and barracks for the accommodation of four hundred soldiers, with proper lodgings for the officers. On the west, to check any attempts from that quarter, stands Fort William, which is of a triangular form, with two bastions; this which is fifteen to twenty fingers, some mortars, and a considerable artillery. It was built during the usurpation of Cromwell, under the direction of general Monk; and was then more extensive than at present, as it contained two thousand effective troops.

The remains of old watch-towers, or very small fortresses, are to be seen on the summits of many of the mountains. In the parish of Laggan is a rock, upwards of an hundred yards perpendicular height, and of very difficult access; yet on the very summit are considerable remains of a fortification. The area is about 500 feet by 253; the wall is upwards of fifteen feet in thickness. In the middle of Coilmore, the great wood on the south side of Loch Eric, is a place called Ailt-Merigie, or "the height on which a standard was wont to be erected." It appears to have been held sacred from the most remote antiquity, and is said to be the burial-place of seven kings of the ancient Caledonians. On a moor in Badenoach, are the remains of a square encampment; which has suggested the idea that the Romans advanced into this mountainous district in clearing some adjacent ground some years ago, an urn was found full of ashes, also a Roman tripod.

In the parish of Kilmore, are the ruins of the ancient priory of Beaulieu, which was founded in the year 1230, by James Bisset, of Lovat. In the parish of Pettry are two circular earthen mounds; one close by the church-yard, the other about 200 yards west from it. These are evidently artificial, the outside being sod or turf, inclining land or light earth. The tradition concerning them is, that they were places for the administration of justice, as their name imports, being called Tom-in-he'it, "The Court-Hill." In the same parish are the ruins of the Castle Stewart, a large old boute, belonging to the earl of Moray. In the eastern corner of the county, near the Moray Frith, is Culloden-Moor, the scene of the memorable battle which terminated the rebellion in 1745.

The modern buildings of this county worthy of observation are but few, and chiefly to be found in the north-eastern corner. The most distinguished residence in the county is Castle Grant, the seat of Sir James Grant, baron. It is situated on an eminence in the parish of Cromdale, on the north side of the Spey; the apartments contain a great variety of portraits and other paintings.

The islands of Barray, Beubecula, Egg, Harris, St. Kilda, Sky, North and South Uilt, which are annexed to, or connected with, this county, will be found described under their respective names. Beauties of Scotland.

INVERSE, is applied to a manner of working the rule of three, or proportion, which seems to go backward, or contrarily to the order of the common and direct rule. In the rule of three direct, the first term is to the second as the third is to the fourth; that is, if the second be greater than the third, or less than the first, in any proportion, the fourth is less than the third in the same proportion. But in the inverse rule the fourth term is as much greater than the third, as the second is less than the first. In the inverse rule, therefore, the proportion is not as the first to the second so is the third to the fourth; but as the fourth
Inverted Crescent, Point, Volt. See the substantives.

Inverted, in Natural History, is a term applied to such relics or extraneous foils as have a nucleus of fomy matter inverted or covered by the relinqu.

Inverary, in Geography, an ancient royal borough in Aberdeenshire, Scotland, is situated on the point of land formed by the confluence of the rivers Don and Ure. It is said to have been made a royal borough by King Robert Bruce, on occasion of a victory obtained by him in this vicinity, over the English forces under Comyn, earl of Buchan. The oldest charter, however, extant, is one granted by Queen Mary; the preamble of which states, that "Inverary had been a royal borough time immemorial, but the charter of its erection had been lost during the civil wars." The town is small, and its increase and improvement have been retarded by the peculiarity of its situation; it being inaccessible, excepting one side, with boats, and even that mode not always practicable. The spirited exertions of the earl of Kintore and the provost, Dr. Thom, have, in a great measure, removed this obstacle, by promoting a public subscription for building an elegant bridge over the Don, at the expense of 2000l.: this was completed in 1791. The borough is governed by a provost, three bailiffs, a dean of guild, a treasurer, and thirteen councillors. The return to parliament in the year 1801, stated the number of houses to be 194, inhabited by 783 persons, of whom 641 were employed in agriculture. Inverary does not appear ever to have been a place of trade.

Investigation properly denotes the searching or finding any thing out, by the tracts, or prints of the feet.

Hence, mathematicians, schoolmen, and grammarians, came to use them in their respective researches.

Investigation of a Theme, is the art, method, or manner of finding the themes of verbs, that is, the primitive tense, mood, and person, of any verb, far removed from its source. To understand a Greek author, it is absolutely necessary to be well acquainted with the method of investigat- ing a theme. This theme, in the Greek tongue, is the present tense of the indicative mood.

Clenard was the first who introduced this term into grammar: he gives the title investigatio thematici to that part where he teaches the manner of finding whence any person, or tense, or verb, proceeds, and of reducing it to its primitive word, or finding its indicative.

Investing, the act of conferring on any one the right or property of a fee, dignity, or office, or of ratifying and confirming what has been obtained elsewhere.

The emperors pretend to a right of investing several princes both in Germany and Italy. There was formerly a particular ceremony for the investing of bishops. After the election of a knight of the Garter, he is invested by the sovereign with two principal insignia of the order, the Garter and George. Before his installation he is also invested with the habit of the order.

Investing, in the Military Art, signifies the opening a siege, and the encamping of an army round the place; to block up its avenues, and prevent all ingress and egress. In order to do this effectually, the general in chief of the approaching army must detach a large body of cavalry, together with the different corps of dragoons, under the command of a lieutenant-general, for the purpose of regularly investing the place. Sometimes a place is partially invested, for the sole purpose of diverting the enemy's attention from the real object, and of inducing him to weaken the garrison by detaching it to different quarters.

Investing, in Common Law, signifies the putting in

Vol. XIX.
possession. A tenant is invested by giving him a verge, or rod, into his hands, and administering an oath.

Others define it thus: *investire* et in feum jus aliquum introdurre, to give liberty of fein, or possession. See _Livy_ and _Sesim_. See also _Froissart_.

_INVESTITURE_, is used both for the right, and the act, of investing a tenant, or vaissel, that is, of receiving the faith and homage by which a vaissel becomes feided, and possefled of a fee, by his lord. See _FEE_.

_Investitures_, in their original rife, were probably intended to demonstrate in conquered countries the actual possession of the lord; and that he did not grant a bare litigious right, which the solder was ill qualified to profecute, but a peaceable and firm possession. And at a time, when writing was seldom practised, a mere oral gift, at a distance from the spot that was given, was not likely to be rather long or accurately retained in the memory of by-products, who were very little interested in the grant. Afterwards they were retained as a public and notorious act, that the country might take notice of and testify the transfer of the estate, and that such as claimed title by other means, might know against whom to bring their actions.

Investiture was anciently performed by rehearing a formula of words; afterwards by the delivery of such things as had the nearest resemblance to what was transferred. Thus, land passed by the delivery of a turf; and to shew the trees were transferred at the same time, a bough was cut and delivered along with it.

In after-times, the things by which investitures were made were not so strictly observed. Many were invested by the delivery of a half, a glove, a knife, a piece of a cloak, of a strap, and a girdle; or by pricking the thumb, by giving the keys, a spit, a blow, a ring, a turf, a bough, a straw, &c. The investiture of a kingdom or lordship, was performed by a standard, a banner, a cap, a sword, a bow, arrows, spurs, &c.

The symbols were sometimes preferred in the repositories of the houses, and were annexed to the titles.

_Investitures_ were also used with respect to spiritual benefices. There were frequently performed by delivering the crozier and pastoral ring.

The kings of England and France, the emperor of Germany, &c., had formerly this right; so that on the death of a prelate, his clergy lent the crozier, &c., to their sovereign, to be used in the ceremony of investing his successor. It is not very certain when this custom began; Cardinal Humbert places the commencement of it in the regium of Otho the Great; and it appears, that in the ninth century, the greater part of the European princes made no opposition to the right of electing the bishops, which was both claimed and exercised by the clergy and the people. The first who disputed this privilege with the emperors and sovereign princes, was Gregory VII.; he excommunicated the emperor Henry IV., and forbade all ecclesiastics, under pain of excommunication, to receive investiture at the hands of secular princes. This occasioned a long and bloody war; the civil and ecclesiastical powers being divided into two great factions, of which one maintained the rights of the emperor, while the other seconded the ambitious views of the pontiff.

The laws of Gregory for the abolition of investitures were confirmed and renewed by Victor III. and Urban II.; the latter of whom not only confirmed the laws and anathemas of Gregory, in a council assembled at Placentia in the year 1095; but published also a prohibitory law in the council of Clermont, forbidding the bishops and the rest of the clergy to take the oath of allegiance to their respective sovereigns. Paschal II. in a council assembled at Rome, A.D. 1102, renewed the decrees of his predecessors against investitures and the excommunications they had thundered out against Henry IV. Paschal, however, was obliged, in 1117, to confirm Henry V. in the right of giving investitures; but repeating what he had done, he assembled a council in the church at Lateran, in 1112, which solemnly annulled his treaty with the emperor, who was excommunicated in many synods and councils, both in France and Germany. At length, however, Calixtus II. engaged him to renounce investiture on certain conditions, and peace was concluded between the emperor and the pope's legates, at a general diet held at Worms, A.D. 1122. This convention was confirmed the following year in the general council of Lateran, and remains still in force.

_INVISCATIO_, a flicking of the eye-lids together.

Gen. _Ch._ _Comm._ _calcis_ imbricata; _scales_ _loose_, spreading, the exterior ones larger, of equal length. _Cor._ compound, radiated, broad; _florets_ of the disk all perfect, equal, very numerous, funnel-shaped, with a five cleft straightish limb; _thoele_ of the radius female, ligulate, numerous, crowded together, linear, entire. _Stem._ (in the tubular florets) _Filaments_ five, thread-shaped, short; _anthers_ cylindrical, composed of five smaller, linear, conjointed ones; each ending below in two straight bristles, the length of the filaments. _Pill._ (in the tubular florets) _Germen_ long; _style_ thread-shaped, the length of the stamens; _ligula_ bifid; somewhat erect. The female or ligulate _florets_ differ in having the _style_ cleft but half way down, and the _ligula_ quite erect. _Pericar_ none, except the unchanging _calyx_. _Seeds_ in the florets of the disk as well as the radius, solitary, linear, quadrangular. _Down_ capillary, the length of the seeds. _Recept._ almost naked, flat.

_Efl._ _Ch._ _Receptacle_ nearly naked. _Down_ simple. _Calyx_ imbricata. _Florets_ of the radius very numerous, linear, _anthers_ with two bristles at the base.

Obf. This genus differs not only from _Alyssum_, but from most others, in having the _anthers_ terminated below by two bristles, though this character is not apparent in all the species. _Inula_ is an extensive genus, Willdenow having enumerated thirty-five species, from which number we select for description the only four which are natives of this country: namely,

The ancients entertained a very high opinion of the virtues of this plant, and in gardens it is still cultivated occasionally, for the sake of its root, which is perennial, large and red, abounding with mucilage, combined with an aromatic.
matric, bitter flavour, and some acrimony. These qualities render it useful to promote expectation.

Herrick was acquainted with its fame, for we find it celebrated by that poet in two of the fates in his second book.

--- cum rapula plenus
Atque acidas mavult inulas.

And also in f. v. 51.

Ericus virides, inulas ego primus amaras
Monstravi incouere.

   Engl. Bot. t. 1115. Curt. Lond. fasc. 3. t. 56. — "Leaves oblong, clasping the stem with their heart-shaped base, downy. Stem woolly, panicked. Calyx-scales bristle-shaped, hairy. — Native of clear ditches and moist places, flowering in August. — Root creeping and perennial. Stem branched in a panicked or corymbous manner. Leaves waved and slightly toothed at their margin; their underside densely clothed with hoary down. Flowers numerous, terminal, of a full bright yellow. The herb is used to the touch, exhaling a peculiar sharpish aromatic scent, not unlike that of a peach.

Mr. Rolban mentions a variety of this species with very short rays, and Linnaeus, in the Flora Svecica, observes that the Russians were cured of the bloody flux by this plant, in their expedition against the Perians, whence its specific name.

   Engl. Bot. t. 1196. Curt. Lond. fasc. 3. t. 57. — "Leaves clasping the stem, waved. Stem much branched, hairy. Flowers hemispherical, with a very short radius. — Found on moor fandy heaths and commons, where water has stagnated, and flowering late in autumn. — Root annual, tapering and branched. Stem generally erect, sometimes spreading or decumbent, zigzag, angular. Leaves lanceolate or oblong, hairy on both sides. Flowers solitary, of a pale dull yellow. There is a variety of this which has feaely any flowers of the radius.

   Engl. Bot. t. 628. — "Leaves linear, fliehly, generally three-pointed. Calyx smooth." — This is a maritime plant, which thrives in a muddy soil, and is rather scarce. It flowers in August. — Root perennial, fibrous. Leaves alternate, smooth and succulent, fall to the roots, those about the centre of the stem generally furnished with a tooth on each side of the tip. Flower solitary, very handsome, having yellow rays and an orange disk. Down rough, bluish-coloured.

The remaining species are I. odorata, Oculans Cirripli, britannica, indica, arabica, firaifolis, japonica, squarrosa, viridiflora, falicina, grandiflora, glandulosa, braunia, birta, fimbriata, Vailani, mariana, dubia, orientalis, germanica, enifolia, provensis, montana, effusa, bifrons, cerulea, aromatica, fimbriatii, pinifolia, falida.

INULA, in Gardening, comprehends plants of the herbaceous and shrubby kinds; of which the species principally cultivated are inula or elecampane (I. helenium); the creeping-rooted inula (I. britannica); the willow-leaved inula (I. falicina); the canary inula (I. canariensis); the savory-leaved inula (I. furolicata); and the shrubby inula (I. fruticosa).

There are some other sorts that may likewise be cultivated.

Method of Culture. — The first of these sorts may be propagated by seeds sown in autumn, soon after they are ripe, on a warm, loamy, rather moist border. The plants should be transplanted to the places where they are to grow in the following autumn.

But the common practice is to increase it by offsets, which, when taken from the old roots carefully, with a bud or eye to each, take root easily; the best season is the autumn, as soon as the leaves begin to decay; planting them in rows about a foot apart, and nine or ten inches distance in the rows. The following spring the ground should be kept clean from weeds, and be slightly dug over in the autumn following. The roots will be fit for use after two years growth, but will abide many years if permitted to lie.

The two following sorts may be increased by parting the roots, and planting them in the autumn, in the borders or other places where they are to remain. They should not be removed oftener than every three years.

The fourth and fifth sorts may be raised by planting cuttings of the branches, in the summer season, in pots of light earth, in shady borders. They must be removed into shelter in autumn, but should have as much free air as possible at all times, when the weather is mild. In cold weather the first should have but very little water, as the flanks and leaves, being succulent, are very apt to rot. In summer they should be placed abroad with other hardy exotic plants, in a sheltered situation.

The laft sort is propagated by seeds procured from places where it grows naturally. These must be sown in pots, or upon a hot-bed, and when the plants are fit to remove, be each put into a small pot filled with light earth, and plunged into a fresh hot-bed; treating them in the same manner as other similar tender plants. It requires to be kept constantly in the frame.

The first sort may be cultivated for the medicinal use of the roots, or for ornament, in large borders.

The two following sorts may have places in the same way.

The fourth and fifth kinds afford variety among other potted green-house plants, and the laft among flow-panes.

INULA Heleniim, in the Materia Medica. See Elecampane.

INVOCATION, in Theology, an act whereby we adore God, and call on him for his assistance.

The Romanists also practice invocation of saints, begging them to intercede with God in their behalf. This is one of the grand articles of dispute between the Romanists and the Reformed.

INVOCATION, in Poetry, an address at the beginning of a poem, wherein the poet calls for the assistance of some god, particularly of his Muse, or the deity of poetry. See Muse.

This part is absolutely necessary in an epic poem, because the poet relates things which he could not be supposed to know, unless some deity inspired him. Besides, this serves his readers as an example of piety and devotion, which ought to be the foundation of this whole work. To thee it may be added, that the gods themselves are to have a part in the action; and it is not decent he should fet them to work, without first asking them leave.

Indeed, in the course of an epic poem, there are usually several invocations; particularly where anything extraordinary, or miraculous, comes to be related; as that when Virgil describes the metamorphosis of Aeneas’s fleet into sea nymphs: but the first invocation is always the most considerate.

In the invocation Bofhio considers two things: the first is what the poet requests; the second, to what deity he addresses his request. As to the first, Homer has joined the
INV

Invocation fo closely to the proposition, that he seems to invoke his Muse for the whole work. But Virgil, on the contrary, only requests his Muse to furnish him with a part of his Subject; and even mentions what particular part it is he desires. After proposing his matter in all its extent, he bids the Muse to acquaint him with the cause of it. See Proposition.

As to the deity invoked, the same author observes, that it must always be, either the divinity that presides over poetry in general, or that which presides over the particular subject of the work. Ovid's invocation, in the Metamorphoses, is of the latter kind; and so is that of Lucan: those of Homer and Virgil are of the former kind; and thus the invocation of the Muse; and thus they distinguish between the divinities who preside over poetry, and those who preside over the actions of the poem, and have parts in it.

By the way, it may be observed, that the deities invoked are not looked on, even by the poets themselves, as divine personnages from whom they expect any real assistance. Under the name of Muse they wish for the genius of poetry, and for all the qualities necessary for the execution of their design. These are mere allegories, or manners of expressing themselves poetically; just as when they personify and make gods of sleep, of pride, of passion, and other natural and moral things. And thus the Muses come to be of all ages, countries, and religions; there are Pagan, Christian, Greek, Latin, and English Muses.

INVOICE, or Invoice, a list, or account of commodities, with their value, customs, provision, charges, &c., sent by a merchant to his factor, or correspondent, in another country.

INVOICE, Book of. See Book.

INVLUCELLUM, in Botany. See the following article.

INVLUCRUM, a term adopted by Linnaeus, at the suggestion of Arndt, for the row of small leaves found at the base of the umbels in most umbelliferous plants. That of the general umbel is termed the General Involution; that of each partial one a Partial Involution, in Latin Involutionum. The same word is used for what might be more properly called Bracteas in Euphorbia and other genera; and Linnaeus has probably erred in reckoning the Involution of a species of Calyx in any instance. In forms, however, we retain this appellation for the membranous covering of their fruitification, in preference to a newly invented term Involutum.

INVLUCRUM Discharge of Urine. See Incontinence of Urine.

INVOLUTARIA Motion. See Motion.

INPLICATE Curve, in the Higher Geometry. See Curve.

INVCItION, in Algebra, the raising any quantity from its root to any height, or power, assigned. See Power.

Any quantity multiplied by itself, the product is the square of that quantity; the square being again multiplied by the quantity, produces its cube. See SQUARE and CUBE.

Thus if \( a + b \) were to be raised to its second power, it will produce \( a^2 + 2ab + b^2 \).

And if it be involved again, or if that square be multiplied by the root, the cube or third power will be produced \( a^3 + 3a^2b + 3ab^2 + b^3 \), &c., so that the involution of any compound quantity is performed by a consecutive multiplication of it by itself: if the powers of \( a - b \) are required, they will be found the same as those of \( a + b \), except that the terms in which the exponent of \( b \) is an odd number will be negative, because an odd number of multiplications of a negative produce a negative; or, in general, the terms of any power of \( a - b \) are positive and negative by turns. See Binomial Theorem.

If a quantity, confiding of three or more terms, is to be involved, it may be distinguished into two parts, which are to be raised to any power in the same manner as a binomial, and then by the same rule, the values of these compound parts may be substituted in their stead; thus,

\[
\frac{a + b + c}{d} = \frac{a + b}{d} + \frac{c}{d}.
\]

And \( a + b + c = a + b + \frac{c}{a + b} + \frac{c}{a} + \frac{c}{b} + a + b + \frac{c}{a} + \frac{c}{b} + \frac{c}{a} + \frac{c}{b} \), &c. The reverse of involution is called evolution. See Extraction of Roots, and Root.

INWARD Flank Angle, in Fortification. See Angle.

JOACHIM, George, a celebrated mathematician and astronomer in the 16th century, was born in 1514, at Feldkirch, in the Tyrol. He was educated at Zurich, where he soon discovered a strong inclination for mathematical pursuits, in the elements of which he was initiated at that place. Afterwards he went to Wittenburg, where he professed his studies with ardour and success. In the year 1555 he was admitted to the degree of M. A., and in two years afterwards he was appointed a joint professor of the mathematics with Reinhold. He was a valiant and able defender of the Copernican system of the world; went into Prussia, where he placed himself under the tuition of Copernicus himself, and became the editor of his great work, entitled "De Revolutionibus." While Joachim continued in Prussia, to render astronomical calculations more ready and accurate, he began an elaborate canon of sines, tangents, and secants, to fifteen places of figures, and to every ten seconds of the quadrant. He did not live to accomplish this great work, but the canon of sines for every ten seconds, and for every single second in the first and last degree of the quadrant, computed by him, was published at Frankfort in 1573, by Pitiscus; the larger work was perfected and published after his death in 1556, by his disciple Valentine Otho. Joachim returned
JOA

returned from Prussia in 1543, and was again admitted to his professorship of mathematics at Wittenberg; he afterwards was elected to fill the mathematical chair at Leipzig. He died in 1576, in the sixty-second year of his age, leaving behind him "Narratio de Libris Revolutionum Copernicii," first published at Danzig in 1540. He also composed and published "Ephemerides," according to the doctrine of Copernicus, till the year 1551, in a private edition.

JOACHIMSTHAL, St., in Geography, a town of South America, in the kingdom of Granada, on the coast; 540 miles E. of Santa Fe de Bogota.-Alto, a town of South America, in the province of Moxos; 150 miles N.E. of Trinidad.-Alto, a town of Canada, on the river St. Lawrence. N. lat. 47° 40'. W. long. 76° 47'.

JOACHIMSTHAL, St., a town of South America, in the audience of Quito, on the river Amazonas; 460 miles S.E. of Quito. S. lat. 4° 40'. W. long. 72° 50'.

JOACHIMITES, in Ecclesiastical History, the name of a sect, the followers of one Joachim, abbot of Flora, in Calabria, who was deemed a prophet while he lived, and left, at his death, several books of prophecies, contained in his Everlasting Gospel, commonly called the book of Joachim, besides other works; which were condemned, in 1215, by the council of Lateran; and by the council of Aries, in 1260.

One of the spiritual friars, named Gerhard, belonging to the order of Franciscans, undertook to explain the Everlasting Gospel of Joachim, in a book published in 1250, entitled "The Introduction to the Everlasting Gospel." In this work St. Francis is declared to be the angel mentioned in the Revelation, xiv. 6, who had prophesied the true and everlasting gospel of God: it is also affirmed, that the gospel of Chrit was to be abrogated in 1260, and this new gospel to be published in its room; and that the ministers of this signal reformation were to be humble and barefooted friars, destined of all worldly emolument. This absurd book was suppressed by order of pope Alexander IV, in 1255, and at length publicly condemned.

The Joachimites were particularly fond of certain tenets: the Father, said they, operated from the beginning till the coming of the Son; the Son from that time to the Apocalypse, B. 1260; and the Holy Spirit then took it up, and was to operate in his turn. Hence they divided everything that related to men, time, doctrine, and manner of living, into three classes, or flutes, according to the three persons in the Trinity; every one of which flutes either had already, or was hereafter to succeed in its turn; and hence they called the divisions ternaries.

The explanation given by Joachim, of the Trinity, in opposition to Peter Lombard, which was considered by many as differing little from the Arian fyfrem, procured the damatory sentence of his doctrine by Innocent III. in the council of Lateran; but notwithstanding this papal sentence Joachim has still a considerable number of adherents and defenders, more especially among those of the Franciscans, who are called Obervarz, or Friars obervant.

JOACHIMSTHAL, in Geography, a town of Bohemia, in the circle of Elbogen, celebrated for its silver mines, which were discovered in the year 1516, and which yielded from the year 1580, to the year 1601, 305,790 marks of silver; 52 miles S.S.E. of Dresden. N. lat. 50° 20'. W. long. 12° 53'.-Alto, a town of Brandenburg, in the Ucker Mark; 31 miles N.N.E. of Berlin. N. lat. 53° 54'. E. long. 13° 56'.

JOAG, a town of Africa, in the country of Kjanga, which Mr. Park supposes to have contained about 2600 inhabitants. It is surrounded by a high wall, in which is a number of port holes, from which muskets may be fired in case of an attack; and every man's possession is likewise surrounded by a wall. To the westward of the town is a small river, on the banks of which arc cultivated considerable quantities of tobacco and onions. N. lat. 14° 21'. W. long. 9° 58'.

JOAL, a town of Africa, in the kingdom of Sen, situated on the sea-coast, with a good road and anchorage; where the French had a factory for slaves, skins, ivory, and wax.

JOAN I., in Biography, queen of Naples, eldest daughter of Charles duke of Calabria, son of Robert king of Naples, was born about the year 1426. Her father died while she was very young, and Robert immediately betrothed her to Andrew, second son of Charles king of Hungary, who was her cousin, and who was then sent to Naples to be educated. On the death of Robert in 1541, Joan was proclaimed queen. She had already conceived a great aversion from her husband, which was increased by the idle tales of her attendants, and was now determined to hold all power in her own hands; but the pope, who was in her interest, granted a bull for the coronation of Andrew, as king in his own right. Joan was suspected of harbouring an attachment for Lewis, prince of Tarento; and she was accused of being privy to the murder of Andrew, who was taken off at the instigation of the princes of the blood, to prevent, as they thought, the kingdom from falling into the hands of the Hungarians. The king of Hungary determined to revenge himself upon the perpetrators of his brother's assassination, and advanced with a large army into Naples; the queen, who had already married the Prince of Tarento, fled into Provence, and all Naples fell under the dominion of Lewis the Hungarian monarch. Joan went to Avignon, and was received with great respect by pope Clement VI. and the cardinals, before whom the underwrote a formal trial on account of her husband's death. She pleaded her cause with eloquence, and was declared not only innocent, but free from all suspicion. With this decision the king of Hungary, believing himself excommunicated, and immediately returned to his own dominions. Joan was now invited by the Neapolitan barons to return her crown; she accordingly fitted out a fleet, and re-entered Naples with general acclamations in 1348. She was next engaged in a contest with the king of Hungary, which proved so much against her, that she was obliged to seek a cessation of arms, which was granted by the king, on the condition that she should abide the event of another trial before the papal court. Upon the issue of this was to be determined the possession of the kingdom of Naples. Joan now had recourse to a different kind of defence, and the plea in excuse that she was under the influence of witchcraft at the time, which rendered her averse from her husband, and encouraged others to conspire against him. This plea served her purpose, and she was declared blameless of all actions committed subsequent to the fupposed fascination. She was left in the peaceable possession of her throne, and was again crowned, with her husband Lewis, in the city of Naples. Lewis died in 1352, and in the course of a few months she married James of Aragon, called the Infant of Majorca, whom she did not allow to assume a higher title than duke of Calabria. This prince died in 1375, and in the following year she took a fourth husband, viz. Otto, of the house of Brunswick, an accomplished and hardy man, on whom she conferred the title of duke of Tarento, with a large estate. Having no children, one of which a court of Bolognese, she adopted as his successor her relation Charles de Duria, who revolted against her at the instigation of the king of Hungary. She then adopted for her heir Lewis of France, Duke of Anjou, which produced a bloody war. Charles, however, was a native prince, and
being more amenable to the wishes of the Neapolitans than a foreigner, he marched to Naples, and being joined by the former he found little or no difficulty in getting possession of the kingdom. The queen was obliged to capitulate, she was imprisoned, and after a few months was put to death. This event occurred in 1562, in the thirty-ninth year of her reign. She was a woman of great accomplishments, and possessed many good qualities, though fulfilled by early difficulties. She was the friend and patron of men of learning. Univer. Hist. Bayle.

JOAN of Arc. See Arc.

JOAN, Pop. A short notice must be taken of this character, as being frequently referred to, though it is now generally regarded as merely fictitious. It is said, that about the middle of the ninth century, a woman named Joan, born at Meaux, and who had received an excellent education, conceiving a violent passion for a young monk named Fullbs, resolved to defend her family and friends to assume the male habit, and gain admittance into the monastery. The plan succeeded, and having long indulged in their amours undiscovered and unsuspected; they eloped together, and travelled into most of the countries of Europe, availing themselves of every opportunity for increasing their knowledge, by engaging the assistance of the learned men in the different cities through which they passed. On the death of her lover, Jean repaired to Rome, still in the drees of a man; her address, and engaging manner roused her from her notice; she commenced the duties of professor, and perfections of the highest rank and most considerable talents exhibited in the number of her disciples. At length, on the death of pope Leo X. in 1513, she was unanimously elected his successor to the pontifical throne. So prudently did she conduct herself, and with so much ability did she perform the duties of her station, that the people had reason to congratulate themselves on their choice. At length she confided her secret to a domestic whom she took to her bed, the confession of which was her pregnancy, and she was taken in labour at one of the most solemn processions, delivered of a child in the street, and died on the spot. It is likewise said, that to perpetuate the memory of such an extraordinary adventure, a statue was erected on the place where it happened; that in subsistence of the crime, the pope and clergy in their subsequent annual processions from the Vatican to the Lateran have turned off from that street; and that to prevent a similar imposition, a custom was introduced of examining each pope previously to his consecration, in order to ascertain his sex. Such are the particulars of a story that seems not to have been related in question till the time of Luther, but which the bell informed his followers usually abandon as fictitious. "Till the reformation," says Gibbon, "the tale was repeated and believed without offence, and Joan's female statue long occupied her place among the popes in the cathedral of Sienna. She has been annihilated by two learned Protestant, Blondel and Bayle, but their brethren were scandalized by this equivocal and generous criticism. Spanheim and L'Enfant attempted to save this poor engine of controversy; and even Molheim concedes to cherish some doubt and suspicion.

JOAN d'ALBERT, queen of Navarre, daughter of Henry d'Albert, and Margaret of V.dois, was born in 1528. In 1548, she married Antony of Bourbon, duke of Vendome, by whom she had, as a third son, the afterwards celebrated Henry IV. of France. At the decease of her father, in 1555, she became queen of Navarre, and her husband took the title of king. They were both favourable to the principles of the reformation, and would probably have openly professed it had they not feared the resentment of the king of France, but after his death they declared their conversion to Calvinism, of which Joan was ever after the zealous protector. Antony, on the other hand, was fickle and weak, renounced his new faith, and was a principal commander in the civil war against the Protestants, in which he lost his life at the siege of Rouen, in 1562. Joan not only established the Protestant religion in her states, but abolished popery, and seized the property of the ecclesiastics, which she applied to the maintenance of the reformed clergy and the schools. In 1568, she quitted her states to join the chiefs of the French Protestants, and at Cognac had an interview with the prince of Condé, to whom she presented her son, then of the age of fifteen, with her jewels, as devoted to the service of the cause. She next withdrew to Rochelle, where she wrote a pathetic letter to queen Elizabeth of England, defending the calamities and opprezzions which had induced the Protestants to take up arms. She died in 1572, at Paris, whether she had come to make preparations for the marriage of her son with the sifter of Charles IX. Her death was not without fulmination of poison, though the fact was never ascertained.

JOANNA, in Geography, a town on the north coast of the island of Java, built on a river of the same name, which is the largest and most navigable along this coast. It is here more than 20 feet deep, and about 200 feet broad. It flows out of a large inland lake, into which several small streams discharge themselves, and falls into the sea about four leagues to the westward of Rembang. The town consists of two rows of houses built along the river, about a quarter of a Dutch mile in length. The fort of Joanna is a redoubt, with four demi-bastions, in which are the rice warehouses, the barracks for the fordon, and some buildings which serve for a kitchen and other offices for the garrison. The emoluments of this residency amount to 15,000 rix-dollars, or about 3500l. sterling. This town yields rice and timber, a little indigo and cotton.

JOANNA, JOHANNA, or Hinzuam, one of the Comora islands, about 30 miles long and 15 broad. The Abbé Raynal describes this island in terms of high commendation. Hills, he says, that are ever green, and values that are always gay, everywhere present a variety of delightful landscapes. Thirty thousand inhabitants, distributed into 73 villages, share its productions. They speak a corrupt dialect of the Arabic language, and their religion is a corrupt kind of Mahometanism: their moral principles are more refined than they usually are in this part of the globe. Aconfounded to the plain diet of milk and vegetables, they are averse from labour. Among persons of distinction, who indulge themselves in ease and indolence, the nails of the fingers are fuller to grow to an immoderate length, and in order to give this effect of negligence the appearance of beauty, they turn their nails with a yellow red, which they obtain from a shrub called Alcanna, which see. Sir William Jones, who touched at this island, in his voyage to India, was much pleased with the beautiful scenery which its verdant hills and mountains, covered with elegant palms and other trees, presented to his view. He particularly mentions the town of Matamudo, distinguished at a distance by the tower of the principal mosque, and another small town called Bautani. For an account of his rambles through part of the island, and his intercourse with some of the principal inhabitants, we must refer to his "Remarks" on this island, in the second volume of the Asiatic Researches. Other voyagers who have visited this island, say, that the hills are steep, covered with wood, and difficult of access, and that the valleys exhibit a few irregular plantations of cocoa-nuts. The original natives, flated at about 7500 in number, occupy the hills in the interior of the island; and they are generally at war with the Arabian interlopers, who have established themselves by conquest.
quest on the sea-coast, and are said to be in number about 3000. These latter are described as poor miserable beings, who, not being able to carry on any extensive cultivation, on account of being exposed to the depredations of the mountain-natives, subsist chiefly by supplying the Indian ships which touch there for refreshment, with a few cattle and tropical fruits. Of their ability to accommodate strangers on shore, those who have touched at the island speak in very degrading terms, as their huts or hovels are filthy and badly constructed. The huts of the poorer people are formed of twigs, interwoven with and covered by a thick coat of grass, and the roof is protected by a kind of mat, made of the leaves of the cocoa trees. People of superior rank have houses built of stone, cemented with tempered clay. The king, as he is called, or chief of the island, refides about nine miles from the town of Joanna, which contains about 200 houses, many of which are built of stone and occupied by persons of principal distinction in the island: but they are long and incommodious; the palace of the king excepted, which is high and spacious. This chief possesses an unlimited power over his subjects, in all concerns, religious as well as temporal: he seldom visits the town except on the arrival of European vessels, when he is accompanied by a numerous equipage, and received with great attention and respect by the commanders of the ships. Every captain finds it his interest to treat him in this manner, as his permission must be obtained before any traffic can be opened with the inhabitants; and with this view he receives a small present of European manufactures. The principal domestic animals in the island are cattle, sheep, and hogs; there are several species of fowl, and different kinds of game. The sea abounds with a variety of excellent fish; and particularly with a sort of electrical fish, seven inches long, a dark blueish, with a long projecting mouth, a head of a dark brown colour, the belly of sea-green, the fides yellow, and the fins and tail of a sandy-green; the body intermixed with red, green, and white spots; the eyes large, and the iris red, having its outer edges tinged with yellow. The sea-coast is wholly composed of coral rocks, which are in many places hollowed by the sea, and in those cavities several of the electrical fishes were found. See a description and drawing in the Phil. Trans. vol. lxxvi. p. 352. The natives of the island are, in general, tall, robust, and well-made; the women are inferior to the men; they have all long black hair, piercing eyes, and colour between olive and black. People of lower rank have no other covering besides a piece of cloth tied round their loins, and on their heads a cap of any fluff which they can procure. Those of higher rank wear a shirt with large sleeves, hanging down upon a pair of drawers and covering a stuffing waistcoat; those of still higher orders wear turbans; and they generally have large knives attached to a belt, which paffes round their middle. The women are clothed in a kind of jacket and petticoat, with a loose robe, and when they go abroad, they cover the face with a veil: they are very attentive to ornaments for their legs, arms, and ears. Their children, both male and female, are suffered to be naked till the age of seven or eight years. The inhabitants in general are commended for their simplicity, obliging disposition, and hospitality. Polygamy is allowed; so that each person has two or three wives, and as many concubines as he can maintain. S. lat. 15° 15'. E. long. 44° 15'.

JOAO, a small island near the coast of Brazil. S. lat. 12° 36'.
JOAO Fishes, a town of Brazil, in the island of Marajo; 26 miles N.W. of Engenho-real.
JOAO de FUNDOS, St., a town of Portugal, in Eftremadura; 32 miles to the E.N.E. of Lisbon.

JOAO de Furtado, St., a town of Brazil, in the government of Para, on the Guanapu; 75 miles S.W. of Para.
JOAO Martinho, a small island in the Indian sea. S. lat. 10° 42'.

JOAO de Nova, a small island in the channel of Mozambique. S. lat. 16° 58'. E. long. 40° 35'.—Alfo, two small islands in the Indian sea. S. lat. 9° 30'. E. long. 49° 14'.
JOAO de Pequimira, St., a town of Portugal, in the province of Beira, on the Duero; containing two parish churches, and about 600 inhabitants; near it is a cataract on the Duero, which prevents the navigation of this river; 21 miles from the town of Beira; 7 miles S.E. of Lamego. N. lat. 41° 41'. W. long. 7° 1'.
JOAO de Po, St., a town of Portugal, in the province of Beira; seven miles N.E. of Braganza Nova.
JOAO del Rey, St., a town of Brazil, in the government of Menas Geraes; 80 miles S.W. of Villarica.
JOAR, a town of Africa, in the kingdom of Bursali, surrounded with palisades as a defence from wild beasts; 10 miles S. of Kower.
JOARTAM, a town and kingdom of the island of Java, in the N.E. part of the island.
JOARY, a town of Bengal; 55 miles S. of Islamabad.
JOB, or the Book of Job, a canonical book of the Old Testament, containing the narrative of a series of misfortunes, which happened to a man, whose name was Job, an inhabitant of the land of Uz, supposed to be that part of Arabia Petraea, which is called Idumea, as a trial of his virtue and patience; together with the conferences he had with his cruel friends on the subject of his misfortunes; and the manner in which he was restored to affluence and happiness. This book is filled with those noble, bold, and figurative expressions, which constitute the very soul of poetry.

Many of the Jewish rabbins pretend that this relation is altogether a fiction; others think it a simple narrative of a matter of fact, just as it happened; while a third class of critics own the ground-work of the story to be true, but that it is written in a poetical strain, and decorated with peculiar circumstances, to render the narration more profitable and entertaining. Others, again, suppose that, like some of our Saviour's parables, it is a fabulous narration designed to convey important and useful sentiments respecting the superintending providence of God, in a manner more forcible and impressive than in the form of abstract rules and precepts.

See an express dissertation on the book of Job, in the bishop of Gloucester's "Divine Legation of Mofes," vol. ii. The bishop is of opinion that this book is a dramatic poem written by Ezra, some time between the return of the Jews from the captivity of Babylon, and their thorough settlement in their own country, and adapted to the circumstances of those times, by being made allegorical as well as dramatic: thus, Job, who is supposed to have been a real person, that lived a generation or two before Mofes, is designed to personate the Jewish people; his three friends the three great enemies of the Jews, Sanballat, Tobiah, and Gehem, who upon their return from captivity, vexed and obstructed them in rebuilding their city and temple; Job's wife was intended by the poet to represent the idle-tongued wives which many of the Jews had taken, contrary to the law, and for which they are reproved by the prophet Nehemiah.

In order to prove the composition of this book to be dramatic, the learned bishop alleges its style, which, excepting the introduction and conclusion, is in measure; its sentiments, which are delivered not only in verse but in a kind of poetry, animated by all the sublimity of figure and floridness of description, whereas he concludes the whole to be a work of imagination; and the whole form of its composition. The bishop's
Le Clerc supposes that the book of Job, which, in his opinion, was a history treated in a poetical manner, or a history treated in the form of a parable, was written after the Jews were carried into Babylon, and urges, in proof of this, the frequent chaldæisms that occur in it.

The learned Grotius apprehends that this book contains a true history, treated in a poetical manner; and he was probably led to adopt this opinion from admitting to the supernatural and surprising incidents that occur in it; such as that of the sons of God presenting themselves before Jehovah, and the divine interposition at the conclusion. But as he supposed the book to be written at the distance of about a thousand years from the date of the subject of which it treats, he could scarcely imagine that there was much of true history in it. Would not a considerable difficulty in settling the time, when this book was written, be obviated, by supposing that the introductory part in the two first chapters, in which Satan makes so conspicuous a figure, (and perhaps the conclusion,) were written after the Babylonian captivity, by some writer, Ezra or another person; for, as bishop Warburton allows, Satan became more known among the Jews after their return from Babylon? Grotius further supposes, that the events recorded in this poetical history happened in Arabia, whilst the Hebrews wandered in the desert; and that the writer, who was a Hebrew, lived before the time of Ezekiel, as he infers from that passage in his prophecy, where Job is mentioned; but after David and Solomon, from whom writings, as he conceives, some sentences and forms of speech are transferred hither; and that it was written for the use of the Edomites, transported to Babylon, to confirm them in the worship of the true God, and to teach them patience in adversity.

The learned writer whose sentiments we are now detailing, acknowledges that there is no mention in this book of any law but such as was traditional; nor of any point of history, besides those of the more ancient times, viz. before the giving of the Mosaic law; that the length of Job’s life, which extended to 120 years, agrees with those times; and that though the writer is unknown, it appears credible from a passage in Ezekiel, that he lived before the time of that prophet. David and Solomon might have borrowed forms of speech from the book of Job; which is no less probable than the supposition of Grotius already mentioned; and if the book was written before the time of Ezekiel, the author could not have borrowed from Daniel, Ezra, and the Chaldean paraphrases, as Grotius seems to intimate.

Schleusner ascribes the poetical, or dialogue part of this book, the style of which, he says, has all the marks of the most venerable and remote antiquity, to Job himself; the rest he supposes to be the work of some Hebrew collector. As for Le Clerc’s chaldæisms, such as the termination in for im in the plural, he says they are true Hebrew and Arabic, of the most ancient stamp. See also Grey’s Job, p. 12. of the preface. Molt of the Jewish doctors believe that Moses was the writer of this book; and M. Huet, with whom professor Michaelis concurs, supposes that it was written by Moses in his exile in the land of Midian; where he resided 40 years. Some have supposed that it was either written by him, or translated by him from the original Syriac, or Arabic, and that it was designed to prepare the Israelites for their Exodus from Egypt, and the hardships of their future peregrination. All those learned men, who suppose this book to have been written by Moses, or Eliahu, as Lighthart imagines, or some person near the time of Job, must of course be persuaded that there is nothing in the style, which is not very consistent with this remote antiquity; and that the pharases which others take for imitations of passages in the Psalms or Proverbs, Daniel or Ezra, are rather
JOB.

...originals to these, and that these last are really the imitations. It is certain, whatever was the author of this book, that the style has a mixture of the Arabic. And those who have made the happiest conjectures for the solution of difficulties and the explanation of particular passages, have been more indebted to the Arabic than to the Chaldee; so that the language in which it was written must have been spoken in Arabia in the days of Job. And this is the more probable, if the sons of Abraham by Keturah (from whom Job himself is supposed to be descended) were those who peopled this part of the world: for then, without doubt, they carried the language of Abraham along with them.

Mr. Peters concurs in opinion with those who believe this book to be the oldest in the world; that it was written, probably, by Job himself; and that it contains, in the main, a true history.

The eminently learned and ingenious critic, bishop Lowth, has devoted three lectures of his "Prelections, &c." to the examination of the book of Job. The scene of this book is laid in Idumea; the history of an inhabitant of that country is the basis of the narrative; the characters who speak are Idumeans, or at least Aravians of the adjacent country, all originally of the race of Abraham. The language is pure Hebrew, although the author appears to be an Idumean; for it is not improbable that all the potteries of Abraham, Isaac, Jacob, and Arabs, whether of the family of Keturah or Ilmaud, spoke for a considerable time one common language. Our learned author, discarding the sentiments of those who ascribe this book to Ehim, proceeds to examine the claims of Moses, to whom it has been more generally ascribed. This hypothesis he represents as very futile, since it is impossible to trace, throughout the whole book, the slightest allusion to the manners, customs, ceremonies, or history of the Israelites. The style of Job appears, also, to be materially different from the poetical style of Moses; being much more compact, concise, or condensed, more accurate in the poetical conformation of the sentences. He therefore avows himself inclined to favour the opinion of those, who suppose Job himself, or some contemporary, to be the author of this poem, which is the most ancient of all the sacred books, as is manifest from the subject, the language, the general character, and even from the obscurity of the work. The style of the poem favours so much of the antique, that in the judgment of the learned prelate, whoever would suppose it written after the Babylonish captivity would fall little short of the error of Hardouin, who ascribed the golden verses of Virgil, Horace, &c. to the "iron age" of monkish pedantry and ignorance.

As to the time in which Job lived, the length of his life evinces that he was before Moses, and probably contemporary with the patriarchs. That he lived at a period prior to the promulgation of the law is very probable, from the nature of the sacrifice which he institutes, conformably to the command of God, namely, seven oxen and seven rams; a request being paid in these countries, and at that period, to that number, from the traditional accounts which were still preferred among them of the seven days of creation. The poem is founded in fact, as far as concern the general subject of the narrative; though the whole dialogue, and probably some other parts, have partaken largely of the embellishments of poetry: but this has not by any means tended so far as to convert the whole into an allegory. The exordium and conclusion, indeed, are distinct from the poem itself, and stand in the place of an argument or illustration; but our author conceives, that they are coeval with the poetical part, and the work of the same author because they are indispensably necessary to the unravelling of the plot, which is not developed in the body of the poem. Michaelis, who considers the subject of the poem as altogether fabulous, and who apprehends that it is more instructive as a fable than it possibly could be if it were a true history, cannot but regard the exordium, in which Satan appears as the accuser of Job, rather in the light of a fable than of a true narrative. It is equally incredible that such a conversation ever took place between the Almighty and Satan, who is supposed to return with news from the terrestrial regions. There, it is true, says the learned prelate, parables exist in the exordium, in which some critics have pretended to discover the hand of a later writer; but he is not convinced by the arguments which they produce. The principal object he'd forth to our contemplation in this production is the example of a good man, eminent for his piety, and of approved integrity, suddenly precipitated from the very summit of prosperity into the lowest depths of misery and ruin; who having been first bereaved of his wealth, his offspring, and his children, is afterwards afflicted with the most excruciating anguish of a loathsome disease, which entirely covers his body. He suffers all, however, with the mildest submission, and the most complete resignation to the will of Providence. "In all this," says the historian, "Job finned not, nor charged God foolishly." And after the second trial, "in all this did not Job sin with his lips." The author of the history remarks upon this circumstance a second time, in order to excite the observation of the reader, and to render him more attentive to what follows, which properly constitutes the true subject of the poem: namely, the conduct of Job with respect to his reverence for the Almighty, and the changes which accumulating misery might produce in his temper and behaviour. Accordingly we find that another still more exquisite trial of his patience yet awaits him, and which, indeed, as the writer seems to intimate, he fearfully appears to have handled with equal firmness, namely, the unjust accusations, the bitter reproaches, and the violent altercations of his friends, who had visited him on the pretence of affording consolation. Here commences the plot or action of the poem: for when, after a long silence of all parties, the grief of Job breaks forth into passionate exclamations, and a vehement execration on the day of his birth; the minds of his friends are suddenly exasperated, their intentions are changed, and their consolation, if indeed they originally intended any, is converted into contumely and reproaches. The first of these three singular comforters reproves his impatience; calls in question his integrity, by indirectly intimating that God does not inflict such penalties upon the righteous; and finally admonishes him, that the chastisement of God is not to be despised. The next of them, not less temperate in his reproofs, takes it for granted, that the children of Job had only received the reward due to their offences; and with regard to himself, intimates, that if he be innocent, and will apply with proper humility to the divine mercy, he may be restored. The third upbraids him with arrogance, with vanity, and even with falsehood, because he has preferred to defend himself against the unjust accusations of his companions; and exhorts him to a tenderer mode of redeeming a more holy life. They all, with a manifest, though indirect allusion to Job, discourse very copiously concerning the divine judgments, which are always openly displayed against the wicked, and of the certain destruction of hypocritical pretenders to virtue and religion. In reply to this, Job enumerates his sufferings, and complains bitterly of the inhumanity of his friends; and of the levity which he has experienced from the hand of God; he calls to witness both God and man, that...
that he is unjustly oppressed; he intimates, that he is weak in comparison with God, that the contention is conseqently unequal, and that he is more on the defensive than the other. He expatiates with God himself still more vehemently, and with greater freedom, affirming, that he does not determine characters, but equally afflicts the just and the unjust. The expatiations of Job serve only to irritate still more the resentment of his pretended friends: they reproach him in severer terms with pride, impiety, passion, and madness; they repeat the same arguments respecting the justice of God, the punishment of the wicked, and the certain destruction after a short period of apparent prosperity. This sentiment they confidently pronounce to be confirmed both by their experience and by that of their fathers; and they maliciously exaggerate the ungrateful topic, by the most splendid imagery and the most forcible language. On the part of Job, the general scope of the argument is much the same as before, but the expression is considerably heightened: it consists of appeals to the Almighty, affirmations of his own innocence, earnest expatiations, complaints of the cruelty of his friends, melancholy reflections on the vanity of human life, and upon his own severe misfortunes, ending in grief and desperation: he affirms, however, that he places his ultimate hope and confidence in God; and the more vehemently his adversaries urge, that the wicked only are objects of the divine wrath, and obnoxious to punishment, so much the more reluctantly does Job assert their perpetual impurity, prosperity, and happiness even to the end of their existence. The next of his opponents, Eliphaz, incensed by this affront, defends directly to open crimination and contumely; he accuses the most upright of men of the most atrocious crimes, of injustice, rapine, and oppression; inveighs against him as an impious pretender to virtue and religion, and with a kind of farrakical bona fide exclaims to him to penitence. Vehemently affected with this reproach, Job, in a still more animated and confident strain, appeals to the tribunal of All-seeing Justice; and wishes it were only permitted him to plead his cause in the presence of God himself. He complains still more into the operation of the unequal treatment of Providence; exalts his own integrity, and then more tenaciously maintains his former opinion concerning the impurity of the wicked. To this another of the trimnate, Bildad, replies by a masterful, though concise, deflation on the majesty and sanctity of the Divine Being, indirectly rebuking the presumption of Job, who has dared to question his decrees. In reply to Bildad, Job demonstrates himself no less express at wielding the weapons of satire and ridicule, than those of reason and argument; and reverting to a more serious tone, he displays the infinite power and wisdom of God more copiously, and more poetically than the former speaker. To the third of the friends making no return, and the others remaining silent, Job at length opens the true sentiments of his heart concerning the fate of the wicked: he allows that their prosperity is suitable, and that they and their descendants shall at last experience on a sudden, God is the avenger of iniquity. In all this, however, he contends that the divine counsel do not admit of human investigation; but that the chief wisdom of man consists in the fear of God. He therefore depends upon his former prosperity; and exhibits a striking contrast between it and his present affliction and torment. Lastly, in answer to the crimination of Eliphaz, and the indignation of the other, he relates the principal instances of his life; he asserts his integrity at display in the life of his, and in the sight of God, and man; and still appeals to the justice and omniscience of God in estimation of his veracity.

When Job's three friends have ceased to dispute with Job, "because he feemeth just in his own eyes," that is, because he has uniformly contended, that there was no wickedness in himself which could call down the heavy vengeance of God; Elihu comes forward justly offended with both parties; with Job, because "he justified himself in preference to God;" that is, because he defended so vehemently the justice of his own cause, that he seemed in some measure to arraign the justice of God; against the three friends, because, "though they were unable to answer Job, they ceased not to censure him," that is, that, concluded in their own minds that Job was impious and wicked, while, nevertheless, they had nothing specific to object against his assertions of his own innocence, or upon which they might safely ground their accusation.

The conduct of Elihu evidently corresponds with this state of the controversy: he professes, after a slight preparatory mention of himself, to reason with Job, unbiased equally by favour or resentment. He therefore reproves Job from his own mouth, because he had attributed too much to himself; because he had affirmed himself to be altogether free from guilt and depravity; because he had presumed to contend with God, and had not scrupled to intimate that the Deity was hostile to him. He affirms, that it is not necessary for God to explain and develop his counsels to men; that he nevertheles takes many occasions of admonishing them, not only by visions and revelations, but even by the visitation of his Providence, by sending calamities and disasters upon them, to repress their arrogance and reform their obstinacy. He next rebukes Job, because he had pronounced himself upright, and affirmed that God had acted histonically, if not impartially towards him, which proves to be no less improper than indecent. In the third place, he objects to Job, that from the mferies of the good, and the prosperity of the wicked, he has falsely and perversely concluded that there was no advantage to be derived from the practice of virtue. On the contrary he affirms, that when the affictions of the just continue, it is because they do not place a proper confidence in God, ask relief at his hands, patiently expect it, nor deplore them unless before him with becoming humility and submission. This observation alone, he adds very properly, is at once a sufficient reproof of the contumacy of Job, and a full refutation of the unjust suspicions of his friends. Lastly, he explains the purposes of the Duey in challenging men, which are in general to prove and to amend them, to repress their arrogance, to afford him an opportunity of exemplifying his justice upon the obstinate and rebellious, and of showing favour to the humble and obedient. He supposes God to have acted in this manner towards Job; in that the account he exhibits him to humble himself before his righteous Judge, to beware of appearing obdurate or contumacious in his sight, and of relapsing into a repetition of his sin. He treats him, from the contemplation of the divine power and majesty, to endeavour to retain a proper reverence for the Almighty. To these frequently intermitted and often repeated admonitions of Elihu, Job makes no return.

The speech of Elihu is followed by the addresses of God himself; at the close of which, Job humbly submits to the will of Providence, acknowledges his own ignorance and imbecility, and "repents in dust and ashes;" "And on a due consideration of these circumstances, the principal object of the poem seems to be this third and last tri of Job, from the injustice and unkindness of his accusing friends. The consequence of which is, in the last place, the anger, indignation, and contumacy of Job, and afterwards his compunction, submission, and penitence. The
design of the poem is, therefore, to teach men, that having a due respect to the corruption, infirmity, and ignorance of human nature, as well as to the infinite wisdom and majesty of God, they are to reject all confidence in their own strength, in their own righteousness, and to persevere on all occasions an unwavering and unshaken faith, and to submit with becoming reverence to his decrees.

The whole history detailed in the Book of Job, taken together, contains an example of patience, together with its reward.

Our author next proceeds to inquire whether the poem of Job be possessed of the peculiar properties of the Greek drama; and after considering a variety of circumstances, he affirms without hesitation, that the poem of Job contains no plot or action whatever, not even of the most simple kind: it uniformly exhibits one constant state of things, without the smallest change of feature from the beginning to the end; and contains nearly a representation of those manners, passions, and sentiments, which might actually be expected in such a situation. The very nature of the subject excludes even the possibility of a plot or action. Upon the whole, our author concludes, that the poem of Job cannot properly be brought into comparison with any of the Greek tragedies. But though it has no claim to the merit of a perfect drama, our author does not wish to derogate from its merits. That encre will rather apply to those who, by criticized it according to foreign and improper rules, would make that composition appear lame and imperfect, which, on the contrary, is in its kind most beautiful and perfect. If indeed the extreme antiquity of this poem, the obscurity and the difficulty that necessarily ensue from that circumstance be considered; and if allowance be made for the total want of plot and action, we shall have cause to wonder at the elegance and interest which we find in its form, conduct, and economy. The arrangement is perfectly regular, and every part is admirably adapted to its end and design. The antiquary or the critic, who has been at the pains to trace the history of the Grecian drama from its first weak and imperfect efforts, and has carefully observed its tardy progress to perfection, will scarcely, without astonishment, contemplate a poem produced so many ages before, so elegant in its design, so regular in its structure, so animated, so affecting, so near to the true dramatic model: while, on the contrary, the united wisdom of Greece, after ages of study, was not able to produce any thing approaching to perfection in this walk of poetry before the time of Eschylus. But however this be—whatever rank may be assigned to Job, in a comparison with the poets of Greece, to whom we must at least allow the merit of art and method; amongst the Hebrews, it must certainly be allowed, in this respect, to be unrivalled. It is of little consequence whether it be esteemed a didactic or an ethic, a pathetic or a dramatic poem; only let it be assigned a difficult and conspicuous station in the highest rank of the Hebrew poetry. The most splendid examples, says our author, of every beauty and elegance of sentiment, of imagery, and of diction, meet the eye of the attentive reader in every part of the poem. Let it suffice to say, that the dignity of the style is answerable to that of the subject; its force and energy to the greatness of those passions which it describes; and as this production excels all the other remains of the Hebrew in oracy and arrangement, so it yields to none in sublimity of style, and in every grace and excellence of composition. Among the principal of these may be accounted the accurate and perfectly poetical conformation of the sentences, which is indeed generally most observable in the most ancient of the poetical compositions of the Hebrews. Here, however, is natural and proper in a poem of its great length. Peculiarity, the writer's skill is displayed in the proper adjustment of the period, and in the accurate distribution of the members, rather than in the niceties of words, or in any laboured adaptation of the passions.

"The poetry of the book of Job," says Dr. Blair, "is not only equal to that of any other of the sacred writings, but is superior to them all, except those of Isaiah alone. As Isaiah is the most sublime, David the most pleasing and tender, so Job is the most descriptive of all the inspired poets. A peculiar glow of fancy, and strength of description, discovers itself in this author. No writer whatever abounds so much in metaphors. He may be said, not to describe, but to render visible, whatever he treats of. Influence every where occur; particularly in the 18th and 20th chapters, in which he paints the condition of the wicked." Schultenz and Le Clerc's Pref. at Comment. in Job. Louth de Sac. Poet. Preflections 32—34. Gregory's Transl. with Michaelis's Notes. Peter's Crit. Differ. Dupin. Heath, Scott, and Grey on Job. Blair's Lect. vol. iii. Dr. Stock, bishop of Killala, in his translation and notes, concurs with those who refer this book to a late period; not earlier than the Babylonian captivity.

Job's Tents, in Botany. See Cox.

Job, S.t, in Geography, a town of Hungary, near which are a celebrated abbey, and an old castle; 24 miles S.E. of Debreczin.

JOB, a town of Hindostan, in the Gurry Mun-delah; 40 miles S. of Gurrah.

JOBBER, a person who undertakes jobs, or small pieces of work.

In some flatuates, jobber is used for a person who buys and sells cattle for others. See Broker.

JOBBING, Stock, denotes the practice of trafficking in the public funds, or of buying and selling flock, with a view to its rise or fall. The term is commonly applied to the illegal practice of buying and selling flock for time, or of accounting for the differences in the rise or fall of any particular flock for a stipulated time; whether the buyer or seller be possessed of any such flock or not. See Stock Brokers.

Jobbing, in Rural Economy, a term used by farmers for a petty kind of buying and selling, or dealing in cattle, or any other sort of farming-flock. Men of this kind are also frequently employed by the larger dealers. It has been observed, that "if a midland farmer goes to a fair, he is ashamed to return without having done some business: he must either buy or sell, or he loses his credit as a market man. Hence, probably, the quantity of business done at the midland fairs, compared with those of other districts, where one-third, or perhaps half, the flock is frequently unfold, is very considerable, while here, the whole fair may be said to be generally transferred." See Nails.

JOBENT Nails. See Nails.

JOBERT, Lewis, in Biography, a French Jesuit, distinguished as well by his antiquarian knowledge, as by his pulpit talents and eloquence, was born at Paris in the year 1657. He was a teacher of the several branches of polite literature, and performed the duties of his station with distinguished ability. He died in 1719, leaving behind him many works, but the most important was an elaborate treatise on the Metaphysics, which was published in two volumes, 12mo., in the year 1692. This work professes great merit, and met with a very favorable reception. It has gone through many editions at Paris, Amsterdam, Leipsicl, and Nurem-
JOELIE, in Geography, an island in the Pacific ocean, at the
entrance of a great bay on the coast of New Guinea; 110
miles long from E. to W., and from 6 to 20 broad. S. lat.
1° 36' to 2° E. long. 135° 50' to 137° 36'.
JOCALLA, a town of Peru, in the diocese of La Paz; 9
miles N. of Potocoi.

JOCHER, Christian Gottlieben, in Biography, doctor of
theology; public professor of history at Leipzig, and librar-
ian to the academy, was born in that city in 1654. Having
received the elements of an excellent education at different
schools, he devoted himself to the study of theology, and ob-
tained his degrees at Leipzig. He soon became a disciple of
Leibnitz and Wolff, and was the first person who gave
lectures on the syllabem of Wolf. He soon attracted a num-
rous concourse of pupils, and was most affiduous in his instruc-
tions. To render his lectures as useful as possible, he studied
indefatigably, so as to injure his health. In 1720 his father
died in dilatered circumstances, which obliged the son to
exert all his powers for his support; he became the editor of
the German "Acta Eruditorum," which he conducted
with great spirit till the year 1739. In 1720 he was ap-
pointed professor of philosophy, then of history, and in
1742 he obtained the office of librarian to the university.
He died in 1758, much esteemed as a man of letters and a
good teacher. He possessed an extensive knowledge in the
various branches of literature and science, and was accou-
ainted with the best writers on the several subjects. His principal
work was "A Compendious Dictionary of learned Men,"
arranged alphabetically. This went through four editions
in the author's life time, of which the last was extended to
four volumes quarto. Two supplementary volumes, which
go as far as I, have been since published by Adelung, enti-
ted "A Continuation of, and Supplement to Jocher's Ge-

JOCKEY, in the management of horses; the person who
trims up, and rides about horses for sale.

JOCKGRIM, in Geography, a town of France, in the
department of the Lower Rhine, situated on an eminence
near the Rhine; 9 miles S.E. of Landau.

JOCKLET, or Yocklet, a term used in some parts of
Kent for a little farm which requires but one yoke of oxen
to till it.

JOCKMOCKI, in Geography, a town of Sweden, in the
province of Lulea; 90 miles N.N.W. of Lulea.

JOCO, in Zoology, See SIMIA SATYRUS.

JOCRONS, in Geography, a town of Hindoostan, in
Mid. fire; 20 miles N.N.E. of Chittodeerg.

JODELLE, Stephen, in Biography, an early French poet,
was born at Paris in 1532, of a family of some rank. He was
a man of various talents, skilled in the ancient languages,
and conversant in the arts of painting, sculpture, and archi-
tecture, as well as dextrous in the use of arms; his chief ex-
cellence was in poetry. He is said to have made
five hundred Latin verses in one night. He was the first
person who introduced tragedy and comedy in the ancient
form into French poetry. His Cleopatra is the earliest of
French tragedies, and was acted with great applause before
Henry II. and all the great men of France. It is simple
in its plan, and provided with a perpetual chorus in imitation
of the ancient play. The comedies of this writer are said
to be superior to his tragedies; he was undoubtedly pop-
ular in his day; but, was, notwithstanding, suffercd to fall
into inindence, to which his carelessnes and love of pleasure
contributed. He died in 1573, at the age of 41, and upon
his death-bed he dictated a sonnet to Charles IX., containing
severe reproaches for defecting him in necessity. His works
have been published collectively at Paris and Lyons.

IODO, in Geography, a town of Japan, in the island of
Nippon; 5 miles S. of Mecoc.

JODOIGNE, a town of France, in the department of
Moy, and chief place of a canton, in the district of Nevelle:
the place contains 21,012, and the canton 14,434, inhabi-
tants, on a territory of 165,613 kilometers, in 88 communes.

JOEL, or the Prophecy of Joel, a canonical book of the
Old Testament. Joel was the fourteenth prophet, and the sec-
ond of the twelve lesser prophets. The style of this prophet
is elegant, perspicuous, copious, and fluent; he is also sub-
limine, animated, and energetic. In the first and second chapters he
displays the full force of the prophetic poetry, and shows
how naturally it is inserted to the use of metaphors, allegories,
and comparisons. Nor is the connection of the matter so
clear and evident than the compulsion of the style. But
after allowing him perspicuity both in language and arrange-
ment, it cannot be denied, that there is something great
of unity in his fabric; and particularly in the latter part
of his prophecy. About the beginning of the last century,
Herman Von der Harde, the Hardouin of Germany, at-
temposed to reduce Joel's allegories, as he calls them, to
metrical verse. Joel upbraids the imitators for their idola-
urgy, and foretells the calamities they should suffer as the puni-
ishment of that sin; but he endeavours to support them with
the comfort that their miseries should have an end upon their
reformation and repentance. Some writers, inferring the
order of time in which the minor prophets lived from the
order in which they are placed in the Hebrew copies, con-
clude that Joel prophesied before Amos, who was contem-
porary with Uzziah, king of Judah. Archbishop Uten
makes this inference from Joel's foretelling that drought
would happen, chap. i. which Amos mentions as having happened, chap. iv.
7, 8, 9. If we consider the main design of Joel's prophecy,
we shall be apt to conclude, that it was uttered after the
captivity of the ten tribes; for he directs his discourse only
to Judah, and speaks distinctly of the faciencies and obla-
tions that were daily made in the temple.

Bishop Newcome, adopting the conjecture of Duffs,
supposes that he lived under the long reign of Marius,
and before his conversion; that is, some time from 667 to
660 B. C. Lowth's Com. Lowth's Prac. xxxi. New-
come's Attempt towards an improved Version, &c. of the
Twelve Minor Prophets.

JOGHS, a sect of heretical religious in the East Indies,
who never marry, nor hold any thing in private property;
but live on alms, and practice strange severities on them-
sefes.

They are subject to a general, who sends them from one
country to another to preach: they are, properly, a kind
of penitent pilgrims; and are supposed to be a branch of
the ancient Gnostics.

They frequent, principally, such places as are consecrated
by the devotion of the people, and pretend to live several
days together without eating or drinking. After having
gone through a course of discipline for a certain time, they
look upon themselves as impecunious, and privileged to do
any thing; upon which they give a loose to their passions,
and run into all manner of debauchery.

JOGHY-COOPA, in Geography, a town of Assam; 90
miles N.W. of Gerghonse.

JOGUES, or Youes, certain ages, eras, or periods, of
extraordinary length, in the chronology of the Hindoos.
They are four in number; of which the following is an ac-
count, extracted from Halhed's Preface to the Code of
Gentoo Laws, p. 36.

1. The Satie Jogue (or age of purity), is said to have
laid three million two hundred thousand years; and they hold
JO G

hold that the life of man was extended in that age to one hundred thousand years, and that his nature was twenty-one cubits.

2. The Thirth Jogue (in which one-third of mankind was corrupt), they suppose to have confided of two million four hundred thousand years, and that men lived to the age of ten thousand years.

3. The Dwapaar Jogue (in which half of the human race became depraved), coëxisted one million six hundred thousand years, and the life of man was reduced to a thousand years.

4. The Collee Jogue (in which all mankind are corrupted, or rather leavened, for that is the true meaning of Collee), is the present era, which they supposed ordained to subfix four hundred thousand years, of which near five thousand are already past; and the life of man in that period is limited to one hundred years. See Hindoo.

We shall here subjoin Dr. Robertson's observations on the above periods, from the Notes to his Historical Disquisition concerning India.

If (as he, p. 363) we suppose the computation of time in the Indian chronology to be made by solar, or even by lunar years, nothing can be more extravagant in itself, or more repugnant to our mode of calculating the duration of the world, founded on sacred and infallible authority. From one circumstance, however, which merits attention, we may conclude that the information which we have heretofore received concerning the chronology of the Hindoos is very incorrect. We have, as far as I know, only five original accounts of the different joggles, or eras of the Hindoos. The first is given by M. Rogers, who received it from the Brahmins on the Coromandel coast. According to it, the Suttee Jogue is a period of one million seven hundred and twenty-eight thousand years; the Thirth Jogue is one million two hundred and ninety-six thousand years; the Dwapaar Jogue is eighth hundred and sixty-four thousand years. The duration of the Collee Jogue he does not specify. (Perte Ouverte, p. 179.) The next is that of M. Bernier, who received it from the Brahmins of Benares. According to him, the duration of the Suttee Jogue, was two million five hundred thousand years; that of the Thirth Jogue, one million two hundred thousand years; that of the Dwapaar Jogue is eight hundred and sixty-four thousand years. Concerning the period of the Collee Jogue, he likewise is silent. (Voyages, tom ii. p. 160.) The third is that of colonel Dow; according to which the Suttee Jogue is a period of fourteen million years; the Thirth Jogue one million eighty thousand; the Dwapaar Jogue two hundred thousand; and the Collee Jogue thirty-six thousand years. (Hist. of Hindostan, vol. i. p. 2.) The fourth account is that of M. le Gentil, who received it from the Brahmins of the Coromandel coast; and as his information was acquired in the same part of India, and derived from the same source with that of M. Rogers, it agrees with his in every particular. (Mém. de l'Académ. des Sciences, pour 1772. tom. ii. part i. p. 176.) The fifth is the account of Mr. Halsbed, which has been already given. From this discrepancy, not only of the total numbers, but of many of the articles in the different accounts, it is manifest that our information concerning Indian chronology is hitherto as uncertain as the whole system of it is wild and fabulous. To me it appears highly probable, that when we understand more thoroughly the principles upon which the fabulous eras or joggles of the Hindoos have been formed, we may be more able to reconcile their chronology to the true mode of computing time, founded on the authority of the Old Testament; and may likewise find reason to conclude, that the account given by their astronomers of the situation of the heavenly bodies at the beginning of the Collee Jogue, is not established by actual observation, but the result of a retrospective calculation."

JOHANNING, in Geography, a town of Bengal; 32 miles N.E. of Calcutta.

JOHANSTHAL, a town of Moravia, in the circle of Prenia, situated in Silesia; 12 miles N.N.W. of Jagen- dorf.

JOHN the Baptist, in Scripture Biography, was the son of Zacharias, a priest of the course of Abia, and of Elisabeth, cousin to Mary, the mother of our Saviour. He was announced before his birth to Zacharias, who received instructions to call him John, and who was apprized of the high and honourable character which he was to fulfill, as the forerunner of the Messiah. See the account of his birth and office in the first chapter of St. Luke's Gospel. Having withdrawn himself from society, in order to prepare, by exercises of devotion, and watchfulness, of duties of the office which was assigned him, he was called to commence his ministry when he was about thirty years of age; and, like the ancient prophets, he quitted his solitude in a garment of camel's hair, and distinguished himself by abstinence and self-denial, and fervency of morals. His commission was to proclaim the approaching advent and kingdom of the Messiah, and to qualify men, by repentance and reformation, for becoming partakers of the blessings which the great teacher and Saviour was empowered to bestow. The success of his preaching was such, that multitudes resorted to hear him, and to be baptized by him in the waters of Jordan. His reputation was such among the people, that many began to debate among themselves, whether he was not the Messiah; and when the Jewish Sanhedrin, hearing of his fame, sent scribes and pharisees from Jerusalem to examine his pretensions, John thought it sufficient honour to be commissioned as the forerunner of the Messiah, and therefore explicitly declared that he was not the Messiah himself. At the appointed time Jesus came to him from Nazareth, and after some hesitation, first from ignorance of his person and character, and afterwards, from humility and diffidence, John performed for him the religious rite of baptism, according
J O H N.

to his request. As soon as this service was concluded, John had ample evidence presented to him of the dignity and real character of Jesus; for a lambent flame descended upon him with a kind of hovering dove-like motion, and a voice from heaven accompanied it, proclaiming "This is my beloved Son, in whom I am well pleased." John, being thoroughly satisfied that Jesus was the promised and expected Messiah, eagerly embraced every opportunity that occurred of announcing him to the multitude, which attended his ministry, under this character. The disciples of John became jealous of the increasing fame of Jesus; and fearful that the reputation and influence of their master would decline: but John corrected their apprehensions, acknowledged his inferiority to Jesus, and directed the people to transfer their views and regard from him, who was merely the forerunner of the Messiah and Saviour, to the person who really fulfilled this high character, and to whom these honourable appellations belonged. In the course of John's ministry his fame commanded the attention of Herod, tetrarch of Galilee, and induced him to send for the preacher to his court; for some time his instruction and counsel seemed to impress the tetrarch's mind, and to give him pleasure. But the fidelity of John would not permit Herod to form an incelesus connection with Herodias, his brother's wife, without scandalous animal verison and severe reproach. The tetrarch refented the faith representations of John, and committed him to prison. During the interval of his confinement, Herodias was plotting his death; but Herod, for some time, partly from reverence for John, and partly from a dread of the people, who believed him to be a prophet, reftified the machinations of Herodias. An opportunity at length occurred, upon the birth-day of Herod, for the execution of the cruel purpose which this wicked woman had formed against John. Her daughter, by her former husband, danced before theinamey that was convened in honour of his nativity, so much to the satisfaction of Herod, that he promised with an oath to grant her whatsoever she requested, even though it should be to the value of half his kingdom. The princes, instructed by her mother, requested that the head of John the Baptist should be delivered to her in a charger, or large dish. Herod was for some time reluctant; but upon her persisting in her request, Herod complied, and ordered John to be beheaded in the prison. The death of John the Baptist is mentioned by Josephus in a passage, the genuineness of which is generally admitted by learned men. A dispute had arisen between Aretas, king of Petrea, the father of the rift wife, whom he had put away for the sake of Herodias, which was partly owing to this conduct, and partly to some difference that took place between them about the limits of their respective territories. In a contest between them Herod's whole army was defeated; and this defeat, says Josephus, was considered by some of the Jews as a just punishment providentially inflicted on Herod, for the death of John, called the Baptist. For Herod, continues the Jewish writer, had killed John, who was a just man, and had called upon the people to be baptized, and to practice virtue, exercising both justice towards men, and piety towards God; for the only baptism he acceptable to God, if they made use of it, not for the expiration of their life, but for the purity of the body; the mind being first purified by right opinions. And many coming to him, for they were wonderfully taken with his discourse, Herod was seized with apprehensions, lest, by his authority, they should be led into faction against him, for they seemed capable of taking any thing by his direction, &c. (Ant. i. 6. § 9.) It has been said by some persons, that this paragraph contradicts our evange
dists: for, according to them, it was at the solicitation of Herodias and her daughter that John was beheaded. But here it is said, that Herod put John to death because he feared that he might be the cause of a faction. But the two accounts are by no means inconsistent: for Herod might have apprehensions from John's popularity, and be disposed, on that account, to take him off. See Lardner's Works, vol. vii. p. 117. The festival of the nativity of John the Baptist was appointed to be observed in the Christian church on the 24th of June: the date of the first appointment is not known: but that it is to be placed before the end of the fourth century, appears from the fragments of St. Augustine, adapted to the day.

John Baptist, Hermits of. See Hermits.

John, Saint, an apostle and evangelist, was the son of Zebedee, a fisherman, of the town of Bethsaida, on the sea of Galilee, the younger brother of James the elder, (see James,) and commonly reckoned the youngest of all Christ's disciples. His mother's name was Salome. Zebedee, though a fisherman, was not poor, and therefore we have no reason to imagine that his children were altogether illiterate, which some have imagined to have been the case, from a misinterpretation of Acts, iv. 13, in which the terms μηχανονευταις and οι λεγουσαι denote persons that were neither doctors nor magistrates, but men of private stations, who had not been educated in the schools of the Rabbis. (Grot, in loc.) See Idit. They were, without doubt, well acquainted with the ceremonies of the Old Testament, having not only read them, but having heard them publicly read and explained in the synagogue. In common with other Jews, they entertained the expectation of the Messiah, and had heard John the Baptist preach, though they were not enlightened in the number of his discipules. Before John was called to be an apostle, it cannot be questioned that he had seen and heard our blessed Lord, and had been witness of some of his miracles, particularly that at the wedding of Cana in Galilee. (See John, ii. 1-11.) His call to attend upon Jesus is first related Matt. iv. 11, 22. Mark, i. 19, 20. Luke, v. 1-10. From this time he and his brother James were the constant attendants on Christ: they heard his discourses, and saw his miracles; and after previous instruction, both public and private, they were honoured with a delegation and appointment to be of the number of the twelve apostles. But the age at this time, his history does not precisely ascertain. Some have supposed that he was then 22 years old: others conjecture that he was about 25 or 26; and others again think, that he was about the same age with our Saviour. Dr. Larder is of opinion, that none of the apostles of Christ were much under the age of 30, when they were appointed to this important office. However it be, John seems to have been the youngest of the twelve, and to have been distinguished by a temper singularly mild, amiable, and affeclyionate. He was eminently the object of our Lord's regard and confidence, and admitted, on various occasions, to free and intimate intercourse with him; so that he was characterized as the disciple whom Jesus loved. The evangelical history recites many instances which evince the regard that subsisted between him and his master, and the high opinion which our blessed Lord entertained of his disposition and character. His failings, however, did not escape notice; and he was reprimanded for them by our Lord. Notwithstanding his affectionate attachment to Christ, and the numerous instances of kind and confidemglyng attention with which he had been honoured, he, in common with the other apostles, betrayed a culpable timidity in forsaking him during his last conflict; though he afterwards recovered his firmness, and attended the crucifixion: and, indeed, he seems to have been the only apostle who thus ha

zarded
J O H N.

eared his own safety. On this occasion he was distinguished by the notice of his master, and by the recommendation of his mother to the future protection of this apostle. He was also a witness of the circumstances that accompanied our Lord's death and burial. After his resurrection John was the first who entertained the belief that he was really risen from the dead. On subsequent occasions, when Jesus manifested himself to his disciples, and thus verified the reality of his resurrection, John was one of the number. In one of these interviews, when Peter, having received information of the manner of his own death, inquired with a reprehensible curiosity concerning the fate of John, our Lord replied, "what if he tarry till I come," thus intimating either that he would survive the destruction of Jerusalem, or that his life would be prolonged till it was terminated in the course of nature. After the ascension of Christ, and the effusion of the Spirit on the day of pentecost, John became one of the chief apostles of the circumcision, and exercised his ministry at and about Jerusalem, in the manner and with the success related in the book of Acts: he was present at the council of this city held in the year 49 or 50. (See Acts, xv.) Until this time he probably remained in the land of Israel, and had not travelled into any foreign countries. During his stay in Judea, it appears that he wrought many miracles. From the book of Revelation (chap. 1. g.) we learn, that St. John was for some time in the isle of Patmos, where he was favoured with visions and revelations. He is supposed to have been banished thither in the 1st year of Domitian, and to have returned in the beginning of the reign of Nerva; so that his exile could not have lasted more than two years, or perhaps not above a year. From ecclesiastical history we learn that he lived to a great age, and that in the latter part of his life he resided in Asia, particularly at Ephesus, the chief city of that country. His settlement in Asia forms, from several circumstances, to have taken place about the time when the war broke out in Judea, in the year 66, or a short time before, when probably St. Peter and Paul had been previously crowned with martyrdom. According to Irenæus, this apostle lived in Asia till the time of Trajan, who succeeded Nerva, A.D. 98. From other accounts it appears that he died at Ephesus, and was buried near that city, about 63 years after our Lord's passion. Supposing our Lord to have been crucified in the year 30 of the Julian era, which seems to have been Jerusalem, the year 100, or the third of Trajan, at which year of that emperor the death of St. John is placed by Irenæus in his chronicle. At the time of his death it is not incredible, nor unlikely, that he was about 120 years of age. Some other particulars have been recorded concerning this apostle, which the most impartial critics have ranked as fabulous. It is related of him, that going to bathe at Ephesus, and perceiving that Cæcilius, or old Tityrus, Ethan, was in the bath, he came out hastily without bathings, saying to those that were with him, "Let us go hence, lest the bath should fall while Christ, the enemy of the truth, is within." It is also said, that by order of the emperor Domitian, St. John was cast into a cauldron of boiling oil at Rome, and came out again without being hurt. The following account, given by Josephus, of St. John's method of preaching when he was far advanced in years, and not able to make a long discourse, is more worthy of credit. "The blessed apostle John, living at Ephesus to extreme old age, and being with difficulty carried to church in the arms of the disciples, and being unable to make a long discourse every time they assembled, was wont to say nothing but this: "Little children, love one another." At length the disciples and brethren who attended, tired with hearing so often the same things, said, "Sir, why do you always say this?" who then made this answer, worthy of himself: "Because," says he, "it is the Lord's command; and if that alone be done, it is sufficient." The writings which are generally ascribed to St. John, and received as his, are a gospel, three epistles, and the book of Revelation. The gospel of St. John has been universally received as genuine; and, as it is generally allowed that he had seen the other three gospels, it may be considered as a kind of supplement to those, containing several things that occur in them, and many others which they have omitted. In the account of our Saviour's perfection, death, and resurrection, all four gospels coincide in many particulars; though here St. John has various things peculiar to himself. In his gospel many things recorded by the other evangelists are omitted. He has given us no account of our Saviour's nativity, nor of his baptism by John. He takes no notice of our Saviour's temptation in the wilderness; nor of the call, or names of the 12 apostles; nor of their mission in the time of our Saviour's life; nor of our Lord's parables, or other discourses of his, recorded by them; nor of our Saviour's journeys, of which they gave an account; nor of any of those predictions relating to the devastations of Jerusalem, which are found in the gospels of Matthew, Mark, and Luke; nor has he repeated any miracles recorded by them, excepting only that of the multiplication of small provision for feeding 5000, with the extraordinary circumstances of the return to Capernaum from the country, where that miracle had been wrought. But he mentions several incidents which the other evangelists have not noticed. St. John gives an account of our Lord's cleansing the temple, at his first visit, when he went to Jerusalem; and all the other evangelists give a like account of his cleansing the temple at the last visit. These two acts are, however, different. He gives an account of the visits of Christ before the imprisonment of John the Baptist, at the wedding at Cana, and of Nicodemus, of the woman of Samaria; of the cure of the blind man born blind from his birth; of the restoration of Lazarus; of the indignation of Judas at the woman who anointed the Lord with ointment; of the Greeks that came to John to see if Christ was worthy of his disciples; and of the extraordinary intervention, which he delivered to his apostles preceding his death, e. St. John's gospel contains also miracles and frequent miracles, not only the first order in the other gospels, that later on only a prophet, and latter dayer of God, the Christ, the Son of God, or the great prophet, that should come to the world: which, from their peculiarities, by peculiar expressions, to his present sacred y, others think deprecate to be faulty. Writers are not agreed as to the time when this gospel was written. St. John says, "in the time of Tiberius, and of Augustus, a name which after his return from the exile of St. Peter, A.D. 67, is the term of the Chrillians of Asia. Voragini thought that this gospel might not be written about the year 71 or 72 after our Lord's ascension. Bp. Strabo and Dr. Lardner, however, that it was written before the destruction of Jerusalem; Dr. Lardner adopts this opinion, and assigns the date of it to the year of Christ 68. This period brings it nearer to that of the other gospels, which was about the year 67 or 66, and the gospel itself, the leading design of which was to show how in all ages the Jews were in not receiving Jesus for Christ, to vindicate the providence of God in the calamities already befallen, or now coming upon them, was suitable to the circumstances of the Jews at this period. It is observed by Dr. Lardner, as an evi-
dence that it was one great design of St. John, in writing this gospel, to shew the unreasonable and great guilt of the Jews in rejecting Jesus, that in his gospel are inserted more instances of their attempts upon our Lord’s life than in the other gospels. Chrysostom was of opinion, that St. John did not write his gospel till after the destruction of Jerusalem. John, he says, writes not of any of the things that occur in Matt. xxvii.; for it should be thought that he took an advantage from the event: for he was living a good while after the destruction of Jerusalem. But the other evangelists, who died before the destruction of Jerusalem, and saw none of these things, record these predictions. But John, if he wrote at the time above specified, viz. when the event was near, might omit these predictions, as they were sufficiently recorded already, and as it is not his manner to repeat what had been related before. He gives, however, several intimations of the miseries that were coming upon the Jewish people. (Ch. iii. 26; vii. 18, 19, viii. 12, 21, 24, ix. 39—41; xii. 35, 36.) Mr. Whitson, observing that St. John uses the Roman or Julian beginning of the day in his gospel, and reckons the hours from midnight and noon, urges this as an argument for the gospel having been written after the Roman government, and the period of the Jewish polity, at Ephesus, a place remote from Judea, and under the Roman government. To this it is replied, that St. John does not compute the hours of the day after the Roman, but rather after the Jewish manner; and, supposing St. John to have used the Roman method of computation, it does not follow that he wrote after the destruction of Jerusalem, &c. As the gospel was written at Ephesus, at a distance from Judea, he might, if he thought fit, have used the Roman way of reckoning, especially when the period of the Jewish commonwealth was near, though not quite accomplished. The late date of the gospel has been also argued, from what some have alleged, to have been the object or end of the writer. Accordingly, many ancient and some modern writers say, that this gospel was written with a design to remove the errors of the Cerinthians, Ebionites, and other sects, which cannot be supposed to have appeared before the destruction of Jerusalem, and the overthrow of the Jewish people. But Mr. Lamp and Dr. Lardner have urged several reasons to shew that St. John did not write against Cerinthus, or any other heresies in his gospel; and that it was written before the rise of those heresies, which are said to be confuted by it. Lardner thinks that it would have been below an evangelist to write against heresies in the history of his Lord and master; and that none of the evangelists have entered into a particular account of things after our Lord’s ascension. Nothing of this kind, says this writer, occurs in the rest of St. John’s gospel; and, therefore, why should we imagine that there is any such thing in the introduction; the design of which is to shew, that Jesus came and acted by the authority of God, the Creator of the world, the God and Supreme Lawgiver of the Jewish people. Some have thought, and particularly Grotius, that St. John concluded his gospel with the words, which are at the end of the 20th chapter; and that which is in the 21st chapter was added after St. John’s death by the church of Ephesus. But this opinion is contradicted by the general, or even universal, consent of manuscripts and versions: to which it may be added, that none of the ancient Christian writers ever made a question, whether this chapter was composed by St. John or another. Moreover, the style is St. John’s. Lardner’s Suppl. to the Credibility, or Works, vol. vi. chap 9.

Besides the gospel, St. John wrote three epistles, which are generally received in these parts of the world. The genuineness of the first epistle does not seem to have been ever questioned. It is referred to by Polycarp, and the martyrs of Lyons, and quoted by Papias. The first and second epistles are cited by Irenaeus, and received by Clement of Alexandria. Origen mentions three epistles, though he says that the second and third were not allowed by all to be genuine. Diognetus of Alexandria receives the first epistle, calling it the “Catholic epistle,” and he mentions the other two as ascribed to St. John. The first epistle was received by Cyprian, and probably the other two. The second epistle is quoted by Alexander, bishop of Alexandria. Eusebius says, that besides the gospel, St. John’s epistle is universally acknowledged by those of the present time, and by the ancients; but the other two are contradicted,” i. e. doubted of by some. All the three epistles were received by Athanasius, by Cyril of Jerusalem, by the council of Laodicea, and by Epiphanius. All three were received by Jerome; and the two last were doubted of by some in his time. All three were received by Rufinus, by the third council of Carthage, by Augustine, and by all those authors who received the four canons of the New Testament with ours. All three are in the Alexandrian MS. and also in the catalogues of Gregory Nazianzen and of Athanasius. The Syrian churches, however, received only one; nor were any more received by Chrysostom. Upon the whole we may oblerve, that one epistle was received by all as certainly genuine; and it is not of any importance to contend about the other two, as they are so very short, and resemble the first in form, subject, and manner of writing. The second epistle is of only thirteen of our verbs; and of these eight may be found in the first, either in fute or expression. See Canon.

As to the time when these epistles were written, critics and commentators have entertained different opinions. Grotius, Hammond, and Whitby, suppose the first to have been written before the destruction of Jerusalem, and the former thinks the place of writing it was Patmos. Dr. Benfon inclines to date it in the year of our Lord 68. Mill and Le Clerc refer it to the year 91 or 92; Bishfor to the year 98, and Baromius to 99. Beaufobre and Lefant refer it to the end of the first century, when the apostle was far advanced in age. Whiston thought that this, and the two other epistles of St. John, were written not long after each other, about the year of Chriss 82 or 83. Lamp supposes the first epistle to have been written after the Jewish war, before St. John’s exile in Patmos, and, probably, some considerable time before it: so that he nearly agrees about the time of the epistle with Whitson. Dr. Lardner, considering that there are no expressions in the epistle declaring the time of it, or clearly referring to the calamities attending the downfall of the Jewish state, thinks it probable, that it was not written till a good while after that event, about the year of Chriss 85, or later. Some have thought that the first epistle was written to Jewish believers in Parthia; and others are of opinion, that it was directed to the Jewish Christians in Judea and Galilee. Others think it more probable, that it was intended to all believers, Gentiles as well as Jews; though Jewish believers are especially regarded. The second epistle is ascribed “The elder to the elect lady, and her children.” By the elect lady some have understood the Christian church in general, and others understand the appellation as designed to express some particular church. Others again have supposed, that it was addressed to a female of the name of “Elecris,” or “Elecris”; and some have rendered the inscription “to the elect Kyria.” Others again understand the inscription agreeably to our own translation; and this has been the common
common opinion, supported by the authorities of Beza, Mill, Wollius, Wall, Le Clerc, and others.

The third epistle of St. John is inscribed, “The elder to the beloved Gaius.” There were two persons of this name, mentioned in the Acts (xix. 29.), and in St. Paul’s epistles (1 Cor. i. 4. Rom. vii. 23.). He seems to have been an eminent Christian, who lived in the city of Asia, not far from Ephesus, where St. John chiefly resided, after his leaving Judea. Concerning the case to which St. John refers in this epistle, there have been various sentiments of learned men. Grotius supposed that the strangers here spoken of were believing Jews, whom Diotrephes, a gentle- man, and bishop of Pergamos, would not receive, because they were Jews, or because they were for blending the rites of the law with Christianity. Others think, that Diotrephes was a Jew, and zealous for the law, and that he would not admit these strangers, converts, from among the Gentiles, because they did not conform to the observance of the rites and ceremonies of the law of Moses. Learned men have lately been of opinion that St. John here speaks of some, particularly Jews, who had gone out into the world, to propagate the Christian religion, without receiving any pecuniary recompense from those whom they had converted to the Christian faith: and they think, that Caius or Gaius is commended by St. John for encouraging such teachers, whilst he blamed Diotrephes for not receiving and helping them. But this opinion is rejected by Lardner as unfounded, and he fees nothing that should lead us to think preachers here spoken of, but only strangers in want. Some have supposed, that Diotrephes excommunicated, or cast out of the church, the “brethren,” members of it, who were for receiving these strangers. Others suppose that the persons, whom Diotrephes cast out of the church were these strangers, not members of the church. It is supposed, that Diotrephes had the disposal of the revenues of the church; and that he opposed the distribution of the common stock to these strangers, partly Jews and partly Gentiles, who needed relief, and discouraged such as were willing to assist them out of their own property. Concerning the time of writing these two epistles, nothing can be said with certainty. Mill places them about the same time with the first, in 91 or 92. Whiston supposes, that all three were written about the year 82 or 83. Dr. Lardner conceives, that St. John was somewhat advanced in age, and that he had reigned a good while in Asia, before he wrote any of these epistles. Hence he concludes, that these two were not written sooner than the first; and if the first was written about the year 80, these two may be reckoned to have been written between the years 80 and 92. See Epistile. Lardner’s Works, vol. vi. chap. 20.

The book of Revelation has been also ascribed to St. John. See Revelation.

John, St., Christian of. See Christians.

John, surnamed Mark. See Mark.

John I. emperor of the East, surnamed Zimisces, was an Armenian noble, who twice with decision in the armies of Romans the younger. After the death of that emperor, he affixed Nicephorus Phocas in his elevation to the empire and his marriage of the imperial widow, Theophano. Zimi- sces became an object of fulpicion to Nicephorus, who deprived him of the post of general of the East, in which he had been generally victorious, and banished him from court. The hero was resolved to be revengeful for the indignities in- flicted on him, and having infenuated himself into the good graces of the empress, he contrived a plot to take away her husband’s life. The plot succeeded, Nicephorus was slain, and John was immediately declared emperor, A.D. 969.

Before the patriarch would consecrate him he was told he must, by public penance, expiate the crime of which he had been guilty. John threw the blame of the deed on his companions, and readily agreed to separate himself from them. Theophano parted in a paroxysm of rage, and was immediately shut up in a monastery of Armenia. The reign of John was chiefly spent in military transactions, in which his valor and good fortune were equally conspicuous. He obtained many victories over the Bulgarians, and Saracens; and is supposed to have taken a share in the expedition to the company Baal, whom he had offended, after a reign of six years. John Zimisces, though arriving at the crown by the act of treason, wore it with glory, and seemed to merit it by his public and private virtues. His piety is extolled by writers of the time, and he is recorded as the first emperor who caused the effigy of Christ to be stamped upon the coin, with the legend, “Jesus Christus, the King of Kings.”

John II., emperor of the East, was born in 1088, and succeeded his father Alexius in 1118. Soon after his accession a conspiracy was excited against him by his father, the celebrated Anna Comnena, to depose him in favour of his husband Bryennius. The conspiracy was discovered in time to prevent the evils that would otherwise have resulted from it. This was the only domestic trouble by which his reign was disturbed, and he had the happiness of being able, during an administration of twenty-five years, to banish capital punishments from the whole empire, not excepting the case of those persons who had engaged with his father to take away his life. Against the public enemies of his country he was active and successful, and he entertained the ambitious project of extending the eastern empire to its former limits, and recovering Antioch from the dominion of the Latins. He not only planned the enterprise but actually set out on the business, accompanied by his two sons. These were carried off by a premature death, and himself died shortly after, in 1143, of a wound from one of his own poisoned arrows. He was called the “Handsome,” an appellation which has been thought to have been applied ironically: but whatever the qualities of his body were, his soul was formed in the mould of moral beauty, and few poissers of a throne have grasped it with purer manners and more humane principles.

John III., Ducas, surnamed Vatatzes, emperor of the East, was born in 1193, and succeeded, by virtue of his marriage with the daughter of Theodore I. criticis, to the throne at the death of that prince. Constaninopole, the capital of the empire, was, at this period, in the hands of the Latins, as was likewise a considerable part of the empire. John, however, was a prince of great virtue, and recovered all the other places which had been taken by the Latins, and reduced under his dominion the European territories almost to the gates of Constantinople, and nearly the whole of Lesser Asia. He fought and gained many battles, defeating the Scythians, Tartars, and Bulgarians, and extended his empire on all sides. While he was thus distinguished in war, he was equally illustrious in the internal administration of his affairs, by which he restored prosperity to the harassed subjects of the eastern empire. He encouraged agriculture, and the useful arts, and promoted simplicity and regularity of manners. He died in 1258, after a glorious reign of 33 years.

John IV., Iacoris, son of Theodore the younger, whom he succeeded in 1259, at the age of six years, but ere he had sat on the throne a single year, he was deprived of his eyes, and imprisoned for life, by the despot Michael Palaeologus.
JOHN V. CANTACUZENUS, emperor of the Eald, descended from the Paladins of France, was one of the principal confidants of the younger Andronicus, at the time of his revolt from his grandfather, and acted with great fidelity in the service of the young prince, in whose reign he held the office of great domesaty, by virtue of which he ruled both the emperor and the empire. At the death of Andronicus in 1341, Cantacuzenus was left guardian to the eldest of his sons, but nine years of age, and was made regent of the empire. His administration was disturbed by the ambition of the great duke Apocauces, who encouraged the emperors dowager to affect a maternal right to the tutelage of her son, and by the patriarch John, who laid claim himself to the office of guardian. In self-defence, therefore, Cantacuzenus caused himself to be made emperor in 1342, which produced a civil war, in which he was, at first, so far unsuccessful, that he was obliged to quit his country and take refuge in Servia. After a series of misfortunes he was at length, in 1347, received as a conqueror into Constantinople. He now assigned himself with his ward in the empire, but the union was soon interrupted by intestine divisions, which, in 1355, put an end to a voluntary abdication, when he took the religious habit in a monastery of mount Athos. Here he employed himself in composing a history of the transactions which he had been witness to, and this work, comprising a period of forty years, from the revolt of the younger Andronicus to his own abdication, is one of the most elegant productions of the modern Greeks. He likewise engaged in a religious controversy, and composed four books against the Jews and Mahometans. This work was published at Basile in 1543; and of his History there is a Louvres edition in three volumes, fol. 1657. He is said to have died in 1411: a letter to him from pope Gregory XI., in 1375, is still extant. These are the only emperors of the name of John that require any notice in this work. Gibbon. Universal History.

John, king of France, succeeded his father, Philip of Valois, in 1359, being, at the time, forty years of age. One of his first acts was to put to death, without the form of trial, the contable, count d’Eu, who was suspected of being in the interest of Edward III., king of England. This arbitrary act occasioned much discontent among his nobles, whom he attempted to appease by the institution of the order of the star, in imitation of Edward’s order of the Garter, but being too lavish of the new honour, it was brought into contempt. A war broke out between England and France, and John hummed the flates-general for the purpose of raising the necessary supplies. In the assembly of these states it was agreed that no proposition should be admitted without the unanimous consent of the three orders, which gave to the third estate an authority and independence which ameliorated them to the commons of England. John made considerable concessions, and was enabled thereby to raise a powerful army. It was in this context that the king of France was opposed to the Black Prince of England; at Maupertus, near Poictiers, they met; the former with an army of sixty thousand men, the latter with scarcely a fragment of an effective army. Edward, feeling the disadvantageous ground on which he stood, offered to reign his prisoners, and the booty which he had already made, and to sign a truce for seven years, provided he might be permitted to return to his own country in security, but John, confident of success, required him to surrender himself a prisoner, with the principal officers of his army. This demand brought on the famous battle of Poictiers, on the 19th of September, 1356, in which John was made prisoner, and many of the French nobility lost their lives. The captive monarch, though respectfully treated, was brought to England to grace the triumph of the conqueror; the peace, in 1360, put an end to his captivity, but to obtain his liberty he made over many of the most valuable provinces of his kingdom to the king of England, and agreed to pay a ransom of three millions of gold crowns. The diffaters to which he had already been subject, had so little effect in teaching him political wisdom, that at the persuasion of pope Urban V. he took the cross, and seriously resolved upon an expedition into the Holy Land. The execution of this project was prevented by the dishonourable escape of his son Lewis, count of Anjou, from England, where he was detained as a hostage. The king’s sense of justice and honour determined him instantly to return to England in the fleet of his son. He landed in 1364, and was received by Edward with great magnificence; but he was shortly after attacked with a disease, of which he died at the palace at the Savoy in April, in the fifth year of his age, and the 14th of his reign. John was possessed of many noble qualities, but he was not gifted with the superior talents of his author of the maxim, "That if justice and good faith were banished from the rest of the world, the right to find refuge in the hearts of princes." Upper Hill. Hume.

John, king of England, born in 1166, was the youngest son of Henry II. by queen Eleanor of Guinevere. He was his father’s favourite, nevertheless he joined his brother Richard in those projects against Henry, which induced the unhappy king, on his death-bed, to pronounce a curse upon his children. He was left without any particular provision, which circumstance gave him the name of “Lack-land.” Richard, upon his accension to the throne, behaved with the utmost liberality to John, but his generosity could not attach him to his interest. During his absence in the Holy Land, he formed secret intrigues with Richard’s rival and invertebrate foe, Philip king of France. Thence broke out into open rebellion, but being unsuccessful, he threw himself upon his brother’s mercy. With a knowledge of his character, Richard said to his intercessor, queen Eleanor, “I forgive him, and hope I shall as easily forget his ingratitude and injuries, as he will my pardon." John, who was utterly void of all sense of honour and generosity, proved the bafeness of his nature by the act with which he purchased forgiveness. He invited the officers of Philip’s garrison of Evreux to an entertainment, caufed them to be all malaccured, put the soldiers to the sword, and delivered up the town to his brother. He invaded the throne at the death of Richard in 1199, but he did not obtain an undisputed succession. War was excited in favour of Arthur of Brittany, in which the young prince fell into the hands of his uncle John; he was at first confined in the castle of Falaise, and his uncle in vain endeavoured to procure his affiliation. At length he was conducted to the castle of Rouen, where John refided, and he was never after heard of. The manner of his death was uncertain, but it is generally believed that the king flabbed him with his own hand. From this period John became the object of universal detestation, and all his foreign subjects prepared to throw off the yoke. The pope also excommunicated him, and absolved his subjects from their allegiance. He for some time resided the papal authority, but in 1213 he made his submission. The pope, now regarding England as his own, and jealous of the aggrandizement of Philip of France, sent a message to that prince, acquainting him with John’s return to his duty towards the church, and requiring him to desist from iniquities against a country now under the protection...
JOHN.

John I., king of Portugal, natural son of Peter the Severe, was born about the year 1350, and reigned to the year 1433, in the defeated of John of Castile, who claimed to be the legitimate son of his wife Beatrice, daughter of Ferdinand. Soon after his accession, the king of Castile invaded Portugal with a powerful army, but victory, which decided in favour of John, permanently fixed him on the throne. In 1387 he married Philippa, daughter of John of Gaunt, duke of Lancaster. It was not till the year 1400, that a peace was finally settled between the two countries, which remained inviolate during the reign of John. The king employed the seafab of public tranquillity in improving the police, and promoting the prosperity of his kingdom. Mindful of his former condition, he beheld with great condescension and familiarity to his subjects, and bowed himself in obedience. Though his bounty kept him poor, he moderated his im- poits, and found resources in his frugality with respect to the ordinary amusements of a court. He was accustomed to say that conversation was the cheapest of all pleasures, as well as the most improving, and he promoted a taste for letters among the nobility. He was, however, inexorable in the punishment of crimes, and by his severity in this respect, he rooted out the bands of bravoes kept by the nobility to execute private revenge. In 1414, he fitted out a formidable expedition against the Moors, in which he was successful, and he entrusted to his son Henry, duke of Viseo, the chief management of affairs in Africa, which gave occasion to that course of maritime discovery by which he became so much distinguished. (See Henry.) The concluding cares of this sovereign were occupied in the settlement of his family, in which he was very successful. He died in 1433, after a long and prosperous reign, leaving behind him the character of one of the ablest and best of the Portuguese sovereigns, under the title of "the father of his country." He is regarded as the founder of a new royal family.

John II., king of Portugal, son of Alphonso V. was born in the year 1455. In 1476, he was appointed regent, and, in 1481, he assumed the whole power of king on the death of his father. Finding that the administration of justice was become exceedingly corrupt, he appointed a committee of three to enquire into abuses, and to reform whatever was wrong. He watched over the conduct of the judges, forewarning them of his displeasure if they proved backward in the equitable discharge of their duties. "Take care," said he, to one of them, "I hear you keep your hands open and your doors shut!" This timely warning sufficed for his reformation. A conspiracy was shortly formed against his life, at the head of which was the duke of Viseo, a young man and the queen's brother. The king, on being informed of it, sent for the duke to court, and taking him aside, charged him with his treasonable purpose. What particularly passed on this occasion is not known, but the result was, that the king drew his dagger, and laid the duke dead at his feet. Several of the other conspirators were apprehended, some were executed, and others went into voluntary exile. John, willing to shew that he was not unnecessarily severe, restored the forfeited estates of the duke of Viseo to his brother, whom he likewise raised to high dignity in the state. It is to the honour of this prince that he was the patron of commerce, particularly of that opened to the Portuguese by their settlements on the coast of Guinea. Being told by Cano, the discoverer of Congo, that the natives concealed their gold-mines, "Never look for them," said the king, "carry them what you want, and you will get their gold without digging for it." He did much towards the discovery of the passage by the Cape of Good Hope; but he had the mortification of reflecting, that by his refusal of the proposals of Columbus, he missed the opportunity of adding the western world to his dominions. About the year 1490, he was grievously affected by the death of his only son, who was killed by a fall from his horse at a race. He endeavoured, after this, to introduce his natural son George into the succession, but the great discontent which he met with in this scheme induced him to lay aside the project. He died in October 1495. The chief object of his reign seems to have been, to depress the nobility, to raise the inferior orders, and to promote the commercial prosperity of his kingdom.

John III., king of Portugal, was born in 1502, and succeeded to the crown in 1521. The events of this reign are in many respects important, and attach to them very serious consequences. In the time of this prince the execrable inquisition was introduced into Portugal, of which it was the curse nearly three hundred years, and has only been abolished within these few months, at the suggestion or demand of the British court. John sent missionaries into the East Indies, of whom the celebrated Xavier was one. The new settlement of Brazil was brought into a flourishing state in this reign, and particular attention was paid to the conversion of the natives. The king was attentive to what he believed would conduz to the happiness of his subjects; he was economical with regard to himself, and unwilling to burden his subjects with new taxes. From his own resources he founded hospitums, constructed fortifications, highways, and aqueducts, restored the university of Coimbra, and executed other projects of utility and splendour. John died of an apoplexy in 1557, at the age of fifty-five, after a reign of thirty-five years. He was succeeded by his grandson Sebastian, a minor.

U 2

JOHN.
JOHN.

John IV., king of Portugal, born in March 1604, was son of Theophilius, duke of Braganza, of the royal line. He succeeded his father in that dukedom in 1630; for, at that time, the Spaniards had taken possession of the Portuguese government, and annexed the country to the crown of Spain. It was become, in the reign of Philip IV., a domain of Castile, intended for the enriching of favourites. The oppressions and indignities suffered by the Portuguese had inflamed their discontent to the highest pitch, and they were only waiting for a leader, to break forth into a general revolt which they meditated. They fixed on the duke of Braganza, and offered him the crown of Portugal, if he would fand forth in their caufe, and merit the high honour by his proves. The Spanish court, aware of their intentions, practiced a variety of arts to get the duke into its power. The highest honours were offered him, in hopes of alienating him from the Portuguese cause; when these proved ineffectual, he was invited, or rather ordered, to come to Madrid to confer on state affairs, and the impossibility of excusing himself from this step, hastened his final determination. The leaders of the conspiracy prevailed him again to accept of the crown; he hesitated, but on confulting the duches, he confirmed him, with this heroic address, "My lord, a violent death awaits you with certainty at Madrid, perhaps at Lisbon; at the former place you must die as a wretched prisoner; here, covered with glory, and a king. Let us confide in the love of the people, your just claim, and the protection of heaven." He accordingly acquiesced, a revolution was effected in his favour in December 1640, and he was instantly proclaimed John IV. The new sovereign was acknowledged by all the powers of Europe, not immediately under the influence of the house of Austria, a conspiracy was however formed against his life and throne, but it was discovered and suppressed, and a treaty with France and the United Provinces affirmed Portugal in foiling the attempts of Spain to recover its sovereignty. The reign, nevertheless, was palsied in perpetual hostilities, though carried on with little vigour on either side. John died in 1646, leaving behind him two sons and two daughters. His reign, though far from brilliant, was useful; he was ever delirious of promoting the good of his people, and very unwillingly imposed any burthens on them. He recovered from the Dutch, and secured the valuable settlement of the Brazils, but lost the island of Ceylon.

John V., king of Portugal, born in 1689, succeeded his father Peter II. in December 1706. The nation was at this time engaged in the Spanish succession war, as one of the allies against the house of Bourbon; the new king was faithful to the cause, but little either of success or honour attended his arms. The peace of Utrecht was favourable to Portugal, and from that time the king's attention was occupied in rendering his country flourishing. His government was wise and moderate, his character generous and patriotic. He died in 1750. For particular particulars relating to the kings of Portugal, the reader is referred to the Modern Universal History.

John, king of Denmark, born in 1455, succeeded his father Chrétien I. in 1481. He had been acknowledged king of Denmark and Norway in his father's lifetime. He expected to have been chosen king of Sweden, but was disappointed by the intrigues of the administrator of that kingdom, and it was not till 1517 that he was crowned the king. At the coronation-feast, one of the king's German officers hinted that it would be a politic act to cut off the heads of those who had been leaders in the opposition to him. John replied with a manly indignation, that he would rather see all his evil counsellors on a gibbet than incur the flame and infamy of so savage a deed. "God forbid," said the virtuous monarch, "that I should ever deny to any free people the right of chufing their own governors." For some time he acted conformably to this sentiment, and exhibited a mind intent upon the public good, which produced a general satisfaction with his government. John, however, did not always act upon the principle of equity, which the maxim above quoted should have inculcated. The people of Dithmarin accordingly vindicated, at the point of the sword, their independence; and their successe was the forerunner of an open revolt in Sweden, where discontent was being gradually accumulating against the king's administration, owing to the facility with which he had conferred offices and grants on his favourites, to the prejudice of the natives. The former reigned headed the malcontents, and renounced his allegiance to John. The queen, Chritina, who was left at Stockholm, was obliged to capitulate; and a revolution was effected in 1562. After this many changes in the government took place, several of which led John to hope for a restoration to the crown; and a treaty for that purpose was concluded. A short time before his death, which happened in February 1573, in consequence of a fall from his horse. He possessed many amiable qualities, and would have been a really good king, but that he suffered himself to be fwayed too much by his favourites.

John III. king of Sweden, born in 1537, was second son of Gustavus Vasa, who settled upon him the dukedom of Finland. In 1560 he was sent to the court of England to forward the proposed union between his elder brother Eric and queen Elizabeth. Not long after this Eric succeeded to the crown, and John became the object of his suspicion. He was arrested, brought to trial, and condemned; but his life was spared, and the sentence exchanged for perpetual imprisonment. Several times it was determined to destroy him, but the tyrant as often relented, till at length, finding it necessary to strengthen his government, he liberated John in 1567, to the great joy of the Swedish nation. In the following year he took up arms against Eric, whom he deposed, and ascended the throne in his stead. He found the nation involved with Denmark and Russia, and almost struggling for its existence. He concluded peace with the former power, but hostilities continued with the latter till they were terminated by a treaty in 1573. By the influence of the queen, John abjured the Protestant religion, and embraced that of the church of Rome. In consequence of this declaration of principle he made many enemies; and although numbers of the clergy were gained over by views of ambition and emolument, yet a formidable party, attached to the reformation, with the king's brother, Charles, duke of Sodermanin, at their head, made such an opposition as nearly to involve the kingdom in a civil war. By the death of the queen, John found it expedient to lessen his zeal with regard to the establishment of the Roman religion, though he retained the desire of making it the religion of the state. He accordingly published a liturgy conformable to it, the use of which he enjoined to the clergy under the severest penalties. The flame of religious discord was hereby re-kindled; and the duke Charles again stood forth as the defender of the Protestant church. In 1590 John married Chrilina, daughter of the duke of Holstein. The war with Russia was renewed, and Sweden lost several fortresses. In this state of affairs John died in 1592, after a reign of 24 years. Mod. Univ. Hist.

John Sobieszki, king of Poland, born in 1624, was son of a brave and able statesman of the same name. He received
JOHN.

received a very liberal education, and visited the politef

but courts in Europe. He ascended, through the feveral gra-

tations, to the highest post in the army, and signalized

himself in many important actions. In the battle of Choczim,

in 1673, after three days fighting, he gave the Turks a total

and bloody defeat. In the following year, after many diffi-

culties, and struggling through much opposition, he succeeded

to the crown of Poland, and immediately applied his resources

in the profecution of the Turkish war, and by a series of

brilliant successes soon induced the Porte to agree to a

treaty, which completely revoked the dishonourable terms of

a former one. His coronation followed the redoration of

peace, and he employed the interval of tranquillity in the

re-establishment of the liberties of the kingdom, and in prepa-

rations for a future war, which his own martial disposition

rendered no distant event. In 1683, he made an alliance,

offensive and defensive, with the court of Vienna, and with-

out hesitation expended the treasures which he had accumu-

lated in levying troops, and putting his army into the bell

of a possible state. The Turks having laid siege to Vienna, and

reduced it to great straits he marched to its relief. Forming

a junction with the imperial general, the duke of Lorraine,

they attacked the Turkish camp on September 11th, 1683,

entirely routed the Grand Vizir, took possession of all his

cannon, warlike-stores, &c. and broke up the siege. The

people of Vienna regarded John as their saviour, and all

Europe has rendered him the homage due to his heroism

on this important occasion; but the pride of the emperor

Leopold produced from him a cold and ungracious acknowl-

dedgment of the service. Between this and the year 1686

he performed many other noble deeds of valour; but from

that period he pafled life without glory, in projects for the

advancement of his family by alliances, and especially for

securing the crown to his son, by which he was involved in

many domestic inquietudes, and civil diftentions. He died in

1696, less regretted than might have been expected;

but he had been accused, in his latter years, of confufing

the interests of his own power and ambition, rather than

those of his country. It was, however, universally admitted

that he was not only a brave warrior and consummate

commander, but possessed all the accomplishments that are

fitted to adorn a throne. As a literary man, he was elo-

quent and well informed on most subjects. He was a good

Latin scholar, converfant in feveral modern languages, and

acquainted with science beyond molt of his countrymen.

Mod. Univ. Hist.

John of Gaunt, or Ghent, duke of Lancaster, was the third

son of Edward III., king of England, and born at

Ghent in 1340. He married Constance, a natural daughter

of Peter the Cruel, king of Castile and Leon; and on the

death of that monarch he laid claim to the throne in right of

his wife, in opposition to Henry of Tramuntane, but

without success. He entered with considerable glory in

France with his brother the Black Prince, and on his death

the management of public affairs was committed to the care

of John during the life of his father. On the accidion of

Richard II. he retired; but the envy of the courtiers,

particularly the ecclesiastics, who hated him for protecting

Wickliffe, followed him with false accusations of a design

to usurp the throne, from which, however, he satisfactorily

vindicated himself. In 1396 his only daughter was married

to the heir apparent of the king of Castile, and John re-
nounced his claim to the crown in consideration of a very

large sum of money and pension. John took for his third

wife Catherine Swinfond, sister to the wife of his fecond

friend Chaucer the poet. He died in 1399, leaving a high character

for valour, prudence, and generosity. His son afterwards

became king, under the title of Henry IV. See Hume's

Hill. and Godwin's Life of Chaucer.

John of Austria, Don, the natural son of the emperor

Charles V. was born at Ratibhon in 1537. He first ap-

peared as a public character in 1569, during the revolt of

the Moors of Granada, when he was appointed captain-
general of the Spanish galleys, and was sent to Carthagena
to take the command. He assisted in the operations of the

war, which was brought to a happy termination the following

year. The holy league against the Turks for the protection

of the Venetians, being formed between the king of Spain,

the pope, and the Italian states, don John was nominated,

in 1571, general in chief, and assembled the united fleet at

Corin. In October he engaged with the Turkish fleet in

the gulf of Lepanto, and obtained that victory which

stands conspicuous in the series of actions between the

Christian and Mahometean powers. Don John, in person,

fought with and took the Turkifh admiral's galley, and the

battle terminated in the loss, on the part of the Turks, of

130 galleys taken, 55 destroyed, 25,000 men killed, and

16,000 made prisoners, besides achieving the liberty of

15,000 Christian slaves. Divisions arose as to the future

operations of the war: the advice of John was over-rulled,

and the advantages obtained by this splendid victory by

no means equalled the public expectation. In 1576 he was

appointed governor of the Low Countries. The Catholic

provinces had united with Holland and Zealand against the

Spaniards, and Don John was directed openly to concur in

this convention, and caufe the Spanish troops to leave the

country. Shortly after this don John took possession of

Namur, Charlemont, and Marienburg, contrary to the in-

terests of the states, who, in 1577, returned their arms, de-

posed don John, and declared the archduke Matthias their

governor. A war commenced, and John gave the army of

the Netherlands a very signal defeat, and made himself

master of many strong places. He was proceeding in his

military career, when, in October 1578, he was taken off,

after a short illness, in his camp at Namur, in the 32d year of

his age. He resembled his father in person, whom he

equalled in activity and enterprise, and whom he greatly

furpassed in generosity and humanity.

John I. pope, was a native of Tuscany, and ascended the

papal chair on the death of Hormidas, in the year 523.

His pontificate was short and uneventful, owing to the in-

temperate zeal of the emperor Julian for the extirpation of

all the sects which would not conform to the Catholic faith:

he even attempted to extirpate the Arians, of which party

Theodoric, king of the Goths, avowed himself a defender.

This prince wrote to the emperor most prying letters in

favour of his persecuted subjects, and when he found that

no regard was paid to them, knowing the influence which

the pope had at the imperial court, he ordered John to at-

tend him at Ravenna; from thence he went in quality of

ambassador to Constantinople, where he was very honourably

received, but the main object of his embassy was conducted

in a way which gave his employer very little satisfaction;

and on his return Theodoric caused him to be conducted

from the palace to a prison. He died in confinement in the

year 526, after a pontificate of little more than two years

and a half.

John II. was elevated to the papal throne in 523, upon

the death of pope Boniface II. In the following year the

dispute, "whether one of the perfons of the Trinity suffered

in the flesh," was carried on with great bitterness. In this

dispute the emperor Julian took a part; he not only

maintained the affirmative side of the question, but declared

all those who differed from him to be heretics. He also

wrote
wrote to John, sending him his own creed, affuring him that it was the faith of the whole eastern church, and intreated him to pronounce a judgment in its favour. The emperor's letter was accompanied with rich presents, and the pope, without much hesitation, decided in favour of Julianian's confession. He died in 555, after a pontificate of two years and five months. Six letters bear his name in the Collect. Council, of which the first is generally rejected as spurious.

John III. pope, named Caius, a native of Rome, was son of Anastasis, a person of considerable distinction. He was elevated to the popehood on the death of Pelagius in 556, and after holding it about thirteen years he died.

John IV. pope, named Scholasticus, was elected to the pontifical dignity upon the death of Severinus, in the year 632. He engaged deeply in the controversy of the Monothelites (which fee), and involved himself in some difficulties in that account. He employed the wealth of the church in humanely redeeming vast numbers of Christians, whom the Selcuk had carried off captives in their inroads into the empire during the reign of Heraclius. The reign of this pontiff did not extend to a single year. Three of the letters are inserted in the fifth volume of the Collect. Council.

John V. pope, a native of Antioch in Syria, was, while only a deacon in the church, appointed by pope Agatho one of three legis, whom he chose to be his representatives at the sixth general council, and it was by him that the Greek copy of the letters of Honorius to Sergius, produced and read in the council, was compared, and found entirely to agree with the Latin original, deposited in the library of the patriarch. In 687, upon the death of Benedict II., John was elected his successor, an honour which he retained something more than a year. He died, after a long and tedious illness, in the year 686.

John VI. pope, was elected to the papal throne in the year 702: the reigning emperor, Tiberius Aplinarus, objected to the election, and ordered him to be driven from the apostolic see; but the soldiers took part with John, and established him on his throne. He displayed great generosity in redeeming many captives, whom the duke of Benevento had taken in an irruption into the territories of the empire of Italy, and at length prevailed upon that prince to put an end to his hostilities against the subjects of the empire. He held a council at Rome, in which Wilfrid, who had been driven from the see of York, and banished England, was declared innocent of the crimes laid to his charge. John died in 705, after a reign of little more than three years.

John VII. pope, was raised to the pontifical dignity on the death of John VI. Immediately on his elevation to the throne, the emperor Julianian demanded of him his opinion with regard to certain canons; but John was too wary to be thus drawn into a trap, and declined giving any judgment, lest, by so doing, he might incur the emperor's displeasure. He died after a pontificate of two years and seven months, in the year 707. A single letter of this pope is to be found in the fifth volume of the Collect. Council.

John VIII. pope, was, on the death of Adrian II., elected to fill the papal see. This was in the year 872; and in the following year the emperor Lewis II. came to Rome, where he held an assembly of the states of Italy subject to his empire, at which the pope afflicted. In that assembly the pope absolved Lewis from an oath which he had taken not to interfere with the government of the dukedom of Benevento, under the pretence that it had been extorted by force, and also that it was inconsistent with the welfare of the empire. In 873 he crowned the emperor Charles the Bald, and three years after went to France, where he held a council at Troyes.

In his pontificate Italy was greatly ravaged by the Saracens, who obliged the pope to pay tribute. He corresponded with Photius, patriarch of Constantinople, who had driven Ignatius from his seat, and usurped for himself the dignity. At first the pope refused to acknowledge him; but Photius, by rich presents, rendered his holiness propitious, who not only contented to abolve him from the excommunications which had been repeatedly thundered out against him, but readily received him as his brother and colleague. In a council held at Constantinople, in the year 879, at which the papal legates and Photius jointly presided, the latter was declared lawful patriarch of the imperial city, and the legates, won over by his presents, ventured so far to depart from their instructions, that they pronounced an anathema against all who should receive any of the councils which had condemned him. Upon their return to Rome, confessions of having gone beyond their instructions, they endeavoured to conceal this circumstance from the pope; but he was soon apprized of it, and exasperated, as well as they, for the treachery, as at the disingeniuty of Photius, declared all their proceedings null and void, and assembled another council in 884, at which he placed the patriarchs to be a second time condemned. After this he made an offer of the imperial crown to Charles the Great; and urged him by all means to come to Rome to receive it. As soon as the fate of his affairs would permit him, Charles proceeded to that city, and was crowned by the pope in St. Peter's church. John, however, could not prevail with the new emperor to lend him any assistance against the Saracens; he, therefore, endeavoured to gain over such of the Italian princes as had entered into an alliance with them. He even went to Naples, to try whether he could persuade Athanasius to turn his arms against them. That prelate promised to support the pope, and was supplied with money to enable him to levy the requisite forces, but with the cooilest treachery he turned those forces against the pope himself. John, from the doubts and difficulties with which the emperor was affected, resolved to assemble a council, to which the emperor was invited to attend. A council was held at Rome, in which he was present, and where he was elected pope. He died in 884, after having held the pontificate for ten years. He was an able and learned man, who did much for the advancement of the church. He was a great patron of learning, and was celebrated for his piety and holiness. He was succeeded by his nephew, who was elected in his stead, and who was named Benedict II. He reigned for a short time, and died in 896.

John IX. pope, a native and deacon of Tivoli, was raised to the papal dignity on the death of Theodore II., in 898. At this period Italy was divided by the factions of different pretenders to the empire: John at first refused to take part in these contests; but owing to the violence of Berenger, king of Lombardy, he was induced, apparently, to espouse his cause, and to crown him emperor. He had, however, no sooner left the city, than the pope assembled a council, in which he declared the coronation of Berenger null and void, as having been extorted by force, and acknowledged Lambert, who had also been crowned king of Italy, as the only lawful emperor. In the same year John convened a council to meet at Ravenna, which confirmed the acts of the council of Rome, and approved of the coronation of Lambert, who was present in person. This pope died in the year 900, after having filled the papal chair about two years. Four of his letters are extant in the ninth volume of the Collect. Council.

John X. pope, rose in the church by degrees, from the rank of deacon to that of archbishop of Ravenna. He was indebted, for this last promotion, to a celebrated prostitute, Theodora, with whom he had long been intimate notwithstanding...
flanding his elevated station in the church. In 914, Theodora, by her intrigues and interest, got her favourite and friend preferred to the pontifical chair. Under this pope, Rome and Italy were destined for deliverance from the barbarous and oppressive Saracens. In 916 he crowned anew Berenger, who readily assisted him in his ambitious projects. The pope resolved to take the field himself as generalissimo of all the forces, and under him the Saracen power was completely annihilated, which, during the space of forty years, had been the terror of the whole of Italy. In the following year the pope began to feel some complications of conscience on account of his former conduct, and accordingly sent a legate, as his proxy, on a pilgrimage to the tomb of St. James, of Compostella, in the kingdom of Leon, hoping, at least, wishing, others to believe, that he should atone for his vices by offering rich presents at the shrine of a departed saint. In the year 925 John shewed how little regard he paid to the canons of the church by confirming the nomination of Hugh, a child only five years old, and son of count Herbert, in the archbishopric of Rheims. As John was indebted for his rank and elevation in the church to the intrigues of one infamous woman, so he left his dignity and life through those of another. This was Marozia, the daughter of his former mistress Theodora. Marozia, exasperated that she did not succeed her mother in the confidence of the pope, resolved to destroy him and his brother Peter, who at that time was in habits of the strictest intimacy with him. She communicated the bloody design to her husband, and prevailed on him not only to approve, but to be the instrument of carrying it into execution. Accordingly this wretch, on a certain day, when the pope and his brother were together in the Lateran palace, broke into it at the head of a band of ruffians, killed Peter before his brother's face, and then, seizing the pope, dragged him to prison, where he soon afterwards died. This tragical event happened in the year 928, after John had been seated on the papal throne more than fourteen years. Three of the letters of this pope are to be found in the ninth volume of the Collect. Cencil.

John XI. pope, was supposed to be the natural son of pope Sergius III. by the infamous Marozia, but according to others he was the son of Alberic, duke of Spoleto. It is certain he attained the dignity of pope through the influence of Marozia, and her husband Guy, marquis of Tuftury, in the year 931, upon the death of Stephen VII. Guy did not long survive the promotion of John, and immediately upon his death, Marozia sent word to his brother Hugh, king of Lombardy, that she would make him master of Rome, upon the condition of marrying her. To this the prince readily acceded, and took possession of his bride, and the castle of St. Angelo at the same time. Hugh rendered himself hateful to the Romans, and excited the resentment of Alberic, a son of Marozia by her first husband, who put himself at the head of the discontented, attacked the castle of St. Angelo, and made himself master of the fortresses. In the confusion Hugh made his escape, but Marozia and pope John fell into Alberic's hands, who kept them both in close confinement during the remainder of their lives. John died in 936, after a pontificate of nearly five years.

John XII. pope, whose original name was Octavian, was son of the Alberic referred to in the last article. On the death of his father in 934, Octavian succeeded to his dignities, and not satisfied with his temporal power, he aspired to the papal throne when it became vacant in the year 956, and secured the possession of it to himself. On this occasion he assumed the name of John XII. and thus introduced the custom which was afterwards adopted by his successors of changing their usual names for others, upon their accession to the pontificate. At this time Berenger tyrannized over Italy, and the pope imploring the assistance of Otho I., who delivered the country. John crowned Otho at Rome, and promised him fidelity, which however was of very short duration, for he united with the son of Berenger against his deliverer. Otho returned to Rome in 953, and called a council, in which the pope was accused of adultery, sacrilege, and other crimes, which were factually proved against him, and he was deposed. When the sentence of his deposition had been pronounced, the council, clergy, nobility, and people, unanimously elected Leo VIII. to fill his place. After this, John several times conspired against the life of the new pope, and was as frequently pardoned, till at length he contrived to set himself again on the papal throne. John infallibly assembled a council of prelates and cardinals, who condemned the council that had deposed him, and passed different sentences of condemnation on all those who had been accessory or privy to the elevation of his rival. John did not long survive the holding of this council, for having engaged in a criminal connection with a married woman, the injured husband, who caught him in the act, put an end to his holier's life and debaucheries by four violent blows which he gave him on his temple. His death is supposed to have taken place in 954, after he had filled the papal throne about eight years. A single letter of his is inserted in the ninth vol. of the Collect. Council.

John XIII. pope, was one of the principal accusers of the pope whose history has been just given. By the part which he took on this occasion, he recommended himself to the favour of the emperor Otho, who, after the death of John, returned with his army to Rome, and held a council there, in which a decree was passed, conferring on the emperor and his successors for ever the power of nominating the pope, and of granting investiture to bishops. After the death of Leo VIII., in the year 955, John was recommended by the emperor as his successor to the holy see, which was decidedly contrary to the inclination of the Roman people, who conspired against him and drove him from his throne. The emperor determined to take ample revenge for this insult, and marching his army, he restored the pope, and severely punished those who had taken part against him. He next went to Ravenna accompanied by the pope, where he held a council in the year 957. Upon the breaking up of the council the pope returned to Rome, where he spent the remainder of his life in the unmodified possession of his high dignity. In 965 he was crowned in St. Peter's church, the young Otho, king of Germany, whom his father had taken for his partner in the empire, and in the year 971 he crowned as empress Theophania, daughter of the late eastern emperor Romanus, who was married to Otho the younger. John died at Rome in 972, after having presided in the Roman see nearly seven years. In his pontificate the Poles were first converted to the Christian religion, and he is said by some writers to have been the person who introduced the practice of bleeding or confecting church bells. Four letters of this pope may be found in the ninth vol. of the Collect. Council.

John XIV. pope, succeeded to the papal chair on the death of Benedict VII. in the year 984; an honour which he enjoyed but eight months. Boniface VII. who is chaffed among the anti-popes, undertook the expulsion of John. He prevailed, feized his rival, confined him in the castle of St. Angelo, and there either starved him to death, or
more humanely dispatched him with poison. Boniface himself did not long survive the victim of his cruelty, being carried off in the same year by a sudden death. Upon this event, John, a native of Rome, and the son of one Robert, was elected pope, and governed the church during the space of about four months, but for some cause or other, not sufficiently explained, he is not reckoned among the popes.

John XV. was elected to the papal dignity in the year 983, on the death of John, the son of Robert, who has been just mentioned. Soon after the commencement of his pontificate, Crescentius, a man of great power at Rome, aspireted at the sovereignty of the city, seized the castle of St. Angelo, and assumed the title of contul. The pope, conceiving that he was in danger, implored the assistance of the emperor Otto III., who promised him, that, if necessary, he would come with his whole army, and support the apostolic see with the same zeal which his father and grandfather had displayed. John informed Crescentius of the imperial determination; he submitted, and sent some of the chiefs of his party to invite his holiness back to Rome, with the strongest assurances of safety, and of that respect which was due to the successor of St. Peter. John complied, and was permitted to live unmolested till towards the close of his pontificate. In the year 993, at a council held at the Lateran palace, the pope, after hearing read an account of the life and supposed miracles of Ulricus, bishop of Angulana, declared, with the approbation of his bishops, that from thenceforth Ulric might be worshipped and invoked as a saint in heaven reigning with Christ. This is the first instance on record of the solemn canonization of a pretendedly meritorious character, a practice which soon contributed to crowd the Roman calendar with saints, and loaded the church with wealth, by the rich offerings with which the supertitious multitude was encouraged to propitiate the favour of these new mediators between God and man. About this period the pope became engaged in a quarrel with the French clergy, over whom he obtained a complete victory; he had, however, more trouble with Crescentius who began to raze his ambitious projects at Rome. John applied again for allegiance to Otho, who marched an army to his allegiance, but in the midst of these warlike preparations the pope died in the year 996, and in the eleventh year of his pontificate. Three of his letters are extant in the ninth volume of the Collect. Concil.

John XVI. pope, was a native of Rossano, in Calabria, of mean extraction, but a person of considerable abilities and addresses. He was employed by the emperors Otho II. and III. in affairs of considerable moment; from the latter he obtained possession of the see of Placentia, and held it till he heard that Gregory V. was driven from Rome by Crescentius in the year 997, when he bargained for, and purchased the popedom of that usurper, and then assumed the title of John XVI. He was excommunicated by several councils held in Italy, France, and Germany, and at length the emperor Otho brought against him a powerful army. The pope, or, as he is sometimes called, the antipope, endeavoured to make his escape from the city, but falling into the hands of some of Gregory's friends, they barbarously deprived him of his fight, and cut off his nose and ears. To complete the climax of their cruelty, they mounted the unhappy wretch on an ass, led him through the streets of the city, and forced him to exclaim "Whoever shall dare to dipollute a pope, let him be fereded like me."

John XVII. pope, was elected to the holy office on the death of Silvester II. in the year 1003, in which year he also died, after he had presided over the church about five months. It has been ascertained, that from this time, the people were deprived of voting at elections of the sovereign pontiffs, which was afterwards confided to the clergy. He was succeeded by

John XVIII. pope, who held the office to which he was elected in 1003, between five and six years, but few of his acts have come down to us, except his sending St. Bruno to preach Christianity to the Russians, and his putting an end to the schism which existed between the eastern and western churches.

John XIX. pope, was son of Gregory, count of Tuscum, and brother of Benedict VIII. Upon the death of the latter in the year 1024, the influence and wealth of Gregory procured the election of his other son, who was then a layman. He was at this moment that he thought it advisable to assume the name of John XIX. Early in this pontificate an attempt was made, by the emperor Basilius, to allow the patriarch of Constantinople the title of Universal bishop of the East, but John sent back the ambassadors with a refusals, telling them that the title of univeral bishop became none but the successors of St. Peter in the apostolic fee. In the year 1026, Conrad, king of Germany, having entered Italy with an army, and having reduced all the towns which had flaked off the imperial yoke, went to Rome, where the pope crowned him emperor, and his queen emprest, with the usual solemnities. On this occasion, Rudolph, king of Burgundy, and Canute, king of England, who were on pilgrimage to Rome, were present. John died in 1033. Three of his letters are extant in the ninth volume of the Collect. Concil.

John XX. or XXI. pope, a Portuguese, son of one Julian, a physician, became eminent for his acquaintance with the sciences, particularly with that of medicine, the practice of which he followed for some time with great reputation. He afterwards devoted himself to the church, and advanced by degrees to high preferment. He was made cardinal by Gregory X., and on the death of Adrian V., in 1276, he was elected to the pontifical dignity, when he took the name of John XX. or XXI. The first act of his pontificate was to revoke the famous constitution of Gregory X. which ordered that the cardinals should be first up in the conclave during the vacancy of the papal see. He did all in his power to aften the Christians in the East. He was ignorant of the world, and became attached to the pretended principles of judicial astrology; from these he thought he had many years to live, and began to devise schemes for the future. He was, however, carried off in eight months after his elevation to the holy fee. He was author of several tracts on logic, one on phisicology, and some medical treatises. One of his letters to Edward I. king of England, is in the tenth volume of the Collect. Concil. and some others in the second volume of Widdings' "Annal. Minor."

John XXI. or XXII. pope, a Frenchman by nation, and by deceit, according to different writers, the son of a noble, a tavern-keeper, or a cobler. In early life he was appointed to some considerable offices in the state, the duties of which he performed with so much credit to himself, as to manifest very superior talents for public business. On the death of Clement V., in 1314, the most violent disputes occurred in the election of a successor to the holy see. These were carried on for two years, after which the cardinals unanimously elected James de Olfis, the subject of this article, who assumed the name of John XXI. or XXII. During his pontificate he founded several abbeys and bishoprics; but he was not only the witness to, but the perpetrator of, many cruelties with respect to the Franciscans; some of whom were, by his order, actually chained alive, as preparatory to their being bound to the stake for burning, which was the regular punishment for heresy.
JOHN.

_Extreme sentence was carried into execution without mercy._

The cruelty of John was condemned by his warmest adherents, who did not scruple to declare that by it he had rendered himself utterly unworthy of the papal dignity, and that his deeds proved him to be the predicted anti-christ. They even revered these victims as martyrs to the truth, paying religious veneration to their bones and ashes. He was next involved in the dispute whether Christ and his apostles ever possessed any property or dominion, either in common or personally. The diclesiouns on this question were violent and bitter, and those who maintained the negative side of the question paid for their temerity by the most excruciating sufferings inflicted on them. John was now engaged in a dispute with Lewis of Bavaria, who, as the reward of his victory over Frederick of Austria, claimed the Imperial crown as his right. John, alarmed at his affuance, infantly excommunicated him, and forbade all the subjects of the empire, on penalty of the same sentence, to acknowledge him for king, or obey him as such. From this sentence the monarch appealed to a general council, and published a manifesto against his holiness, describing him as one who trampled on all laws, human and divine, to gratify his ambition or avarice; as a ravenous wolf, fleecing and devouring the flock committed to his care; and, as an avowed heretic, in condemning as heresy the doctrine concerning the poverty of Christ. John died after a most turbulent pontificate, in the year 1374, at the great age of ninety years. Notwithstanding his various acts, which have been but merely referred to, he found biographers to praise his good deeds, forgetting those which were of a contrary description. They said he was a man of learning, and an encourager of the learned. The historian has held him up as ambitious, arrogant, cruel, andavaricious. He is supposed to have been the person who invented the "Amates," obliging every clergyman, preferred to a benefice, to pay into the apostolic chamber one year's income before he took possession of it. He died immensely rich, and was known in the literary world as author of several treatises: one "On the Contempt of the World;" one "On the Transmutation of Metals;" and twenty-two Constitutions which he ordered to be called "Extravagantes." Many of his bulls and letters are likewise extant. He is said also to have been author of several treatises on medicine, which led some of his biographers to say he was better fitted for a physician than a pope. He is said by Walther to have written, among other things, a treatise on music, "Die Musica;" but no such treatise is enumerated in the list of his works by Baronius or Fabrius. This pontiff, however, seems to have interested himself very much about ecclesiastical music. The attempts at difficult, or extraneous and temporary counterpart, were thought to licentious in his time, that he prohibited the use of it in the church by a bull in 1322. There is, however, at the end of it this favourable clause: "It is not our intention wholly to prevent the use of concords in the sacred service, particularly on great festivals, provided the ecclesiastical chant or plain-song be carefully preferred. The Abbé Le- beuf of Orleans, that those who drew up this bull, which is inserted in the body of canonic laws, erroneously confined difficult to fourths, fifths, and octaves, from the perusal of ancient authors on the subject of music, particularly Calliope, where they had found the following definition: "Symphonia eft temperamentum sonitum gravis ad acutum, vel acuti ad gravem, modulamcns effe, live in voce, live in percussione, live in flato. Symphoniae sunt sex: prima, diatessaron: secunda, diapente: tertia, diapason. Quarta, diapason et diatessaron; quint, diapason et diapente; sext, diapason et diapason."—"Symphony, or music in conso-

Vol. XIX.

_The mixing graveounds with acute, or acute with grave, either in finging or playing upon flinged or wind instruments. Symphonie concords are six: the fourth, fifth, and eighth, with their octaves. It is hardly possible to read this passage, and not give up the contest concerning ancient counterpoint, or at least reduce it to the meager kind of which Padre Martini has framed an example in his Storia Musica._

John XXII. or XXIII. pope, formerly known by the name of Balthasar-Coffa, was a native of Naples, and being descended from a noble and wealthy family, he enjoyed the advantages of an excellent education at Bologna, where he took his degrees, and from thence he set out to Rome, anticipating the honors that seemed to be reserved for him, for on being asked by some of his friends whether he was going, he replied "to the popedom." Scarcely had he arrived at this great city, when he was made chamberlain to pope Boniface IX. who, in 1402, promoted him to the purple. He took an active part in the deposition of Gregory XII. and exerted all his talents, influence, and property to secure the election of Alexander V. Soon after that pontiff's election the plague obliged him to quit Pisa, and he was prevailed upon by cardinal Coffa to pay a visit to Bologna. Here he found means to detain the pope, under various pretences, till his holiness fell dangerously ill, and his complaints proved fatal to him. The bulk of our present article has lain under the heavy charge of causing him to be poisoned by his physicians; he was, however, elected his successor, and from the title of cardinal Coffa he assumed the name of John XXIII. On the very day that he was raised to this high dignity in the church, he wrote to all Christian princes, acquainting them of his promotion, and exhorting them to support his claims against the pretensions of those who had been condemned and deposed by the church universal. One of the earliest objects of John's administration was to raise a fund to support the claims of his friend Lewis of Anjou, in opposition to those of his inveterate enemy, Ladislaus, to the possession of the kingdom of Naples. In his progress he solemnly excommunicated Ladislaus, and then ordered a crusade to be preached against him all over Christendom. By the bull inflin on this occasion, all were exhorted to take the cross and engage in this holy war; and to all who should embark in it, the fame indulgences were granted as to those who went to the conquest of the Holy Land. In a short time peace was restored; this was effected by John's taking off the excommunication from Ladislaus, who, in return, agreed to abandon the cause of Gregory, whom he had hitherto vindicated as the true pope. After the restoration of tranquillity, John made a promotion of fourteen cardinals, and lustrated all the prelates of the church to attend a general council at Rome. At this council few bishops were present, its proceedings were probably, unimportant, except in this, that it condemned the doctrine of Wicklif, and ordered his works to be committed to the flames. Ladislaus took the first opportunity of attacking pope John: the pontiff appealed to all Christian princes, exhorting them to appoint a general council to put a stop to the reigning evils, and to unite the whole church under one head. The choice of the place was left to the emperor, who fixed on Constance. Here the council was opened on the 15th of November 1414. After many feittions a list of accusations against the pope was read, containing seventy articles, some of which, however, were too scandalous even to be gone into: the others related to the pope's simony and tyranny; and to the means which he took of amassing immense riches. After these articles, and the depoisions in support of them, were read and examined, the council
JOHN.

council declared them to be fully proved, and then unani-
mously passed a sentence of suspension against the pope. This sentence was communicated to him by a deputation from the council. After this, viz. on the 26th of May 1415, the council proceeded a step farther, and unanimously passed the definitive sentence of John's deposition, and or-
dered his seals to be broken. He was then committed to the care of Lewis, duke of Bavaria, and count palatine of the Rhine, who kept him prisoner, but treated him with civility and respect. At the expiration of about four years he obtained his liberty, and made such concessions to the exci-
ting pope Martin V. that he created him cardinal bishop of Tufulcum, and dean of the sacred college: he also ordained that he should always sit next to the pope, and that his seat should be elevated a little above those of the other cardinals. He did not live many months to enjoy these honours. His character has already been described: he was unquestionably vicious and indolent of good principles, and merited that full which he experienced. He was author of a poem "De Varietate Fortunae," which is said to be distinguished by fitness and taste. His bull for assembling the council of Con
tance; the form of his resignation, and some of his letters, are still extant. For further particulars relating to the punics John, the reader is referred to Bower's History. 

John of Bayeux, known also by the name of John of Avranches, an illustrious Gallican prelate in the eleventh century, the first of all the bishops of Avranches, and afterwards promoted to the archiepiscopal see of Rouen. He held a provincial council in the year 1074, at which several statutes were passed for the regulation of ecclesiastical dis-
cipline, which provoked the resentment of the lax and diffi-
pated clergy, who obliged him to seek for safety in flight. Other persecutions obliged him to resign his preferment, and retire to his country house: here he was attacked by the monks of the abbey of St. Owen, who killed him on the spot. He was author of a work "On the Duties of Ecclesiastics," which was first published with notes, by John le Prevor, canon of Rouen. Moreri.

John Damascenus, or St. John of Damascus, who lived in the eighth century, is celebrated by the writers of his life, and by ecclesiastical historian, as the compiler and re-
former of chants in the Greek church, in the same manner as St. Gregory in the Roman. And Leo Allatius, under the title of Oecechus, tells us they were composed by John Damascenus. Zarago goes still farther, and informs us that in the first ages of Christianity the ancient Greek notation by letters having been thrown aside, John Damascenus invented new characters, which he accommodated to the Greek ecclesiastical tones; and that these characters did not, like ours, merely express single sounds, but all the intervals used in melody: as a femitons, tone, third minor, third major, &c. ascending and descending with their different duration.

This resembles, in many particulars, the notation in ancient Roman missals, before the time-table and characters in pre-
fant life were invented, or even the Gregorian notes generally received.

John de Muris. See Muris.

John of Salisbury, a learned Englishman of the 12th cen-
tury, was elected bishop of Chartres in France in the year 1177, an office which he held about four years when he died. He wrote the life of Thomas a Becket and several other works. This learned prelate seems to have been much offended and febrile at the licentiousness of the friars in performing the sacred rites. We should suppose, by his cenures, that the chant was outrageously addicted to flourishing, and that many of them sang in fake. What the complaints of the good bishop of Chartres were, the following passage from his Poliaticus will shew.

"Mulie Exultationis, sequtum, quod ante concТЬptum
Dominii, in iphis penetrabilibus sanctuariorum, incipient occussus vocis luxo, quaudam ostentatione fuit, multi ploribus modis nodularium articu-
cularum excus, fluctantes animas emolire nuturrunt. Cum praecendentium, et succionentium, causentium, et deceminentium, interclementium, et occementium, praeoles modula-
tiones audieris, Sirenum concensus crescit, em, non homi-
num, et de vocum facilitate miraberis, quibus philosopha vel paimtac, aut it quid honoris ell, modos fuisse sequent co-
quare. Ex liquide cum ascendetendi defcedendique facultas; eam fecto vel gementi nodularium, ea replicatio articularum, singularumque confididico; sic acuta vel acutissima, gra-
bus et subgravibus temperatur, ut auribus fui indici fere
librathatur auctoritas." Poloetricus, libe Nudi Curia-
ium, lib. i. c. 6.

"The rites of religion," says he, "are now profaned by music: and it seems as if no other use were made of it than to corrupt the mind by wanton modulations, effeminate in-
fections, and frightned notes and periods, even in the Pen-
treatiales, or awful sanctuary itself. The stupid crowd, de-
lighted with all these vagaries, imagine they hear a concert of fmiour, in which the performers strive to imitate the notes of nightingales and parrots, not those of men; sometimes deeceding to the bottom of the scale, sometimes mounting to the summit; now softening and now enforcing the tones, repeating palfages, mixing in such a manner the graver founds with the more grave, and the acute with the most acute, that the aflonished and bewildered ear is unable to dif-
tingh two voice from another."

John of Ragusa, a learned Catholic prelate, who flourished in the fifteenth century, was born in the city whence he de-
river his surname. While young he entered himself among the preaching friars, and applied with much diligence to his studies, that he became one of the most learned men of his time. He was particularly celebrated for his deep acquaintance with the Oriental languages. In 1426 he was appointed attorney-general of his order at the court of Rome, and was nominated by pope Martin V. one of his divines at the council of Basli. At this assembly he was the principal difpultant against the doctrines promulged by John Hais. After this he was sent on different legations to Constan-
tinople, with a design of bringing about an union between the eastern and western churches, but his exertions were not at-
tended with success. On his return to Italy he was nomi-
nated to the see of Argos in the Peloponnese. It has been affered by some authors that he was made a cardinal. His works are "A Discourse against the Hufites," "Acts of his Legation to Constantinople," and "An Account of his Travels in the East." Moreri.

St. John's Sweet. See Pink

St. John's Wort. See Hypericum.

St. John's Wort, Hypericum perforatum, in the Modera-
ma, a species of hypericum which grows, commonly to the height of a foot and a half, in woods and uncultivated grounds, and flowers in July. This plant has a bitterish, subastringent taste, and a sweetish smell. Among the ancients it was in great reput; and they preferred it in hy-
terias, hypochondrias, and mania: they also imagined that it had the peculiar power of curing demonies, and it thence obtained the name of "fuga demonum." It was also rec-
chmed internally for wounds, bruises, ulcers, hemoptyes, mictura cruenta, gravel, dysentery, ages, worms; and outwardly as an anodyne, and as a diuretic and de-
tergent.
tergent. However, it is now very rarely used. The flowers only are directed for use, as containing the greatest proportion of the resinous oily matter, in which the medical efficacy of the plant is supposed to reside. The dark puncta of the petals and the capsules afford this essential oil, which is contained in minute vehicles, or glands, and gives a red colour to rectified spirit, and to expressed oils: the latter has been long known in the shops by the name of "oleum hyperici." The colouring matter is said to give a good dye to wool.

John's, St., College, in America. See College.

John de la Frontera, St., in Geography. See Juan de la Frontera.

John's Haven, a small sea-port town in the parish of Benholme, and shire of Kincardine, Scotland, was formerly one of the most considerable fishing towns on the southern coast of Scotland. At present, however, it is much reduced, its trade declined, and population diminished. A company of sail-cloth manufacturers have established works here, and thus given employment to the inhabitants. The population of the parish, in the year 1763, was calculated at 1019. This place is 9 miles north of Montrose.

John's Island, islands of America, near the coast of South Carolina, S.W. of Charlestown harbour, divided from James's island by the river Stono, which forms a convenient and safe port.

John's Island, an island in the bay of Quira, Upper Canada, opposite the Mohawk settlement, w.g.t. of Richmond.

John, St., a town of the island of May, one of the Cape Verde islands.—Also, one of the Virgin islands, in the West Indies; 12 leagues E. of Porto Rico; about five miles long, and one broad; said to be the best watered of all the Virgin isles, though it has little good land, and its exportations are trifling. Its harbour, called "Craw bay," is reckoned better than that of St. Thomas, and is accounted the best to the leeward of Antigua. N. lat. 18° 5'. W. long. 63° 52'.—Also, a sea-port town well built, on the west coast of the island of Antigua. It is situated in a parish of the same name, on Loblolly bay. It is the capital of the island, and a port of entry. Its harbour is excellent and well fortified. This town is the residence of the governor-general of the leeward Charaibc islands; here the assembly is held; and its port carries on a great trade. This town was nearly destroyed by fire in August 1769; upwards of 250 houses being burned, besides wharves, cranes, &c. N. lat. 17° 5'. W. long. 64° 5'.—Also, an island, called also Prince Edward's Island (which fee), in the gulf of St. Lawrence, situated at a small distance to the west of the island of Cape Breton, and to the north of Nova Scotia, to which it is attached. Its coast on the north and south are much intersected with bays; it is well watered by rivers, and its soil is for the most part rich and fertile. It formerly belonged to the French, who improved it to such advantage, that it was deemed the granary of Canada, which it supplied with plenty of corn, as well as beef and pork. On the conquest of Cape Breton in 1745, the inhabitants quietly submitted to the British arms. Its capital is Charlotte's town, which is the residence of the lieutenant-governor, who is the chief officer in the island: its other towns are George town, Prince's town, Hillborough town, Pownal town, Maryborough town, &c. Its length from N.E. to S.W. is reckoned about 100 (Pinkerton says 60) miles, and its mean breadth is 30 miles. The whole island is divided into three counties, viz. King's, Queen's, and Prince's counties, which are subdivided into 14 parishes, consisting of 27 townships, and comprehending in all 1,363,400 acres. The number of inhabitants is estimated at about 5000. N. lat. 45° 20'. W. long. 63°—Also, a small island in the Pacific ocean, east of New Ireland, so called by Schouten, and by Dougainville Bournard. S. lat. 4°. E. long. 153° 50'.—Also, a small island in the Red sea—Also, a small island in the West Indies, north of St. Croix, and south of Tortola; noted for its fine harbour, which, it is said, is sufficient to contain the whole British navy. — Also, a bay and island on the west coast of Newfoundland, in the gulf of St. Lawrence, at the S.W. end of the straits of Belleisle. — Also, a town on the east coast of Newfoundland. N. lat. 47° 35'. W. long. 52° 20'.—Also, a town of America, being the north-westernmost in Sufsex county, Delaware, situated at the head of Nanticoke river, about 22 miles S.W. of Dover. N. lat. 38° 48'. W. long. 75° 40'.—Also, a town and fort in Lower Canada, on the west bank of Sorel river, at the north end of lake Champlain, 28 miles south of Montreal. This town has been established as the sole port of entry and clearance for all goods imported from the interior of the United States into Canada, by the executive council of Lower Canada, in July 1766. N. lat. 45° 9'. W. long. 73° 18'.—Also, a sea-port on the S.E. coast of the island of Tinos. N. lat. 37° 32'. E. long. 25° 15'.—Also, a river of America, in East Florida, which rises in a swamp in the interior of the province, and pursues a northern course, in a broad navigable stream, spreading frequently into spacious bays or lakes, of which Lake George is the chief. At its mouth is a shifting bar; 104 leagues north of St. Augustine. —Also, a river, called Little St. John's, which rises in a swamp called Ouaquepenogaw, and after a winding course of about 200 miles, falls into Apalache bay, about 10 miles east of Apalache river. It is said to be the purest and clearest of any in America, receiving, as the Indians say, no tributary streams, but being fed by springs which gush through its banks, and is about 200 yards broad, and about 15 or 20 feet deep at the town of Talahasahete.—Also, a river which is the largest in the British province of New Brunswick. From its mouth on the north side of the bay of Fundal to its main source it is computed to be 330 miles; the tide flows 80 or 90 miles up this river; and it is navigable for vessels of 50 tons 60 miles, and for boats 200. Its general course from its origin is E.S.E. It is the common route to Quebec. It furnishes the greatest plenty of salmon, haddock, and sturgeon. This river is fed by many tributary streams, and in its various branches it waters and enriches a large tract of excellent country, which is settled and under improvement. The uplands are, in general, covered with fine timber, such as pine and spruce, hemlock and hard wood, principally beech, birch, maple, and ash. The pines on this river are the largest in British America, and afford a considerable supply of masts for the British navy. — Also, a river of Africa, which runs into the Indian sea, S. lat. 31° 20'; and another of Africa, which runs into the Atlantic, N. lat. 19° 20'.—Also, a lake in Lower Canada, which receives rivers almost in every direction, and discharges its waters through Saguenaui river into the St. Lawrence, at Tadoussac. It is about 25 miles in diameter.

JOHNNY GROAT'S HOUSE, the most northerly dwelling of Scotland, in the county of Caithness; one mile W. of Duncanby Head.

JOHNSBURY, a township of America, in Caledonia county, Vermont, bounded S.W. by Danville; containing 663 inhabitants.

JOHNSTON, John, in Biography, a learned divine of the church of England, was born at Friendsbury, near Rochester, in Kent, in the year 1662. He received the elements of a good education at King's school, Canterbury, and from there...
thence he was sent, when he was about 15 years of age, to Magdalen college, Cambridge. Here he took his degrees and entered into deacon’s orders, and shortly after obtained a curacy near Canterbury. In 1686, he was ordained priest and collated by Archbishop Sancroft to the vicarage of Boston and Hearne-Hill. After the revolution he compiled with the new order of things, and became an able advocate in its defence, which gained him the friendship and patronage of archbishop Tenison, from whom he received several instances of church preferment, and in 1707, was collated to the vicarage of Cranbrook. Here he seems to have completely abandoned his friends and his principles, and to have advanced from step to step till he even denied the king’s supremacy, and refused to read the prayers enjoined on the accession of George I. Notwithstanding this delirium of principle, he was twice chosen proctor in convocation for the diocese of Canterbury. He died in 1725, having been several times under scrutiny, from the effects of which he was releaved by submission to the higher powers: had his fortitude been equal to his zeal, he would have suffered in defence of the most arbitrary and indefensible opinions, that can well be broached by a man of sense. Johnson was unquestionably a man of found learning; his morals were exemplary and his piety unaffected. He was diligent in the discharge of the several duties belonging to the pastoral office, but his temper was bad, and during the latter years of his life, he showed much bigotry and intolerance against those who thought as he himself had formerly thought, as detracted from the value of his good qualities. His principal works are “The Clergyman’s Vade Mecum;” “A Collection of Ecclesiastical Laws, Canons &c.;” “The unbloody Sacrifice and Altar unveiled and supported;” and “A Paraphrase on the Psalms in the Liturgy.” After his death his surviving daughter published two volumes of his Goldsmith’s sermons and discourses. Biog. Brit.

JOHNSON, SAMUEL, an English divine, was born in the year 1649, in the county of Stafford, though others have named Warwickshire as his birth-place. He was educated at St. Paul’s school, London, whence he was removed to Trinity college, Cambridge. After he had taken orders, he was presented to the rectory of Corringham, in the hundreds of Essex, but the place not agreeing with his health, he removed to London, and took an active part in the political discussions of the times. He was introduced to Lord Ruffell, who immediately made him his domestic chaplain. He now became a formidable writer in the cause of liberty, and was called on during the reign of Charles II. to bear his testimony to the truth by severe impropriety. But his sufferings were brought to the acme by a paper which he drew up in the year 1686, when the army was encamped upon Hounslow Heath, entitled, “An humble and hearty Address to all English Protestant in the present Army.” For this he was brought to trial, and condemned to stand in the pillory at three places, to pay a fine of 500 marks, and to be publicly whipped from Newgate to Tyburn. Before they executed this lavgage sentence they intended to degrade and deprive him of his orders, but fortunately for the sufferer, the prelates Crew, Sprot, and White, too eager, probably, to perform the commands of the tyrant, forgot to strip off his cassock. This informality was fatal to their plans, and they found it impossible to take away his living. Notwithstanding the laceration of his body, his heart was unbroken, and he continued to employ his pen in the same cause, till the revolution changed his situation. Parliament now declared that the proceedings against him were illegal, and the house of lords addressed king William to confer upon him some preferment. Johnson was ambitious of a bishopric, but he was offered a deanship; this he did not accept, but received a pension of 300l per annum during his own and his son’s life, a present of 1000l, and a place of 300l per annum for his son. A tract, which he afterwards published, was the cause of so much personal violence as nearly to have cost him his life: the piece was entitled “An Argument proving that the Abrogation of King James by the People of England from the Royal Throne, and the Promotion of the Prince of Orange in his stead, was according to the Constitution of the English Government, and prescribed by it.” It was, unquestionably, on account of this pamphlet that seven suffrains broke into his house early in the morning, assembled round his bed, gave him a wound on the head with a sword, and otherwise ill-treated him. They threatened to take his life, but shrinking from so foul a deed, they left him wounded, and did no injury to his house or effects. Notwithstanding his general attachment to the new government, he did not spare its defects; he complained grievously of the duration of parliaments, which he maintained ought to be continued for one year each only. On some occasions his opposition was carried so far as to lead his best friends to suppose he was about to abandon his original principles. He died in 1723, and his works were collected and printed in one volume folio. Biog. Brit.

JOHNSON, SAMUEL, a celebrated English writer, was born at Litchfield, in the year 1720, in which city his father carried on the book-selling business on a very small scale. He was educated partly at the free-school of his native city, and partly at Stourbridge, in Worcestershire. He was proba bly intended for trade, but having acquired a reputation for learning, his father very willingly complied with the proposal of Mr. Corbet, of maintaining Samuel at Oxford, as companion to his son. He accordingly was entered a commorant of Pembroke college, in the year 1728, when he was in the nineteenth year of his age. Johnson was careful of his character with respect to the discipline and the studies of the place, yet he obtained credit by some of his compositions, of which the most distinguished was a translation into Latin of Pope’s Messiah, written with great spirit and vigour. He remained at Oxford but three years, during a part of which he had to struggle with the gripping hand of penury. Soon after his return home, his father died in very narrow circumstances, and about this time it appears, from his own account, that he was first led to think in earnest of religion, by the perusal of Law’s “Serious Call to the Unconverted.” He engaged himself as usher to the grammar school of Market Bosworth, Leicestershire, but the treatment which he met with at this place ill accorded with his feelings, and he quitted the school, and passed some time with a friend at Birmingham. Here he wrote some literary effays, and translated and abridged from the French the account of the voyage to Abyssinia, by father Lobo. This was published without the translator’s name, at London, in 1735. Returning to Litchfield, he issued proposals for publishing by subscription, the Latin poem of Politian, but they did not meet with encouragement, and the design was abandoned. He now made a bold effort to improve his situation, married the widow of Mr. Porter, a merchant of Birmingham, and opened a school. He had received 800l with his lady, and depending on his own learning and powers, he took a large house, and advertised for scholars to be boarded and instructed in the Greek and Latin languages. His plan did not succeed; not more than three scholars offered, among these was the celebrated David Garrick. After a year’s trial he abandoned his school, and resolved to become a literary adventurer in the metropolis. He accordingly set out, taking his scholar
John Johnson, being furnished with recommendatory letters by Mr. Gilbert Wakeley, a gentleman who had been before the friend and benefactor of Johnson, and his friend arrived in London in March 1737; his first and principal engagement was with Cave, the proprietor of the Gentleman's Magazine, and at the desire of this gentleman he undertook a translation of Father Paul's History of the Council of Trent, which was partly printed and then the scheme was given up. At this period Johnson became acquainted with Savage, in whose misfortunes he sympathized, and in whose company he was a spectator of the vices and disorders of the metropolis, and probably a sharer in the hardships which he endured, and in the irregularities which he committed, but whatever flaws the morals of Johnson might receive from this connection, it was obliter-ated by the permanent influence of the principles of piety and virtue. The literary piece which brought him into public notice, was entitled "London, a Poem," written in imitation of Juvenal's Third Satire. For this he received of Dodderidge the sum of 10l. It was printed without any name, but it was paid for by Pope, then in the height of his popularity, that the author of so good a satire could not remain long concealed. Johnson, at this period, wanted something more substantial than mere praise, and offered himself as a candidate for the mastership of a free-school in the country. This he was unable to attain, because it was necessary that the master should have taken his degree of M.A. This he had neglected to do while he was at Oxford, and now he had applied for the honour to the university of Dublin, through the medium of Lord Gower, who, in writing to his friend on the subject, says, "he is not afraid of the strictest examination, though he is of so long a journey; and yet he will venture it, if the dean (Swift) thinks it necessary, choosing rather to die on the road, than to bestarved to death in translating for the book-sellers, which has been his only subsistence for some time past." This application produced no effect, and he was obliged to content himself with the patronage of the London book-sellers, particularly with the employment which he obtained in the Gentleman's Magazine. In this work were given the parliamentary debates, under the fiction of "Debates in the Senate of Lilliput," and the speakers were disguised under feigned names. Gutterie, for a time, compos'd these speeches from such hints as he could bring away in his memory. Johnson first assisted in this department, and then entirely filled it, and the public was highly gratified with the eloquence displayed in these compositions. In 1739 he published a humorous pamphlet, entitled "Marmot Narrolofers," confuting of a suppos'd ancient prophecy in Latin monkish rhymes, with an explanation. He compos'd, about the same period, several biographical articles for the Gentleman's Magazine, of which the principal was the life of Savage, which was afterwards published separately, and has been universally admired both as a most interesting and curious portrait, and as containing many admirable reflections on life and manners. In the year 1747 he published the plan of his English Dictionary, addressed to the earl of Cliftonfield, whom he would gladly have recognized as his patron in this arduous task. But his lordship concerned himself very little about the author or his work. No two men could be more opposite in their manners than Johnson and lord Cliftonfield, and a very slight intercourse on this occasion terminated in their mutual aversion, so that the author in his preface informed the public, that "the English Dictionary was written with little allowance of the learned, and without any patronage of the great; not in the loft obscurities of retirement, or under the shelter of academic bowers, but amidst inconvenience and distraction, in sick-ness, and in sorrow." From the booksellers, Johnson received fifteen hundred guineas for his labour, which was not completed till the year 1755. The intervals of this compilation were sufficient to allow of various literary aveniences. In 1747 he wrote a prologue on the opening of Drury-lane theatre. In 1749 he produced another imitation of Juvenal, entitled "The Vanity of Human Wishes," and his tragedy of "Irene." He next commenced his periodical work, entitled "The Rambler," which came out in papers at the rate of two in a week, from the month of March 1750, till the same month in 1752. He was the author of all the whole of this work, with the exception of about ten papers only, and in it he appears the warm and steadfast friend of religion and morality. The serious style of the Rambler prevented it at first from attaining a very extensive circulation, but after it was collected into volumes, it rose in the public estimation, and the author saw the publication of the tenth edition. Soon after the close of this paper he had the misfortune to lose his wife, a circumstance which he never ceased to deplore. Not long afterwards he took into his house, as an inmate, Mrs Anne Williams, the daughter of a physician in South Wales, who had consumed his time and fortune in pursuit of the longitude. Her deplorable condition, aggregated by blindness, with her talents for writing and conversation, recommended her to the benevolence of Mr. Johnson. In the "Adventurer," conducted by Dr. Hawksworth, he inter-RELATED himself, supplied it with several papers of his own, and obtained for it the contributions of Mr. Warick. Previously to the publication of his dictionary, the degree of M.A. was conferred on him by the university of Oxford, and about the same time the earl of Chelfield wrote two letters in its favour in "The World." This civility was regarded, by Johnson, as an advance from that nobleman for the purpose of obtaining from him a dedication as patron of the work, but he now rejected the patronage which he would before have gladly accepted, and wrote a letter to the noble lord, in which he employed all the force of pointed sarcasm and manly disdain to make him ashamed of his former conduct. The dictionary was received by the public with general applause, and its author was immedi-ately ranked among the greatest benefactors of his native tongue. The publication of this great work did not relieve him from his embarrassments, for the price of the labour had been consumed in the progress of its compilation. He was still entirely dependent upon the exertions of the day for its support, and so low was he reduced, though now regarded as an honour to his country, that in the following year he was put under an arrest for the trifling sum of five or six pounds. In 1758 he began "The Idler," a periodi-cal paper, which was published in a weekly newspaper. On the death of his mother in 1759, he wrote the romance of "Rafelas," to defray the expenses of her funeral, and to pay her debts. This, though written in a very hasty manner, is reckoned one of his most splendid performances: it is elegant in language, rich in imagery, and weighty in sentiment. It has been translated into several modern lan-guages. Such, however, was the depressed state of his finances, that he was obliged to break up house-keeping and retire to chambers. From this situation he was rescued by the grant of a pension of 300l. per annum, in 1762, without any stipulation with respect to his literary exertions. In 1765 he had the honour of an interview with his majesty in the royal library, when the sovereign asked if he intended to publish any more works? To this he re-plied, that he thought he had written enough, on which the king...
JOH

king said, "I should have thought so too, if you had not written so well." In this year he published his edition of Shakspere's Works, which was sent into the world with a preface, written with all the powers of his masterly pen, and which is reckoned among the most valuable of his critical disquisitions. About this period he instituted a literary club, consisting of several of the most celebrated men of the age, among whom were some who occupied very elevated situations in society. In 1770 he appeared an advocate for the measures of government, and published, first, "The Tale of Alarm," occasioned by the expulsion of Mr. Wilkes from the house of commons. This was followed by "Thoughts on the late Transactions respecting Falkland's Island," designed to shew the unreasonable ness of going to war on account of the conduct of Spain relative to that barren pol lution. His next publication on political subjects was entitled "The Patriot," which was composed on the eve of a general election in order to inflame the people against the measures of the opposition. In 1775 he published, "Taxation no Tyranny," which was written in defence of the right of the mother country taxing the colonies at pleasure. These pamphlets, which were probably written on principle, did but little service to the cause which he vindicated. In 1773 he went on a tour with Mr. Boswell to the western islands of Scotland, of which journey he published an account under the title of "A Journey to the Western Islands of Scotland." In this he gave a most decisive opinion against the authenticity of the poems ascribed to Ossian, which occasioned a difference between him and the translator, Mr. Macpherson. In 1775, the university of Oxford conferred on him, through the interest of the minister, the degree of doctor of laws, which he highly valued. The same honour had been given him some years before by the university of Dublin, of which he had made no use. When the unhappy Dr. Dodd lay under sentence of death, in Newgate, Johnston moved either by compunction for the man, or by a desire of rescuing the cloth from public disgrace, wrote two petitions to his majesty in his name, and apprised him with a speech at the bar, and a sermon to be preached to his fellow convicts. (See Dodd.) In the year 1779, Dr. Johnston began his last literary undertaking, "The Lives of the English Poets," which, notwithstanding the strong prejudices of the author, may be regarded as a most valuable treasure of sound criticism, and a model of literary biography. This work was completed in 1781; it is not only attached to his edition of the English poets, but has been reprinted a great many times in a separate form. The concluding portion of Dr. Johnston's life was clouded over by the loss of several highly respected friends, by a progressive decline of health, and by the prospect of approaching dissolution, which neither his religion nor his philosophy taught him to bear with even decent composure. At last, however, his mind became calm, composed, and truly resigned; he died December 13th, 1785, in the 75th year of his age. His remains, attended by a respectful concourse of friends, were interred in Westminster abbey; and a monumental statue has been erected to his memory in St. Paul's cathedral. His works, with a life of the author, were published collectively in 11 volumes. Svo. by Sir John Hawkins, in 1787; and in 1792, a new edition of them in 12 volumes, with a life by Mr. Murphy, was given to the public. Mr. Boswell and Mrs. Piozzi have likewise given ample accounts of their friend: perhaps there is no influence of a private man of letters, in this country, whose demise was marked by the appearance of so many laudatory and biographical tributes to his public reputation. As a writer, Dr. Johnston did much service to his country, by fixing its language and regulating its morality. In his person he was large, robust, and unwieldy; in his dress he was singular and slovenly; in conversation he was pugnacious, and impatient of all contradiction. But with these deductions, he was an excellent character; he had a heart full of tenderness and compassion, and all his actions were the result of principle. He was a zealous advocate for what he regarded as the truth. He was high in his religious and political principles, and at one period of his life he was friendly to the views of the house of Stuart. He had a noble independence of mind, and would never stoop to any man however exalted, nor dignify his sentiments to flatter another. His judgment was uncommonly acute, his imagination quick, his memory tenacious, and his conversation, though very dictatorial, was often brilliant, and always instructive. For farther particulars, the reader is referred to the works above-mentioned.

JOHNSON, in Geography, a county of America, in North Carolina and Newbern districts, containing 6201 inhabitants, of whom 1763 are slaves. It is 32 miles square, and watered by several streams. The greatest part of the county is level, and its principal produce is corn. Its chief town is Smithfield.

Eff Ch. Pera nth (rather corolla) in fix deep equal segments, withering, deciduous. Filaments dilated and united at their base, inserted into the base of the inner segments of the corolla. Style thread-shaped. Stamina obtuse. Capsule superior, of three cells and three valves, with partitions from the middle of the valves. Seeds two in each cell, inserted into the central column, one of them pendulous. Sperm crested.

1. J. lupulina. Native of the south coast of New Holland. Rods tubrous, perennial. Leaves two-ranked, twisted, linear, dilated, and half sheathing at the base. Stalk radical, simple, bearing near its top a solitary, oblong, hop-like spike of small lobe-like flowers, with coloured imbricated bracteas, the lowermost of which are small and barren.

JOHNSTON, in Biography, an eminent naturalist, was born at Sambter, in Great Poland. In the year 1623 he received the greater part of his education in his own country; but in 1622, he came to England, and from thence he went to Scotland, where he studied with great diligence in the university of St. Andrews till the year 1625. He afterwards studied at Leyden and Cambridge. He undertook the education of the two sons of the count de Kurzbach, and accompanied them to Holland. While he refituated with his pupils at Leyden, he took his degree as doctor of physic; and when he went a third time to England, the same honour was conferred on him by the university of Cambridge. He died in June 1675, in the 72d year of his age. He is known in the literary world by a number of works in the different departments of natural history. Gen. Biog.

JOHNSTON, in Geography, a township of America, in Providence county, Rhode island. well of the town of Providence; containing 1364 inhabitants. -- Also, a township in Franklin county, Vermont; having 135 inhabitants.

JOHNSTONE, George, in Biography, a naval commander, son of a Scotch baronet, devoted himself to the sea service at an early period of life. After passing through the subordinate
and commander; and in two years after, he was raised to the rank of poll captain. At the peace, he was appointed governor of West Florida; and on his return to England, he took an active part in the affairs of the East India company, particularly in opposition to lord Clive. In 1771 he wrote a work, entitled, "Thoughts on our Acquisitions in the East Indies, particularly respecting Bengal." He fat twice in parliament, first for Cockermouth, and afterwards for Appleby. He had a duel with lord George Germaine, on account of some reflections which fell from him in the house respecting his lordship. He was one of the commissioners sent to treat with the Americans. He died in 1787.

JOHNSON'S STRAITS, in Geography, a channel of the Pacific ocean, between the island of Quadra and Vancouver, and the west coast of North America. This channel branches off from the northern part of the gulf of Georgia, from point Chatham to the west, bearing a little north for about 60 miles in length, the breadth being from two to four. N. lat. 50 20 to 50 35. E. long. 233 to 244 46.

JOHNS TOWN, a town of America, and capital of Montgomery county, in the state of New York, situated on the north bank of Mohawk river, 24 miles west of Schenectady. The town contains about 70 houses, a Presbyterian and an Episcopal church, a court-house, and a jail. In the township are 3932 inhabitants.—Also, a town in the township of Edwardsburgh, Upper Canada, situated upon the river St. Lawrence, above the uppermost rapids, in ascending to Lake Ontario. From this town vessels may be navigated with safety to Queenstown, and at the ports of Lake Ontario.

JOINTOWN, New, a town in the township of Cornwall, Upper Canada, situated upon the river St. Lawrence, below the long Sault, to the northward of Grand Isle St. Regis; and is now called Cornwall.

JOINTOWN, the name of several villages in Ireland. One of these, in the county of Kilkenny, has been lately made a port-town. It contains a number of new houses, built for the accommodation of those who frequent the neighboring salubrity spa of Ballyliffellan. It is on the mail-coach road from Dublin to Cork, through Cashel, and is 60 miles S W, from Dublin. Another Jointown, in the county of Kildare, is about 13 miles from Dublin, on the Great Southern road; and in consequence of a good inn, is frequently made a halting place by those who travel that way. Two others, called St. Jointown, were formerly boroughs represented in parliament: one of them in the county of Down, on the river Foyle, which is here of considerable breadth, 87 miles N. by W. from Strabane, and 108 N. by W. from Dublin; the other in the county of Longford, 6 miles W. from Granard. There is also a small town called Johnstown Bridge, in the county of Kildare, on the borders of Meath, situated on the river Blakwater, 21 miles from Dublin.

JOI, a town of the peninsula of Malaca, near the south coast, and capital of a kingdom of the same name. N. lat. 1 40. E. long. 103 54.

JOIGNY, a town of France, and principal place of a district, in the department of the Yonne, near the river Yonne. The place contains 5210, and the canton 13,137 inhabitants, on a territory of 21.7 square miles, in 17 communes; 13 miles N. W. of Auxerre. N. lat. 47 59 E. long. 3 19.

JOIN, GUR. See JYENGUR.

JOINER, or JOINER, is the coupling, or joining, two persons in one action, or suit, against another. See DEMURRER.

JOINERY is a branch in Civil Architecture, and consists of the art of framing or joining wood together, for internal and external finishings of houses, as the coverings and linings of rough walls, or the coverings of rough timbers, and of the construction of doors, windows, and stairs.

Hence joinery requires much more accurate and nice workmanship than carpentry, which consists only of rough timber, used in supporting the various parts of an edifice: joinery is therefore used by way of decoration only, and being always near to the eye, and consequently liable to inspection, requires that the joints should be fitted together with the utmost care, and the surfaces made smooth.

The wood used is called stuff, and is previously formed by the pit-faw into rectangular prisms, which are denominated boards, battens, or planks, according to their breadth. Battens run from two to seven inches wide, boards from seven to nine inches wide, and planks from nine inches to any greater breadth that can be cut out of a piece of wood.

The operations of joinery consist of forming surfaces of various kinds, also of grooving, rebating, and moulding, and of mortising and tenoning, and lastly, of joining two or several pieces together, so as to form a frame or solid mass.

Surfaces, in joinery, are either plane or curved, but most frequently plane.

All kinds of surfaces are first formed in the rough, and finally brought to exact forms by means of tools adapted thereto.

Grooving consists in taking away a part of a rectangular section from a piece of wood, so as to form a channel of equal breadth throughout, with three surfaces, one being parallel, and the other two perpendicular to the surface of the wood from which the channel is recessed: the channel thus formed is called a groove.

Rebating consists in taking away a part from a piece of wood of a rectangular section, so as to leave only two sides, each of a parallel breadth, the one side being perpendicular to the surface of the wood, and the other parallel thereto: the cavity thus formed is called a rebate. From this definition it is manifest, that a rebate can only be formed by reducing the piece of wood to be rebated at the angle itself, and may therefore be looked upon as a half groove.

A mortise is a cavity recessed within the surface of a piece of wood, with four sides perpendicular to that surface, and like-wise to each other: the act of making a mortise is called mortising.

A tenon is a projection formed on the end of a piece of wood with four plane sides, at right angles to each other, and to a plane, from which it projects; and this plane is called the hinder of the tenon.

In the following, all pieces of wood whatever are supposed to be rectangular prisms, and the length in a direction of the fibres; two of the sides of every mortise to be perpendicular, and the other two sides parallel to the fibres; the four sides of every tenon in the direction of the fibres, unless otherwise alluded: likewise, if two of the surfaces of a piece of wood be of greater breadth than the other two, these are called the edges and those the sides; and each line of concurrence, formed by two adjacent sides, is called an arris.

Moulding consists in forming the surface of a piece by curve or plane surfaces, or by both, in such a manner, that
JOINEY.

all parallel sections will be similar figures, that is, their boundaries may be made all to coincide.

The first thing to be done in joinery is to select the stuff or boards, which ought to be well seasoned for every purpose in joinery, and then line it out; and if the stuff is not already at the size, as is most frequently the case, it must be ripped out with the ripping saw, or crofs cut with the hand saw, or both, as may be wanted. The next thing is the planning of the stuff first upon a side, then the edge squared, and then gauged to a breadth and thickness, should either or both be found necessary.

Two or more pieces of stuff may be falfened together in various ways by pins of wood or by nails, but in work prepared by the joiner for the use of building, pieces are more frequently joined together by making their surfaces coincide, and then planing them over with a hot tenonous liquid called glue, then rubbing the surfaces until the glue has been almost rubbed out, and the one piece brought to its situation with respect to the other. The bolt work is always joined by this method.

When boards are required of a greater breadth than common, several common boards must be falfened together edge to edge, either by nailing them to pieces extending across the breadth, or gluing them edge to edge, or by joining pieces transversely together with small boards, tongued and grooved into the interfaces.

Two pieces of stuff are joined together at right or oblique angles by mortise and tenon adapted to each other, and falfened together with glue. When a frame, confenting of several pieces, is required, the mortises and tenons are fitted together, and the joints glued all at one time, then entered to their places, and forced together by means of an instrument called a cramp.

The operation of forming a given surface, by taking away the superfluous wood, is called planing, and the tools themselves planes.

The first tools used by joiners are bench planes, which generally confilt of a Jack plane, for taking away the rough of the saw and the superfluous wood, only leaving so much as is sufficient to smooth the surface; the trying plane to smooth or reduce the ridges left by the Jack plane, and to ftraighten or regulate the surface, whether it be plane or convex; the long plane when the surface is required to be very ftraight; and the smoothing plane in smoothing, as its name implies, and giving the half finifh to the work.

Besides the bench planes there are others for forming any kind of prismatic surfaces whatever, as rebating planes, grooving planes, and moulding planes; but for a more particular description of these and the bench planes, we shall refer to the article Plane.

The tools employed in boring cilindric holes are a flock with bits of various descriptions and sizes, gimlets and Brad awls of several diameters.

The tools used in paring the wood obliquely, or across the fibres, and for cutting rectangular prismatic cavities, are in general denominated chiffsels; thofe for paring the wood across the fibres are called firmers, or paring chiffsels, and thofe for cutting rectangular prismatic cavities. are called mortife chiffsels, the rectangular cavities themselves being called mortises when made to receive a projection of the fame form and size, and by this means to fatten two pieces of wood together at any angle. The fides of all chiffsels, in a direction of their length, are ftraight, and the fide of a chiffel which contains the cutting edge at the end is fteel. The belt paring chiffsels are made entirely of cold fteel. Chiffsels for paring concave surfaces are denominated gouges.

Dividing wood, by cutting away a very thin portion of the material of equal thicknefs throughout, to any required extent, by means of a thin plate of fteel with a toothed edge, is called fawing, and the instruments themselves are called faws, which are of several kinds, as the rippinf saw, for dividing boards into separate pieces in a direction of the fibres; the hand saw, for crofs cutting and fawing thin pieces in a direction of the grain; the pannel faw, either for crofs cutting or cutting very thin boards longitudinally; the tenon faw, with a thick iron back, for making an incifion of any depth below the surface of the wood, and for cutting pieces entirely through, not exceeding the breadth of that part of the plate without the iron back; likewise a faw fteel and a dovetail faw, used much in the fame way as the tenon faw. From the thinnefs of the plates of these three last faws, it is necessary to fatten them by a ftrong piece of metal called the back, which is grooved to receive the upper edge of the plate that is fixed to the back, and which is thereby secured and prevented from buckling. When it is required to divide boards into curved pieces, a very narrow faw without a back, called a compass faw, is used, and in cutting a very fnmall hole a faw of a fimilar description, called a key-hole faw, is employed. All these faws have their plates longer and thinner, and their teeth fnifer, as they Succeed each other in the order here mentioned, excepting the two laft, which have thicker plates and coisher teeth than either the faw or dovetail faw. The external and internal angles of the teeth of all faws are generally formed at an angle of 60 degrees, and the front edge teeth slope backward in a small degree, but incine or recline from the ftraight line drawn from the internal angle perpendicular to the edge in the plane of the plate, as the faw may be employed in rippinf or in crofs cutting, or cutting perpendicular to the fibres. The teeth of all faws, except turning and key-hole faws, are bent on contrary fides of the plate, each two teeth succeeding each other, being alike bent on the diferent fides of the plate; viz. the one as much to the one fide as the other is to the other fide, and consequently all the teeth on the fame fide alike bent throughout the length of the plate for the purpofe of clearing the fides of the cut which it makes in the wood.

Of all cutting tools whatever, the faw is the moft ufeful to the joiner, as the timber or wood which he employs can be divided into slips or bars of any fize, with no more waffe of fluff than a flice, the breadth of which is equal to the depth of the piece to be cut through, and the thicknefs equal to the distance of the teeth between their extreme points on the alternate fides of the faw measured on a line perpendicular to the fide fides: whereas, without the use of the faw, cylindric trees could only be reduced to the intended fize by means of the axe; in the use of which there would not only be an immense confumption of fluff, but also much greater labour would be required to ftraighten it.

Joiners use a small axe, called a hatchet, for cutting off the superfluous wood from the edge of a piece of a board, when the waffe is not of sufficient conformance to be fawn. All the above are what are commonly denominated edge tools, but there are others required to regulate the forms. All angles whatever are formed by other reversed angles of the fame number of degrees as an external angle by an interior one; and the contrary. The instrument for trying right angles is called a fquare, and thofe for trying oblique angles are called bevels. The two fides which form the edge of a fquare are always diameterary, but thofe of bevels are generally moveable one leg upon the other round a joint.
JOINERY.

In some cafes, where a great number of pieces are required to be wrought to the same angle, a stationary bevel, called a joint box, is used.

When it is required to reduce a piece of fluff to a parallel breadth, an instrument called a gage is used for the purpose. The gage consists generally of a square piece with a square mortise, through which a bar at right angles thereto is fitted and made to slide. The bar, which is called the item, has a sharp point, cutter, or tooth at one extremity, projecting a little from the surface, so that when the side of the gage, next to the end which has the point, is applied upon the vertical surface of the wood, with the flat side of the item which has the tooth upon the horizontal surface, and pushed and drawn alternately by the workman from and towards him, the cutter will make an incision from the surface into the wood, at a parallel distance from the upper edge of the vertical side on the right hand. This line, so drawn, will mark out with precision, and show the superfuous fluff to be taken away.

When a mortise is required to be cut in a piece of wood, a gage with two teeth is used. The combination of this instrument is the same as the common gage; but in addition thereto, the item has a longitudinal slider with a tooth projecting from the end of the slider, so that the two teeth may be brought nearer, or to any remote distance from each other, at pleasure; and also to any distance, from the face of the head or guide within the reach of the item.

When wood has been planed, and required to be fawn across the fibres, and as it is necessary to be kept stationary while sawing, in order to prevent the fissures or the edges from being bruised, joiners use a flat piece of wood with two projecting knobs on the opposite sides, one at each end, called a side hook. The vertical side of the interior angle of one of the knobs is placed close to the vertical side, and the under side upon the top of the bench; then the wood is pressed against the knob which projects from the upper surface while it is cutting with the saw; but this use of two side hooks is better, as they keep the piece of wood to be fawn more steady.

When it is required to cut a piece of wood to a mitre with one side, that is, to half a right angle, joiners use a trunk of wood with three sides, like a box without ends, or a top, the sides and bottom being parallel pieces, and the sides of equal heights; through each of the opposite sides is cut a kerf in a plane, perpendicular to the bottom, at oblique angles of 45 and 135 degrees, with the planes of the sides; and another kerf is made in the manner, so as to have its plane at right angles to the former. The trunk thus constructed is called a mitre-box. When the wood is to be cut, the mitre-box is fixed steady against two side hooks, and the piece, which is always less than the interior breadth of the mitre-box, is laid within, and pressed against the further interior angle of the mitre-box with the fide downwards, to which the saw-kerf is intended to be perpendicular, and in this position it is to be cut. The two kerfs in the sides of the mitre-box are requisite, in order to form the acute angle on the right or left-hand side of the piece, as may be required.

When it is required to make a piece of wood straight in one direction, joiners use a flip of wood straightened on one edge, from which the flip of wood itself is called a straight edge. Its use is obvious; by its application it will be seen whether there is a coincidence between the straight edge and the surface.

When it is required to know whether the surface of a piece of wood is in the same plane, joiners use two slips of wood straightened each on one edge with the opposite edge parallel, and both pieces of the same breadth between the parallel edges; each piece has therefore two straight edges. Suppose it were required to know whether a board is twisted or its surface in a plane, the workman lays one of the slips across the one end, and the other across the other end of the board, with one of the straight edges of each upon the surface; then he looks in the longitudinal direction of the board, over the upper edges of the two slips, until his eye and the two upper edges of the slips are in one plane; or otherwise, the intersection of the plane, passing through the eye and the upper edge of the nearest slip, intersect the upper edge of the further slip. If it happen as in the former case, the ends of the wood under the slips are in the same plane; but should it happen as in the latter, they are not.

In this last case the surface is laid to wind; and when the surface is so reduced that every two lines are in one plane, it is laid to be out of winding, which implies its being an entire plane: from the use of these slips they are denominated winding ficks.

Before we can proceed to the method of bringing a rough surface to a plane, it will first be necessary to show how to make a straight edge or ruler.

Here the joiner must not lose sight of the definition of a straight line, viz. a straight line is that which will always coincide with another straight line, however applied together.

The operation of making the edge of a board straight is called by joiners shooting, and the edge so made is said to be shot.

Straight edges may be thus formed: plane the edges of two boards and apply them together, so that the superficies of faces of the boards be in the same plane, and if there be no cavity between the joint, the edges will be straight; but if not, the faces must be applied to each other, the edges brought together, and planed and tried as before, until they are found to coincide.

Another mode is by having a plane surface given: plane the edges of a board as straight as the eye will admit of, and apply the face of it to that of the plane, and by the edge of the board draw a line, turn the board over with the other side upon the plane, and bring the planed edge to the line drawn before, and the extremities of the edges to their former places, and draw another line; then if all the parts of this line coincide with the former line, the edge is already straight, but if not, repeat the operation as often as may be found necessary.

Another mode is to plane the edge of a board as straight as the eye will admit of; then plane the edge of another board until it is made to coincide with the former; take a third board and plane the edge of this in like manner, by making it coincide with the edge of the first board; apply the edges of the two last boards together, then if they coincide the operation is at an end, but if not, repeat it as often as may be found necessary.

By any of the methods now shewn, the superficies of the boards, to be shot, are supposed to be parallel planes not very distant from each other; for if the faces be not parallel, or if the thickness be considerable, the operation will be the more liable to error.

To reduce the rough surface of a body to a plane.—This will not be very difficult, when it is known that a plane is that which will everywhere coincide with a straight line.

The most practical methods are the following: Let the workman provide two winding ficks, and apply them as before directed, making the ends out of winding if they are not found to be so; then if all the parts of the surface are straight on which the edges of the winding ficks were placed,
placed, it is evident that the whole surface must be plane. If the surface is hollow between the fald lines, one of the ends or both must be planed lower, until the surface acquires a small convexity in the length, and then, if straitened between the straight lines at the ends, it will be a perfect plane.

Another mode of forming a plane of the surface is of a quadrilateral form: apply a file along the diagonals, then if they are straight, they are in a plane, but if they are both hollow, or both round, the surface to be reduced is either concave or convex, and must be straitened in these directions accordingly; and, lastly, if by trying across the diagonals with the straight edge it be found that the one be hollow and the other round, the surface of the board winds. In this case bring down the protuberant part of the convex diagonal, so as to be strait with the two extremities; then straiten the concave diagonal, by planing either of the two ends or both of them, according as the thickness of the board will require. Both diagonals being now strait, traverse the wood, that is, plane across the fibres, until all the protuberant parts between the diagonals are removed; then the workman may proceed to smooth it by working it in the direction of the fibres.

To join any number of planks together, so as to form a board of a determinate breadth, the fibres of each running longitudinally to those of any other.—Shoot the two edges that are to be jointed; turn the fides of the boards towards each other, so that the edges that are shot may be both uppermost; spread these edges over with strong glue of a proper confidence, made very hot; one of the boards being fixed, turn the other upon it, so that the two edges may coincide, and that the faces may be both in the same plane; rub the upper one to and fro in the direction of the fibres till the glue is almost out of the joint; let these dry for few hours; then proceed to make another joint; continue to join as many boards or planks in the same manner, till the whole intended breadth be made out. If the boards or planks of which the board is to be composed are very long, the edges that are to be united would require to be warmed before a fire; and, for rubbing and keeping the joints fair to each other, three men would be found necessary, one at each extremity, and one at the middle. Boards, glued together with this kind of cement, will stand as long as the subsistance of the deals or planks composing them, if not exposed to rain or intense heat, provided that the wood has been well seasoned beforehand, and that the grain be free and strait, uninterrupted with few or no knots. When a board which is to be exposed to the weather is to be made of several boards or planks, the cement to be used for uniting them should not be of thin glue, but of white lead ground up with linseed oil, so thin that the colour may be sentibly changed into a whitish calk: this kind of glue will require a much greater time to dry than thin glue. Boards to be exposed to the weather, when their thickness will admit, are frequently tongued together; that is, the edges of both boards are grooved to an equal distance from the faces, and to an equal depth; and a lip of wood is made to fit the cavity made in both: this lip should be made to fill the grooves, but ought not to be so tight as to prevent the joint from being paled with proper cement.

To glue any two boards together forming a given angle.—This may either be accomplished by floatting the edge of the one board to the whole of the given angle, and the face of the other strait; then, by applying these two surfaces together, and rubbing as before, they will form the angle required; or, if the two edges are shot to half the given angle, and the edges applied together and rubbed and
of wood upon the back of it, closely fitted to its surface, and the other joints to each other, the fibres of the blocks corresponding with those of the veneer.

A third method is to make a cradle and place the veneers upon it, confining one end of them spread in the glue between the veneers with a brush, and fix a bridle across, confining the ends of this bridle either by nails or by screws; open the veneers again, and put in glue a second time between each two, and fix another bridle across them; proceed in this manner to the other extremity.

A fourth method is to run a number of equidistant grooves across the back of the board at right angles to its edges, leaving only a small thickness forward the face; let this be bent round a cradle or templet made on purpose; and let the grooves be filled with slips of wood, which, after the glue is quite dry, are to be planed down to the surface of the cylindrical board, which may be finished with canvas glued across the back.

Instead of using a grooving plane, workmen frequently make kerfs with the law; but this is not so强烈 when finished, as it is very difficult to infert the slips, and very uncertain as to the depth of each of the kerfs, which will occasion a very unequal bending of the board, if not to a regular depth.

To bend a board, so as to form the frustum of a cone, or any segmental portion of the frustum of a cone, such as the shaft of the head of an aperture. — Find the form of the covering according to the geometrical principles of carpentry; cut out a board to this form, and run a number of equidistant grooves across it tending to the centre: this being fixed to a templet made to the surface of a cone, proceed and finish it in the same manner as in the last method given for a cylinder.

To bend boards so as to form a spherical surface. — Make a mould to the covering of a given portion of the sphere in plan, according to the geometrical principles of carpentry; complete the number of kerfs by this mould; make a templet or mould to a great circle of the sphere; groove each of the kerfs acrals at right angles to the line passing through the middle, and bend it round the templet; put slips in the grooves; lastly, smooth the edges of the slips, so as to be in planes tending to the centre of the sphere; these slips being glued together will form a spherical surface.

To glue up the shaft of a column. — Describe two circles of diameters, equal to those of the superior and inferior ends of the shaft.

Circumscribe these by polygons, confiding of the same number of regular sides as the column is to consist of kerfs.

From the angles draw lines to the centre, which will give the bevels for working the edges of the kerfs. In this process, after two pieces are glued together, and dried, proceed to glue a third piece in the same manner and so on to the last but one. The last, previous to being glued, the blocks should be fixed upon it, and then the whole may be closed in. N. B. The number of kerfs should be eight or twelve, otherwise the joint will fall in the middle of the kerfs, which should not be in the cafe. It is a very good method to diminish the kerfs, previous to their being glued together, as otherwise the wailes of stuff would be very great.

To glue up the base of a column in several horizontal courses, or rings, in order to be turned in a lathe. — Consider the number of horizontal or bevel joints, which are bent made at the internal angles of mouldings; prepare a board, so as to have a plain furnature; let a circle be described on the plane of a diameter, equal to the diameter of the greatest circle in the height of the course, and circumscribe an equilateral polygon about the circle, with as many sides as there are to be pieces in a course, and from the angles draw lines towards the centre; then any radial line, and one of the adjoining sides of the polygon, will form the angle by which the ends of every two pieces that are to form the course will meet, so as to make their planes coincide. The geometrical part being thus finished, prepare the pieces each in length equal to the side of the polygon, with an acute angle at each end from the outer side, equal to the aforesaid angle on the board, so that each piece will thus have a longer and a shorter side: apply the longer side of each piece to the polygon, the shorter side being next to the centre, so that one of the ends may coincide with a radial; then the other end will also coincide, and thus the whole will meet together, if the work be true. But as this is difficult, it is common to allow the pieces to be a small matter longer, in order to plane them, so as to make close work: for though the method be true, the workman, though ever so careful, cannot work to geometrical exactness; even the thinnest of having, or the smallest degree of twist in the board, will spoil the work. Suppose the course completely jointed, take the whole to pieces, and glue the surfaces which are to meet each other, and rub each two adjacent pieces to a joint, until the whole ring or course is firmly closed.

When the glue is dry, plane the upper side truly; take the radius of the greatest projecting member in the next course, and describe a circle upon the top of the course, on the same axis with the centre of the lower circle; and with the centre of this circle, in the plane of the top of the course, bisect any one of the arcs compris'd between two adjacent joints; and from the point of bisection, divide the circumference into as many equal parts as there are pieces in the under course, and draw radiating lines towards the centre: join every two nearest points in the circumference, and thus an inscribed polygon will be formed; draw lines to touch the circumference parallel to the sides of the inscribed polygon, and thus a polygon will be made to circumcribe the circle: produce the radiating lines, until they meet the angles of the circumcircibing polygon; then the sides of the circumcircibing polygon will be the situations of the bottom edge of the vertical outer sides of the second course, and the radiations the situations of the joints. Proceed, as in the first course, to adapt the pieces to their respective situations, making close work; glue each piece to its place in the lower course, and likewise the joints; and when the glue of this course is dry, its upper side may be planed true. Proceed with the uppermost course in the like manner, making the joints fall in the middle of the lengths of the pieces of the lower course; and when finished, the work may be sent to the turner.

To glue up the Ionic and Corinthian capitals for carving — The abacus must be as joined in parts, such that their joints may be in vertical planes. The leaves and caulicles of the Corinthian capital may be first made of rectangular blocks, and fixed to the vans.

To make a cornice round a cylindric body out of the least quantity of wood, when the body is greater than a half cylinder, and concave, and when the members will nearly touch a right line applied transverse: — Draw a section of the cylinder through its axis, and let the section of the cornice be represented upon the cylindric section. Draw a transverse line touching the two extreme members of the cornice: parallel to this line draw another line within, at such a distance from the former as may be found necessary for thickets of ftuff; produce this last line, until it meet the line representing the
axis of the cylinder. The junction will either be above or below, according as the cornice is applied to the convex or concave sides of the cylinder. This meeting is the centre of two concentric circles, whose radii are the distances between the nearest and farthest extremities of the section of the cornice. This is evidently an application of the method of finding the covering of a cone. When mouldings are got out in this manner, viz. by a piece which does not occupy the space, when let to the place represented by the height and breadth, they are said to be sprung.

When a cornice is to have much projection, the corona or middle part is got out of a solid piece, and the parts above and below, or one of them, as may be found necessary, only let to the spring, and supported by brackets.

To describe the various kinds of joinings in the practice of joinery.—Fig. I. Plate XXII. is a section showing the most simple method of joining boards, or any kind of framed work together at the angles; this kind of joining is much used in coarse work; it is called lap-joining.

Fig. 2. the method of joining troughs together.

Fig. 3. the method of joining dado together at an internal angle.

Fig. 4. the manner of fixing two pieces of framing together at the angle of their meeting with a returned bead, in order that the joint should be concealed. This is only used in common finishings; in good finishings a bead of ⅛ths of an inch broad is generally run close to the joint, and the angle is left entire.

Fig. 5. shews the common method of mitring. This form is always used in mouldings at an external angle, and sometimes also in internal angles; but for internal angles, the fitting is to be preferred, when it can be applied, which may always be the case, when there are no quirked mouldings; that is, when mouldings are such that a perpendicular line to the plane of the wall may fall upon any part of them without going through the fold of the moulding.

Fig. 6. is another method of mitring. This may be used in all plane surfaces, at an external angle, but is not applicable to mouldings. This manner of mitring is much more preferable in point of strength to that of Fig. 5, in cases where the two can be applied.

Dove-tailing is another mode of joining two plane surfaces together at an angle, by cutting pins of a prismatic form and trapezoidal section on the end of one piece, and notching the end of the other in the same manner, so that the exterior parts of the one is adapted to the indentations of the other, without leaving any cavity when the two sides are brought home to their places. This is the strongest method of joining plane boards; it should always be used in work which may be required to be moved from place to place. There are three sorts of dove-tailing. One kind, called common dove-tailing, shews the ends of the joints; another kind, called lap-dove-tailing, conceals the joints of the dove-tails, but shews a straight joint, not at the angle, but at a small distance parallel to it. The third is called mitre dove-tailing, which shews no joint but in the angle. This method is very neat, it is stronger than the straight joint shewn by the section fig. 6, and where both strength and beauty is required it must be preferred to any other. Fig. 7. N* 1, is a section of common dove-tailing; N 2, the side of one of the pieces shewing the pins; N 3, shews the ends of the pins; N 4, the side of the other piece, shewing the indentations for receiving the pins.

Fig. 8. N 1, 2, 3, 4, and 5, different parts of mitre dove-tailing.

To join two pieces of wood together, the fibres of the one running transversely to the fibres of the other by mortise and tenon, or dove-tailing.—One method is by cutting a mortise to a very small depth in the one piece, and a tenon of the same length in the other, and by bolting them together with one or two bolts: where the breadth of the piece having the tenon is considerable, the nuts are to be let in from that side of the tenoned piece which is not exposed to sight; the heads of the bolts upon the mortised piece may be sunk into the wood entirely below the surface, and the cavity may be filled up with a piece of the same kind of wood, neatly fitted in.

Definitions.—1. A frame, in joinery, is the connection of several pieces of timber of equal thickness, joined transversely to each other, made fast by means of mortises and tenons, the connecting rectangular spaces between for other pieces of timber, called pannels, each of which is inserted into each edge of the former by means of a groove.

2. Those parts of the frame which terminate the two vertical extremes are called styles.

3. The horizontal parts, which are mortised into the styles, are called rails.

4. If there be any intermediate pieces mortised into the rails, parallel to the styles, such pieces are called muntins.

In framed-work, rails have several epithets, according to their situations; that bordering the framing at the lower extremity is called the bottom rail, that bordering the framing at the other extremity, is called the top rail. The names of intermediate rails vary according to their number and situation. In doors, that in which the lock is inserted is called the middle, or lock rail; the intermediate rail next to the top rail, is called the frame rail.

Doors.—A door, in joinery, is a framed piece of timber-work, or boards nailed together, for the purpose of shutting up at pleasure any aperture in a wall or partition, in order to give or prevent piazza from one apartment to another.

Plate XXIII. Fig. 1, is a four equal pannelled door: the form is only used in very common work, and is frequently without mouldings.

Fig. 2. is a nine-pannelled door, with square panels at the top. This form is frequently used in street-doors, of which the back is often lined with boards, in the manner of fig. 3, flush with the styles and top rail; the other rails and muntins must therefore be recessed upon one side to receive the boarding.

Fig. 4. is a six equal-pannelled pair of folding-doors, having two panels in the breadth.

Fig. 5. is a double margin, or a pair of folding-doors, with four panels in height, and two in breadth, having lying pannels below the top-rail, and above the lock-rail.

Fig. 6. is a ten-pannelled pair of folding-doors, five in height, and two in breadth, having lying pannels at the top, bottom, and in the middle, with long pannels between them. Of this form is the ancient door of the Pantheon at Rome.

Fig. 7. a sash-door: this form, if not shut with another separare door, should have shutting-slitters, to cover the glass parts, fixed with bolts and nuts. For this purpose, it should at least be one inch and a quarter thicker than a pannelled door in the same place: this gives room for the outside of the shutter to be flush with the styles of the door; but if otherwise, an ugly frame must be patched round the glazed parts, in order to contain the shutter.

Fig. 8. an ancient door, of which form are the windows and doors of the temple of Vesta at Rome, and also those of the temple of Ereleus at Athens.

Figs. 9 and 10. are doors of communication, or such as, when open, will not encumber the floor, as other kinds of recessed doors, by setting into the room, but may either be concealed.
concealed entirely within the partition, or folded close to it: they are used for the purpose of making a free communication between one room and another, at great meetings or balls, when any one of the rooms would be insufficient though large enough for common use.

Fig. 9. the elevation of a door to be folded close to the partition, by means of a hanging style, or pilafer, on each side which is first hung to the jamb, then a folding door to each pilafer.

Fig. 10. is a door consisting of four parts: each middle part is hinged to each extreme part; each two parts, on each side; in time of company, may be removed entirely out of the way into hollows on each side of the partition, and guided by grooves at the top and bottom, and made to slide freely upon rollers.

Fig. 11. is a jib-door, that is, such a door as, when shut, may be as much concealed as possible from having the appearance of a door. Jib-doors are used, when only one aperture at the end of the side of a room is necessary; and when it is required to keep the symmetry of that side, without having the appearance of a door; the base, farbale, and paper are, therefore, continued over it as in the other parts of the room, the joint being only seen at the top, and upon the edge opposite the hinge.

JOINING of ISSUES. See ISSUE.

JOINT, the juncture, articulation, or affinblage, of two or more things. See ARTICULATION.

Joint, in Anatomy, the connection of two or more bones to each other; these parts are generally so organized as to admit of motion, but in some instances this is not the case.

The joints or articulations are generally referred to three classes: the immovable, or synarthroses; the middle movable, or amphiarthroses; and the completely movable, or diarthroses.

The first of these includes the various kinds of future; for the description of which, see CRANIUM.

The amphiarthroses, or joint admitting of slight motion, is made up either of cartilaginous ligaments (symphyses), or of true cartilage (syncondrofysis). The union of the bodies of the vertebrae to each other, and the articulations of the pelvis, are examples of the former: the connection of the first pair of ribs to the sternum, and of the different bones of the sternum to each other, exemplify the latter.

For the account of the third species, or movable articulation, see DIARTHROSIS.

A general description of the composition of a joint will be found under the article EXTREMITIES, near the beginning; and in the same article the particular joints of the limbs are described. The account of the articulation of the lower jaw is given under DEGLUTITION; that of the connection of the head to the vertebral column under HEAD. The articulations of the vertebrae are considered in the article SPINE; those of the ribs, in Ribs; and of the pelvis, in PELVIS.

JOINTS, Difficulties of. Under this head we intend to notice a few cases which belong to the department of Surgery, and are not elsewhere treated of in this publication.

Inflammation of Joints.—Idiopathic cases of this kind are not common. The complaint ordinarily originates in consequence of a contusion, sprain, wound, or other kind of injury done to the part affected. Phlegmonous inflammation, wherefoever situated, is uniformly attended with certain local symptoms, by which both its presence and degree may be ascertained. Pretumoral redness, increased heat, a throbbing pain, and a tense swelling, affecting the seat of its attack, are the common marks which denote its existence in all situations. When a joint is inflamed, the same local phenomena are present, and the constitution is disturbed by the usual symptoms of inflammatory fever; but in these cases they are apt to be exceedingly severe. The inflammation attacks the capsular ligaments, and not remaining confined to any particular portion of them, it very quickly diffuses itself universally over their whole extent, as is commonly the case in all inflammations of smooth membranes. That there is this peculiarity in inflammation of membranes, is often strikingly proved in the instance of peritonitis, arising after the operation of lithotomy. Here, we know, that the inflammation commences in the bladder, is communicated to the portion of the peritoneum which covers the fundus and posterior surface of this viscus, and thence rapidly spreads over the whole extent of the abdomen.

The capsules of the joints are naturally endowed with little sensibility; but, like the gums, and several other parts in a similar state, they become acutely painful when inflamed. The complaint is accompanied by an increased secretion of the synovia, which becomes of a more aqueous, and of a less albuminous quality than it is in a healthy state. Hence this fluid is not so well calculated for lubricating the articulations, and preventing the effects of friction, as it is in the natural condition of the joint. This circumstance may explain why a grating sensation is often perceived on moving the patella when the knee is inflamed.

The capsules of the joints may, as well as other membranes, be thickened by inflammation. At other times an exudation of coagulating lymph may take place upon their internal surfaces; and as, by a general law of the animal economy, the contiguous vessels are always prone to shunt into lymph thus effused upon an inflamed surface, the consequence frequently is, that organized substance, such as pieces of cartilage and bone, are produced in the interior of the joint. The inconveniences of these extraneous bodies, and the mode of relief, will be a subject which we shall presently have to consider.

When the inflammation is more vehement, suppuration may happen within the capsular ligament. Unfortunately, this is by no means an unfrequent occurrence. At length the capsular ligament ulcerates, and purulent matter is effused beneath the integuments. The skin may next ulcerate, so that the abscess is discharged, and the cafe seems to be somewhat benefited. The openings through which such collections of matter are discharged, will be found, upon examination with a probe, to be the terminations of sinuses leading into the cavity of the joint.

A large joint seldom falls into a state of suppuration, in consequence of acute inflammation, without the constitution being at the same time so disturbed, that life itself is greatly endangered. In the most violent state of the inflammation, or that which is the immediate forerunner of suppuration, the pulse is exceedingly frequent, but not quite so full and strong as it would be if the said affection were of a structure better adapted to relieve the ravages of disease. The patient's skin is dry and hot; he is redhot and vigilant; and, in very bad cases, delirium and coma may ensue, and end fatally.

But the rapidity with which the common inflammatory fever agencies in such cases the hectic type is a circumstance which must not be passed over in silence. When an abscess has formed in a large joint, in consequence of a severe attack of common inflammation, the patient immediately begins to be affected with hectic symptoms, and the strong action attendant on the inflammatory fever suddenly ceases.

Local consequences, even worse than those above described may follow inflammation of a joint. As the layer of the capsular ligament reflected over the cartilages of the articulation is often inflamed, the cartilages themselves are very liable
liable to have the inflammation communicated to them. Parts partaking of a cartilaginous structure being very incapable of bearing the irritation of disease, are often absorbed, so that, in the instance before us, a portion, or the whole of the articular surface of the bones, may be left completely demolished of its natural covering. At length the heads of the bones entering into the formation of the affected joint inflame, and become seared.

Sometimes only such parts as are exterior to the capular ligament of the joint are inflamed, and in this case the symptoms are never so severe, nor so obliurate, as when the complaint is more deeply situated. Even when suppuration takes place on the outside of the capule, the case is not dangerous, provided the cavity of the joint be not involved in the inflammatory attack.

Every inflammation of a large joint may generally be considered as a case of considerable importance; yet certainly there are instances where the inflammation being mild in degree, and simple in its nature, the danger is not urgent. However, every surgeon ought to be well impressed with the fact, that though the inflammation be originally of a healthy sort, it is always very likely to be converted into one of a specific nature, whenever there is a tendency in the constitution to serofulous disease. A person, whose habit is serofulous, may sometimes continue, during life, exempt from any local diseases of this specific nature, provided he be fortunate enough to avoid all irritation of parts on which serofula is most particularly disposed to make its attack. Among such parts we must class the joints, especially the knee, hip, elbow, and ankle. Hence, when a joint is inflamed, how mild and foever the affections may be, we ought never to forget, that when there is a tendency to serofula in the system, the original case of simple inflammation is very apt to be the exciting cause of the white swelling, one of the most fever and intractable diseases which increase the catalogue of human miseries. Hence the prudence of adopting with caution whatever method of treatment may be indicated. In the following observations, we shall suppose the case to be that of an inflamed knee.

The means best calculated for the relief of an inflamed joint are, generally speaking, those which are called antiphlogistic. There are few cases in which general and local bleeding is more necessary and useful. The violence of the inflammation, and the strength, age, and pulse of the patient, must determine with what freedom the lancet should be employed. Leeches, however, may always be applied, and their application be repeated several times with advantage. When the leeches have fallen off, the bleeding is to be promoted by fomenting the part. The surgeon should daily perfuse in this method, until the acute stage of the inflammation has entirely subsided. In conjunction with this treatment, he should take care to keep the joint continually surrounded with linen wet with the farrumine lotion. In no case of inflammation are the application of cold lotions, and the maintenance of a constant evaporation from the surface of the part affected, more strikingly advantageous.

Fomentations and emollient poultices, however, sometimes afford most case to the patient, in which circumstance they ought to have the preference.

Together with the foregoing means, laxative and febrifuge medicines are to be exhibited, and in a case of severe pain and loss of sleep, opiates.

When the acute stage of the inflammation has abated, the plan of treatment may be a little altered. The grand object is now to remove the effects which have been left by the preceding affection. There are a thr-kened state of the capular ligament, and parts surrounding the articulation; a stiffness of the joint, and pain when it is moved; a collection of fluid in the capsule, &c. This state of the complaint, when neglected, and there is a tendency to serofula, may prove exceedingly obliurate, and even terminate in an irremediable specific distemper of the joint. When, therefore, the local redness, tension, and throbbing, and the symptoms of inflammatory fever subsist, the activity of the practitioner ought not to be relaxed. The application of a blister to the joint will now be found particularly efficacious, and the discharge should be kept up for a few days with the farrumine. Very large collections of fluid in the capular ligament of the knee, great thickening about the joint, and other remaining effects of inflammation, may often, under such treatment, be quite got rid of in a week or ten days.

In other cases, in which the inflammation and its effects are lighter, lotions composed of spirit of wine, vinegar, and sal ammoniac, suffice for the removal of any chronic complaints which may continue after the acute inflammation is at an end.

When the inflammation of a large joint like the knee is induced by a wound, the stomach is often much affected, and the symptoms may be very violent and even fatal.

Of Preternatural Cartilaginous Substances in Joints.—The ancients have either neglected to notice this disease in their writings, or they have not been at all acquainted with it. Ambrose Paré is the first author who mentions it: he had made an incision, in order to discharge some fluid from the cavity of the knee-joint, when a hard, polished, white body, about as large as an almond, was discharged from the wound. (Livre 25. chap. 15.) Since the time of Paré, the complaint has been described by numerous surgical authors; but the most valuable information on the subject may be found in the works of Reimarus, Morgagni, Bromfield, Ford, Default, Home, Hey, and Abernethy.

The external part of the extraneous sublubances, to which allusion has been made, is in general of a cartilaginous consistence, while their internal part is frequently offensive. Their figure is subject to great variety; but they usually have one concave side, and another which is convex. They are, for the most part, formed in the knee, and have been supposed by Reimarus, and a few other writers, to be met with in no other articulation. Morgagni, however, has seen effilified bodies of this kind in the ankle-joint. Haller, also, discovered a great number of cartilaginous bodies in the articulation of the jaw, where the natural cartilages had been delivered. Mr. Hey, of Leeds, mentions a cafe, in which there were two bodies of this description in the elbow-joint. The largest preternatural cartilage perhaps ever met with is mentioned by Mr. Home, as being nearly equal in size to the knee-pan itself, and situated in the knee-joint of a soldier, belonging to the 31st regiment. The greatest number ever known to be contained in one articulation is twenty-five. In most instances, we only find one. These preternatural cartilaginous sublubances are either attached to some part of the inside of the joint, or they are quite unconnected, loose, and moveable. It is only when they become so situated, as to interpose themselves between two cartilaginous surfaces, which glide over each other in the motion of a limb, that much inconvenience commonly results from their presence. While they continue by the side of the patella they cause but slight trouble; but when they lie under the ligament of that bone, or between the same bone and the condyles of the femur, or between the latter bone and the head of the tibia, then they impede progression, cause considerable pain, and often excite inflammation.

Much light was thrown upon the formation of loose cartilaginous tumours in the joint, by the penetrating genius of the
the late Mr. Hunter. It was his belief, that a coagulum of extravasated blood might, under certain circumstances, be converted into an organized vascular substance, by the vessels growing into it from the neighbouring living surface. No one doubts that the coagulating lymph has constantly a tendency to become vascular, when effused on the surface of an inflamed membrane. Now, if we take the trouble of perusing the cases which are related by different authors, we shall find, that the formation of loose cartilaginous fibrines in the joints, has generally been preceded by violence done to the part, and by symptoms of inflammation. Of this description are the examples published by Mr. Ford, M. Brochier in Default's Journal, Mr. Abernethy, and Mr. Hey. Latta mentions four instances which were preceded by rheumatism. In this state, we conceive that the capsular ligament, or its delicate layer, reflecting over the articular cartilages, effuses coagulating lymph upon a part of its surface; that such lymph soon becomes vascular and organized; and that it gradually assumes a structure more or less like that of cartilage.

Loose preternatural cartilages are mostly attached to some part of the articular cavity, which does not suffer attrition when the joint is moved. Dr. Alexander Monro, in dissecting the knee of a malefactor, found in the joint an osseous tumour, which was connected by a ligamentous pedicle with the exterior edge of the cartilage covering the external cavity of the tibia. (Edin. Essays, vol. iv. p. 245.) Perfect quietude is essential to the growth of new vessels into coagulating lymph, and in the case just now quoted, if the exudation had taken place, where it would soon have been disturbed in the motion of the limb, its organization could fearlessly have happened. Alfo, if such cartilaginous bodies were to be commonly formed on a part of the articular cavity, necessarily exposed to friction in walking, &c. then patients would experience pain from the first. But, as they do not feel inconvenience till the tumour has become very moveable by the gradual elongation, or sudden rupture of its pedicle, and only then when the tumour glides into a situation where it is pinched between the articular surfaces, we have a right to conclude, that most cartilaginous bodies of this kind grow originally in a situation, where they are not particularly exposed to disturbance in the motion of the joint. In most instances, the communication of vascularity must also happen, during the tenderness of the joint, at which period the patient naturally keeps his limb in a quiet state, in order to avoid pain. After all inflammation has subsided, the limb is again moved with freedom; the organized coagulum is gradually loosened by the motion, and at length it only remains connected with the joint to which it was originally attached, by means of a long slender pedicle, through which its nutrient vessels proceed. At last the pedicle breaks, and the cartilaginous substance is left quite loose, like an extraneous body, in the cavity of the joint.

The irritation of loose cartilages in the knee often occasions an increased quantity of fluid in the capsular ligament, but this is not invariably the case. When the irritation is such as to induce a degree of heat and tenderness in the joint, there is usually a preternatural quantity of the synovia secreted; when pain and inconvenience have not lately been felt, this fluid is generally not more abundant, than in the natural state of the joint.

With respect to the treatment of these cases, we are not acquainted with any certain means of freeing the patient from the inconveniences of the disease, if we except making an incision into the joint, for the purpose of extracting the cartilaginous substance. To this plan, the danger attendant on all wounds of so large an articulation as the knee is a very serious objection. Hence, Middleton and Gooch tried another method, which was to conduct the extraneous body into a situation where it produced no pain, and to retain it in that position a long time, by means of bandages, under the idea, that the cartilaginous substance would adhere to the contiguous parts, and occasion no future trouble. These surgeons appear at least to have thus afforded temporary relief.

Mr. Hey, impressed with a just sense of the dangerous symptoms, which have occasionally resulted from the most simple wounds penetrating the knee-joint, tried the efficacy of a laced knee-cap, and the cales which he has added to it. He clearly demonstrates, that the benefit thus obtained is not transient, at least as long as the patient continues to wear the bandage. In one case, the method had been tried, for ten years, with all the success which the patient could desire.

All things considered, it is our decided opinion, that the effect of a knee-cap, or of a compree and roller, ought generally to be tried before having recourse to the knife, supposing the cartilaginous substance can be placed in a situation where it gives no pain, and admits of being compressed. But doubtless there are instances, in which it is the duty of the surgeon to operate. If a man be deprived of his livelihood by not being able to use his knee; if he cannot, or will not, take the trouble of wearing a bandage; if he be urgently desirous of running the risk of the operation, after circumstances have been impartially explained to him; if a bandage fail in affording sufficient relief; and lastly, if excessive pain, severe inflammation of the joint, and lameness, be frequently brought on by the device; the employment of the knife seems justifiable and proper. It is very certain, that success has generally attended the operation; but small as the hazard may be of loosing the limb, and even life, in the attempt to get rid of the complaint; yet, since the inconveniences of the device are in most cases very bearable, and are also capable of palliation by means of a bandage, endangering the limb and life in any degree must appear to many persons contrary to the dictates of prudence.

We have no infallible record, where there was a necessity for removing a cartilaginous tumour from any joint but the knee.

The device being often attended with a degree of heat and tenderness about the joint, there can exist no doubt of the propriety of keeping the patient in bed a day or two before he submits to the operation, the danger of which is in a great measure proportioned to the subseuent inflammation. When the attempt to heal the wound by the first intention succeeds, much of the hazard is also past. Therefore, the joint should be brought into as quiet a state as possible before the incision is practised, and besides a little confinement, the surgeon should direct ice-hes and cold foraminous lotions to be applied to the knee, and an opening draught or two to be taken.

As the loose piece of cartilage may, in general, be moved round the joint, the surgeon frequently has it in his power to choose the place where he will make the incision. Ford, Latta, and others have made the wound on the outside of the joint. Default used to bring the loose cartilage to the inner side of the articulation, against the attachment of the capsular ligament, and then make the cut in that situation. Mr. Abernethy has recommended bringing the extraneous substance to the outside of the internal condyle of the os femoris, and dividing the capsular ligament at that part. Mr. Ruffell advises us to paths the moveable body upwards, on the inside of the thigh, in order that the incision may be as distant as possible from the moving surface of the joint. Mr. Hunter also preferred removing these loose bodies at the upper
upper part of the joint, because there the bag, which contains the synovia, has less of the nature of a capsular ligament.

But whatever place may be chosen for the incision, it is of great consequence that an affiliiant prevent the loose cartilage from falling away, lest it should not easily be found again, and the purpose of the operation be frustrated. It is clear, that if the capsular ligament were wounded when an accident of this kind occurred, the patient would be exposed to all the danger of the operation, without any chance of being benefited by it.

All operators have followed the plan of drawing the integuments to one side before making the incision, so that as soon as the excision of the cartilage is accomplished, the wound in the capsular ligament may become immediately covered with skin. Thus the bad effects of the cavity of the joint being exposed, are materially prevented. The piece of cartilage, when brought into view, is to be directly extracted by means of a tenaculum.

The skin is then to be brought over the opening in the capsular ligament; the external wound is to be closed with sticking platter; cold lotions are to be applied to the knee; and every antiphlogistic measure adopted, which may seem prudent and necessary.

Experience has further proved, that the patient is not completely out of danger as soon as the wound is united; and that he ought, for some time longer, to keep the limb at rest. See Bromfield's Chirurgical Cares and Observations, vol. i. p. 335, 336.

Of Hydrops Articularis, or Dropsey of the Joints.—This disease consists of an accumulation of water in the capsular ligament of a joint, and is very analagous to the hydrocele, or collection of an aqueous fluid in the tunica vaginalis testis. Both these complaints, indeed, are alike, in not arising from a general dropsical affection of the constitution, the patient being frequently in other respects quite sound. There are, it is true, a few exceptions to the latter part of this observation. The knee is, of all joints, the most liable to the disease, perhaps on account of the largeness and looseness of its capsular ligament.

The pustules of hydrops articularis are often beyond the reach of investigation. The disorder, however, is frequently preceded by severe rheumatic affections, fevers, and local violence. In most cases a fluctuation is very distinguishable, unless the joint be uncommonly distended. When the limb, also, is extended, so as to relax the extensor muscles of the leg, the knee-pan may be made to rise up, by pressing the tumour, and a fulness may then be discerned on each side of that bone. The complaint is in general unattended with serious pain, though some uneasiness, and a sense of stiffness is experienced.

In considering the treatment of this, as well as of most other diseases, it behoves us to pay especial attention to the causes where they are discoverable, the mere removal of them being often of itself capable of effecting a cure. Thus, when hydrops articularis occurs during the debility consequent to typhoid and other fevers, the complaint can hardly be expected to get well till the strength of the constitution is in some degree restored. The connection between the local and constitutional disorder is well illustrated in a case in which Mr. Raffell has related, and in which every local remedy was tried without avail: the dis ease, which would not yield as long as the debility consequent to a typhus fever lasted, got well spontaneously immediately when the patient regained his strength. On Morbid Affections of the Knee, p. 192.

In ordinary examples hydrops articularis is quite a local malady, unconnected with any disorder of the constitution, and may be dispersed by topical treatment. One of the most effectual means for this purpose, is the application of a blister, which should be kept open with the favin crease.

The operation of the blister may also be very materially promoted by the pressure of a bandage. In some instances, the action of the absorbents may be insufficiently excited by moderate exercise, and frictions with flannel impregnated with the leam of vinegar, or by electricity, and rubbing the joint with camphorated mercurial ointment. The patient should likewise be purified with calomel, or kali acetanum, unless any particular reasons forbid.

Surgical writers inform us of cases, which, without common treatment, are attended with immediate diatention, and even with such irritation upon a weak constitution, as seriously impairs the health. Here, the surgeon would be justified in making a small puncture into the joint, in order to discharge the fluid. Care should be taken to make the opening no larger than necessary, and to draw the integuments to one side, before introducing the lancet, or trocar, so that the wound in the capsular ligament, as soon as the operation is finished, may become covered with skin.

Excision of Diseased Joints.—In the year 1782, Mr. Park, a surgeon at Liverpool, made the proposal of totally extirpating many diseased joints, so as to do away the necessity of cutting off limbs, which might still be of more use to the patients than any artificial contrivance. It was his plan to effect an entire removal of the heads of such bones as composed the diseased articulation, and then to make the feme extremities of the bones grow together, like the ends of a fracture.

After undertaking some experiments upon the dead subject, Mr. Park, in 1781, performed the operation of extirpating the diseased knee of a strong robust tailor, aged 33. The method pursued was much like that which had been previously tried upon the dead subject, and which was as follows: An incision began about two inches above the upper end of the patella, and extended about as far below its lower part. Another one was made across this at right angles, immediately over the patella, down to the bone, and nearly half round the limb, the leg being in an extended state. The lower angle was formed by the incisions, were raised, so as to lay bare the capsular ligament; the patella was then taken out; the upper angles were raised, so as to fairly denude the head of the femur, and to allow a small eathing to be passed across the posterior flat part of the bone, immediately above the condyles, care being taken to keep one of the flat sides of the point of the instrument quite close to the bone all the way. The cutting being withdrawn, an elastic spatula was introduced into its place, for the purpose of protecting the soft parts during the faving of the thigh-bone. The head of the bone, thus separated, was carefully dissected out; the head of the tibia was then easily turned out and sawn off, and as much as possible of the capsular ligament dissected away. The quantity of bone removed in the operation was a very little more than two inches of the thigh-bone, and rather more than one inch of the tibia. The only large artery divided was one on the front of the knee, and it ceased to bleed before the operation was concluded; but the ends of the bones bled very freely. To keep the redundant integuments from falling inwards, and the edges of the wounds in tolerable contact, a few futures were used. The dressings were light and superficial, and the limb was put in a tin case, which was long enough to receive the whole member, from the ankle to the trochanter major.

We learn from Mr. Park, that afterwards many troublesome circumstances occurred, arising chiefly from the diffi-
ulty of keeping the limb in a fixed position, the great depth of the wound, and the abscesses and fistulas which were formed in the part. The first symptoms, however, were not at all dangerous. But the patient was obliged to keep his bed nine or ten weeks, and it was many months before the cure was complete. The man afterwards went to sea, and so useful was his limb, that he was able to do his duty extremely well.

Mr. Park made another attempt to extirpate a diaphanous knee, but it was less favourable; as the patient lingered a few months after the operation, and died.

About the same time that Mr. Park made his proposal, a similar plan was recommended by P. F. Moreau, a French surgeon, and tried in several instances, upon the knee, elbow, &c. by himself and his son.

The excision of diaphanous joints seems, at present, to have no advocates among surgeons of judgment and experience. A full account of all that is known upon the subject has been lately published by Dr. Jeffays, in a work entitled “Causes of the Excision of Curious Joints.” In this book may be found a description of a very ingenious way for facilitating the operation. The instrument is constructed with joints, like a watch chain, so as to allow itself to be drawn behind a bone with a crooked needle, and be calculated for cutting the bone from behind forwards, without injuring the soft parts. It was made by Mr. Richards, who was assisted by his nephew, the present Mr. Richards, of Brick Lane, London. In placing the saw under the bone, its cutting edge is to be turned away from the flesh. Handles are afterwards hooked on the instrument.

The reasons which keep the practice of cutting out diaphanous joints from being imitated, are, in our opinion, of the most invincible kind. We believe that it is only right to amputate a limb, on account of a diaphanous joint, when the patient’s health is so reduced, that it cannot any longer bear the irritation of the local disease, and that as long as the strength holds out, the propriety of endeavouring to cure the disease, and preserve the limb, is dictated by every principle of good surgery, as well as humanity. If it be only in hopeless circumstances, and in a reduced state of the patient, that we are to turn our minds to the use of the knife, it seems improbable that a patient, after being greatly reduced by hectic symptoms, would in general recover from its effects and terrible an operation, as that of diaphanating away the whole of the knee-joint. If some few should escape with life and limb preserved, would the bulk of physicians treated in this manner have the fame good fortune?

The extirpation of so large an articulation as the knee cannot be compared with the operation of amputation, in point of simplicity and safety. The chief objections are founded, however, not upon the pain, nor difficulty of the operation, but upon the great length of time which the healing of the wound requires, and which, in the first case recorded by Mr. Park, was no less than eighteen months. His second example, as we have already mentioned, ended fatally. Moreau’s patient, though much debilitated, escaped the first dangers consequent to the operation; and after three months confinement, the patient was in such a state, that Moreau expected he would be able to walk upon crutches in another month or six weeks!” In the mean time the young man died of a dysentery. Allowing the excision of the knee to be followed by all possible success, few men of judgment will allow to acknowledge, that the advantage of having a mutilated, shortened, stiff limb, instead of a wooden leg, is an adequate compensation for the more painful operation that has been endured, and the greater risk that has been run.

Many of the foregoing observations were originally published in a Treatise on the Difficulties of the Joints by S. Cooper, 1807.

Joints, in Mining, are applied to the vertical fissures, or cutters, by which most of the strata are divided nearly vertically, into separate blocks and pieces. In the limestone quarries in Derbyshire, two very distinct kinds of joints are noticed in the rock, some that are peculiar to the particular beds of stone, (the fissures of W. Martin,) and rarely link through more than two or three beds; and others, that break through all the beds of limestone, and form a perfectly straight wall often to the face of their quarries. These latter are perfectly allied to mineral veins, though often not more than the eighth, or a quarter of an inch wide, and have their sides skirted with flour, or calcareous spar, or barytes, as if they were polished, or thrown thicker bones in some instances, and often these joints contain small specks of lead ore; while it is very rare for the other, or partial joints, to contain spar or ore; these kinds of joints, when close filled with spar, it is as easy to cement the parts of the rock firmly together again, from a answer to the contemporaneous veins of Werner; and the spar-joints of other writers; Mr. William Martin calls them rifts, Outline, p. 171. Quarrymen sometimes apply the term joint to the partings or thin way-beards which separate the different thin strata or beds of stone in a rock; but properly, these are called bed-joints, or strata-foams. The definition which M. Werner gives of strata, viz. “those parts of a rock which lie between parallel rents and fissures,” (Transl. of New Theory of Veins, p. 2,) is much too general, as it may include both the kinds of joints above-mentioned, and the imporprity also is striking, of applying the term rent to the bed-joints of a rock, or demi-strata of Martin; with such vague ideas as these, it is no wonder that many observers have mistaken the cutters or joints of thick strata, that happen to range parallel, for bed joints or strata-foams, and defiled strata as vertical, which are in reality horizontal, or near it.

Joints, in Architecture, denote the separations between the stones; which are filled with mortar, plaster, or cement.

Joint, in Carpentry, &c. is applied to several manners of affixing, or fitting, pieces of wood together. Thus we say, a dovetail joint, &c. See Joinery, Mortise, Dovetail, &c.

Joint, in Universal, in Mechanics, an excellent invention of Dr. Hook, adapted to all kinds of motions and flexures; of which he has given a large account in his Cuthbert Lectures, printed in 1678. This seems to have given occasion to the globules called in suspending the sea-compass, the mechanism of which is the same with that of Delfagier’s small lamp.

Joint, in Ship Building, a term signifying the juncture of the frame-timbers, which is represented by a line, whereby the shape of the vessel is determined at the fissions of the frames, to which the moulds are made for forming the various timbers, and although the frame is composed of a double set of timbers, yet they are generally close enough that the mould, made at the joint or middle, gives the shape of the fore and aft of the one, and the other of the other.

Joint Action, in Law. In personal actions several wrongs may be joined in one suit; but actions found on a tort, and one contract, cannot be joined; for they require different pleas and different proofs.

Joint-battery. See Battery.

Joint-executors, in Law, are two or more persons appointed such by will, in which cases they are accounted but as one single person, so that the actions done by one of them...
are taken to be the acts of all because they all represent the person of the testator; thus, where two joint-executors are possessed of a lease for years, in right of their testator, one of them may file the term without the other's joining; and in like manner, where one joint-executor gives a release, the others are bound by it, each having an authority over the whole estate; but a joint-executor is not charged with the acts of his companion, any farther than he is actually possessed of the goods of the testator; however, if joint-executors enter into an agreement, such shall intermeddle with particular parts of the testator's estate, in that case each becomes chargeable for the whole by agreement. It has been held, that two joint-executors cannot join separate pleas, because their testator, if living, on an action brought against him, could have been allowed but one plea; and that, if all the executors are not named in any action brought by one executor, the action will abate. As to bequests, the copy of one executor charges not the other. See Executor.

Joint-tenancy, denotes lives in common during the same time; or that exist together. See ESTATE.

JOINT-TENANCY, in law, see the next article.

JOINT TENANTS, or joint-tenants, in law, those who co-own and hold, lands and tenements by one title pro indiviso, or without partition.

There are distinguished from fealties, or several-tenants, from part-owners and from tenants in common. Anciently they were called participes, and not heredita. See SEVERALTY.

An estate in joint-tenancy is where lands or tenements are granted to two or more persons to hold in fee-simple, fee-tail, for life, for years, or at will. This is sometimes called an estate in "jinture," which word, as well as the other, signifies an union or co-action of interest. The "creation" of an estate of this kind depends upon the wording of the deed or devise by which the tenants claim title; for this estate can only arise by purchase or grant, that is, by the act of the parties, and never by the mere act of the law. Now, if an estate be given to a plurality of persons, without adding any restrictive, exclusive, or explanatory words, as if an estate be granted to A and B and their heirs, this makes them immediately joint-tenants in fee of the lands. For the law interprets the grant so as to make all parts of it take effect, which can only be done by creating an estate in them both. As, therefore, the grantor has thus united their names, the law gives them a thorough union in all other respects. The "properties" of a joint estate are derived from its unity; and this unity is fourfold; viz., the unity of interest, the unity of title, the unity of time, and the unity of possession. In other words, joint-tenants have one and the same interest, accruing by one and the same conveyance, commencing at one and the same time, and held by one and the same indivisible possession. With regard to unity of interdict, it may be observed, that one joint-tenant cannot be ejected to one period of duration, or quantity of interest in lands, and the other to a different; one cannot be tenant for life, and the other for years; one cannot be tenant in fee, and the other in tail. (Co. Litt. 178.)

But if land be limited to A and B for their lives, this makes them joint-tenants of the freehold; if to A and B and their heirs, it makes them joint-tenants of the inheritance. (Litt. § 377.) If land be granted to A and B for their lives, and to the heirs of A; here A and B are joint-tenants of the freehold during their respective lives, and A has the remainder of the fee in severalty; or, if land be given to A and B, and the heirs of the body of A; here both have a joint estate for life, and A hath a several remainder in tail. (Litt. § 282.) Joint-tenants must also have an unity of title; their estate must be created by one and the same act, whether legal or illegal; as by one and the same grant, or by one and the same devise. (Litt. § 278.) Joint-tenancy cannot arise by defect or act of law; but merely by purchase, or acquisition by the act of the party; and, unless that act be one and the same, the two tenants would have different titles; and if they had different titles, one might prove good, and the other bad, which would absolutely destroy the jointure. There must also be an unity of time; their estates must be vested at one and the same period, as well as by one and the same act. As in case of a present estate made to A and B; or a remainder in fee to A and B after a particular estate; in either case A and B are joint-tenants of this present estate, or this vested remainder. But if, after a lease for life, the remainder be limited to the heirs of A and B; and during the continuance of the particular estate A dies, which vests the remainder of one moiety in his heir; and then B dies, whereby the other moiety becomes vested in the heir of B; now A's heir and B's heir are not joint-tenants of this remainder, but tenants in common; for one moiety vested at one time, and the other moiety vested at another. (Co. Litt. 189.) Moreover, in joint-tenancy there must be an unity of possession. Joint-tenants are said to be leased "per my et per tum," by the half or moiety, and by all; that is, they each of them have the entire possession, as well of every parcel as of the whole. (Litt § 288. 5 Rep. 10.) And therefore, if an estate in fee be given to A man and his wife, they are neither properly joint-tenants, nor tenants in common; for husband and wife being considered as one person in law, they cannot take the estate by moieties, but both are severed of the entirety, "per tout et non per moi," the consequence of which is, that neither the husband nor the wife can dispose of any part without the consent of the other, but the whole moiety remain to the survivor. (Litt. § 667. Co. Litt. 187. 2 Vern. 120. 2 Leav. 39.) From these principles we may deduce other incidents pertaining to the joint-tenant's estate. If two joint-tenants let a verbal lease of their land, referring rent to be paid to one of them, it shall enure to both, in respect of the joint-reversion. (Co. Litt. 214.) If their lease runs for one of them, it shall also enure to both, because of the privity or relation of their estate. (Co. Litt. 192.) For the same reason, livery of fealty, made to one joint-tenant, shall enure to both of them (Co. Litt. 49); and the entry, or re-entry, of one joint-tenant, is as effectual in law as if it were the act of both. (Co. Litt. 319. 364.) In all actions, also, relating to their joint-estate, one joint-tenant cannot sue or be sued without joining the other. (Co. Litt. 195.) But if two or more joint-tenants be seized of an advowson, and they prefent different clerks, the bishop may refuse to admit either; because neither joint-tenant hath a feudal right of patronage, but each is seized of the whole; and if they do not both agree within six months, the right of presentation shall lapse. But the ordinary may, if he pleases, admit a clerk presented by either, that divine service may be regularly performed; and if the clerk of one joint-tenant be seised of it, such shall keep up the title in both of them. (Co. Litt. 175.) It is held also, that one joint-tenant cannot have an action against another for trespass, in respect of his land (3 Litt. 262; for each has an equal right to enter on any part of it. But one joint-tenant is not capable, by himself, of doing any act which may tend to defeat or injure the estate of the other, as to let leases, or grant copy-holds (4 Litt. 254).; and if any waife be done, which tends to the destruction of the inheritance, one joint-tenant may have an action of waife against
against the other, by construction of the statute Westm. 2. c. 22. (2 Litt. 423.) So likewise, though at common law no action of account lay for one tenant against another, unless he had constituted him his bailiff or receiver (Co. Litt. 222.) yet now by the statute 4 Anne, c. 16. joint-tenants may have actions of account against each other, for receiving more than their due share of the profits of the tenements held in joint-tenancy. From the same principle also arises the remaining grand incident of joint estates; viz. the doctrine of survivorship; which fee.

An estate in joint-tenancy may be severed and destroyed, by destroying any of its constituent unities. The first, indeed, cannot be affected by any subsequent transaction. But the joint-tenant's estate may be destroyed without any alienation, by merely dividing a part or portion. Hence, if two joint-tenants agree to part their lands, and hold them in fealty, they are no longer joint-tenants, and the right of survivorship is by such separation destroyed. (Co. Litt. 188. 191.) By common law all the joint-tenants might agree to make partition of the lands; but one of them could not compel the other to do (Litt. § 290.; but now by the statutes 31 Hen. VIII. c. 1. and 32 Hen. VIII. c. 32. joint-tenants, either of inheritance or other free estates, are compellable by writ of partition to divide their lands. Again, the jointure may be destroyed by destroying the unity of the. As if one joint-tenant alienates and conveys his estate to a third person, the jointure is severed, and turned into tenancy in common. (Litt. § 292.) But a devise of one's share by will is no severance of the jointure; for no testament takes effect till after the death of the testator, and by such death the right of the survivor, which accrued at the original creation of the estate, and has therefore a priority to the other, is already vested. (Litt. § 287.) It may be also destroyed by destroying the unity of interfeft. And therefore, if there be two joint-tenants for life, and the inheritance is purchased by or descends upon another, it is a severance of the jointure. (Cro. Eliz. 470.) In like manner, if a joint tenant in fee makes a lease for life of his share, this destroys the jointure, for it destroys the unity both of title and interfeft. (Litt. § 302. 303.) And whenever, or by whatever means the jointure ceases or is severed, the right of survivorship takes its place in the same manner as if it had been severed in the same manner as if it had been severed. (Co. Litt. 108.) Yet, if one of the joint-tenants alienates his share, the two remaining tenants still hold their parts by joint-tenancy and survivorship (Litt. § 294.; and if one of three of these joint tenants releases his share to one of his companions, though the joint-tenancy is dissolved, their part to that part, yet the two remaining parts are still held in jointure (Litt. § 304.); for they still preserve their original constituent unities.

Things personal may belong to ten owners, not only in fee, but also in joint-tenancy, and in common as well as real estates. Thus if a houfe, or other personal chattel, be given to two or more absolutely, they are joint-tenants of it; and, unless the jointure be severed, the same doctrine of survivorship shall take place as in estates of lands and tenements. (Litt. § 282. 1 Vern. 482.) The king cannot have a joint property with any person in one entire chattel, or such a one as is not capable of division or separation; but where the titles of a king and a subject concur, the king shall have the whole. Blackft. Com. b. ii.

JOINT-water, a term used by our farriers, for what the old writers in medicine have called hydathros; a running of a clear chiro from the joints, when they are either wounded or ulcerated: it is common in diseases of horses.

JOINTEE, in the Manor. See Handful.

JOINTRESS, or Jointeress, she that hath an estate settled upon her by her husband, to hold during her life, if she survives him.

JOINTURE, in Law, a covenant whereby the husband, or some friend in his behalf, makes over to his wife, on condition of marriage, certain lands and tenements for the term of her life, or otherwise, in lieu of dower.

Others define jointure a bargain and contract of livelihood, adjudged to the contract of marriage, being a competent provision of freehold lands or tenements, &c. for the wife, during her life at least, to take effect in profit or possession, after the death of her husband, if his dower be not the cause of the extinguishment of the jointure of it.

And to make a perfect passing within the statute of 27 Hen. VIII. c. 19. to bar dower, several things are to be observed. 1. It must be made to take effect for the life of the wife in possession or proprfluously after the decease of her husband. 2. It must be the term of her own life, or a greater estate; but it may be limited to continue no longer than she remains a widow, &c. 3. It must be made for forfeiture, and to one other in truth for her. 4. It is to be expressed to be in satisfaction of her whole dower, and not a part of it. 5. It may be made before or after marriage; if it be made before, the wife cannot waive it, and claim her dower at common law (4 Rep. 122.) but if it be made after marriage, she has her election, after the husband's death, and may either accept it, or refuse it, and betake herself to her dower at common law; for she was not capable of confessing to it during coverture, unless the jointure be made by act of parliament. After the death of her husband, the wife may enter into her jointure, and is not driven to a real action, as she is to recover dower by the common law; and upon a lawful eviction of her jointure, she shall be endowed according to the rate of her husband's lands, whereas she was dowable at common law.

A wife's jointure shall not be forfeited by the treason of the husband (Co. Litt. 372.; but female-coverts, committing treason or felony, may forfeit their jointure, and being convicted of recusancy, they shall forfeit two parts in three of their jointures and dower, by 3 Jac. I. c. 4.

JOINVILLE, John de, in Biography, a French historian, born in the early part of the thirteenth century, made a considerable figure in the court of Lewis IX. This prince he followed in all his military expeditions, and shielded him also in the administration of justice. One of the duties which he had to perform, was to hear the pleas of applicants at the palace gate, and to report them to his majesty, and also to investigate the truth of the allegations. When Lewis took the crois, and made his expedition into Egypt in 1249, Joinville, infected by the martial spirit and devotion of the age, attended him with a train of followers fitted to his rank, and his narrative of this enterprise in his life of Lewis, is one of the most curious and valuable records of that age. The historian shared his sovereign's captivity, as well as the dangers which they all suffered from the common enemy. He returned inafety, and was so much impressed with the danger and impolicy of those expeditions, that he made no scruple of condemning them: who advised Lewis to undertake his second crusade, and excused himself from accompanying the king, on the pretext of having been ruined by the first. Joinville's history was completed in the year 1309, when the author, according to Gibbon, must have been more than ninety years of age; it is a faithful detail of the facts which occurred under his own observation.

A monkish historian should have been content to applaud the most deplorable part of his (the king's) character; but the noble and gallant Joinville, who shared the friendship...
and captivity of Lewis, has traced with the pencil of nature the free portrait of his virtues as well as his failings." The most valuable edition of this work is that of Du Cange in 1688; but the text of the Paris edition in 1761 is reckoned the most pure and authentic. It has been already translated into the English, and published by Mr. Johnes of Hafod.

JOLIVILLE, in Geography, a town of France, in the department of the Upper Marne, and chief place of a canton, in the district of Waizy, situated on the Marne; 15 miles S.E. of St. Dizier. The place contains 3086, and the canton 4760 inhabitants, on a territory of 145 kilometres, in 15 communes. N. lat. 47° 28'. E. long. 5° 13'.

JOIRE, St., a town of France, in the department of Mont Blanc; 4 miles S.E. of Chambéry. — Also, a town in the same department; 15 miles S.E. of Geneva.

JOIRE, or Jouyeux, in Architecture, those pieces of timber framed into the girders and hummers on which the boards of floors are laid.

Jokers are from six to eight inches square, and ought seldom to lie at a greater distance from each other than ten or twelve inches; nor ought they ever to bear at a greater length than ten feet, or to be left into the wall than eight inches.

See Carpenter.

Sometimes the joiners fasten their joggles, as they call it; that is, they lay two rows of joggles, one over the other.

JOKALAY, in Geography, a town of Sweden, in the government of Abo; 22 miles N.W. of Abo.

JOKES. See Jesting.

JOKI, in Geography, a town of Japan, in the island of Nippon; 40 miles N. of Mexico.

JOKIOS, a town of Sweden, in the province of Tavallland; 28 miles W.S.W. of Tavallhus.

JOKKAS, a town of Sweden, in the province of Tavallland; 17 miles N.E. of Tavallhus.

JOKKATO, a town of Africa, in the kingdom of Barra.

JOKOMI, a town of Japan, in the island of Nippon; 25 miles N. of Jedo.

JOLCOS, or, as Homer calls it, Jelcos, in Ancient Geography, a town of Thessaly, in Magnesia, at the lower extremity of the Pelopon gulf, seven stadia from Demetrias and the sea. It was anciently considerable, and had a famous port. Pindar says that Adrales at this place invented the funeral games; and Strabo reckons it in the number of those towns which were destroyed in order to people the town of Demetrias. Jafon, the son of Eos, was king of Jolcos, and from hence the Argonauts took their departure; and it is said that on their return they found the town in the possession of Pelias, brother of Jafon, who had him put to death.

JOLIAN, in Geography, a town of Hindostan, in Guzerat; 20 miles N. of Cogo.

JOLIB, a denomination in the language of the Negroes, "great water," is a name which they give to the river Niger, called by the Moors "Nilil Abul," or the river of Slaves. When Mr. Park, in his interesting Tour, first discovered this river, it appeared to him as broad as the Thames at Westminster, and flowing majestically, but slowly, from west to east, through the middle of a very extensive town, called Soro. This enterprising and ingenious traveller pursued the course of the Joliba from W. long 5° 30' to Silla, long. 1° 30', the utmost extent of his expedition. See Gun and Niger.

JOLIATHUS, in Botany, from wo, a violet, and λιαθ, a stone, a cryptogramic plant, referred by Linnaeus to the genus Buffia, by some others to that of Libellus. It is found in the form of broad crimson pinchions, when moist, smelling strongly of violets, or rather of Orris root, clothing the surface of stones in clear springs, as at Holywell in Flintshire, Tunbridge, and other places. Nothing is known concerning the fructification.

JOLONE, Key, in Geography, a small island among the Bahamas. N. lat. 20° 14'. W. long. 77° 2'.

JOLU, or SOBE CARTA, a town of Java, and capital of the kingdom of Soesoeboenam.

JOLUCAR, a town of Spain, in the province of Granada; 7 miles N.E. of Motril.

JOLUT, an island near the west coast of East Greenland. N. lat. 66° 56'. W. long. 46° 56'.

JOLY, CLAUDE, in Biography, a French writer, was born at Paris in 1607. He was preceptor of the cathedral of Paris, and died in that city in the year 1700. He was author of a book entitled "Maxims for the Education of a Prince," which was condemned by the judicature of Paris, and was burnt by the hands of the common hangman in 1665. He likewise wrote several other pieces, chiefly theological.

JOLY, Guy, a French writer of memoirs, was confidelo to the king, and syndic of the rentiers of the hotel de ville, in Paris. He was attached to the cardinal de Retz, whom he followed, for a considerable time, in all his various fortunes. After the return of that minister from Rome, Joly quitted him on account of want of mutual confidence. He drew up "Memoirs from 1648 to 1665," in two volumes 12mo, which are chiefly an abridged account of what the cardinal himself has recorded in his own memoirs: but they are written in a more exact style than those of the cardinal, and contain many additional curious facts. Joly was engaged to defend the rights of the queen, and drew up "Remarks on Two Treatises written by Peter Stockmans in opposition to her Claims on Brabant and the Low Countries." He was author of another work, entitled " Intrigues of Peace, or Negotiations at Court by the Friends of M. le Prince, after his retreat in Guenne." Moreri.

JOLY, in Geography, a port on the S. coast of Nova Scotia.

JOMELLI, NICOLO, in Biography, one of the most intelligent, learned, and affecting dramatic composers of modern times, was born at Avellino, a town about twenty-five miles from Naples, in which city he had his musical education under Leo and Durante. The first opera to which we find his name, is "Ricciamo Re de' Gotti," composed for the Argentina theatre at Rome, 1740; and between that period and 1758, he composed for that city fourteen operas, besides others for Venice and different Italian theatres.

From 1758 to about 1768, he resided in Germany, being engaged in the service of the duke of Wurtzburg, at Stuttgart, or rather at Ludwigsburg, his new capital, where Jomelli's works were performed. Here he produced a great number of operas and other compositions, by which he acquired great reputation, and totally changed the taste of vocal music in Germany. On his return to Italy, he left all these productions behind him, upon a supposition that he should again resume his station at Ludwigsburg, after visiting his native country. But as he never returned thither to claim these compositions, they fell into the hands of his patron, the duke of Wurtzburg, who preferred them as precious relics of this great master.

Proposals were published at Stuttgart, in 1783, and in Cramer's Mag. der. Mus. for September of the same year, for
for printing by subscription the entire dramatic works of Jomelli in score, which he composed during his residence at the court of the duke of Wurttemburg, consisting of fifteen serious operas, five pastoral dramas, and three balettas; but whether this undertaking was ever accomplished, we have not been able to learn.

Very few entire operas of Jomelli were ever performed in England; the first was "Artificio Regalo," in 1755, without any captivating singer. Seraffi, first man, with little voice, though a good actor; and the Vulcanti, first woman, but now Polla, were little able to render the music captivating, or even to do it justice. Yet an extraordinary circumstance happened during the whole run of this opera, which no other, perhaps, could ever boast. This drama was terminated by a piece of recitative without a subsequent air, in speaking which, Seraffi was constantly encorèd. A circumstance the more extraordinary, as the English in general, who are ignorant of the Italian language, hate recitative, and would never go a second time to an opera, if not attracted by the airs and fine singing.

In 1755, Jomelli's opera of "Andromaca" was performed in London; in which the first air, "Si foste un cor trionfo," has considerable merit; but the clote of the allegro is now old fashioned. A great part of this opera was composed by Jomelli in his first manner; but originality and the hand of a master always appear. The airs, "Eccoci il figlio," as sung and acted by Mingoletti, was truly dramatic and affecting. The whole is very superior to almost all contemporary productions.

In 1759, a duet by Jomelli, in the pasticcio opera of "Volagelo," was extremely pleasing, and the first of which we remarked on the present dramatic model, chiefly in dialogue, with only burles of passion, in two parts. And Elifi, while he was in England, sung several grand airs by Jomelli, composed on purpose to display that singer's dexterity in hitting wide intervals.

In 1769, Gardiner, instead of an opera for his benefit, had the oratorio of "Bettulina Liberata," written by Metastasio, and fet by Jomelli, in which, among many admirable compositions, an air of supplication by the high priest, through which were heard the murmurs of the people in a distant chorus crying for peace and bread in tones so subdued as scarcely to be heard, was justly admired for its fine and new effect.

After he quitted Germany, Jomelli composed a great number of operas expressly for the king of Portugal, who tried every expedient to tempt him to go to Lisbon; which honour, though he declined, on account of the delicate state of his wife's health, yet he annually furnished that prince with new productions, as well as with whatever he composed for other purposes.

He composed, after his return to Naples, three operas for that city: "Armida," in 1769; "Demofoonte," in 1770; "Ifigenia in Aulide," in 1771. And in 1772, "Achille in Sciro," for Rome, which was his last.

Some of the music which he composed for the dances of his operas has been much celebrated, particularly his "Chaconne," which is well known in England, and has served as a model for that species of dance throughout Europe, ever since it was composed.

The operas of Jomelli will be always valuable to professors and curious collectors, for the excellence of the composition; though it has been thought necessary, in compliance with the general rage for novelty, to lay them aside and to have the fame dramas new set for the stage, in order to display the talents, or hide the defects, of new fingers.

At Jomelli was a great harmonist, and naturally grave and majestic in his style, he seems to have manifested abilities in writing for the church, superior even to those for the stage.

Of the many oratorios he composed, we are only acquainted with three: "Ifacco Figura del Redentore;" "Bettulina Liberata;" and "La Paffione;" all written by Metastasio, and all admirably set. In the first accompanied recitative and air of "Ifacco," at the opening of the second part, beginning, "Chi per pietà mi dice, il mio figlio che fu?" in which are painted, with an uncommon degree of agitation and passion, the anxiety and terror of Sarah, during the absence of Abraham, whom the supposition is in the act of sacrificing her son Ifaco, have been justly much admired.

We are in possession of a Te Deum and a Requiem of his composition, which manifest his being a great master of the church style; though he had acquired great fame as a dramatic composer before he began to extolize himself in this species of writing, concerning which he had never bestowed a thought since he left the musical school, or conservatorio, till about the year 1751, when it has been determined at Rome that the music for passion-week should be as excellent as possible, Durante, Jomelli, and Perez, were employed to set the lessons from the Lamentations of Jeremiah, for the three most solemn days of that holy time. Jomelli's composition was performed on Wednesday, Perez's on Thursdays, and Durante's on Good Friday. The first is entitled "Lettione Prima per li mercoledi Santo, con Violini, Oboe, Viola, Flauti e Corni da Caccia." The second, "Lettione Prima del Giovedi Santo, con un Supranofallo, con Violini, Viola, Oboe, e Corni da Caccia." And the third, "Lettione Terra del Venerdi Santo, a 4 Voci, con Violini, Viola, e Corni da Caccia.

Having procured a score of these compositions at Rome, and lately examined them, we can venture to say that they all appear admirable; and as the composers were all men of great abilities, who exerted themselves on this honourable occasion, it is difficult to determine, in their several styles, which is the best. The productions of Jomelli and Perez are in an elevated, elegant, dignified, supple, and expressive oratorio style; and that of Durante more in the ancient style of church music, more learned in modulation, more abounding in furrows, and more elaborate in the texture of the parts, as might be expected from his mature age, and the solemnity of the day on which his music was to be performed.

But though Jomelli acquired considerable fame by this composition for the church, yet he was so far from being intoxicated by it, that in a visit to Padre Martini, at Bologna, soon after, he told him learned contrapuntist that he had a scholar to introduce to him. Padre Martini assured him, that he should be glad to instruct any one so well recommended. And a few days after, the gentle father asking who and where was the disciple he had talked of? Jomelli answered, Padre Jomelli; and pulling a bundle of paper out of his pocket, on which he had been trying to

Strength
Jomelli.

Strength in modulation and fugue upon canto fermo, begged
of him to examine and point out his errors.

From this period he produced many admirable composi-
tions for the church, in which he united elegance with
learning, and grace with bold design. Among other pro-
ductions of this kind, the two following merit commemora-
tion. An “Oifertorio,” or motet, for five voices without
instruments, followed by an Alleluia of four parts in
chords; and a “Missa pro defunctis,” or burial service,
which he composed at Stuttgart for the obsequies of a
Lady of high rank and favour at the court of his patron,
the Duke of Wurttemburg. These compositions, which
are learned without pedantry, and grave without dulness,
will be lasting monuments of his abilities as a contra-
lutenist.

But the most elaborate of all his compositions, is the
“Miserere,” or fifty-first psalm, translated into Italian ver-
es, by his friend Saverio Mattei, which he set for two voices,
accompanied with instruments, in 1773, the year before his
decease. In this production, which breathes a pious gra-
vity, and composition of heart suited to the contrite senti-
ments of the psalmist, there is a manifest struggle at extra-
aneous modulation and new effects, perhaps too much at the
expense of facility and grace. Though all the movements
of this composition are slow, yet the execution is so dif-
ficult, both to the voices and instruments, that when it was
performed in London at Marchetti’s benefit, it was the opinion
of the late Mr. Bach, that Jomelli had purposely written
what he could not execute himself, in order to per-
plex the performers. This, however, must have been said
in pleasantrity, for Jomelli had so malevolence in his dispo-
sition; perhaps in striving at excellence with too great fol-
litude, he sometimes had recourse to art and flattery, instead
of giving way to his own feelings. There are, however,
ambitious strokes of passion as well as science in the music
that he has set to this psalm, which, though above the com-
prehension of common hearers, will afford great plea-
sure to those that are able to read the score, or to follow
the performers through the labyrinths of art.

This admirable composer had, in general, such a facility
in writing, that he seldom courted the Mufe at an instru-
ment; and so tenacious a memory, that Sacchini afforded
us he frequently composed an air on opening a book of
lyric poetry, while, like a peripatetic, he had been walking
about a room, which he remembered a year after, and then
committed it to paper, as fast as he could write a letter.

As Raphael had three manners of painting, Jomelli had
three styles of composition. Before he went to Germany,
the easy and graceful flow of Vinci and Pergolesti pervaded
all his productions; but when he was in the service of the
duke of Wurttemburg, finding the Germans were fond of
learning and complication, he changed his style in com-
pliance with the taste and expectations of his audience; and
on his return to Italy, he tried to thin and simplify his dra-
matic Mufe, which, however, was still so much too op-
role for Italian ears, that in 1770, upon a Neapolitan being
asked how he liked Jomelli’s new opera of “Demonofoante,”
he cried out with vehemence, “federata, Signore!”

Climate seems to operate so much on music, however its
influence may be disputed in manners and government, that
what is admired in one country is detest in another. In
cold climates labour is necessary to circulation; in hot, cace
is the grand defideratum. This principle is carried to such
excess in Italy, that whatever gives the hunger of music the
dead and troublesome diftangle, is Gothic, pedantic, and fle-
ratate. As to difficulties of execution, in a single part, the
composers and performers may spin their brains, and burn
their blood-vascular, and welcome, provided the texture of the
parts is clear and simple.

The Gothic inventions, as they call them, of fugues,
canon, and labourd countertooy of the sixteenth century,
the are willing to resign to the Flemings, who first brought
them into Italy; but of which all the natives, except a
few obbligate pedants, struggled to divest their music, par-
cularly that for the flags, during the last two centuries.

It is the exclusive only of learning and facility that is truly
reproducible by good taste and sound judgment; and diffi-
cult and easy are relative terms, which they only can define.
To lovers of music who have heard much in various styles,
little is new; as to others who have heard but little, all is
new. The former can only research and new effects, which, to
the latter, old music can furnish. Palates accustomed to
plain food find ragoles and macheaux fridends too highly fa-
famed; whilst to those who have long been pampered with
dainties, simplicity is injsat. How then is a composer or
performer to please a mixed audience, by avoiding too
much compliancy to the exclusive taste of either the
learned, or the ignorant, the fupercrials, or the simple?

The health of Jomelli began to decline in 1776, soon
after we had seen him in perfect health at Naples. He was
then corpulent, and reminded us of the figure of Handel.
In 1771, he had a stroke of the palsy, which, however,
the not impair his intellect, and he composed “Achille in
Sciro” for the Roman theatre, and a cantata for the fake
delivery of the queen of Naples, in 1772; and in 1773,
his Italian “Miserere,” the most elaborate and studied of all
his works.

His learned friend, Signor Saverio Mattei, the translator
of the psalms into Italian verse, from whose admirable ver-
son Jomelli had taken the “Miserere,” or fifty-first psalm,
drew up a very interesting account of the works and public
funeral of the great musician, and printed it in his “Saggio
di Poesia Latina et Italiane,” published at Naples imme-
diately after his decease.

The reverence and regard with which we have been long
impressed for the works and character of this gifted man,
have already rendered the article too long to admit of fur-
ther extension, or we should have wished to insert Signor
Mattei’s whole account; but having given it elsewhere, we
shall here only cite the introduction, which does equal ho-
nour to the author and his friend.

Naples, September, 1774. “Yesterdav all the musicians
of this city united in celebrating the funeral of the great
Jomelli. The church was very finely ornamented; and a
great number of wax tapers were placed about the pompous
bier. Two or three of these rows each could scarcely
contain the vocal and instrumental performers who assisted
in executing the music that was expressly composed on the
casion by the worthy Sabitini, who beat the time himself,
as maestro di capella. It was the celebrated Genaro
Manna, composer of the archiepiscopal church, who first sug-
gested this plan of a public funeral, in which all these musicians
had an opportunity of manifesting their regard for Jomelli,
and of furnishing an example to posterity of the gratitude
due to great talents, which may likewise stimulate young
artists to merit equal honours. At the desir of Signor
Manna, not only every musician attended the funeral and
performed gratis, but contributed likewise towards the ex-
\ences of this solemnity.

“Jomelli was my friend; he lived two years in my neigh-
bourhood, and I had frequent opportunities of conversing
with him, and admiring his captivating manners, par-
cularly his modesty in speaking of rival artists, whose com-
positions
positions he readily praised, though their authors were not equally candid in speaking of him.

"Jomelli had acquired considerable knowledge in other arts than music: his poetry was full of taste, and there is a fine ode of his writing, in the collection published at Rome, on the subject of the reconciliation between the pope and king of Portugal.

"He was ambitious of distinguishing himself from other composers in a way peculiar to himself. His invention was always fertile, his style lyrical and Pindaric; and just as Pindar darted from one subject to another, Jomelli changed his tones and themes in a way wholly new, and learnedly irregular."

This account is terminated with many excellent reflections on the style of Jomelli, and the elaborated and frivolous taste of the Neapolitans at the time of his death. All we shall add is, that the latter works of Jomelli will be ever regarded with reverence by real judges of composition, as there is no mixture of trivial or fantastical movements or passages in his truly chivalric, and often sublime works.

JON, in Natural History, the name of a gem described by Pliny, and said to be brought from the East Indies; he describes it as being of a purple or violet colour, but rarely very deep in the tinge. It seems to have been a species of amethyst.

Jovis Chloris, in Biography, a tragical and lyric poet and philosopher, who first recited his poems in the 82d Olympiad, 432 years B.C., mentions in some verses quoted by Eudoc, the ten-lined and lyric poem, "CII. 203-209," a proof that the conjoint tetraeteron was added to the heptachord in his time, which was about fifty years after Pythagoras is supposed to have contrived the octachord. Jon died, according to Fabricius, vol. i. p. 681. 419 B.C., and 78 years after Pythagoras. Before tragedies and dithyrambs, Jon composed odes, poems, hymns, and funeral songs.

IONA, I, Hii, or I. Colum-kil, in Geography, one of the western islands of Scotland, in the thistle ocean, is separated from the western point of Mull by a narrow channel, call d the Sound of I. It measures about three miles in length, by three quarters of a mile in breadth. It is a place of much note in the early annals of the country, as the retreat of learning, during the age of barbarism and illiteracy which pervaded Europe after the overthrow of the Roman empire. Dr Johnson calls this place "the luminary of the Caledonian regions, whence savage clans and roving barbarians derived the benefits of knowledge, and the blessings of religion." The monkish writers called this island Iona, which signifies the island of waves; Bede calls it Hii; but the proper name is I, (founded by the English e) which in the Gaelic signifies island, this being called to by way of eminence. In more modern times, this insular district obtained the name of I-Colum-kill, that is, the island of Colum's cell. The name Iona is now diffused, and the island is generally called I, except when the speaker would wish to mark it with peculiar emphasis, and then it is expressed I-Colum-kill. The Druids were undoubtedly in possession of this island prior to the introduction of Christianity: a green eminence, close to the sound of I, is to this day called the Druid's burial place; and here are still extant the remains of a small Druidical temple, or circular row of upright stones, in a farm called Rosfall, where, as the name imports, the courts of justice were held. The island seems to have been early the seat of a religious society of Christians, or order of monks, named Culdees, who settled here about the beginning of the sixth century. The foundation of a circular building or house, called the Culdee's cell, still remains. The history of the Druids in this island is wholly unknown; but that of the Culdees has been amply and learnedly narrated by Dr. Jamieson, in a quarto volume, published in 1811. It was referred for Columba to raise the fame of the island to the great height it attained to in his own and after ages. This eminent man left his native country, Ireland, in the year 563, to preach the gospel to the Northern Picts; and having converted the Pictish monarch, obtained from him the grant of this sequestered isle, where he founded an abbey for canons regular. Having successfully preceded here upwards of thirty years, he died June 9th, 597; leaving his abbeys finally settled, a people converted by his labours from Paganism to Christianity, and a name renowned for sanctity, piety, and "good works." The abbey acquired very extensive jurisdictions; held, for many ages, the chief fay in among the Scottish and Pictish nobility; and was literally endowed by the piety and munificence of the kings and great men of Scotland. The Danes dislodged the monks in 857, and the abbey remained for several years depopulated; but on the retreat of the invaders, it received a new order of inhabitants, the Cluniacs, who continued to occupy it till the dissolution of monastic institutions, when the revenues were united to the see of Argyile; and, on the abolition of episcopacy, became the property of the duke of Argyile. The remains of the abbey, and its appendages, though much dilapidated, are, by the chance and attention of the Argyile family, kept in better preservation than moth and rust of the kind in Scotland. The late duked built a wall round the whole abbey, to prevent further depredations; and prohibited their tenants from removing any fallen stones. Time has levelled some of the buildings with the ground; but the greater part is still standing. The cathedral, or St. Mary's church, is almost entire: it is built in the form of a cross, 115 feet in length, and 23 in width; the length of the transept 70 feet. In the churchyard is a crook of a single piece of red granite, 14 feet high, 22 broad, and 13 inches thick. St. Oran's chapel, said to be the first building begun by Columba, is still standing, but in a ruinous condition. The Virgin's chapel was entire till within a few years, when part of it fell. Most of the cloisters and the bishop's house are also standing. There is still remaining of the abbey, sufficient to give a tolerable idea of what it was. Of the nunery, an establishment nearly coeval with the abbey, there are fewer remains: the church belonging to it is deprived of the roof. Here also stands what was called the parish church, yet entire, but verging to decay. Near the chapel of St. Oran is a large enclosure, called the "burying-place of Oran," in which are deposited the remains of forty-eight Scottish kings, four kings of Ireland, eight Norwegian monarchs, and one king of France, who were ambitious of reposing in this hallowed ground. In the same fanciful, at a respectful distance, lie most of the lords of the isles. The island of I is included in the united parishes of Kilfinichen and Kilviccen. It abounds with many valuable minerals. Here is but one small village, containing about 60 houses and 250 inhabitants. The parish minister of Kilviccen visits this island every quarter of a year, which is the only opportunity of public worship and religious instruction which the people now enjoy. Strange reverie! that divine service should be performed but four times in the year, in a place where it was formerly celebrated as many times in a day. Sinclair's Statistical Account of Scotland, vol. iv. Pennant's Tour in Scotland. Johnson's Journey to the Western Islands. Chalmers's Caledonia. Jamieson's Historical Account of the ancient Culdees, &c. 410. 1811.

Iona, a town of Hindoostan, in the country of Delhi; 25 miles S. of Delhi.
JONAE Piscis, the *Jonas-fish*, a name given by many authors to the common shark, the *canis carcarias* of authors.

It has this name from an opinion that it was the fish which swallowed up the prophet of that name. But there are many objections to such an opinion.

JONAH, or the Prophecy of Jonah, who was the son of Amittai, and a native of Gathhepher, a town belonging to the tribe of Zebulon, in Lower Galilee, a canonical book of the Old Testament, in which it is related, that Jonah was ordered to go and prophesy the destruction of the Ninevites; but that disobediently attempting a voyage another way, he was discovered by the rising of a sudden tempest, and cast into the sea, where he was swallowed up by a large fish. Having lodged three days and three nights in the belly of the fish, he was discharged upon the shore: whereupon, being sensible of his past danger, and surfeiting deliverance, he betook himself to the journey and embassy to which he was appointed. Arriving at Nineveh, the metropolis of Assyria, he, according to his commission, boldly laid open to the inhabitants their sins and miscarriages, and proclaimed their sudden overthrow; upon which the whole city, by prayer and fasting, and a speedy repentance, happily averted the divine vengeance, and escaped the threatened ruin. Jonah, instead of admiring the divine clemency, was indignant under the apprehension that his veracity would be frustrated, and that he would be deemed by the people to be a false prophet. Having retired from the city, he prepared for himself a booth, over which a plant sprang up miraculously in one night, which, by its spreading foliage, sheltered him from the burning heat of the sun. But the plant suddenly withering away, so that he was exposed to a suffocating wind and the sun's scorching beams, he again expressed his impatience, and his wish to die rather than to live in such circumstances of distress. At length, having been reproved for his impatient, querulous temper, and the conduct of Providence in sparing the Ninevites having been justified to his full conviction, his complaints were silenced. Of his further history we have no authentic account.

Jonah was the most ancient of all the prophets whose writings are preserved in the Scripture canon. Some have supposed that he prophesied in the latter end of Jehu's, or the beginning of Jehoahaz's reign, at which time the kingdom of Israel was brought very low by the oppressions of Hazael king of Syria. (2 Kings, xix. 22.) Others refer his predictions to the reign of Jeroboam II. king of Israel, or between the years 823 and 783 B.C. 2 Kings, xiv. 25.

Newcome's Verison and Notes.

JONDA, in Geography, a town of Norway, in the diocefe of Bergen; 30 miles E. of Bergen.

JONDISABUR, a town of Perfa, in the province of Chufiban; 183 miles E.S.E. of Bagdad.

JONEKISCHKEN, a town of Prussian Lithuania; 36 miles W. of Tiht.

JONES, in Biography, a Welshman who was blind, and the best performer on the harp of his time. The old duches of Marlborough would have retained him in her service, with a pension, as an inmate; but he could not endure confinement, and was engaged by Evans, the landlord of a well-auculomed home-brewed ale-house, at the Hercules' Pillars, opposite Clifford's Inn passage in Fleet-street, where he performed in a great room up stairs during the winter season. He played extemporaneous voluntaries, the fugues in the fantasias and concertos of Corelli, and most of his solos, with many of Handel's opera songs, with uncommon neatness, which were thought great feats, at a time when scarcely anything but Welsh tunes with variations was ever attempted on that instrument in the hands of other harpers. He also played on the violin, and accurately imitated on that instrument, to the great delight of the home-brewed ale-drinkers, the fobs, figs, and groans of a Quaker's sermon.

Evans dying, his widow took Cuper's Gardens in Surrey, opposite to Somerset-house; erected an orchestra there, which was reckoned the best for music in the kingdom; furnished it with an organ, which was played by little Harry Burges, the harpsichord-player at Drury-lane, with his usual unmeaning neatness; and established the Gardens as an evening place of entertainment for the summer season, like Vauxhall, with the addition of fire-works. But it was too much in the vicinity of Drury-lane and Covent-garden for order and decorum to be long preferred inviolate; so that after four or five summers, it was suppressed by the magistrates; and poor Jones, who had been admitted as a performer in the orchestra by mother Evans, (as he was usually called,) losing both his salary and importance, died about the year 1748. He was buried in Lambeth churchyard, and his funeral procession, attended by a great number of musical people, was solemnized by the performance of a dead march by a voluntary band of innumerable instruments.

JONES, John, late organist of St. Paul's, the Charterhouse, and joint organist of the Temple with Stanley. The father of this musician, a worthy man of professional merit and good conduct, having lived many years at lady Vanbrugh's, Whitehall, as a domicil musician, prevailed on her ladyship to patronize his son; which he did so efficiently, that though his abilities as a performer or composer were not above mediocrity, he was perfon or manners very captivating; yet, by the zeal and influence of his father's patronage, he obtained three places, which are regarded by musicians as the polls of honour in London, and more desirable, if the king's chapel be excepted, than any at which an organist can aspire.

JONES, John, a physician of the 16th century, and author of several works, but of whose history little more is known than that he was born in Wales, or was of Welsh extraction; that he studied at both our universities, and took a medical degree at Cambridge; and that he became eminent in the practice of his profession at Bath, and in Nottinghamshire and Derbyshire. He mentions curing a perfon at Louth in 1502; and the date of his last publication is 1579. He wrote only in the English language, and left the following works: 1. "The Dial of Ayes," Lond. 1556; 2. "The Benefit of the ancient Bathes of Buckitome, which cureth most grievous Sicknesses," ibid. 1572. This work contains very little concerning either the nature or history of these baths; but chiefly general directions, compiled from ancient authors, relative to the diet and regimen proper to be used with a cure of bathing; 3. "The Bathes of Bath's aye, wonderful and most excellent against very many Sicknesses," ibid. 1572; 4. "A brief, excellent, and profitable Discourse of the natural Beginning of all growing and living Things, Heat, Generation, &c." Lond. 1574; 5. "A Translation, from Latin into English, of Gale's four Books of Elements," ib. 1574. Dr. Aikin puts the following quere, after mentioning this work: "Is not this the same with the preceding piece?" 6. "The Art and Science of preferring Body and Soul in Health, Wisdom, and Catholic Religion," 1579, 4to. See Aikin, Biog. Mem. of Med.

Another physician, of the name of John Jones, is mentioned by Bibliographers, who was born at Landaff, and was admitted a member of the Royal College of Physicians, in
JONES.

JONES, NICH., an eminent architect, was born in London about the year 1752. He was probably intended for a mechanical employment, but his talent for the fine arts at- tracted the notice of some considerable persons about the court, among whom were the earls of Arundel and Pembroke. To the latter of these noblemen he was indebted for that degree of patronage which enabled him to visit Italy for the purpose of perfecting himself in landscape-painting, to which his genius seemed first to point. He took up his residence chiefly at Venice, where it is said the works of Palladio gave him a turn to the study of archi- tecture, which branch of art he made his profession. He was invited by Christian IV. king of Denmark, to under- take the office of his first architect. Having been some years in the service of that sovereign, he accompanied him, in 1666, on a visit to his brother-in-law, king James; and, expressing a desire of remaining in his native country, he was appointed architect to the queen. He served prince Henry in the same capacity, and obtained a grant, in re- version, of the place of surveyor-general of the works. After the death of the prince, Mr. Jones visited Italy again, and spent some years there in improving himself in his art. On his return he undertook the duties of the office of surveyor- general, and finding the Board of Works much in debt, he relinquished his own dues, and prevailed upon the other principal officers to do the same, till all arrears were cleared.

In 1629 the king sent him to investigate the nature and pur- pose of that remarkable antiquity, Stonehenge; and he wrote a treatise to prove that it was the work of the Ro- mans, but he made no converts to this opinion. He was now employed in building the banqueting-house at White- lhall, which remains a model of the pure and elegant taste of the architect. He was likewise appointed a commis- sioner for repairing the cathedral of St. Paul's, which office, as well as his other posts, was continued to him under the reign of Charles I. The repairs of St. Paul's did not commence till 1633; and he is accused of having com- mitted, in that undertaking, some capital faults by mixing the Roman and Grecian style with the Gothic. He had much employment both from the court and nobility, and realized a handsome tune, which was diminished by his sufferings during the troubles which succeeded. He was obnoxious as a favourite of his royal master, and as a Roman Catholic. He was first attacked in 1643, when he was called before the house of lords, on a complaint of the parishioners of St. Gregory's, for demolishing part of their church, in order to make room for his additions to St. Paul's. He was fined, in 1646, 535l, as a malignant. He was much afflicted by the king's death, and died, worn down by grief and misfortune, in July 1651. He was the greatest English architect previously to Sir Christopher Wren. A collection of his designs was engraved and published by Mr. Knell, in two volumes folio, 1717. Others were published in 1733 and 1744. A copy of Palladio's architecture, with manuscript notes by Mr. Jones, is in the library of Worcester college, Oxford. Biog. Brit.

JONES, WILLIAM, father of Sir William, the subject of the next article, was born in the year 1660, in the island of Anglesey, North Wales. His parents were yeomen, or Vol. XIX.
who knew her husband's dangerous situation, addressed him with a letter of condolence, recommending his acquiescence and resignation from a due consideration of the brevity of life. Mrs. Jones, perceiving its purport, and probably dreading its effects on the spirits of her husband, when this was denied by him to read it, composed the moment another letter to convey it, and to express that she had no suspicion of his design to desist from it, and the execution of a duty to herself, entertaining that, instead of being delayed, it was greatly exhorted by it. His disorder and length continued in his death, which happened soon after the incident we have related, in July 1740. The property of which he was possessed was real estate, but his reputation was materially acknowledged. After his death, the widow was furnished with many offers of service by those who respected his deceased husband; and she was under peculiar obligations to Mr. Baker, author of a treatise on the microscope, &c. for a benefaction amounting to a collection of microscopes, folios, and other curiosities left by Mr. Jones, and disposing of them to the greatest advantage. His library was bequeathed to lord Macclesfield. It has been paid by the compilers of the Biographical Dictionary, that Mr. Jones had completed a very important mathematical work, and had actually sent the first sheet to the press, but that the progress of his disorder obliged him to discontinue the impression. It is now said that the MS. fairly transcribed, was entrusted a few days before his death, to the care of lord Macclesfield, who promised to publish it for the honor of the author, and the benefit of his family. If this account be true, and a work, which was to have been entitled, "The Foundation to the Mathematics," had been actually prepared, the MS. must have been lost, as it could not be found among the books and papers of lord Macclesfield, who survived his friend many years. Among the memoranda of sir William Jones, there is no document that serves to confirm or disprove this account. The mathematical works of sir William Jones, that have been published, are much admired for novelty, brevity, and accuracy; and they afford ample evidence, entitled also by his correspondence with Mr. Cotes of Cambridge, that he was a very eminent mathematician. We have already mentioned his "New Compendium of the whole Art of Navigation," 8vo. 1702; and his "Synopsis Palmariarum Matheseos; or, a new Introduction to the Mathematics, containing the Principles of Arithmetick and Geometry, demonstrated in a short and easy Method;" 8vo. 1705. In the Philosophical Transactions, we have several papers on logarithms, on the properties of conic sections, on the solution of equations for exhibiting the relations of geometrical lines, &c. communicated to the Royal Society, of which he was a member. He was also the editor of some mathematical works of Sir Isaac Newton, under the title of "Analysis per Quantitatum Series, Fluxiones, ac Differentias; cum Methodis Linearum Talentium," 2 vols. 12mo. 1715; and the "Letters Writing, and Correspondence of sir William Jones," by lord Templeton.

John Jones, a son of the subject of the present work, was educated in the natural sciences, in the university of North Wales; but, in the course of much study, he was driven to a study of mathematics, which brought him to a rank of mathematician, and a professor in the university of Oxford. He was induced by his father's wish to study law at the bar, and to become a counsel to the king; but the subject of the present work, who was the eldest son of his father, was able to give an account of this distinguished person, which, however imperfect it may be, and however inadequate to our sentiments of personal respect, and feelings of lively gratitude, cannot fail of being interesting to our readers; nor will they need any apology if we exceed our usual limits on this occasion.

Sir William Jones was born in London on the eve of the festival of St. Michael, in the year 1740; but having left his father when he was three years old, the care of his education devolved upon his mother, who appears to have been eminently qualified to direct and superintend it, more particularly in his infant years. Her character has been delineated by her husband in the following terms: "She was virtuous without blemish, generous without extravagance, frugal but not niggardly, cheerful but not giddy, close but not fallen, ingenious but not conceited, of spirit but not pugnacious, of her company cautious, in her friendship trusty, to her parents dutiful, and to her husband ever faithful, loving and obedient." Mrs. Jones took great pains, by the study of algebra, trigonometry, and navigation, to qualify herself for being the preceptor of her father's son; and to these sciences, rather remote from a lady's province, she paid particular attention, because he was destined to a maritime profession. Her solicitude for the improvement of her own son induced her to decline accepting the kind invitation of the countess of Macclesfield to remain at Shrewsbury castle after her husband's death; and her discriminating judgment led her, in her plan for his instruction, to reject the facility of direct teaching, and to conduct his mind intelligently to knowledge and exertion, by exciting his curiosity and directing it to useful objects. In consequence of her attention, he was, in his fourth year, able to read distinctly and rapidly any English book; and with a view to the cultivation of his memory, she caused him to learn and repeat some of the most popular speeches in Shakspere, and the best of Gay's fables. His propensity to reading was signally manifested in his fifth year; and in his sixth he was initiated by the assistance of a friend in the rudiments of the Latin grammar. At Michaelmas 1753, in the close of his seventh year, he was placed at Harrow school, of which Dr. Thackeray was the head master. During the two first years of his residence in this seminary, he was distinguished more by diligence than by superiority of talents; but his faculties gained strength by exercise, and the prospect of the eminence to which he afterwards attained gradually brightened. His mother, who anxiously watched over his progress, improved the opportunities which his vacations, and the absence of 12 months from school, in consequence of the fracture of his thigh-bone, afforded, of increasing his acquaintance with his native tongue, and with English authors; and of teaching him also the rudiments of drawing, in which he herself excelled. During this interval, the progress of his classical studies was interrupted. However, on his return to school, he was placed in the class to which he would have attained, if no interruption had occurred. This error of judgment, on the part of his master, though it subjected him to corporal punishment and degradation for non-performance of exercises which should not have been required, and though it produced in his mind an acrimonious alienation of his caller's conduct, served to dispose his judgment, and to call forth the exertion of his native powers; so that in a little while he was advanced to the head of his class, and might, if he had been so disposed, have returned to his class-fellows these former reproaches of his inactivity or dulness. In the 12th year, he was removed to the upper school. At this time a circumstance occurred, which afforded signal evidence of the strength and tenacity of his memory. His school-fellows proposed
to amuse themselves with the representation of a play; and at his recommendation the Tempeft was erected; but not being able to procure a copy, he furnished them with it from his memory; and in the exhibition he performed the part of Protesilaus. As he advanced in the school, his diligence increased; and he commenced the study of the Greek language. At this time he translated into English verse the history of the expedition of Ulysses, and all the palaestrias of Virgil; and he compiled a dramatic piece on the story of Medea, which he dominated a tragedy, and which, during the vacation, was acted by some of his mulatto school fellows; the part of the hero being performed by himself. His acquaintance with profody was very distinguished; so that he was able to feem the tragi-comic verfes of Terence, before his companions suspected that they were any thing but mere profody. At fourteen he wrote the exercises of many boys in the two superior classes, and those in his own class were happy to borrow his pupils. During the holidays he learned the rudiments of French and arithmetic; and in this early age he was highly gratified by being honoured with a donation to the society of learned and ingenious men at the house of Mr. Baker and his friend Mr. Pond. At the requiffes of his mother he read the "Spectacle de la Nature," but derived greater amusement, as he acknowledged, from the Arabian tales, and from Shakespear, whose poems and plays he repeatedly perused with increased delight. At Harrow he invented a political play, in which Dr. Bennet, bishop of Cloyne, and the celebrated Dr. Parr, were his principal associates. "They divided the fields in the neighbourhood of Harrow, according to a map of Greece, into fates and kingdoms; each fixed upon one as his dominion, and assumed an ancient name. Some of their school-fellows confented to be killed barbarians, who were to invade their territories and attack their habitations, which were denominated fortresses. The chiefs vigorously defended their respective domains against the incursions of the enemy; and in these imaginary wars the young gentlemen held councils, made vehement harangues, and composed memorials, all doublets very buoyant, but calculated to fill their minds with ideas of legislation, and civil government."

In the numerous amufements Jones was ever the leader. On the 15th of January Dr. Thackeray was succeeded by Dr. Sumner, who soon discovered the talents and acquirements of his pupil; and who afforded him every advantage in the prosecution of his studies which he had in his power to grant him. Indeed this excellent instructor of youth, with an excufable partiality and an amiable modesty, was heard to declare, "That Jones knew more Greek than himself, and was a greater proficient in the idiom of that language."

During the two years which he spent with Dr. Sumner, he employed his time in reading and imitating the best ancient authors of Greece and Rome, and, devoting the night as well as the day to study, he acquired the knowledge of the Arabic characters, and a sufficient acquaintance with the Hebrew language to enable him to read fome of the Psalms in the original. His reputation was extremely great in the early period of his life to excite, "that he was often flattered by the inquiries of strangers, under the title of the great scholar.

Some of his juvenile compositions, both in prose and verse, may be found in the fragment of a work which he began as a school, and entitled "Linnæus," in imitation of Ciceron, and may be found in the complete edition of his works. His inclinations occasioned a weakness in his sight, which rendered it necessary for Dr. Sumner to interdict it during the last months of his residence at Harrow. The intervals of interrupted study, which he reluctantly allowed himself, were employed in learning chess, by practising the games of Philidor. As he was intended for the profession of the law, for which, however, he does not seem to have had any great predilection, some of his friends recommended his being placed, at the age of 16, in the office of a special pleader; others, however, wished him to be removed from Harrow to one of the universities. The choice of an university was for some time the subject of discussion; but at length Oxford was preferred in consequence of the recommendation of Dr. Glaiff, and the pronouncement of his master, who recommended to reside with him at the university. In the year 1764, he was sent to and admitted into Oxf ord hall; and in the following term, for having worn his master at Harrow, in order to finish a couple of verses, in which he was much embarrifed, he was expelled at Oxford. Upon his first return to the university he was rather more pleased with the plan of learning. He ended his principles on the subjects of Latin, Greek, and oriental, and practical languages, he could not say that he was devoted to attending dull comments on abstract materials, and he found in such barbarous Latin, that he professed to know, little of it as he then knew of Arabick, which, the only mode then in fashion was that of the fellows; and in a memorandum written by himself, which, by his biographer Lord Trin- ament, "is my authority for these remarks," he was more attached to one of the fellows, who was resigning his own upon his own, that he carefully took over every passage in which that great metaphysician decides the old system." After a residence of a few months at the university, on the 31st of October, 1764, Mr. Jones was unanimously elected one of the four fellows on the foundation of sir Simon Bennett, for which office he was grateful; more especially as the prospect of a fellowship was remote. Addicted to oriental literature for several years, he now indulged his inclination by the study of Arabic under the example and encouragement of a fellow student, and with the assistance of a native of Aleppo. His vocation at the university became gradually more pleasant to him in that he was at leisure his college tutors, perceiving that his whole time was devoted to improvement, dispensed with his attendance on their lectures, and even allowed him to pursue his studies in a manner agreeable to his tastes and inclination. To the perusal of the principal Greek poets and historians, and of the entire works of Plato and Lucian, he added the study of the Arabic and Aff of the modern Persian languages. During his假期, which he spent in London, he attended the schools of Angle, in order to acquire the elegant accomplishments of riding and fencing; and at home he directed his attention to the modern languages; reading the best authors in Italian, Spanish, and Portuguese. The completion of a fellowship, which he was anxious of obtaining, partly for relieving his mother from the burden of his education, and partly for securing some kind of independence, however inaccessible, to himself, was still at a distance; and he was not unprepared of containing it. Having been recommended to the family of earl Spencer by Dr. Shipley, to whom he was not personally known, but who was an unacquainted with his compositions at Harrow, an offer was made to him by the earl, and he was married, to his friend Sumner, of being private tutor to lord Althorp, now earl Spencer. The proposal was cheerfully accepted, and upon an interview with his pupil, then five years old, he was so pleased, that he determined to give up all thoughts of a profession, and to devote himself to the faithful discharge of the duties of education now devolved upon him. In the summer of 1765, he wholly left the university, and entered on his new office. At Wimbledon,
where he refrained till the approach of winter, he found leisure to compile many of his English poems, and to read the greatest part of the Old Testament in Hebrew, particularly the book of Job, and the Prophets, which he studied with great attention. In the following summer a fellowship became vacant, and he was offered it at Aug. 7, 1766. At this time he was furnished by the duke of Grafton, then at the head of the treasury, the place of interpreter for Eastern languages, which he politely declined, apprehending that it would be inconsistent with his other engagements and pursuits. In the course of this summer he formed an acquaintance with a young lady, Anna Maria, the eldest daughter of Dr. Shipley, then dean of Winchester, who was visiting at Wimborne, to which he owed the happiness of his future life. But such were his views of an honourable independence, and his resolution never to owe his fortune to a wife, or her kindred, that, notwithstanding the impressions made upon his heart by the person and conversation of this lady, he could not then admit any idea of a matrimonial connection. In the following winter he attended the two schools of Angelo, and by a secret arrangement with Gallini, acquired the accomplishment of dancing. Having occasion to accompany Lord Spencer's family to Spa in the summer of 1767, he improved himself, during the short period of three weeks' residence in this place, in the art of dancing, by the lefles of Janouf of Aix-la-Chapelle, and acquired a very considerable knowledge of the German language. In the year 1768 application was made to Mr. Jones by the secretary of flats, on behalf of the king of Denmark, then in England, requiring him to give a literal translation of the life of Nadir Shah in the French language. Having for some time declined the proposal, he at length accepted it; and the translation was published, after some delay, in the year 1770. To the history of Nadir Shah, he added a treatise on Oriental Poetry, which treatize, executed by a young man in his 23d year, has been justly confidered as an extraordinary performance; "instructive and elegant, interesting from its novelty, entertaining from its subject and variety, and exhibiting the combined powers of taste and erudition." Being at Tunbridge in 1768, he then began to learn music, and afterwards received lessons from Evans on the Welsh harp. We may here mention his attendance on a course of anatomical lectures by the celebrated Hunter, and his study of the mathematics, which he so well understood, as to be able to read and understand Newton's Principia.

In the beginning of this year he had commenced an acquaintance with Rawlini, afterwards the imperial minister at Warfaw, and ambasador at the court of England, with the title of count. This accomplished nobleman being captivated by the charms of oriental literature, cultivated in intimacy with Mr. Jones, which was continued by a correspondence, that was carried on for many years. Many of the letters that passed between them on their favourite subject are published in the life by lord Teynemouth. In the summer of 1709, Mr. Jones attended his pupil to Harrow; and it was with peculiar satisfaction that he renewed that intercourse with Dr. Sumner, which had been for some time interrupted, though not altogether discontinued. Here he translated a Persian grammar, which three years before he had composed for a school-fellow, who was destined for India; he also began a dictionary of the Persian language.

Of the religious principles of Mr. Jones some account may be reasonably expected. While he was at Harrow, in his 24th year, we have reason to believe that his faith in Christianity was not unblended with doubts. Indeed no particular attention seems to have been paid to this part of his education; a circumstance which, we confess, appears to us surprising, and for which we are unable to account. His mind, however, was so upright and so well disposed, that he suppressed his doubts, not in the too fashionable mode of concealing or stifling, but with a sincere desire of obtaining a solution of them. Finding himself disappointed, he determined to examine the subject for himself, and to peruse the whole scripture in the original, that he might be enabled to form a correct judgment of the connection between the two parts, and of their evidence both internal and external. The result was a firm belief in the authenticity and inspiration of the sacred writings. About this time he drew up a series of propositions, which have been found in his own hand-writing in a Hebrew copy of the book of Hosea, and which contain the sketch of a demonstration of the divine authority of the Christian religion. To these propositions, transferred by his biographer, the following note is subjoined: "what must be the importance of a book," of which it may truly be said, "if this book be not true, the religion which we profess is false?"

Towards the end of the year 1769, Mr. Jones accompanied lord Spencer's family to the continent. Soon after his return he adopted the resolution of altering his plan of life. The course which he was pursuing, however agreeable it was rendered to him by the family with which he was connected, did not exactly correspond to that idea and spirit of independence which marked his character. "He united the laudable desire of acquiring public distinction and of making his fortune by his own efforts: above all, he was animated with the noble ambition of being useful to his country;" accordingly he determined to devote himself to the study and practice of the law; and with this view he was admitted into the Temple on the 19th of September 1770. His attachment to Oriental literature and to general science, however, continued unabated, notwithstanding the time and attention which he devoted to his new profession. In 1772 he published a small volume of poems, containing chiefly of translations from the Asiatic languages, with two prose dissertations annexed: and though he does not appear to have communicated any paper for the Philosophical Transactions, he was, on the 30th of April 1772, elected a fellow of the Royal Society. On occasion of taking his Master's degree in the university in 1773, he composed an oration, intending to have spoken it in the theatre. The speech was published 10 years after, and the topics that characterize it are, "an ardent love of liberty, an enthusiastic veneration for the university, a warm and discursive eloquence on learned men, who devoted their talents and labours to the cause of religion, science, and freedom." In the commencement of 1774, he published his commentaries on Asiatic poetry, a work begun in 1766, and finished in 1769, when he was in his 23d year, which "was received with admiration and applause by the oriental scholars of Europe in general, as well as by the learned of his own country." To these commentaries is annexed an elegant address to the Muffs, in which Mr. Jones declares his purpose of renouncing polite literature, and devoting himself altogether to the study of the law. In January 1774 he was called to the bar; and for some years he seems to have inflexible adhered to the above-mentioned resolutions. For some time he declined practice, and faithfully applied himself to his legal studies. In 1775, for the first time, he attended the spring circuit and sessions at Oxford; perhaps more as a spectator than an actor; and in the following year he was regular in his attendance at Westminster-hall. In 1778 he published a translation of the speeches of Israels, in causers concerning the law of succession to property at Athens, with a preface discourse, notes critical and historical, and a commentary. The year 178.
1784 forms an interesting era in the memoirs of Mr. Jones. His professional practice had increased, and afforded a prospect of farther enlargement with augmented profit; but as his views were particularly directed to the vacant seat on the bench of Fort William in Bengal, and as Lord North had encouraged his expectation of occupying it, he was less anxious about the augmentation of benefits in his legal profession. In this state of suspense, the political events of the times engaged his attention. To the American war, in its commencement and further progress, he was decidedly adverse. At this time the reflections which he indulged dictated a very animated and classical ode to liberty, which he composed in Latin, and published under the title of "Julii Meleagroni ad Libertatem," the affixed name being formed by a transposition of the letters of C. Julianus Jonesius. This ode strongly displays his genius, erudition, feelings, and political principles. The vacancy of a seat in parliament for the university of Oxford being likely to occur, Mr. Jones was encouraged by his friends to offer himself as a candidate; but though he was ambitious of this honour, the disappointment gave him no great concern. Although this contested election occupied a considerable portion of his thoughts and time, he found leisure to publish a small pamphlet, entitled "An Inquiry into the legal Mode of suppressing Rota, with a Constitutional Plan of Future Defence." In a speech, eminently characteristic of his principles and feelings, which he intended to have delivered at a meeting of the freethinkers of Middlesex, assembled Sept. 9th of this year, for nominating two representatives in the new parliament, he repudiated the American war and the conduct of the late parliament in supporting it; he expressed his sentiments without reserve on the African slave trade, and avowed the conduct which he would have pursued, if he had been placed in the house of commons. In the course of this year, the death of his mother, to whom he was attached by every possible tie of nature, affection, and gratitude, involved him in the deepest affliction. In this and the following year he was diligently employed in his professional studies and practice, whilst literature and politics also engaged a degree of his attention; but the principal object of his ambition and hopes was the vacant seat on the bench in India. Whatever was connected with this object interested his thoughts; and hence he was led to undertake the translation of an Arabian poem on the Mohammedan law of succession to the property of intestates. In the year 1782 the public attention was much occupied with attempts to procure, by constitutional means, a reformation of parliament. This was a subject congenial to Mr. Jones's sentiments and feelings; and he concurred in the public efforts for this purpose, both by speaking and writing. About this time he published his "Essay on the Law of Eaiments," and in the same year, 1782, he became a member of the Society for Constitutional Information. In his letter of acknowledgment for being elected into this society, he professes his attachment to the excellent constitution of his country; and then adds, "on the people depend the welfare, the safety, and the permanence of every legal government; in the people must reside all substantial power; and to the people must all be done, in whose ability and knowledge we sometimes wisely, often imprudently, confide, he always accountable for the due exercise of that power with which they are for a time entrusted." Whilst he was at Paris, in the year 1782, he wrote a little "Jeu d'esprit," as he calls it; and of which he says, in a letter to Lord Althorp, "it was printed here by a society, who, if they will hear clear of party, will do more good to Britain, than all the philosophers and antiquaries of Somerset house. But to speak the truth, I greatly doubt, whether they, or any other man in this country, can do it substantial good. The nation, as Demosthenes says, will be fed like a consumptive patient, with chicken broth and panada, which will neither suffice him to expire, nor keep him wholly alive." This "jeu d'esprit" was a "Dialogue between a Farmer and Country Gentleman on the Principles of Government." After a bill of indictment had been found against the dean of St. Alph, for the publication of the edition, which was printed in Wales, Sir William Jones sent a letter to lord Kenyon, then chief-justice of Chester, in which he avowed himself to be the author of the dialogue, and maintained that every position in it was strictly conformable to the laws and constitution of England. In the beginning of 1783, Mr. Jones published his translation of the seven Arabian poems, which he had finished in 1781. The most interesting period of Mr. Jones's life was now approaching; for in March 1783, by the active friendship of lord Althorpe, and under the administration of lord Shelburne, he was appointed a judge of the supreme court of judicature at Fort William in Bengal, on which occasion he received the honour of knighthood; and in the April following, he married Ann Maria Shipley, the eldest daughter of the bishop of St. A 198, a lady to whom he had been long attached, who deferred his most affectionate esteem, who contributed in a very high degree to his domestic happiness, and who lamented his death with a most pungent and permanent grief. To the publications of Sir William Jones, which we have already noticed, we shall here add an abridged history of the life of Nadir Shah, in English, and a history of the Persian language, intended to be prefixed to the first edition of his Persian grammar.

Sir William Jones embarked for India in the Crocodile frigate, and in April 1783 left his native country. He was now in his 37th year, with his faculties in full vigour, in possession of the appointment to which his views had been long directed, indulging the expectation of acquiring an ample independence, and having no reason to apprehend that the climate of India would be hostile to his constitution. He could not be furry to abandon the political discussions, that divided his friends and alienated them from one another; and which must have produced mutual shyness and reserve between him and those to whom he was in other respects attached; and which served to agitate the whole country. He had with him a companion and friend, from whose society he could not but derive the greatest satisfaction and comfort, which kindred minds and united hearts are capable of receiving and communicating. In such society, and with ample resources in his own mind, a kind of temporary banishment from his country would be tolerable, the long voyage would not be tedious and uninteresting, and a settlement for important and beneficial purposes in a foreign land would be regarded without anxiety and aversion. In September 1783 he landed safely at Calcutta, and was received with cordial congratulations by those who were chiefly interested in his arrival. In the following December he entered upon his judicial functions, and at the opening of the sessions, delivered to the grand jury his first charge, which was concise, elegant, appropriate, and conciliatory. Scientific objects, during the intervals of professional duties, engaged his attention; and in order to combine the pursuits of many in useful pursuits, he devised the institution of a society in Calcutta, similar in its plan and objects to that which has been established in the principal cities of Europe. See Society.

In the year succeeding that of his arrival, Sir William Jones was attacked with a disorder which exhausted his strength, and threatened his valuable life. As soon, however, as he was able to undertake it, he projected a journey to Benares.
principally with a view of opening sources of useful information. He proceeded by way of Moorshedabad, Jangipore, Bhagalpur, and Patna, to Benares. In the course of this journey his disorder once and again returned upon him, and induced him to excite in his mind an apprehension of its fatal termination. That this was the case we have from a prayer which he composed on this occasion, and which is as follows:

"O thou bellower of all good! if it please thee to continue my eddy talks in this line, grant me strength to perform them as a faithful servant; but if thy wisdom hath willed to end them by this thy visitation, admit me, not weaging my unworthiness, but through thy mercy declared in Christ, into thy heavenly mansions, that I may continually advance in happiness, by advancing in true knowledge and awful love of thee, thy will be done!"

After a short residence at Benares, he returned by the Ganges to Bhagalpur; and in his journey from hence to Calcutta, he visited Gour, once the residence of the sovereigns of Bengal. In a letter written to a friend after his return, he says, "As we approached Calcutta we perceived the difference of climate, and thought of Bhagalpur with pleasure and regret." "I am just returned," says he, in another letter, "as it were from the brink of another world, having been absent near seven months; and reduced to a skeleton by fevers of every denomination, with an obdurate bilious flux at their heels. My health is tolerably restored by a long ramble through South Bahar, and the districts of Benares." During this tour he wrote two tracts; one a little tale in verse, under the title of "The Enchanted Maid," or "Hindu Wife;" and the other, "A Treatise on the Gods of Greece, India, and Italy," afterwards prefixed to the Society, and published in the Asiatic Researches. The design of this work is to excite a resemblance, too strong to have been accidental, between the popular worship of the old Greeks and Italians, and that of the Hindus, and between the strange religion and that of Egypt, China, Persia, Phrygia, Phoenicia, and Syria, and even remoter nations. This resemblance, if it were established, would authorize, as Sir William Jones conceives, an inference of a general union and affinity between the most distinguished inhabitants of the primitive world, at the time when they deviated, as they did too early, from the rational adoration of the only true God. Sir William Jones, with his restored health, renewed his functions in the supreme court of judicature, and renewed the meetings of the Society, interrupted by his absence. The Society of Sir William Jones was so much valued and fought for, and he was subject to so many intrusions, that, for the sake of enjoying the benefit of air and exercise, and of pursuing his literary pursuits without interruption, he made a retreat at a residence at Chandannagar, where the foil was very healthy, and the air pure. To the Asiatic Miscellany, a periodical work undertaken at Calcutta in 1787, but afterwards unconnected with the Asiatic Society, sir W. Jones contributed occasional compositions. Sir William, having been proposed making an excursion to Chatigam, the easternmost part of the Bengal dominions in Bengal, executed his design after the receipt of the court in the beginning of 1788, and returned thither by sea. During his short residence at Chatigam, he found nature, and all other occupations, to be particularly the source of Poetical, the Homer of Persia, supposed to contain 60,000 couplets. But the work to which his principal attention and labour were directed, was a translation of the Hindu and Mohammedan laws. Accordingly, in one of his letters, he says, "Sanskrit and Arabic will enable me to do this country more service, than the introduction of arts, (even if I should be able to introduce them,) by procuring an accurate digest of Hindu and Mohammedan laws, which the natives hold sacred, and which both justice and policy require that they should be governed." Accordingly, he addressed a letter to the Governor-general, lord Cornwallis, on this subject. The marquis Cornwallis considered the accomplishment of the plan of design, as calculated to reflect the highest honour on his administration. With this function for W. Jones, he laid the execution of the work; and having carefully selected, from the most learned Hindus and Mohammedans, a sufficient number of persons duly qualified for the task of compilation, he traced the plan of the digest, prepared its arrangement, and pointed out the MSS. from which it was to be formed. Although it is much to be regretted that sir W. Jones did not live to translate the digest of Hindu law, to the compilation of which he had devoted so much attention and labour; yet it is satisfactory to know, that his benevolent intentions have not been disappointed, and that Mr. H. T. Colebrooke, in the civil service of the East India company at Bengal, from motives of public spirit, and a laudable hope of diffusion, has completed a translation of it with the aid of the highest talent. Sir W. Jones had suggested an improvement in the police at Calcutta, so as to render it more efficient, and more conformable to the British constitution. His suggestions were adopted in an application to parliament, and confirmed by its sanction. The application of sir W. was ineffectual; and after what he calls his "leaving," the state of his health allowed his devoting several hours a day for four or five months in the year to professional engagements, and unremitting attention, during the vacations, to a complete knowledge of India, which was to be obtained only in the country itself, where it was his intention not to prolong his stay beyond the last year of the eighteenth century. Among other literary occupations which engaged his attention, he undertook the charge of editing the elegant poem of Haste, on the unfortuante loves of Laila and Majnun, an Arabian youth and princess. He published the book at his own expense, and appropriated the profits of the sale to the relief of indigent debtors in the gaol at Calcutta. The business that was devolved upon him as president of the society at Calcutta, and in consequence of preparing the various excellent papers which he contributed to it, will be more particularly noticed in our account of that Society. In the year 1789, sir W. Prefixed to the public a translation of an ancient Indian drama, entitled "Sacontala," or the "Fatal Ring," exhibiting a very pleasing and authentic picture of old Hindu manners, and one of the greatest curiosities that literature of Asia had yet brought to light. Calidas, the author of it, called by sir W. the Shakespeare of India, lived in the first century B.C., and wrote several other dramas and poetical pieces. The principal sources of amusement of which sir W. availed himself, was the compilation of the Puranas, with whom he talked freely, in the language of the gods (Sanskrit), and botany, in which latter study, if it may be called, he was much assisted by lady Jones. Their evenings were generally passed together, and devoted to the perusal of the best modern authors in the different languages of Europe. We feel, however, from several of his letters, that he felt great anxiety concerning the debilitated state of his health, and that, unᾶifual be their mutual separation, he longed to break his promise to take her palfage for Europe in January 1792. Such was her affectionate attachment to her husband, that she remained in India in opposition to the advice of physicians, though she could entertain no reasonable expectation of recovering her health in the climate of that country. It was finally settled, however, that she should return to England; and it was his determination to follow
JONES.

follow her in the ensuing season, hoping that at that period to have discharged his engagements with the government of India, and intending to pursue his residence through Peru or Chili by a circumstantial route, to his native country. Lady Jones embarked in December 1792. Soon after his departure, viz. in the beginning of 1793, Sir William Jones published a translation of the Ormmandy, comprising the Indian system of duties, religions and civil. In this work he had been long engaged from motives similar to those which had induced him to undertake the compilation of the digests; viz. to aid the benevolent intentions of the legislature of Great Britain, in securing to the natives of India the administration of justice, to a certain extent, by their own laws.

To those who entertain a just sense of the importance of the principles and the utility of the duties of religion, the following prayer, composed by Sir W. Jones on the first day of the year 1783, about fifteen months before his embarkation for India, and more than twelve years before his death, will not be unacceptable:—

"Eternal and incomprehensible Mind, who, by thy boundless powers, before thy time began, created innumerable worlds, for thy glory, and innumerable orders of beings for thy happiness, which thy infinite wisdom prompted thee to, and thy infinite goodness caused thee to know! We fly on wings, vanishing into nothing before thy supreme majesty; we hourly feel our nothingness; we daily bewail our vices; we continually acknowledge our folly: therefore we adore with ardent veneration, thee, to whom the most fervent end; in the pure and unpretending devotion and rapture; to the holy and humble fulness, of all thy goodness we devoutly implore protection; on thy favour we firmly and cheerfully rely. We do but open our eyes, and faintly we perceive thy divine existence; we do but exert our reason, and in a moment discover thy divine works; but our eyes could not behold thy splendour, nor could our minds comprehend thy divine essence; we feel ourselves through thy tremendous and all-perfect words; we bow the knee to that ray of sacred light which has planted thee to cereals. Nevertheless, if creatures too ignorant to exist, and too depraved to pursue, the means of their own happiness, may, without premeditation, express their wants to their Creator, let us humbly supplicate thee to remove from us that evil, which thou hast permitted for a time to exist, that the ultimate good of all may be complete, and to secure us from that vice, which thou suffrèst to spread abroad among us, that the triumph of virtue may be more conspicuous. Irradeate our minds with all useful truths; infil into our hearts a spirit of general benevolence; give and understand to the foolish; meekness to the proud; temperance to the dissolute; fortitude to the feeble-hearted; hope to the desponding; joy to the unbelieving; diligence to the slothful; patience to those who are in pain; and all my evidences to those who are in favour. Suffer not us, we anxiously pray, suffer not us to be afflicted, nor to prevail over benevolence, nor the, weight of the, over the contents of the soul. Whenever we are placed in our present state from the vanities of the world, the prayers are sufficient, pray us; if prayer is not sufficient, give us all power for good; grant them, all power for good; if they and, as with our being, we will express our submission to thy will, as, above, tothence, and for all future times, to which we reverently hope thy goodness will rule us, great that we may continue praising, admiring, venerating, worshipping thee more and more, through worlds without end, and ages without end!" This prayer is unconditionally the effusion of a truly pious mind, impressed with just sentiments of the Deity and of human nature; and though it does not express any explicit faith in the doctrines of Christianity, these sentiments are such as can lead to, and express a prayer, such as revelation expressly teaches us. It should also be recollected, that long before this prayer was written, Sir W. Jones had demonstrated, as we have already observed, to his own satisfaction, that Jesus was the Messiah predicted by the prophets. We have also further evidence, which no incredulity can conceal, of his firm belief in the divine authority of the scriptures and divine mission of Jesus Christ. Of the sacred writings, he says, in a passage transferred from his own MS. in his bible:—"I have carefully and regularly perused these holy scriptures, and am of opinion, that the volume, independently of its divine origin, contains more sublimity, pure morality, more important history, and other trains of knowledge, than can be collected from all other books, in whatever language they may have been written." It would indeed be hard to cite one from his writings, which do not manifest the same influence, and at the same time, it is not necessary to impress his own brefs on us. In the meantime we cannot forbear announcing a passage from the Memoirs of his biographer, which do honour to his judgment and his heart.

"In matters of eternal concern," says Lord T. Bostock, "the authority of the holy Bible is not to be admitted, as a ground of belief; but it must, with the strictest propriety, be opposed to that of none of inferior learning and penetration; and, while the pious derive satisfaction from the perusal of their sentiments according to their own, those who doubt or disbelieve should be induced to weigh, with candour and impartiality, arguments which have produced conviction in the minds of the best, the wisest, and the most learned of mankind."

After the departure of lady Jones, "while society had sweetened the toil of application, and cheersed his hours of relaxation," Sir W. Jones mixed more in promiscuous society; "but his affections were transported with her to his native country," and, without doubt, led him to anticipate, with an anxiety blended with delight, the period which he had fixed in his own mind for leaving India, and renewing his intercourse with her, and with other friends. But Providence had otherwise determined. On the evening of the 26th of April, or nearly about that date, in 1795, he prolonged his walk to a late hour; in consequence of which he complained of aguish symptoms; but feigning no alarm he regularly repeated an old idage:—"An agrain in the spring is known for a king." But his complaint, of which he had no apprehension, was that which is common in Bengal, viz. an inflammation in the liver. The physicians prescribed by the physician who attended him, and whom he disbelieved the nature of his disorder, were admitted without effect. The progress of the disease was unceasingly rapid, and terminated fatally on the 25th of April 1794. His last scenes, on the morning of that day, "led in a region of indigitation and to a lofty sky, where a bow of rainbow was in the heart, which it is hard to express, and he expired with a groan. His body lies calmly on the earth, and the soul of his adversary, which had derived comfort from the sable, where he had lain in the last stage of it, and where alone, in our sad moments, it can be found."
found." On the following day the funeral ceremony was performed, "with the honours due to his public stations; and the numerous attendance of the most respectable British inhabitants of Calcutta evinced their sorrow for his loss, and their respect for his memory."

The following epitaph, evidently intended for himself, was written by Sir William Jones, not long before his demise. It displays some striking features of his character, resignation to the will of his Creator, love and good-will to mankind; but it is modestly silent upon his intellectual attainments.

Here was deposited
the mortal part of a man,
who feared God, but not Death;
and maintained independence,
but fought not riches,
who thought
none below him, but the base and unjust,
none above him, but the wife and virtuous;
who loved
his parents, kindred, friends, and country,
with an ardour
which was the chief source of
all his pleasures and all his pains;
and who, having devoted
his life to their service,
and to
the improvement of his mind,
resigned it calmly,
giving glory to his Creator,
wishing peace on earth,
and with
good will to all creatures,
on the [Twenty-seventh] day of [April]
in the year of our blessed Redeemer
One thousand seven hundred [and ninety-four.]

By an unanimous vote of the Court of Directors of the East India Company, it was resolved, that a monument to his memory should be planted, for the purpose of being erected in St. Paul's cathedral, with a suitable inscription; and that a statue of Sir William Jones should be prepared at the expense of the company, and sent to Bengal, with directions for its being placed in a proper situation there. A society of gentlemen in Bengal, who had received their education at Oxford, subscribed a sum to be given, as a prize, for the best dissertation on his character and merits, by any of the students of that university; and the premium was adjudged to Mr. Henry Philpotts, A. M. Fellow of Magdalen college. Lady Jones testified her affection for Sir William, and her desire to perpetuate his fame, by an elegant monument erected, at her expense, in the anti-chamber of Univerity college, Oxford, and by the publication of his works in an elegant edition of 400 volumes; thus strictly conforming to his opinion, that the "monument that can be erected to a man of literary talents, is a good edition of his works."

"In the short space of 47 years," says his biographer, "by the exertion of rare intellectual talents, he acquired a knowledge of arts, sciences, and languages, which has seldom been equalled, and scarcely, if ever, surpassed. Without considering him as a competitor in Grecian literature with a Porson or a Parr, he deserves to be ranked high among classical scholars; and "as a philologist, he could boast an universality in which he had no rival. His skill in the idioms of India, Persia, and Arabia, has perhaps never been equalled by any European; and his compositions on oriental subjects display a taste, which we seldom find in the writings of those who had preceded him in these tracts of literature. The language of Constaninople was also familiar to him; and of the Chinese characters and tongue, he had learned enough to enable him to translate an ode of Confucius. In the modern dialects of Europe, French, Italian, Spanish, Portuguese, and German, he was thoroughly conversant, and had perused the most admired writers in those languages."

The following transcript of a paper written by himself, will inform us, how far his knowledge of languages extended:

**Languages**

Eight languages studied critically;
- English, Latin, French, Italian, Greek, Arabic, Persian, Sanscrit.

Eight studied less perfectly, but all intelligible with a dictionary;
- Spanish, Portuguese, German, Russian, Hebrew, Bengali, Hindi, Turkish.

Twelve studied less perfectly, but all attainable;
- Tibetan, Pali, Phalavi, Dari, Russian, Syriac, Ethiopic, Coptic, Welsh, Swedish, Dutch, Chinese.

Twenty-eight languages.

In another memorandum, he mentions having read a grammar of the Russian and Welsh. The knowledge of languages, however, was, in Sir W. Jones’s estimation, inferior and subordinate to other objects. They were, in his opinion, the keys of universal literature and science, and served, according to the use which he made of them, to unlock fountains of ancient and modern treasures, for the amelioration, instruction, and general benefit of mankind. The eleven discourses which he addressed to the Asiatic society, and to which we shall have occasion to refer under future articles, are specimens of the uses to which he applied them.

"A mere catalogue of the writings of Sir William Jones," says his biographer, "would swell the extent and variety of his erudition; a perusal of them will prove, that it was no less deep than miscellaneous. Whatever topic he discusses, his ideas flow with ease and perspicuity, his style is always clear and polished; animated and forcible, when his subject requires it. His philological, botanical, philosophical, and chronological disquisitions, his historical researches, and even his Persian grammar, whilst they fix the curiosity and attention of the reader, by the novelty, depth, or importance of the knowledge displayed in them, always delight by elegance of diction. His compositions are never dry, tedious, nor disgusting; and literature and science come from his hands, adorned with all their grace and beauty. No writer, perhaps, ever displayed so much learning, with so little affection of it." With regard to his law publications, it is said, that his "Essay on Balloons" was conceived by the approbation of lord Mansfield; and all his writings in this department flowed, that he had thoroughly studied the principles of law as a science. As to his opinion of the British constitution, it appears from repeated declarations that occur in his letters, and particularly in his 10th discourse, delivered to the Asiatic society in 1793, that he considered it as the noblest and most perfect that ever was formed. With regard to his political principles, he was an enlightened and decided friend to civil and religious liberty. Like many others of the same principles, he entertained a favourable opinion of the French revolution at its commencement;
Sir William, you attempt, in vain,
By depth of reason to maintain,
That all men’s talents are the same,
And they, not nature, are to blame.
Whate’er you say, whate’er you write,
Proves your opponents in the right.
Let genius should be ill-defined.
I term it your superior mind,
Hence to your friends ’tis plainly shown,
You’re ignorant of yourself alone.”

Sir William Jones’s Answer.

“All but too well, dear friend, I know,
My fancy weak, my reason low,
My memory by art improved,
My mind by brawl to science add.
Give me (thus high my pride I raise)
The ploughman’s or the gardener’s praise.
With patient and unceasing toil,
To meliorate a stubborn soil,
And say, (no higher need I ask)
With zeal half thou perform’d thy task.
Praise, of which virtuous minds may boast.
They felt confer, who merit most.”

Besides the finished productions of Sir William Jones’s skill and labour, he had contemplated many more than he had executed; and for this reason, as well as many others, we cannot forbear regretting his premature death.

It is needless to add any thing in commendation of his private and social virtues. The independence of his integrity, his probity and humanity, and also his universal philanthropy and benevolence, are acknowledged by all who knew him. The compiler of this article joins with many others in a grateful and respectful remembrance of this disposition to perform acts of kindness; and he has reasons, peculiar to himself, for regretting his premature death. In every domestic relation, as a son, a brother, and a husband, he was attentive to every dictate of love, and to every obligation of duty. In his intercourse with the Indian natives, he was condescending and conciliatory; liberally rewarding those who afforded him, and treating his dependents as friends. His biographer records the following anecdote of a circumstance which occurred after his decease: “the Pandits who were in the habit of attending him, when I saw them at a public durbar, a few days after that melancholy event, could neither restrain their tears for his loss, nor find terms to express their admiration of the wonderful progress which he had made, in the sciences which they professed.” Upon the whole, we may join with Dr. Parr, who knew his talents and character, in applying to Sir William Jones his own words: “It is happy for us that this man was born.”

Having attained, by the numerous exertion of his abilities, and in a course of useful service to his country and mankind, a high degree of reputation; and by economy that did not encroach upon his beneficence, a liberal competence, he was prepared, one would have thought, at the age of 47 years, to enjoy dignity with independence. His plans, and the objects of his pursuit, in the prospect of future life, were various and extensive; and he would naturally indulge many pleasing ideas in the view of returning, at a fixed period, to his native country, and to beloved friends, who would anxiously wait for his arrival. Few persons seemed to be more capable of improving and enjoying prolonged life than Sir William Jones; few persons seemed to be better prepared for a more elevated state of progressive improvement.
JONES.

and of permanent felicity, than that to which the most distinguished and prosperous can attain within the regions of mortality.

We will close this article with observing that lady Jones, since the demise of Sir William, has prefixed to the Royal Society a collection of MSS. Sanscrit and Arabic, which he reckoned inestimable, and also another large collection of Eastern MSS.; of which a catalogue, compiled by Mr. Wilkins, is inserted in the 13th volume of Sir William Jones's Works, 6vo. ed.

Jones, Sir Thomas, lord chief justice of the Common Pleas in the reign of Charles II. and James II., is celebrated for his reply to the latter, who confounded him on his disputing power, and failed he could form have twelve judges of his opinion; Sir Thomas answered, "Twelve judges you may possibly find, sir, but not twelve lawyers." He was author of Reports. Granger.

Jones, Jeremiah, a learned English non-conformist divine in the eighteenth century, is supposed to have been born about the year 1693. It is not known where he received his grammar learning, but he was, at an early age, distinguished for his proficiency in useful knowledge. He published his academical studies under the tuition of his uncle, the Rev. Samuel Jones of Tewksbury, in Gloucestershire, from whose seminary many pupils were sent into the world, who became distinguished for their literature or rank in life. Among these were Butler, afterwards bishop of Durham; Secker, afterwards archbishop of Canterbury; and Samuel Chandler, minister of the Old Jewry meeting-house. When Mr. Jones had finished his course of academical learning, he settled with a congregation of Protestant Dissenters at Aveing, in Gloucestershire. He obtained a high character for sound and very extensive learning; and he was popular as a preacher. Though a hard student and a profound scholar his manners were not severe or forbidding; he would often relax from his studies and join a party in his neighbourhood in the exercise of bowls. He died in 1724, when he was only in his thirty-first year. During his life he published "A Vindication of the former Part of St. Matthew's Gospel, &c." But his most valuable and important work, which he had prepared for the press before his death, but which was not published till the year 1762, was his "New and full Method of settling the Canonical Authority of the New Testament." The works of Mr. Jones remain as monuments of his learning, ingenuity, and indefatigable industry, and would have done credit to the affability and dulness of a literary man of fifty. They were become exceedingly scarce, and bore a very high price, when, about twenty years since, the compilers of the Calendar prens published them. "Mr. Jones," observes Dr. Malthy, "has brought together, with uncommon diligence and judgment, the external evidence for the authenticity of the canonical books; and he has, with equal ability and fairness, stated his reasons for deciding against the apocryphal." Had his life been spared, Mr. Jones would have drawn up another and distinct volume on the apocritical fathers. Monthly Magazine.

Jones, William, a worthy clergyman of the church of England, was born at Lowick, in Northamptonshire, in the year 1726. He laid a good foundation of grammar learning in the country, and when he was of a proper age he was admitted a scholar at the Charter-House in London, where he made rapid progress in the Latin and Greek languages, and at the same time showed a turn for philosophical pursuits. When he was about eighteen years of age, he entered at University college, Oxford, and in this seminary he pursued the usual course of studies with unremitting diligence. Here he adopted the Hutchinsonian opinions in theology and natural philosophy. Mr. Jones was admitted to the degree of B. A. in the year 1749, and was, in the same year, admitted to deacon's orders. In 1751, he was ordained priest, and in 1753, he published his "Full Answer to Bishop Chilton's Essay on Spirit," in which he endeavoured to support the cause of orthodoxy by an appeal to the religion and learning of heathen antiquity. His next work was entitled the "Catholic Doctrine of the Trinity," which was favourably received by the orthodox party. He now engaged in a course of experiments with the view of elucidating and establishing his favourite theory. In this he was liberally supported by friends who published among themselves, a very large sum, to enable him to purchase such an apparatus as he found in need of. The result of his labours was "An Essay on the first Principles of Natural Philosophy," published in 1762. In the year 1764, he was presented by archbishop Seeker with the vicarage of Beverley, in Kent. Here, to increase his income, he undertook the tuition of a few pupils, an office for which he was admirably qualified. In 1765, the archbishop presented him to the rectory of Pluckley, where he continued his plan of education, and at the same time discharged the parochial duties with exemplary zeal and diligence. In the year 1769, he published "A Letter to a Young Gentleman at Oxford, intended for Holy Orders, containing some Reasonable Caution against Errors in Doctrine." From this time, to the year 1781, he published several other pieces, chiefly theological, and in the latter year he gave the world his "Physiological Disquisitions, or Discourses concerning the Natural Philosophy of the Elements." This work contains much instructive, and much fanciful matter, ingeniously applied in an attempt to investigate the causes of things, and to construct a theory of nature on the principles of the author's favourite system. His next publication was theological; it consisted of lectures on the figurative language of the Holy Scriptures, and the interpretation of it from the Scripture itself. This was published in 1788, and, in 1790, he gave the public two volumes of sermons on moral and religious subjects, which include discourses on natural history, delivered at an annual lecture at Shore-ditch church, of which the preacher is appointed by the Royal Society. In the year 1792 he employed his pen in the service of politics, and printed a two-penny pamphlet entitled "A Letter from Thomas Bull to his Brother John," which was most indolently circulated throughout the kingdom by the friends of administration. Mr. Jones attempted to form a society "for the reformation of principles," but it did not succeed; he was the founder of the periodical publication entitled the "British Critic," and he edited a collection of tracts in two volumes, which had been originally published by Mr. Law, Mr. Norris, Dr. Horne, and others. This work was entitled "The Scholar armed against the Errors of the Time, or a Collection of Tracts on the Principles and Evidences of Christianity, the Constitution of the Church, and Authority of civil Government." In 1795 he published "Memoirs of the Life, Studies, and Writings of the Right Reverend George Horne, D.D. late lord bishop of Norwich," to the second edition of which he prefixed a concise exposition of Mr. Hutchinson's leading theological and philosophical opinions. His last publication was "A Discourse on the Use and Intention of Some Remarkable Passages of Scripture, &c." Shortly after this, he suffered most severely from a paralytic seizure, which at length, in February 1800,
JON

1830, put an end to his life in the seventy-fourth year of his age. Mr. Jones's learning was very respectable, his attachment to truth was zealous and ardent, and his moral conduct highly exemplary. He delighted in doing good, and was a vigilant and affectionate pastor. He was, in addition to his other learning, a proficient in music, and composed ten church-pieces for the organ, and four anthems, which have been much admired. His works have been published in 12 vols. 8vo. See Gentleman's Magazine for 1800.

JONES, Paul, a naval adventurer, was a native of Selkirk, in Scotland, but settling in America, he obtained, in 1775, the command of a ship under commodore Hopkins, and distinguished himself in several engagements, on which account he received a captain's commission. He then sailed to France, and being well acquainted with the coast of Ireland, and the northern part of England, he conceived the design of effecting a deft. He accordingly landed at Whitehaven, and did considerable mischief there. He afterwards sailed for Scotland, where he landed on the estate of the earl of Selkirk, and plundered his lordship's house of all the plate: he next took the Drake fleet of war, with which he went to Brest. After this he sailed round Ireland to the North Sea, where he captured the Serapis frigate, and another armed vessel, both of which he captured off Flamborough-head. For these services the king of France conferred on him the order of merit, and gave him a gold laced sword. We hear no more of his exploits after the conclusion of the American war. He died at Paris in 1792.

Monthly Mag.

JONES, in Geography, a county of North Carolina, in Newbern district, bounded N. by Craven, and well watered by the river Trent and its tributary streams. It contains 4241 free inhabitants, and 1899 slaves. Its chief town is Trenton.

JONES, St., a town of America, in Kent county, Delaware, containing 1786 inhabitants.

JONES's Creek, a river of Pennsylvania, which runs into the Delaware. N. lat. 40° 58'. W. long. 75° 15'.

JONES's Island, an island in Hudson's bay. N. lat. 61° 52'. W. long. 63°.

JONES's Key, a small island in the Spanish Main, near the Morquot shore, surrounded with rocks. N. lat. 15° 35'. W. long. 82° 27'.

JONES's Town, in Pennsylvania. See WILLIAMSBURG.

JONESBOROUGH, a post-town of America, and chief town of Wallingford district, in Tennesse, and also the seat of the district and county courts, 26 miles from Greenville and 40 from Abingdon, in Virginia. Also, the chief and post-town of Camden county, Edenton district, North Carolina; containing a court-house and a few dwelling houses.

JONESIA, in Botany, is a genus dedicated by Dr. Roxburgh to the memory of the celebrated Sir William Jones, who, amongst the varied and unvalued accomplishments which he attained in almost every department of science, was by no means unskilful in botanical researches. Roxb. Afrat. Researches, v. 4. 355. Wildl. Sp. Pl. v. 2. 287. (Ajogon; Hort. Malabar. v. 5. 117. t. 59.) Fläis and order, Hiptamadia Monogon. Nat. Ord. . . . . . . ?

Eff. Ch. Calyx of two leaves. Corolla funncl-shaped, with a closed, flaky tube; limb four-creft. Peduncle a little ring bearing the flaments, inserted into the throat of the tube of the corolla. Germin pedicellated. Podshaped like a cymatic, turgid, containing from four to eight seeds.

1. J. pinnata. Wildl. (J. Acora; Roxb. Afrat. Researches, v. 4. 355.) A native of the East Indies.—This

tree rifies to the height of about 15 feet. Root whitish, covered with a blackish bark, indomurn, firmly fixed in the ground and spreading by means of numerous fibres. Leaves alternate, unequally pinnate, confiding of from four to six pairs of oblong-lanceolate, smooth, flaky, strong leaves. Flowers making a dense cyme, odorous, of a fine yellow colour. Stamina long and slender, of a beautiful flaky red, with dark purple spots. Style greenish-white, with a round tip.

We have here a beautiful specimen of this plant which was gathered and presented by lord Valentin in his Travels through India; and this authorizes us to say that the Ajogon or the Hiptamadia Monogon is a most correct delineation of our Jonesia. It is found in gardens about Calcutta, where it grows to be a very handsome tree. The plants and seeds were originally brought from the interior of the country, where it is indigenous.

JONGLEURS, musicians, players on instruments, in the infancy of French poetry, who attached themselves to the troubadours or provincial poets.

The history of the French theatre informs us that a kind of merry-andrews were thus called that accompanied the troubadours, who began to flourish about the beginning of the eleventh century. The term Jongleur seems to be a corruption of the Latin word joculator, in French joueur, and in English player on an instrument. Mention is made of the jongleurs from the time of the emperor Henry II., who died in 1156. As they played upon different instruments, they associated with the troubadours and singers, to execute the works of the first, and thus, in their company they gained admittance into the palaces of kings and princes, and drew from them magnificent presents. Some time after the death of Joan I., queen of Naples and Sicily, and countess of Provence, which happened January 1382, all those of the profession of troubadours and jongleurs, separated into two different classes of actors. Some, under the ancient name of trobairists, joined singing to instruments, or the reception of voices; others simply took the name of players, or joculators, as they were named in their certificates.

About the year 1330, the minstrels of Paris, including the jongleurs, formed themselves into a company, and obtained a charter. The police frequently reproved their licentiousness, and regulated their conduct: Philip Augustus banished them the first year of his reign; but they were recalled by his successors, and united under the general name of menefraudus, minstrels; having a chief appointed over them, who was called king of the minstrels. Lewis IX. exempted them from a tariff or toll at the entrance into Paris, on condition that they would sing a song and make their monkeys dance to the tollman, perhaps to prove their title to such indulgence; and hence arose the well-known proverb: Payer en gambades et en monnoye de fange.

The associated minstrels inhabited a particular street, to which they gave the name, which it still retains, of St. Julien des Menefriers. It was here that the public was provided with minstrels for weddings and parties of pleasure; but as a greater number of them usually attended on such occasions than were ordered, and all expected to be paid the same price, William de Germont, provost of Paris, in 1331 prohibited the jongleurs and jongleresses from going to those who required their performance in greater numbers than had been stipulated, upon a severe penalty. In 1395 their libertinism and immoralities again incurred the ceniture of government, by which it was strlly enjoined that they should henceforth, neither in public nor private, speak, act, or sing any thing that was indecorous or unfit for modest eyes and ears, upon
pain of two months' imprisonment, and living on bread and water.

Though the word minstrel, in English, is confined to strolling musicians, players on instruments; yet the term jongleur, in old French, included buffoons, fortune-tellers, flight of hand, tumblers, &c. besides viulins, or performers on the viol or viol; jugars, or flute players; mufarts, or players on other instruments; comiques, or comedians.

All these, at last, assumed the name of jongleurs, as the most ancient, and the women who followed this profession were designated jongleuresses. They settled at Paris in one particular street, which thence was called "la rue des jongleurs," and which is still called the street of "St. Julien des Merciers." In that street people used to apply for performers on festivals, and for parties of pleasure.

By an ordinance of William of Clermont, provost of Paris, 14th Sept. 1355, the jongleurs were forbidden to utter, retell, or sing in public places, or elsewhere, any thing that would occasion scandal, on pain of fine and two months' imprisonment. Since that time we hear no more of them, except their dancing and performing tricks with swords and other weapons. These were called battalores, in Fr. bateleurs, merry-makews; and, at length, tumblers and ropedancers. See MINSTRELS.

IONIA, in Ancient Geography, so called from the Ionians, who inhabited this part of Asia Minor, was bounded on the N. by Æolia; on the W. by the Egean and Icarian seas; on the S. by Caria; and on the E. by Lydia and part of Caria. It lies between the 37th and 40th degrees of north latitude, but its extent in longitude, which has not been accurately determined, was inconsiderable. The most remarkable cities of Ionia were Phocaea, Smyrna, Clazomenae, Erythrae, Teos, Lebadus, Colophon, Ephesus, Priene, and Miletus. The islands of Chios and Samos were likewise inhabited by the Ionians, and belonged to their confederacy. See the next article.

IONIANS, constitute a clafs of people among those who were the most celebrated of the Greeks. They derived their origin from the Helles, who were so called from Helen, the son of Deucalion, and who formed a small tribe in Thessaly; and from Dorus, Æolus, and Ion, his more remote descendants, the Hellesenes were discriminated by the names of Dorian, Æolian, and Ionian. The name of the latter was gradually lost in the more illustrious appellation of Athenians, settled in the lefs barren parts of Attica. (See ATTICA and ATHENS.) When the Heraclean took possession of the Peloponnesus, 80 years after the taking of Troy, B.C. 1104, a signal revolution took place in several states of Greece; and those tribes, which occupied the islands and coasts of Asia Minor, were either expelled by their conquerors, or migrated to seek new settlements. The Æolians were the first of these emigrants, they crossed the Hellespont 88 years after the taking of Troy, B.C. 1096, and established themselves in the country, afterwards called Æolis or Æolia. According to Blair's tables their migration took place before the return of the Heraclides, in the year B.C. 1124. (See ÆOLIANS.) Upon the death of Codrus, B.C. 1070, the monarchical form of government was abolished in Athens, and succeeded by the administration of Archons. Dissatisfied probably with this change, Nceles and Androcles, younger sons of Codrus, determined to leave their country. Accordingly being joined by many refugees, and Athenian citizens, who complained that Attica was too narrow and barren for maintaining the increasing number of its inhabitants, failed to Asia Minor, and, expelling the ancient inhabitants, fixed the central and most beautiful portion of the Asiatic coast, Their colonies were gradually diffused from the banks of the Hermus to the promontory of Poseidion. They afterwards took possession of Chios and Samos; and all these countries were united by the common name of Ionia, to denote that the Ionians composed the most numerous division of the colony. The Ionia migration is fixed in Blair's tables at the year B.C. 1044, 60 years after the return of the Heraclides; but others refer it to the year B.C. 1057. The last tribe which emigrated was that of the Dorians, who, in the year B.C. 944, failed to the islands of Rhodes and Crete, already peopled by Doric tribes; while others transported themselves to the peninsula of Caria, which, in honour of their mother country, received the name of Doris. (See DORIS.) In consequence of this establishment, which was formed 240 years after the Trojan war, the western coast of Asia Minor was planted by the Æolians in the north, the Ionians in the middle, and the Dorians in the south. The Ionians, in particular, settled in a country of great extent and fertility, enjoying the most delicious climate, and peculiarly adapted to a commercial intercourse with the most improved nations of antiquity. Thus favoured, they silently flourished in peace and prosperity, till their growing numbers and wealth excited the avarice or jealousy of the powerful Asiatics. They were successively conquered by the Lydians and Persians, but never thoroughly subdued. "Having imbibed," says Dr. Gillies (Hist. of Asia. Greece, vol. 1. chap. 4.) "the principles of European liberty, they spurned the yoke of Asiatic bondage. In their glorious struggles to resume the character of freemen, they solicited and obtained the assistance of their Athenian ancestors, and occasioned that memorable rivalry between the Greeks and Persians, which having lasted two centuries, ended in the destruction of the Persian empire. In this illustrious contest, the first successes of the Greeks against enemies far more powerful, and incomparably more numerous than themselves, inspired them with an enthusiasm of valour. Their exploits merited not only praise but wonder; and seemed fit subjects for that historical romance, which, in the progress of literature, naturally succeeds to epic poetry." In process of time the Ionians, possessing the delightful country above-mentioned, together with the mouths of great rivers, having before them convenient and capacious harbours, and behind, the wealthy and populous nations of Asia, whose commerce they enjoyed and engrossed, attained such early and rapid prosperity in the arts of navigation and traffic, as raised the cities of Miletus, Colophon, and Phocaea, to an extraordinary pitch of opulence and grandeur. Their population increasing with their prosperity, they diffused new colonies everywhere; and, having obtained footing in Egypt, in the eighth century before Christ, they acquired, and thenceforth preferred, the exclusive commerce of that ancient and powerful kingdom. Their territories, though in their greatest breadth comprised between the sea and the dominions of Lydia to the extent of scarcely forty miles, became not only flourishing in peace, but formidable in war. With the utmost industry and perseverance they improved and ennobled the useful and elegant arts, which they found already practiced among the Phrygians and Lydians. They incorporated the muses of those nations with their own. Their poetry far excelled whatever Pagan antiquity could boast most precious: They rivalled the skill of their neighbours in moulding clay and casting brass. They appear to have been the first people who made statues of marble. The Doric and Ionia orders of architecture perpetuate, in their names, the honour of their inventors. Painting was first reduced to rule, and practised with success among the Greeks; and we may be assured, that, during the
the seventh century before Christ, the Ionians surpassed all their neighbours, and even the Phoenicians, in the arts of design, since the magnificent presents which the far-famed oracle of Delphi received from the orientation or piety of the Lydian kings, were chiefly the productions of Ionian artists. In the following century Ionia gave birth to philosophy; and both science and taste were diffused from that country over Greece, Italy, and Sicily. (Gillies, ubi supr.) The Ionians, however, long degenerated from the valour of their ancestors, and became a superfluous, effeminate, and voluptuous people, melancholy that, in the time of Herodotus, they were looked upon as quite unfit for any military service. They and the Greek colonies settled in Asia, enjoyed their liberties, and lived, according to their own laws, from the time of their migration in the reign of Croesus, king of Lydia, to whose superior power they were forced to submit, after having baffled all the attempts of his predecessors. Before Cyrus invaded Lower Asia, he casually interred the Ionians (B. C. 547) to share the glory of his arms; but having lived at ease under the mild government of Croesus, they preferred their allegiance to him before the friendship of another unknown master. Accordingly they opposed him when he first invaded Lydia, and rejected the advantageous proposals of that prince: but after the defeat of Croesus they sent ambassadors to the conqueror, offering submission upon the terms which had been formerly granted them by Croesus. Cyrus having heard them with attention, answered them by the following apologue: "A piper seeing numerous shoals of fishes in the sea, and imagining he might entice them ashore by his music, began to play; but finding his hopes disappointed, he threw a net into the water, and drew a great number to the land. When he saw the fishes leaping on the ground, since you would not dance, said he, to my pipe before, it is unnecessary for you now to dance, since I have ceased to play." They now perceived that if they would escape the rigour of servitude, they must owe their safety to the fierce exertions of a brave defence, not to the clemency of Cyrus. The Lacedaemonians, to whom they applied, interposed in their behalf, and remonstrated with Cyrus against his design of subduing the Asiatic Greeks; but without effect. The Ionians had previously formed a powerful confederacy with the other states. Cyrus, having ordered Croesus into captivity, was eager to return towards the East to complete his conquests in Upper Asia; and he committed the reduction of all the countries of Lower Asia to the skill of his lieutenant, Harpagus (B. C. 539.) This general, in a few months, completely executed his commission, and made himself master of all the countries in Lower Asia, policed by either Greeks or Barbarians. In the reign of Darius Hyllapes, they made an attempt to recover their ancient liberty, and maintained a war against the whole power of the Persian monarch for six years; but they were constrained to submit, and punished with great severity for their presumption in endeavouring to regain their rights. The Ionians afflicted Xerxes in his expedition against Athens with 100 ships; but they were persuaded by Themistocles to abandon the Persians, and their flight contributed not a little to the famous victory gained by the Athenians at Salamis. A similar expedition was recurred to at Mycale, so that few Persians escaped slaughter. The Lacedaemonians were so pleased with their behaviour on this occasion, that they proposed to transplant them out of Asia into Greece; but they declined accepting the proposal. On the conclusion of the peace between the Greeks and Persians, which happened in the reign of Artaxerxes, one of the articles sworn to by both parties was, that all the Greek states of Asia should be made free, and allowed to live according to their own laws. The Ionians, thus delivered from the Persian yoke, formed an alliance with the Athenians; but were treated by them rather like subjects than allies. Their fortune was various; at one time subject to the Persians, and at another time revolting from them, till they were at length delivered by Alexander, who restored all the Greeks in Asia to the enjoyment of their ancient rights and privileges. After the death of Alexander, they fell under the power of the kings of Syria, till the Romans obliged Antiochus III., furnished the Great, to grant the same liberty to the Greek colonies in Asia, which they had procured for the Greek states in Europe. On this occasion, most of the free cities entered into an alliance with Rome, and enjoyed that kind of liberty which the Romans offered to grant; till they were again brought under subjection by the famous Mithridates, king of Pontus, whom they joined against the Romans. By his order they massacred, without distinction, all the Romans and Italians whom they met, or the facility of the climate, had drawn into Asia. Nor would they have suffered even their famous temple of Diana to be an asylum to those who fled to it for refuge. Upon Sylla's arrival in Asia they abandoned Mithridates, and declared for the Romans. Sylla, having routed all the armies of Mithridates, and reduced all the Lucian Asia, revenged on the Athenians the death of so many thousand Romans, whom they had inhumanly murdered in compliance with the savage orders of Mithridates, by depriving them of their liberty, and laying such heavy taxes and fines on their cities, as reduced them to beggary. The city of Ephesus was treated with the greatest severity; Sylla having suffered his soldiers to live there at discretion, and obliged the inhabitants to pay every officer 50 drachmas, and every soldier 16 denaries a day. The whole sum which the revolted cities of Asia paid Sylla, amounted to 220,000 talents, that is, three millions eight hundred and seventy-five thousand pounds sterling; for the raising of which they were forced to sell not only their moveables, but even a great part of their lands. This was a most fatal blow to Asia; nor did the inhabitants ever after recover their ancient splendour, notwithstanding the favour shewn them by many of the emperors, under whose protection they enjoyed some fumes of liberty. (Gillies's Hist. of Greece. Anc. Hist. vol. vi.)

IONIC ORDER, an order of Architecture, which owes its invention to the people of Ionia, and was first employed in the temple of Diana, at Ephesus. This order is an improvement upon the Doric; the column is more slender and graceful, and, according to Vitruvius, is intended to determine the delicate proportions of the female figure, as the Doric indicates the stronger characteristics of the male. This idea, he says, is preserved throughout its decorations; the capital having two spirals, peculiar to this order, on either side, in imitation of ringlets of hair projecting from the head; the cymatium indicates the locks hanging over the forehead; while the mouldings of the base represent the turn and shape of the shoes worn by women in the age when the order was invented. Its general appearance is simple, though graceful and majestic; and as forming a medium between the masculine Doric and the virginal tenderness of the Corinthian; it has been, in figurative language, compared to a sedate matron in decent, rather than in rich attire.

This order may be used in all places consecrated to peace and tranquillity; accordingly we meet with it in churches, colleges, and libraries; and the ancients used it in temples dedicated
dedicated to Diana, Juno, Apollo, Fortune, Concord, &c. It may also be employed in palaces, halls of justice, and private houses.

In erecting the temple at Ephesus, the bold characteristics of the original but were omitted; and instead of the triglyphs and mutules of the Doric order, the more delicate dentils of the Ionic were substituted. The omission of these large members obviates the difficulty experienced in the execution of the Doric in confined situations, particularly in internal angles.

The Ionic base, according to Vitruvius, consists of a torus and two scoties, with aflatagris between them. In the Athenian Ioniсs, the base consists of two tori, with a scotia or trochilus between them, and two fillets, each separating the scotia from the torus above and below. The fillet above the torus generally projects as far as the extremity of the upper torus, and the lower fillet beyond it. The scotia is very flat, and its section forms an elliptic curve, joining the fillet on each side. The tori and scotia are nearly of equal height. In the Ionic temple on the Illyr, a bead and fillet are employed above the upper torus, joining the fillet to the face of the column. In this temple, and in that of Erechtheum, the upper torus is fluted, except the lower part, where it joins the upper surface of the fillet, which is preferred entire. The bases of the anta of the latter temple are also receded. In the temple of Minerva Polias, the upper scotia is enriched with a guilloche, and the bases of the anta are fluted, the flutes being separated from each other by two small cylinindrical mouldings of a quadrantal section, which join each other at their convexities. This is the true Attic bow, it was invented by the Athenians, and is the most favourite base both with the ancients and moderns, being lighter in its upper part than the Ionic, more pleasing in its contour, and elegant in its general appearance. The Romans did not confine the use of this base to their Ioniсs, but very frequently adopted it in the Corinthian and Composite orders. They, however, differed very much from the Greeks in the proportions they assigned to it; for they always make the upper torus of a less height than the lower one, have both tori plain, and give the scotia a much greater concavity. The bases of the Ionic and Corinthian orders on the Colosseum, the Ionic on the theatre of Marcellus, and the temple of Fortuna Virilis at Rome, have nearly the same proportions with those described by Vitruvius. In the temples of Minerva Polias, at Priene, and of Apollo Didyma, near Miletus, the Ionic bases consist of a large torus, three pair of aflatagris, separated by two scotiae inverted towards each other; the upper pair of aflatagris lying below the torus. In the former temple the torus is elliptical, and separated from the shaft by the intervention of an aflatagris. The lower part of this torus is also fluted, and there is a fluted cornice at the upper part near the head. In the latter temple the upper torus is plain, of a semi-circular section, with a narrow fillet between each bead of every pair. The base of the Attic Ioniсs differ very little from that of Vitruvius, except that they have the scotia inverted towards each other, which gives a greater variety in the profile than when both stand in the reverse position. The Ioniсs also sometimes used the Attic base, as may be seen in the temple of Bacchus, at Teos.

The Ioniс shaft is sometimes plain, but more frequently fluted and having fillets, with an equal number of fillets.

The volute is a distinguishing feature in this order, and is very much varied. In all the Athenian Ioniсs, and in the temple of Minerva Polias, at Priene, the lower edge of the canal between the volutes is formed into a graceful curve, bending downwards, and coiling round the spirals which form the volutes. The volutes of the capitals of the temples of Minerva Polias, and of Erechtheum at Athens, exceed every other remain of antiquity for singularity and beauty: each volute has a double channel, formed by two distinct spiral borders, which leave between them a deep reces or groove, diminishing gradually in its breadth till it is entirely lost on the side of the eye. In the former temple, the shaft is terminated with a single fillet below the lower edges of the volutes; and in the latter, with a fillet and aflatagris. In both, the Colorino is decorated with wood-bines, formed alike in the alternate courses, but differing in the adjoining ones. The upper annular moulding of the column is of a semi-circular section, embellished with a guilloche. In the temple of Bacchus, at Teos, the great theatre at Laodicea, and in all the Roman Ioniсs, the connecting channel of the volutes has no border on the lower edge, but is terminated with a horizontal line, which falls a tangent to the beginning of the second revolution of each volute. When columns are given to the flanks as well as on the front of a building, the angular volute of the outside column is double, and made to face both the contiguous sides of the building; examples of which are to be met with in the temples of Fortuna Virilis at Rome, of Minerva Polias at Priene, of Bacchus at Teos, and of Erechtheum, and the temple on the Illyr, at Athens. Sometimes the capitals of all the columns are made to face the four sides of the abacus alike, as in the temple of Concord at Rome, from which example the Scamozzian capital, as it is called, was first imitated by Michael Angelo, as may be seen in the Conservatorium, embellished by him with this capital during the pontificate of Paul III. before Scamozz was known as an architect.

Both Grecian and Roman Ioniс capitals have the echinus, aflatagris, and fillet. The echinus is uniformly cut into eggs, surmounted with borders, and tongues between every two borders. The aflatagris consists of a row of beads, two large and two small alternately. In all the Roman buildings, except the Colosseum, these mouldings are cut alike, differing only in the taste of the foliage.

In the temple of the Illyr, the architrave consists of one broad fascia, crowned with a cymatium. The parts of the cornice visible in front are the corona, with its cymatium, and itsmita. The cymatium of the frieze is wrought under the cornice, and consists of a fima reversa, and head below it. The height of the architrave is about two-fifths of the entablature, and by dividing the upper three-fifths into five other parts, the plain part of the frieze will be found to occupy three, and the cornice two parts. The architraves of the temples of Erechtheum and Minerva Polias at Athens, consist of three fasciae, and a cymatium; the cymatium of the frieze being modified wrought under the cornice. Divide the height of the entablature, from the bottom of the lower fascia to the top of the cymatium of the cornice, into 19 parts, and the architrave, with the part of the frieze that is seen, will be found to occupy 16, viz. eight for the architrave, and as many for the frieze; the other three parts will comprise the cornice, including the larimer and cymatium.

In general, the height of the entablature may be two diameters; but in buildings requiring grandeur as well as elegance, it should not be less than a fourth.

The Attic Ioniс differs materially from the European or Attic. In the former, most of the remains are without the friezes, so that the height of the entablatures cannot be precisely determined, notwithstanding that the architraves and cornices have been accurately measured. In the great theatre
ION

theatre at Laodicea, however, this order has a pulvinated frieze, whose height is rather less than a fifth of that of the whole entablature. In the temples of Bacchus at Teos, and of Minerva Polias at Priene, the architraves are divided into three facies below the cymatium. In all the Attic specimens, the crowning moulding is a fima recta, less in projection than in height; the dentils are constantly used, and their height is about a mean proportion between that of the fima recta and that of the laricer; it being always greater than the height of the laricer, and less than that of the fima recta. The cymatium of the dentilicated band being wrought almost entirely out of the foist of the corona, receded upwards, its elevation is almost concealed from the eye of the beholder. The height of the cornice, from the top of the fima, to the lower edge of the dentils, is about equal to that of the architrave. The attitude of the frieze, exclusive of its cymatium, or upper mouldings, may be taken at about a fourth of the whole entablature. To give it a greater proportion, would make the entablature too high for the columns.

In the Ionic examples of Greece, there is a constant ratio between the upper part of the cornice, from the lower edge of the corona upwards, and the height of the entablature, which is nearly as two to one. This is a very distinct division, occasioned by the great receds of the mouldings under the corona; for which reason the cornice is not reckoned too clumsy, though the whole dentilicated band and cymatium of the frieze be introduced below it; and this seems to be the characteristic difference between the European and Attic Ionics. This order, as found in Ionia, is complete; while the specimens of Attica want the dentil band, though in other respects they are very beautiful. But the most exquisite remains we have of this order, are to be found in the temple of Minerva Polias at Priene, which, for beauty of proportion and elegance of decoration, exceeds every other specimen.

Plate XXVIII. exhibits a representation with the proportions of this magnificent example, the proportions being marked upon the outline.

Plate I. exhibits in figs. 1, 2, 4, 5, different bases applicable to the Ionic orders, fig. 1, from the temple of Jupiter Olympus; fig. 2, from that of Minerva Polias, at Athens; fig. 4, an Ionic base according to Vignola; fig. 5, elevation of the temple of Minerva Polias, at Athens. This is perhaps the most elegant specimen that is to be found of the Ionic capital.

IONIC Architrave, bise, capital, cornice, entablature, frieze, pedistil. See the substantives.

IONIC Dialect, in Grammar, a manner of speaking peculiar to the people of Ionia.

At first, it was the same with the ancient Attic; but passing into Asia, it did not arrive at that delicacy and perfection to which the Athenians attained; instead of that it rather degenerated in Asia Minor; being corrupted by the admission of foreign idioms.

In this dialect it was that Herodotus, Hippocrates, and Galen wrote. See DIALECT.

IONIC &c was the first of the ancient sects of philosophers, and was called the Ionic school.

The founder of this sect was Thales, (see his article) who, being a native of Miletus, in Asia, occasioned his followers to assume the appellation of Ionic.

It was the distinguishing tenet of this sect, that water was the principle of all natural things.

This is what Pindar alludes to in the beginning of his first Olympic ode.

But Thales could not mean to affcet, that water is the efficient cause of the formation of bodies; but merely, that this is the element from which they are produced. It is not improbable, that by "water," he meant to express the same idea, which the Cosmogonists expressed by the word chaos, the notion annexed to which was that of a turbid and muddy mass, from which all things were produced. (See CICERON.) It has been much debated, whether Thales, besides the passive principle in nature, which he called water, admitted an intelligent, efficient cause. Those who have maintained the affirmative lay great stress upon fundry apologists concerning God, which are ascribed by the ancients to this philosopher, particularly the following; that God is the most ancient being, who has neither beginning nor end; that all things are full of God; and that the world is the beautiful work of God. They also allege the testimony of Cicero, who says, (De Nat. Deor. l. c. 10.) that Thales taught, that water is the first principle of all things, and that God is that mind which formed all things out of water. Those who are of the contrary opinion, urge that the ancients, and even Cicero himself, though not very consistently, ascribe to Anaxagoras the honour of having first represented God as the intelligent cause of the universe, and that they regard the fire in Euclid's Elements as the word of God, and only upon traditional testimony, which may be opposed by other authorities. (Elem. Alex. Strom. II. ii. p. 354. Ang de Ca. Dei. I. viii. c. 2. Ensef. Prep. Ensef. I. i. e.)

The truth may probably be this; that Thales, though he did not expressly maintain an independent mind as the efficient cause of nature, admitted the ancient doctrine concerning God, as the animating principle or soul of the world. Concerning the material world, Thales taught, that nothing existed before day, which doctrine he probably borrowed from the Greek theologians, which placed Nat. or Chaos, among the first divinities. He held that flats are fiery bodies; that the moon is an opaque body illuminated by the sun, and that the earth is a spherical body, placed in the middle of the universe. In mathematics, Thales is said to have invented several fundamental propositions, which were afterwards incorporated into the elements of Euclid; particularly the following theorems, viz. that a circle is bisected by its diameter; that the angles at the base of an isosceles triangle are equal; that the vertical angles of two intersecting lines are equal; and that, if two angles and one side of one triangle be equal to two angles and one side of another triangle, the remaining angles and sides are respectively equal; and that the angle in a semicircle is a right angle.

Of his knowledge of the principles of mensuration, and consequently of the doctrine of proportion, his instructions to the Egyptians for finding the height of their pyramids, are a sufficient proof. His method was this; at the termination of the shadow he erected a staff perpendicular to the surface of the earth; and thus obtained two right-angled triangles, which enabled him to infer the ratio of the height of the pyramid to the length of its shadow, from the ratio of the height of the staff to the length of its shadow. (Laert. i. § 24, 25, 27. Proclus in Euclid. I. i. Plin. His. Nat. I. xxxvi. c. 17.) Astronomy, as well as mathematics, seems to have received considerable improvement from Thales.

He was able to predict an eclipse, though probably with no great degree of accuracy as to the time; for Herodotus, who relates this fact (I. i.), only says, that he foretold the year in which it would happen. He taught the Greeks the division of the heavens into five zones, and the oblong and equinoctial points, and approached so near to the knowledge of the true length of the solar revolution, that he corrected their calendar, and made their year to contain 365 days. The seeds of natural science, which had been found by
by Thales, the father of the Grecian philosophy, were successively cherished in their growth by Anaximander. He was followed in the Ionic school by Anaximenes, Anaxagoras, Diogenes Apollonietes, and Archelaus of Miletus, who may be considered as the last preceptor in the original Ionic school. See the several biographical articles. Socrates is commonly reckoned to have been the disciple of Archelaus. He was himself the founder of a school; for an account of which see Socrates and Socratic school. The inferior sects in the Ionic succession were the Cyrenaic, the Megareic, and the Eleatic or Eretriac. Those of higher celebrity were the Academic and the Cynic, from which latter arose the Prisipatic and the Stoic, which was the last branch of the Ionic school. See each of those articles.

The Ionic philosophy, notwithstanding the celebrity of its first professors, soon failed in the Grecian schools, and never afterwards recovered its ancient reputation and authority. This was owing to the fulmination of impiety under which it lay in Athens, to the early growth of new branches from the Socratic Rock, and to the rise and spread of the Eleatic and Epicurean philosophy. In later times, the universal prevalence of the Platonic and Aristotelian systems precluded every idea of reviving the physiology of the Ionic school till, in the 17th century, an attempt was made for this purpose by Bergierd, but in a manner so circuitous and convoluted that this philosopher was commonly ranked among the followers of Aristotile, and even supposed to be deeply tinted with the impurity of his system. Claud Bergierd was born at Molena in Spain in the year 1592, and studies first at Aix, then at Paris, and afterwards at Pisa, where, by the favour of the dukes of Tuscany, he was appointed professor of mathematics and botany. His fame, which spread through Italy, induced the republic of Venice, in the year 1649, to appoint him, with a liberal stipend, professor of philosophy in Padua. Here he remained till his death in 1668. In the year 1652, he published, under a fictitious name, a work entitled "Dubitaciones in Dialogos Galilei de Terra Immobillitate!" but his principal work is his "Circuli Pisani," in which he relates the disputations which were held at Pisa, on the physical writings of Aristotile, and gives his own sentiments upon them. Bergierd, having perceived the folly of that implicit obedience which had been long paid to the authority of the dogmatists, became a determined opponent of his philosophy, not openly, which would have been hazardous, but in the indirect and concealed method of dialogue. Abandoning the Ionic system, he framed a dissertation between the Aristotelians and Ionics, in which he made Aristotile refute the reasoning of Chalcies, and support the doctrine of the Ionic school, by an appeal to experience, as well as by many ingenious arguments. However he saw, and confuted, that both the Peripatetic and Ionic systems were materially defective, and in many particulars erroneous; and therefore much inclined to philosophical scepticism. Nevertheless he endeavoured to prove, that the followers of Thales approached nearer to truth than those of Aristotile, the dangerous tendency of whose tenets, in several particulars, he clearly exposed. Among the doctrines of the dogmatists, those which he chiefly reproached were the following, viz., that the world is eternal; that the residence of the first mover is confined to the outer sphere of the universe; that neither the world, nor any being, can properly be said to have been created; and that there is one soul common to the whole human species. In opposition to these opinions, which Bergierd rejected as capital errors, from which many others made a mine, he maintained the Ionic doctrine of the eternity of the primary particles of matter; of a forming and preexisting mind, by whose agency these particles were collected into distinct bodies; and of the combination and dispersion of these as constituting the formation and dissolution of all things. In short, Bergierd seems to have prepared the way for the revival of the Atomic system of Epicurus, which was, soon after this time, restored and defended by Gafferdi. Brucker's Hist. of Philos. by Emfield, Bayle.

Ionic Transmigration was heretofore a celebrated epocha, which took its rise from the retreat of the Athenian colonists; who, upon the death of Codrus, put themselves under the command of his son Neleus, and established the twelve cities of Ionis in Asia.

Those colonies, according to Eratofihenes, were established fifty years after the return of the Heraclidae; and, according to Maximus, seventy-seven years after the taking of Troy. See Ionis.

Ionic, or Ionic, Mod., in the Ancient Greek Music. The Ionian mode, reckoning from the grave to the acute, is the second of the five middle modes in the Grecian system. This mode was also called Iotan, and Euclid still terms it the grave Pbyrigen mode. See Mode.

IONIS, in Surgery, a calabash of a violet colour.

IONIA, KONDA, Geography, a town of Africa, in the kingdom of Yamma, on the N. side of the Gambia. N. lat. 13° 27', W. long. 15° 50'.

JONKIOPING, a town of Sweden, in the province of Smaland, beautifully situated between two small lakes, at the southern extremity of the Wetter lake; it is the capital of the province, and the seat of the parliament or superior court of justice for the kingdom of Gotland. The town is two miles in circumference, and contains 2000 inhabitants; the houses are mostly of wood, covered with turf. This town contains two faythbourgs, three churches, an arsenal, and a manufacture of arms: 136 miles S.W. of Stockholm. N. lat. 57° 45'. E. long. 13° 50'.

JONKS, or JOVENCUS, in Ship Building, vessels very common in the East Indies, about the bigness of our fly-boats, but differing in form of building, according to the various methods of the nations in those parts. See Junk.

JONOOI, in Geography, a town on the N.W. coast of the island of Timor. S. lat. 5° 50'. E. long. 125° 14'.

JONQUETIA, in Botany, was so called after Denis Jonquet, who, in the year 1665, published the Hortus Regius Paribus, in folio. This catalogue contains about 3000 plants, of which indeed the greater part are only varieties; but amongst them are many Canadian and Alpine plants.—Schreb. 208. Willd. Sp. Fl. v. 2. 750. Mart. Mich. Dict. v. 2. (TAPIRIRA; Aubl. Guinan. v. 1. 370;—Tapirina, Juss. 572.) Cliffs and order, Descendia Pentagyna. Nat. Ord. Tercinartes, Juss.

Gen. Ch. Cal. Perianth of five, roundish, deciduous leaves. Cor. Petals five, roundish, concave, spreading, longer than the calyx. Stam. Filaments ten, shorter than the corolla, affixed to a gland, others roundish. Pist. German five-lobed, surrounded by a glandule; styles none, filaments five. Peric. Capsule somewhat globular, roundish, five-fruited, of one cell and five valves. Seed five, ovate, asillated, each affixed to the valves.

Eff. Ch. Calyx of five leaves. Petals five. Capsule sub-globular, of one cell, five valves, and five arillated seeds.

1. J. paniculata. Willd. (J. guianensis; Mart.—Tapirina guianensis; Aubl. Guinan. t. 188.)—A native of woods in Guiana, where it flowers in November, and brings forth fruit in April. It is there called Tapiri. This tree rises to the height of fifty feet, has a smooth restless bark, and a white uncompact wood. Leaves alternate, unequally pinnate; consisting of four or five pairs of smooth, thin,
3 C

entire, oral, pointed leaflets. *Flowers* small, numerous, white, axillary, and terminating in large, wide, flattened panicles.

JONQUIL. See Narcissus.

JONSON, in Geography, a town of France, and principal place of a district, in the department of the Lower Garonne; nine miles S.S.E. of Toulouse. The place contains 2,500, and the canton 11,959 inhabitants, on a territory of 16,754 square miles, in 20 communes.

JONSBURG, a town of Sweden, in East Götaland, near the coast of the Baltic; 22 miles E. of Norderöping. JONSON, or JONSON, BENJAMIN, in Biography, an English poet, was born, in 1574, at Westminster, about a month after his father's death. He was educated at Westminster school under the learned Camden, and had made great progress in his studies, when his mother, who had married a bricklayer for a second husband, took him from school to work under his father-in-law. From this employment he escaped, enlisted for a common soldier, and served in the army, contending with the Spaniards in the Netherlands. On his return from a service in which he had gained much reputation, he entered himself at St. John's college, Cambridge; but the state of his finances obliged him soon to quit this residence. He next attempted the profession of an actor on the stage, but his talents were but ill adapted to this business; and from the life of an actor he undertook the more arduous task of dramatic writing. He was patronized by the immortal Shakspere. The first piece which Jonson printed was "Every Man in his Humour," acted in 1598; his success in this effort led him to furnish a play yearly, till his time was occupied by the composition of the masques, &c. with which the accession of king James I. was celebrated. In 1619, he produced his "Epigram, or Silent Woman," which is accounted the most perfect of his comedies and in the following year "The Alchemist" was performed with great applause. So indiscreet had his life been, that in 1616 he published a folio volume of his works, and in the same year he received a grant from the king of the salary of poet-laureat for life; the office being at that time occupied by another, but to the duties of which Jonson succeeded in 1619. He continued to write for the court and stage, but, in 1629, one of his comedies was hissed off the stage. From this time he fell into incessant circumstances, owing as well to the negligence of his disposition, as to his fondness for convivial society. It has been asserted, that king Charles I. hearing of his distress, lent him ten pounds, a present very unsuitable to the means of a great monarch, and which the poet received with an ill grace; the fact has, however, been doubted, because in Jonson's works is to be found an epigram, "To king Charles for an hundred pounds he sent me in my sickness, 1629." From this period the powers of his mind and body seemed to droop together, and his later productions are but mendicant poems addressed to different patrons. He died in 1637, at the age of sixty-three. He was interred in Westminster Abbey, and the inscription "O rare Ben Jonson" was placed over his grave. This short sentence speaks in what estimation his talents had been held. He had indeed been regarded as at the head of English poetry, and was addressed by the wits with the reverential title of "Father Ben." The bulk that now marks his place in Westminster Abbey, was put up by the second earl of Oxford. The fame of Jonson is principally founded upon his comedies, which were for a long time reckoned the most perfect in the English language; but they have gradually disappeared from the stage. It is now generally admitted that his excellence was comprised within narrow limits, and chiefly confined in the preservation of the unities and the skilful management of the plot, but he was defective in almost every thing which makes comedy pleasant. "As a general poet, Jonson is for the most part hard, frigid, and tedious, perpetually in pursuit of some uncommon thought, which he wants taste and genius to render striking and agreeable." Biog. Brit.

JONTHI. ASPH, in Botany. See Cellulose.

JONTHOS, in Medicine, signifies small inflamed tumours, or pimples, which occur in the face. It was translated χαράδης by the Latins, which term they also applied to the acne of the Greeks. The χαράδης, or χαράδης, according to Sauvages, "are those small, red, hard, and obliterative tumours, which scarcely ever suppurate, do not itch, are not painful, and only appear in the face." He considers them as of the same nature with the Guta rotunda.

JOOO-BOODANG, in Geography, a town on the W. coast of the island of Celebes. S. lat. 13° 39'. E. long. 119° 21'.

JOOOPA, a circular of Hindoostan, being one of the three great principalities into which Rajputana is divided. It was also named Marwar. In Achaear' division of the empire, these principalities were classed as belonging to the fortah of Agimmer, which is sometimes called Marwaa. This principality lies to the N.W., bordering angularly on the other two, i.e., Oudipour and Jeyemur. The revenues are less than those of the Vain. (See Rajputana.)—Also, a town in the above circur, in the country of Agimmer; 8S miles W.S.W. of Agimmer. N. lat. 27° 16'. E. long. 73° 49'.

JOOIGHDA, a town of Bengal; 160 miles N.W. of Calcutta.

JOOO-JIMDA, a town of Bengal; 70 miles S.E. of Dacca.

JOOOY, a town of Bengal; 14 miles N.E. of Boglpour.

JOOSTLAND, Sr., a small island of Holland, separated from the island of Walcheren, by a narrow channel, and containing one village.

JOOSTELIMA, or JOUTELIMA, two small islands of Japan, near the N. coast of Niphon. S. lat. 37° 56'. E. long. 137° 50'.

JOPPEH, among the ancients, an exclamation used on account of a victory, or some prosperous event. Hesiod thinks that *To Pean* is a contraction of the Hebrew *Jephehn", from Jepperoth, and 753, exultat; and was the same with the Hebrew *Doom*, i.e. *Domus* repolat in natura.* Something like this exclamation still remains among the Sumerians, a people of the West Indies, who, on any joyful occasion, frequently cry out To Peah.

JOPPA, in Ancient Geography, a town of Phoenicia, situated on the southern extremity of the plain of Sharon, on a high hill, which commanded a full prospect of the sea on one side, and of a fertile country on the other. It had the town of Jamnia on the S. ; Cassarea Philistina on the N. ; and Ramat, or Ramala, on the E. ; and it is often mentioned both in the Old and New Testament. The Greeks and Phcenicians ascribe to it a very high antiquity; and it is certain that it existed 500 years before the Chaldaen era, since Joseph marks the limits of the tribe of Dan in the vicinity of Jopho, the Phcenician name of this town. Joppa, which had a good port, and the only one that the Jews had on the Mediterranean, belonged successively to the Chaldeans, Persians, the Egyptians, the Selucidae of Syria; and it was under the dominion of these last 163 years B.C. The inhabitants of this place provoked the indignation of...
indignation of Judas Macchabaeus, by a violation of their treaties, and by precipitating 200 Jews into the sea, which induced him to fall upon them by surprise in the night and to burn all their vessels. Joppa underwent various revolutions until the arrival of Pompey in Syria, about 64 years before our era. This general restricted Judea within its ancient bounds, and obliged Hyrcanus to evacuate the towns of Phoenicia; but Augustus gave this town to Herod. In consequence of the revolt of the Jews, Gallus, Cæcilius, governor of Syria, took it and set it on fire. A.D. 65. The Jews made several efforts to re-establish it; but Vespasian, in the year 67, dispatched a body of troops from Caesarea, who took it without difficulty. The Jews betook themselves for refuge to the sea; but being befted by a violent tempest, more than 4000 of them perished. The Romans again destroyed it. (Josephus de Bell. Jud.)

The town was so entirely ruined during the holy war, that it had scarcely any buildings left standing but the old caille, situated on an eminence above it, and another near the seaside. The town was afterwards rebuilt towards the sea with good store-houses; and is now called Jaffa, or Jafa, which see.

JOPPA, in Geography, a small town of America, in Harford county, Maryland; 20 miles E. by N. of Baltimore. JORBORG, a town of Siamogilia, on the Niemen; 20 miles S. of Rorienne.

JORDAN, in Ancient Geography, the chief river of Palestine, which had its source in the lake of Phiala, about 10 miles N. of that of Samachon; which origin of the river was ascertained by Philip the tetarch, who made the experiment of throwing some flour or chaff into the lake, which came out at the Panion, or Panesas, where the river emerges out of the earth, after having run about 120 furlongs under ground. This lake Phiala, a name commonly given to all other rivers of that kind, is situated in a most delightful country, so well adapted for commerce, that marts and fairs are held in the adjacent places through the summer by the neighbouring inhabitants. The etymology of the name has been variously alligned. Jordan, in Hebrew Jordân, is derived from jored, defendit, or jordan, defenius, from its rapid descent through that country. This origin is more probable than several others which have been given by different writers. Some say that it is formed of the oriental Jor, a stream, and Dan, a town, near which it had its source. Harouni says that this name signifies the "river of delight," or the "delightful river." Others say, that dan or dan signifies depth, whence it was named the "deep river," to distinguish it from others in Palestine, all which were comparatively brooks or rivulets. The Arabs call it Arden or Harden, or Ordonnon; the Persians, Aerdun; and the Nabian geographer Edrisi gives it the name of Zechan, which, in Arabic, signifies swelling or overflowing. Jordan is so considerable, in comparison with others, that it is sometimes styled, by way of emphasis, "the river." The course of the Jordan is mostly foulward, bending a few degrees towards the west. After a run of about ten or twelve miles, it paches quite through the Samachonite lake, whence, after a course of about eighteen or twenty miles more, exclusive of its windings, it enters into the sea of Tiberias on the N. side, and comes out again on the S. side, at a small distance from a city of that name. Thence it proceeds till southerlyward through a plain and desert of about 60 miles, and falls into the Aphlaltite lake. Its course is very rapid, though its bed is deep. Pococke compares its breadth to that of the Thames at Windsor. Shaw gives it only 20 yards, while he states its depth, even at its brink, to be three yards. Its banks are occasionally beautiful, and in some places covered with high and thick reeds, canes, and trees, such as willows and tamarisks, which afford a convenient lodging for lions and other wild beasts. This river, it is said, confantly overflowed its banks about the time of the early harvest, or soon after Easter; and in this respect differed from other rivers, which commonly swell moil during the winter. This inundation has been ascribed to its subterraneous communication with the Nile. But it is more probably owing to the melting of the snows about that time, and the early rain which falls in great abundance. Modern travellers inform us, that it is no longer subject to these overflows; because, as they conceive, it has, by the rapidity of its current, worn its channel deeper than formerly, or, perhaps, diverted some of its waters another way. Its water is commonly very turbid, occasioned by its rapidity; but it is said to be very wholesome and incorrupitable; and superition has even invested it with the property of washing away the sins of mankind. Dr. Pococke, who mentions this circumstance, adds, that not only men, but women, are ambitious of deriving benefit from these saltaceous waters, by bathing and swimming in it, even at the hazard of their lives. The Latin priests erect altars along its banks, where they lay masts to the devout pilgrims. We shall only add, that the plain on both sides of this river, from the sea of Tiberias to the Aphlaltite or Dead sea, is very dry, sultry, and infalubrious during the heat of summer, and every where barren, except in that part which lies near the river, and is watered by it. Anc. It. Hist. vol. ii.

JORDAN, Edward, M. D. in Biography, was born in the year 1569, at High Helden, in Kent, and probably educated at Harrowe, Oxford. After completing his studies in his own country, he travelled abroad, visiting several foreign universities, and taking his degree of doctor in that of Padua. On his return, he practised for a time in London, where
where he became a member of the College of Physicians, and was in great reputation for learning and abilities. He gave an influence of his good sense in detecting the imposture of one Ann Gunter, who was affected with strange and singular symptoms, which were imputed to witchcraft. Dr. Jordan removed, after some time, from London to Bath, where he spent all the latter part of his life, universally respected as well in his private character as in his medical capacity. The judicious and sedentary life which he led, aggravating the disorder to which he was constitutionally subject, the gout and stone, he died in his sixty-third year, on January 7th, 1632. He was author of two publications:

1. "A Brief Discourse of a Disease called the Suffocation of the Mother, &c." Lond. 1632; and 2. "A Discourse of Natural Baths and Mineral Waters." Lond. 1631, 4to. This soon went through a second edition, and was afterwards reprinted in 1669, in 8vo, by Dr. Guidott, and again in 1673. It is a work of considerable learning and ingenuity, written in a clear style and judicious method. Aikin’s Bibl. Mon. of Med.

JORQUERA, a town of Spain, in New Castile, on the Xnacar; 38 miles S.S.E. of Ajoaon.

JORRACH, a town of Arabia, in the province of Hedjas; 188 miles S.S.E. of Mecca.

JOSA, one of the smaller western islands of Scotland, between Scarba and Kerrera.

J. W. J. JOHN, in Biography, born in London in 1608, was son of Renatus Jortin, a native of Bretagne, in France, who came over as a refugee on the repeal of the edict of Nantes, and who was appointed one of the gentlemen of the privy-chamber to king William III. in 1691. He was afterwards secretary to admiral Ruffell, earl of Orford, and Sir Cloudesley Shovel, and perished with the latter when his ship struck on the rocks of Sicily. This was in October 1707, when his son John, only nine years of age, was sent to the Charterhouse as a day-scholar, where he laid the foundation of an exact and elegant classical taste. In 1715 he was admitted professor of Jesus college, Cambridge, and so distinguished himself by his talents and application, that while he was undergraduate, he was engaged, by the recommendation of Dr. Thirlby, to translate some of Euthinus’s notes on Homer for Mr. Pope. He performed the work to the satisfaction of the poet, who, however, did not think it worth while to make any personal enquiry after a young student at college. "I was," says Mr. Jortin, "in some hope, in those days (for I was young), that Mr. Pope would make enquiry about his coadjutor, and take some civil notice of him. But he did not, and I had no notion of obtruding myself upon him—I never saw his face." Mr. Jortin was admitted to the degree of bachelor of arts in January 1718-19, and was elected fellow of Jesus college in October, 1721, and in the following year took his degree of M.A. In this latter year he was appointed one of the moderators at the disputations, and appeared likewise as a writer, by the publication of his "Lath Poetici," a collection of Latin poems, which have been ranked among the most elegant and truly classical compositions of the kind produced by a modern scholar. They have been frequently reprinted, and retain their original reputation. He was admitted to priest’s orders in 1724, and in 1727 was presented by his college to the vicarage of Swavesey, near Cambridge. In 1730, he resigned his vicarage, and settled in London, where he served a chapel belonging to St. Giles in the Fields, in New-street, Bloomsbury, about sixteen years. His first publication, after his arrival in the metropolis, consisted of four sermons on the truth of Christianity, which have since been incorporated in some of his subsequent publications. In the years 1731 and 1732, Mr. Jortin, in conjunction with bishop Pearce, Dr. Taylor, Mr. Upton, Dr. Thirlby, and others, published, in a series of twenty-four six-penny numbers, "Miscellaneous Observations upon Authors, ancient and modern," which were highly applauded by the learned of his own country, and which were translated into the Latin language at Amsterdam. He next published "Remarks on Speyer’s Poems," to which were subjoined "Remarks on Milton"; he published likewise "Remarks on Seneca." In 1747 he was appointed by his friend Mr. Pears, then rector of St. Martin in the Fields, to be afternoon preacher at a chapel in Oxendon-street. In 1749, Mr. Jortin, at the recommendation of archbishop Herring and bishop Sherlock, was appointed preacher of Bayle’s lecture. The substance of the discourses which he delivered on this occasion, was afterwards inserted in his "Remarks upon Ecclesiastical History." Of this work, the first volume was published in 1751, and the second and third in the years 1752 and 1754, the other volumes were given to the world after the author’s death. In 1751, he had been presented by archbishop Herring with the rectory of St. Dunstan in the East; and in the year 1755 he was presented by the same prelate with a Lambeth degree of D.D. The principal work of Dr. Jortin was his "Life of Erasmus," of which the first part was published in 1758, in one volume 400; the second volume, printed in 1760, consisted only of observations on the writings of Erasmus. The groundwork of this piece of biography, is one drawn up by the celebrated Le Clerc, and published in his "Bibliotheca Chieic."

JOSEPH, in Scripture Biography, a Hebrew patriarch, who fulfilled a rank and character that entitled him to particular notice. He was the son of Jacob by his wife Rachel, and born about the year 1743 B.C. As he was the favourite of his father, on account of his personal and mental endowments, he became the object of the jealousy and hatred of his brethren; and they sold him to some Ishmaelites who were travelling to Egypt (B.C. 1725), feigning a tale that he had been devoured by wild beasts. When the Ishmaelites arrived in Egypt, they sold Joseph to Potiphar, an officer of the royal household. In this situation Joseph conducted himself with such prudence, industry, and fidelity, that his master commended all his affairs to his management. After ten years service Potiphar's wife affailed him with a temptation, which every principle of gratitude and honour, as well as of religion, induced him to resist; but the confederation of his integrity was her repentance, and a resolution, as far as he could prevail, to effect her ruin. Accordingly she formed an artful story, intimating that Joseph had made an attempt upon her virtue; and the contriv'd to impose upon her husband Potiphar, and to procure Joseph's commitment to prison. The patriarch's conduct, during his imprisonment, engaged confidence, and he was entrusted with the care of his fellow-prisoners. Among these were two persons of some distinction, who had belonged to Pharaoh's household. Both of them had dreams in the same night, which they communicated to Joseph, and which he understood to interpret. One of them was to be restored to his office, and the other was to be hanged; and the events corresponded to his predictions. Upon the future advancement of one of these persons, who was the chief butler, the other

JOSEFEGROD, a town of Russian Poland, in the palatinate of Braclaw, situated on a river which runs into the Bog; 75 miles S.S.E. of Braclaw.

JOSEPH, in Scripture Biography, a Hebrew patriarch, who fulfilled a rank and character that entitled him to particular notice. He was the son of Jacob by his wife Rachel, and born about the year 1743 B.C. As he was the favourite of his father, on account of his personal and mental endowments, he became the object of the jealousy and hatred of his brethren; and they sold him to some Ishmaelites who were travelling to Egypt (B.C. 1725), feigning a tale that he had been devoured by wild beasts. When the Ishmaelites arrived in Egypt, they sold Joseph to Potiphar, an officer of the royal household. In this situation Joseph conducted himself with such prudence, industry, and fidelity, that his master commended all his affairs to his management. After ten years service Potiphar's wife affailed him with a temptation, which every principle of gratitude and honour, as well as of religion, induced him to resist; but the confederation of his integrity was her repentance, and a resolution, as far as he could prevail, to effect her ruin. Accordingly she formed an artful story, intimating that Joseph had made an attempt upon her virtue; and the contriv'd to impose upon her husband Potiphar, and to procure Joseph's commitment to prison. The patriarch's conduct, during his imprisonment, engaged confidence, and he was entrusted with the care of his fellow-prisoners. Among these were two persons of some distinction, who had belonged to Pharaoh's household. Both of them had dreams in the same night, which they communicated to Joseph, and which he understood to interpret. One of them was to be restored to his office, and the other was to be hanged; and the events corresponded to his predictions. Upon the future advancement of one of these persons, who was the chief butler, the other
Joseph.

other being the chief baker, he was altogether unmindful of Joseph, and made no effort, notwithstanding his application to him, to procure for him his liberty. In process of time Pharaoh had two dreams, by which his mind was much improved, and which none of the wise men who belonged to his court were able to interpret. The chief butler was thus reminded of Joseph, and acknowledging to the king this ingratitude for neglecting him, related the circumstances pertaining to himself and the chief baker. Upon this information, Pharaoh ordered Joseph to be brought to him. The king imparted to him his dreams; and Joseph, modestly declaring all pretensions to superior wisdom, and relying on that divine inspiration with which he was supposed to be favored, interpreted them to his satisfaction. (B.C. 1715.) These dreams and their interpretation it is unnecessary for us minutely to recite. It is sufficient to observe, that the king was then forewarned of seven years of fertility and abundance, which were to be succeeded by the same period of sterility and famine; and he found it necessary to make previous provision accordingly. With this view Joseph, who was near thirty years of age, was appointed general superintendent of the affairs of the kingdom, and invested with authority next to that of Pharaoh himself, who also gave him in marriage the daughter of Potiphar, priest of On. The course of events was precisely such as Joseph had prefigured by his interpretation of Pharaoh's dreams; so that granaries were established under his direction in the cities of Egypt, and corn collected in great quantities, and laid up in stores, during the years of plenty, for the supply, not only of Egypt, but of neighboring countries in the succeeding years of dearth. The years of famine began B.C. 1758. In this period of general distress Jacob sent 12 of his sons, from Canaan to Egypt, in order to purchase corn. As this business was wholly committed to the management of Joseph, they were referred to him. Joseph instantly recognized their persons, though he was unknown to them; but in order the more effectually to prevent their discovery of him, and, probably, to excite in their minds a due sense of their piteous condition, he questioned them in an angry tone, and by an interpreter, concerning their country; and being informed that they had come from the land of Canaan, charged them with being spies, which charge they obviated by giving a true account of their father and family. A younger brother, they said, was left at home with his father, and another was now no more. Joseph still persisted in the charge, and required their verifying the account which they had given of themselves, by dispatching one of their number to fetch their younger brother, while the rest remained in custody. However, he afterwards relented, and proposed that one of them should remain till, the arrival of the younger brother, and that all the rest should go home with corn for their families. During their detention they accused one another for the cruelty of their conduct towards Joseph, who, still feigning himself a stranger to their language, heard their mutual reproaches with an emotion which he could not suppress, and which, therefore, required his withdrawing from them. At length he gave them leave to depart, informing them, that if their account of themselves was true, they would be permitted to traffic in the land. Simeon, who is supposed to have been the principal aggressor in the treatment of Joseph, was kept in custody; and the others were dismissed. Before their departure orders had been given that when the sacks were filled with corn, each man's money should be returned in his sack's mouth. This circumstance, when it was discovered in their journey homewards, very much alarmed them; and they concluded that this was done in order to furnish a pretence for enslaving them when they next visited Egypt. Jacob heard their adventures with surprise and concern, more especially when he found that Simeon was left behind in custody, and that they were compelled to take Benjamin with them before they could obtain his release. At length, as the scarcity increased, and their supply was nearly exhausted, Jacob, with great reluctance, consented to part with Benjamin; and having ordered them to remove presents for the ruler of Egypt, and to carry with them twice as much money as before, he committed them to the king of heaven, and dismissed them. Upon their arrival in Egypt, Joseph, kindred to Pharaoh himself, was kindly received and liberally entertained at a public dinner, which he had provided for them. Some circumstances occurred on this occasion which might have brought their brother to their recollection; but they again departed with their sacks and money as before, and in Benjamin's sack was the silver cup out of which Joseph had drunk. Upon their return towards Canaan they were followed by an officer, who charged them with ingratitude for the hospitality with which they had been treated, and with the theft of his lord's silver cup. All of them protested their innocence; but upon searching the sacks, the cup was found to their great surprise and concern in that of Benjamin. They were therefore taken back to Joseph, who intimated upon detaining Benjamin as a slave, whilst they might be allowed to return home in peace. Recollected the reluctance with which his father had parted with his son Benjamin, and that they were forsworn for his return, they urged various pleas for his being allowed to accompany them. Judah was the advocate for his brother's liberty; and he offered himself as a substitute if he were permitted to return. Joseph was at length overcome; dignity became interchanged with innocence to him; and he could no longer refrain from discovering himself to his brethren. (B.C. 1705.) This part of the sacred history is wrought up with incomparable beauty and pathos, and must suffer by any attempt to abridge it, or to relate it in different language. The discovery being made, they were all received, and particularly Benjamin, his brother by the same mother, with expressions of the tenderest and most affectionate regard; and did Joseph, the viceroy of Egypt, for such was the high rank he occupied, lose any time in acquainting Pharaoh with the arrival of his brother, and with the circumstances of his father and his family? The king immediately gave orders for their being furnished to Egypt, and for setting them in the richest part of the country. Gothen was the district which Joseph allotted to them; and there they were supplied with ample means of subsistence, whilst the inhabitants of other parts of Egypt were suffering great distress on account of the famine, which still continued. The long duration of this calamity drained the people of all their money, and constrained them at length to part with their cattle, their houses, their land, and even their personal freedom for support. (B.C. 1755.) Thus the whole kingdom of Egypt, the lands of the priests excepted, became the domain of the crown; and all the people were reduced to the servile condition of bondmen to the crown. Moreover, the old owners were separated from one another, and dispersed through different parts of the kingdom, that they might thus forget their integrity in lands which they had held, and be excluded from future combinations for regaining them. In this instance, Joseph's zeal for Pharaoh's interest caused him to overlook the bounds which had been fixed, and prohibited from forming combinations for regaining them. In this instance, Joseph's zeal for Pharaoh's interest caused him to overlook the bounds which had been fixed, and prohibited from forming combinations for regaining them. In this instance, Joseph's zeal for Pharaoh's interest caused him to overlook the bounds which had been fixed, and prohibited from forming combinations for regaining them.
Israelites. In the last year of the famine, Joseph informed the Egyptians that they might expect a crop during the following year; and that he would enable them to renew their attention to agriculture, by distributing among them fresh lands, cattle, and corn; but he stipulated this condition with them, that from henceforward the fifth part of all the produce of their lands should be reserved for the king, and that the residue should be their own. From this time, (B.C. 1703;) as the people contented with this regulation, it became a law, that remained in force for several centuries, that the fifth part of the produce of the whole kingdom of Egypt, the lands of the priests excepted, should belong to the crown. After the death of Jacob, and the return of his brethren to Egypt from Canaan, whether they had attended the remains of their father (see Jacob,) they were apprehensive that Joseph might retaliate the injuries which they had done him; and therefore they informed him, by a messenger, that it was their father's dying request that he would forgive them, and continue to afford them his protection. Joseph immediately took an opportunity of removing their suspicion and anxiety, by repeated assurances of his unalterable affection and zealous concern for their welfare. Having survived his father about 80 years, he informed his brethren (B.C. 1653,) that God, according to his promise, would bring their posterity from Egypt to the land of Canaan; and he therefore made them pledge themselves on oath, to bury him with his ancestors. Joseph, having occupied under his sovereignty the office of viceroy of Egypt, during 80 years, retained it till his death, which happened when he had attained the age of 110 years, in the year 1655 B.C. When the Israelites took their departure from Egypt, they observed his injunction concerning the removal of his body; and as we read in Josh. xxiv. 32. it was buried at Shechem, in the field which Jacob bought of Hamor. From Jerome we learn, that the Israelites erected a noble monument to his memory, which was to be seen in his time. We shall not enlarge this article by an account of the tales of the Talmudists and of the Koran (chap. xii.) but refer the reader to D'Herbelot's Bibl. Orient. art. Joa[\textipa]., for specimens of these legendary tales. Gen. xxx.-1. Anc. H. Hist. vol. iii.

Joseph I., in Biography, emperor of Germany, son of the emperor Leopold, was born in 1758. He was declared hereditary king of Hungary, and crowned in 1687. In 1690 he was elected king of the Romans, and ascended the imperial throne on the death of his father, in 1705. He purified the syren of the late emperor, and maintained the alliance with France, with England, Holland, and Savoy, in support of the claim of the archduke Charles to the crown of Spain; in which war the allies were successful. Joseph was of a haughty and arbitrary disposition, employed violent measures against all the opposers of his authority, and supported with a high hand all the claims of his house. In 1706 he put the electors of Bavaria and Cologne to the ban of the empire, for taking part with France; and having deprived those princes of a great part of their estates, he showed the same on his own relations and favourites. He quarrelled with the pope, whom he afterwards obliged to recognize his brother the archduke Charles as king of Spain. He made himself master of Italy, and levied contributions on Mantua, Parma, Modena, Lucca, Genoa, and other places. His armies defeated the revolted Hungarians; but in the midst of his successes, he was carried off by the small-pox, in April 1711, at the age of thirty-three, owing it was believed, to the unskilfulness of his physicians. His character has been variously represented. He was imprudent in matters of opposition, active, and enterprising; and frequently pursued from motives of resentment what he had first undertaken from policy. In his temporal capacity, he governed with more despotism than any of his predecessors; and the house of Bavaria was a monument of the inflexibility of his temper. Univ. Hist. Joseph II., emperor of Germany, son of Francis of Lorraine and the empress Maria Theresa, was born at Vienna, in May 1741. Great care was taken of his education; and at the age of thirteen, he was married to Isabella, the infanta of Parma. He had, at an early period, displayed a desire of distinguishing himself, and military glory was his first passion. He was crowned king of the Romans in 1764; and having lost his first wife, to whom he was tenderly attached, he married, in 1765, the sister of the elector of Bavaria. In this same year, on the death of his father Francis I., he succeeded to the imperial crown without opposition. He now displayed great talents and activity, by new-modelling the armies, and reforming all the departments of government. He travelled through his dominions, and visited Prussia, Italy, France, and Russia; and on his return, among many other wise and excellent regulations which he adopted, he set apart one day in every week for receiving petitions and complaints from all his subjects, without any distinction of birth or fortune; and the officers of his court were expressly forbidden to repulse any, even the meanest object, who came to implore his protection. "It behoves me," said the emperor, "to do justice; and it is my invariable intention to render it to all the world, without respect of persons." In the year 1771, Germany suffered the horrors of a famine, which was more or less felt in all the countries of Europe. But in several parts of Germany, the scarcity was so great, that vast numbers of people actually perished for the want of the common necessaries of life. During these calamities, the emperor joined the monarchs of Prussia and Russia in the dismemberment of Poland. The first treaty for this injurious business was signed in 1772, and which finally terminated in the total extinction of that unhappy kingdom. In 1780, by the death of the empress-queen, Joseph succeeded to the crown of Hungary and Bohemia; and in the following year, he issued a decree in favour of the liberty of the press, which was followed by others equally liberal, particularly one in favour of a more liberal toleration. The suppression of the insurrection at Milan may be attributed to the prevalence of a similar spirit in the imperial councils. He extended the privileges of subjects to the Jews; and he showed his attention to economy, by certain regulations relative to pensions, and by retrenching many which had been granted by the benevolent facility of his mother. He promulgated a decree in favour of the liberty of the press; and by one of the articles, he allowed a free circulation to literary reviews, and other periodical publications; he even permitted that all fictitious persons upon the throne itself might be published with full security; he provided they did not concur in the character of libels or pamphlets. "If," he said, "they be founded in justice, we shall profit by them; if not, we shall disregard them." In a journey to the Netherlands, the emperor gained the love of the people by his courtesy and generosity. He carried into effect a project for reforming that line of fortresses which was called the Dutch barrier, and was garrisoned by their forces. These were all dismantled, and the materials sold. On this visit he declared Offend a free port, and ordered several improvements to be made in the harbour at his own expense. The emperor afterwards demanded of the Dutch the free navigation of the Scheldt; but in this he was unsuccessful. On his return to Vienna, he abolished the system of vaflagés; and
and took the most decisive steps in ecclesiastical reform, and
the reduction of the power of the church. Numerous sup-
predictions of religious houses took place throughout all his
dominions; and in an imperial edict, all subordination
whatever, in secular affairs, to the holy see was formally
disclaimed. Such proceedings awakened the most lively
alarms in the papal court; and on this occasion, pope
Pius VI. made a journey to Vienna: but notwithstanding
the very flattering attentions which he received on his arrival,
he found it impossible to procure an intermission of those
reforms, which were now extended to the secular clergy and
hierarchy, as well as to the religious orders or regulars; and
only obtained a refpite for some threatened religious founda-
tions. In 1786 the emperor followed his attack on the
papal authority, by calling an assembly of the ecclesiastical
princes at Reitabon, in which it was resolved to withdraw
from the jurisdiction of the pope. In 1788 a declaration of
war was published against the Turks, and in the same year
the emperor in person reduced Schabatz; but this was fol-
lowed by the defeat of Prince Linchenstein, who fell in the
action. Soon after a bloody battle was fought between the
Imperialists and the Turks, on the heights of Rohadin, in
which neither party could claim the victory. The emperor
now prepared to attempt the reduction of Belgrade; but
notwithstanding the great preparations made on this occasion,
his plans were defeated, and he had to mortification to wit-
tness the rapid destruction of his troops by a dreadful mor-
tality. Pueril fever and dysenteries of the most malignant
d kind spread their influence through the imperial armies:
discontent and complaint became universal; and in a short
time, one of the few armies in the world was reduced, in a
single campaign, to less than half the number of its original
combatants; the remainder being lost by mortality, defec-
tion, and the sword, or rendered incapable of present service
by disease. In the mean time, Joseph was laboring under
the rapid decline of health, but still continued to employ
himself indefatigably in public affairs. These, however,
were mostly of a kind to aggravate, by vexation and anxiety,
his bodily disorder. The Low Countries were again in a
flame, and the most violent measures were taken to reduce
the people to submission. Military execution took place in
several cities, and a general gloom, bordering on despair,
spread over the provinces. At length an open insurrection
broke out, conducted with so much prudence and valour,
that the imperial troops were repeatedly defeated; several
important cities were taken possession of by the insurgents;
and the states of Flanders, on November 2dth, 1789, feizid
the government of the province, openly declaring that the
emperor had forfeited all title to sovereignty. By the end
of the year, Brussels had expelled its garrison; and a treaty
of confederation was formed between all the Belgo-
province as independent states. Joseph, almost on his death-
bed, was further mortified by a remonstrance from the Hun-
garian nobility, demanding the restoration of their ancient
rights and privileges. Willing to die in peace, he con-
fected to all their requisitions, but insisted upon retaining
three articles, which were highly creditable to his heart,
viz. a general toleration, provision for the parochial clergy
out of the revenues of some suppressed monasteries, and cer-
tain concessions in favour of the liberty of the peasants.
He died with great composure, on the 26th of February
1790. Leaving no issue, he was succeeded by his brother
Leopold. Joseph had many private virtues, as well as many
of the qualities of a great and good sovereign. He was
patient of fatigue, and possessed of an ardent mind. He ap-
plied himself with unremitting diligence to the suppression
of intolerance and superstition, and the promotion of indus-
try, throughout his dominions. He has been accused of en-
croaching on the liberties of his Flemish subjects; and it will
be readily conceded that he was not perfect; but his faults
almost vanish among the truly glorious actions which con-
tributed to the aggrandizement of his own name, and the per-
manent felicity of his people. Universal Hill.

Joseph, king of Portugal, of the family of Braganza,
was born in the year 1714, and succeeded his father in 1750.
He was much beloved by his people, a circumstance that
enabled him to effect several important regulations, in which
his good sense and moderation were eminently conspicuous.
Susceptible of the danger of sudden changes, he advanced his
designs by almost imperceptible steps, so as to prevent all
just grounds of alarm and complaint. He subjected the
powers of the infamous Inquisition to some restrictions, by
directing that none of its sentences should be carried into
execution till reviewed and approved by the privy council.
He carried into effect a treaty concluded between Spain
and Portugal just before his father's death, which was considered
as intrinsical to his country, on the principle "that all engage-
ments among sovereigns should be held sacred and inviolable."
This reign was marked, in 1755, with the terrible disaster of
an earthquake, which destroyed a great part of the capital.
A conspiracy in 1758, headed by the duke of Aveiro, and
favoured by the Jesuits, who had been banished from court,
brought his life into great danger. The principal conspira-
tors were feizied and executed, and the whole order of Je-
suits was banished the kingdom. Joseph had afterwards a
dispute with the court of Rome, and a war with Spain: in the
latter, Portugal was affifted by the English, whose bat-
talions, under general Burgoyne, checked the career of the
invaders, and obliged them, before the end of the campaign,
to retreat within their own limits. After the peace of 1763,
little of importance occurred in the affires of Portugal.
The king's councils, in the latter years of his reign, were enti-
tirely governed by the marquis de Pombal, a man of en-
larged views, but of a haughty and violent disposition.
A dispute with Spain, about the limits of the two nations on the
borders of Rio de la Plata in South America, occasioned ho-
tile preparations on both sides, but little was effected by
either. Joseph died February 2777, and was succeeded by
his daughter, Maria Francesa Isabella, who is still queen,
thougli in a deranged state of mind, and an exile in South
America. See PORTUGAL.

Joseph of Exeter, or Josephus Iscanus, is mentioned as
a remarkable example of purity of literary taste and eleg-
eance of style, in an age generally reputed barbarous. He
was a native of Devonshire, and flourished in the close of
the twelfth, and the commencement of the thirteenth cen-
tury. He was an ecclesiastic, and patronized by Baldwin,
archbishop of Canterbury. According to the learned Can-
den, he accompanied Richard I. of England into the Holy
Land. He was author of two epic poems in Latin hexamers.
The first, in six books, is on the Trojan war; the other is
entitled "Antiochus," the war of Antioch, or the Cru-
fade; of this last only a fragment remains, in which the
heroes of Britain are celebrated. The style of Joseph is not
only, for the most part, pure, but rich and ornamented, and
his verfification approaches the best models of antiquity.
His dictior is compounded chiefly of Ovid, Statius, and
Chaucer, the favourite poets of the age. "It is said
Mr. Warton, in his History of English Poetry, "had at that
time produced no poet comparable to him." He was
author of numerous poems, epigrams, and miscellaneous
works.

JOSEPHUS, Flavius, in Biography, an eminent Jewish historian, was born in the year 37, when Caligula was emperor. His father was Mattathias, defended from the ancient high-priests of the Jews: by his mother he was of the royal lineage of the Ammonians, who, for a considerable time, had the supreme government of the Jewish nation. He was educated together with his brother Matthias, and made such proficiency in knowledge, that when he was but fourteen years of age, the high priests, and some of the principal people of the city, came frequently to consult him about the right interpretation of things in the law. In his sixteenth year he retired into the wilderness, where he lived in great obscurity, and habits of self-denial during the space of three years. He studied the principles of the leading sects, and embraced, as the rule of his life and conduct, those of the Pharisees, and being now nineteen years of age, he began to act in public. At the age of twenty-six, he went to Rome, where, by means of a slave-player of his own nation, he obtained an introduction to Toppas, the emperor Nero's wife, by whose intercess the procurers of the release of some priests, whom Felix had sent prisoners from Jerusalem. Returning home, he was appointed by the revolted Jewish governors of the two Galilees, in which capacity, as a general, he bravely defended Jetapata against Vespasian, but which was taken after a siege of forty-seven days. When the city was in the hands of the conqueror, he gave orders to search for Josephus, who had escaped the general massacre, by concealing himself in a cavern cut in a rock. In this gloomy recess he met with forty men of eminence who had concealed themselves, and had with them provisions sufficient for their support several days. Upon being discovered, he propounded to the forty men who had taken refuge there with him, that they should all surrender, and upon their determination rather to perish by mutual wounds, he persuaded them to cast lots successively, who should kill the next man, and by an extraordinary circumstance he and one other were left the survivors of the rest. This single companion was easily prevailed upon to join him in accepting the professed mercy of the Romans. On being taken before Vespasian, he boldly predicted that within a short time the empire would fall to the share of that general, by which prediction, which was afterwards fulfilled, he secured a favourable reception from him; though he was retained as a prisoner on account of the use which Vespasian intended to make of him in the farther prosecution of the war against the Jews. It should seem that Josephus felt himself with the notion that he was inspired with a knowledge of future events. "It is likely" says the judicious and learned Lardner, "that he often thought of Joseph in Egypt, and of Daniel in Babylon, and was in hopes of making a like figure at the court of Rome. But I suppose it may be no disparagement to Josephus to say, that he was not equal to them in wisdom, or in virtue and integrity." As soon as Vespasian ascended to the imperial throne, Josephus was set at liberty, and was taken by Titus with him when he marched to lay siege to Jerusalem. Here he saw the ruin of his country, of which he afterwards became the historian. He was sent into the city with offers of peace upon condition of the submission of his countrymen. They despised his offers, and rejected his counsels with scorn. The Jews now considered him as a deserter and traitor to their cause, and it is a fact that they never manifested any great respect for his writings. During the progress of the siege he did not cease exhorting them to avoid their inevitable fate by a timely surrender, and once, approaching too near the walls, he received a wound which laid him helpless on the ground. At the capture of the city, Josephus obtained the liberation.
JO

S

sion of Matthew and several friends without restraint; he had permission also to give what he pleased out of the ruins; but he contented himself with a copy of the sacred writings. The emperor heaped upon him his favours, and as a mark of his gratitude, he assumed his family surname of Flavius. He employed his leisure in drawing up those works which have immortalized his name. There are, 1. "The History of the Jewish war, and the taking of Jerusalem," in seven books. It was written in the language of his own country, and he afterwards published it in Greek for the benefit of other nations. He proceeds to have written with great fidelity, and appeals, for the truth of his history, to living witnesses. He prefaced the work to Vespasian and Titus, of whom the latter ordered it to be published, and signed it with his own hand to show that it was authentic. 2. "The Jewish Antiquities," in twenty-four books, or the history of the Jews from the creation to the 12th year of Nero, in which the war began. To this is subjoined his life, written by himself, and dedicated to Epaphroditus, of whom we know nothing but from Josephus himself, who describes him as a lover of all kinds of learning, but as principally delighted with the knowledge of history, and this on account of his having been himself concerned in great affairs, and many turns of fortune, and having flown a wonderful vigour of an excellent nature, and an immovable resolution, in them all. 3. He wrote also "Two books against Apion of Alexandria," which is a vindication of the Jewish people against the calumnies of that Egyptian author. 4. A Discourse on the Martyrdom of the Maccabees" is sometimes ascribed to him, but its genuineness is disputed, and Mr. Whiston who translated the other works would not give this a place in his volumes. The works of Josephus, though written for the Jews, are held in high estimation by Christians; his style is pure, agreeable, and sometimes eloquent; he has been called the Greek Livy; and, like that Roman writer, he is fond of displaying the powers of his own imagination by long speeches. The history of the Jewish war, of which he was a spectator, is a most interesting narrative. The best editions of the works of Josephus, are those of Hudson in two vols. folio. Oxford, 1720, and of Hazenard, in two vols. Amsterdam 1726. There have been a multitude of English translations; to that of Whiston we have already referred. Univer. Hist. Lardner. vol. i. and vi. edit. 1788. And Josephus's own Life. JOSUA, or Josephus's own Life. JOSUA, or Josephus's own Life. JOSUA, a canonical book of the Old Testament containing a history of the wars and transactions of the persons whose name it bears, who succeeded Moses in the government of the Israelites, in the year 1551 B.C. at the age of 90 years; and was their commander to the land of Canaan. He was the son of Nun, the tribe of Ephraim, and born in the land of Goshen, in the year 1552 B.C. At the period of the Exodus (which see), Joshua was distinguished by his talents and virtues, so that he was taken into the confidence of Moses, and selected to command the Israelites, when they were attacked by the Amalekites, in their march from mount Horæb to mount Sinai. He was likewise honoured with the privilege of accompanying Moses to mount Sinai, and of remaining with him forty days, when he received directions for the future government of the Israelites, and the laws written on the first tables of stone. He also accompanied Caleb, and other ten persons who were deputed to examine the land of Canaan, previous to the invasion of it by the Israelites. When Moses was apprized of his approaching dissolution, he confirmed Joshua as his successor in the most public and solemn manner. Although he was advanced in years when he conducted the Israelites to Canaan, he performed this arduous undertaking with singular prudence and valour. When they were passing the river of Jordan, in the extraordinary manner which is recorded in their history, he directed two monuments to be erected as a memorial of their miraculous passage, one on the spot where the ark had stood in the bed of the river, and the other on the shore; and from the bank of Jordan he proceeded towards the plains of Jericho, and pitched his tent for the first time in Canaan, the land of which he was taking possession at Gilgal. For the conflicts and successes that attended his future progress, we refer to his history. Having surveyed and divided the lands among the several tribes (B.C. 1455), he governed Israel in peace; and when he became sensible that the termination of his life could be at no great distance, he summoned all the tribes of Israel to Schechem, and read the extraordinary operations of the providence of God in their favour, and having awakened in their minds a becoming sense of gratitude, enforced upon them the will and duty of persevering obedience to his laws, and exhorted them to renew the covenants by which they had already engaged to worship and serve him. This transaction was then solemnly registered, and a monument for perpetuating it was erected near a great oak which was in Schechem. Soon after this event, viz. in the year B.C. 1439, Josiah, having exhibited ample evidence of the propriety of his name, which denoted to Saviour, died in his retirement at Timnath-sera, at the age of 110 years. The book of Josiah, supposed to have been written by himself, and to have received some additions from Samuel and Ezra, (see Bible and Canon,) may be divided into three parts; the first of which is a history of the conquest of the land of Canaan; the second, which begins at the twelfth chapter, is a description of that country, and the division of it among the tribes; and the third, comprised in the last two chapters, contains the renewal of the covenant he caused the Israelites to make, and the death of their victorious leader and governor. The whole comprehends a term of seventeen, or, according to others, of twenty-seven years. JOSIAH, king of Judah, deserves particular mention on account of his wisdom and piety, and some memorable events that occurred in the course of his reign. He succeeded to the throne, upon the assassination of his father Amen, at the age of eight years, in the year B.C. 643, and at a period when idolatry and wickedness, encouraged by his father's profligate example, very generally prevailed. Josiah, who manifested the influence of pious and virtuous principles at a very early age, began in his sixteenth year to project the reformation of the kingdom, and to adopt means for restoring the worship of the true God. At the age of twenty years he vigorously purified the execution of the plans which he had meditated. He began with abolishing idolatry, first at Jerusalem, and then through different parts of the kingdom; destroying the altars which had been erected, and the idols which had been the objects of veneration and worship. He then proceeded, in his twenty-sixth year, to a complete reformation of the worship of God, and the regular service of the temple. Whihl he was prosecuting this pious work, and repairing the temple which had been long neglected, and which had sunk into a state of dilapidation, the book of the law, which had been concealed in the temple, was happily discovered. This was probably a copy of the Pentateuch, which had been lodged there for security by some pious people in the reign of Ahaz or Manasseh. Josiah determined to adhere to the directions of the law, in the business of reformation which he had undertaken, and to observe the festivals enjoined by Moses, which had been shamefully neglected. With this view he assembled all the elders of the people in the temple at Jerusalem, and

Vol. XIX.
having ascended the throne, read the book of the Mosaic law, and then entered into a solemn covenant to obviate the statutes and ordinances which it enjoined. To this covenant the whole assembly testified their consent. The ark was restored to its proper place; the temple was purified; idolatrous utensils were removed; and those appropriate to the worship of God substituted in their room. After these preparations, the passover was observed with singular zeal and magnificence. This took place in the eighteenth year of Josiah's reign. But in pursuing his laudable plans of reformation, he was resisted by the invertebrate habits of the Israelites, so that his zealous and persevering efforts were ineffectual. Their degeneracy was so invincible, that the Almighty sovereign was provoked to inflict upon them those calamities which were denounced by the prophet Zephaniah.

In the thirty-second year of Josiah's reign, Pharaoh Necho, king of Egypt, advanced with his army against Carchemish, a city situated on the river Euphrates; and he was opposed by the king of Judah, so that a bloody battle ensued at Megiddo, in which Josiah received a mortal wound, which terminated in his death, after he had been conveyed to Jerusalem, in the thirty-ninth year of his reign, B.C. 609. His death was greatly lamented by all his subjects; and an elegy was written on the occasion by the prophet Jeremiah, which is not now extant. 2 Kings, xxxii. xxiii. 2 Chron. xxxiv. xxxv.

Josquin des Prez, or, as he is called in Latin, Josquinus, or Jodocus Pratenus, and in Italian Giofquino del Prato, in Biography, a Netherlander, the disciple of Ockenheim, and maestro di cappella to Louis XII. king of France, was the greatest musician of his time; and, in many particulars, of any time, since the invention of counterpoint.

His compositions for the church, though long laid aside, and become obsolete by the gradual changes in notation, continue still to merit the attention of the curious. Indeed the laws and difficulties of canon, fugue, augmentation, diminution, reverent, and almost every other species of learned contrivance allowable in ecclesiastical compositions for voices, were never so well observed, or happily vanquished, as by Josquin; who may justly be called the father of modern harmony, and the inventor of almost every ingenious construction of his constituent parts, near a hundred years before the time of Palestrina, Orlando di Lasso, Tallis, or Bird, the great musical luminaries of the sixteenth century, whose names and works are still held in the highest reverence, by all true judges and lovers of what appears to us the true and genuine style of choral compositions.

This ingenious, learned, and voluminous composer, is enumerated, by Lewis Guicciardini, among Flemish musicians, however, the confluent alteration of Pratenus, or Del Prato, to his name, seems rather to make him a native of Prato, in Tuscany; and the frequent mention that is made of him by Italian writers, implies at least, if he was not a native of Italy, that he had lived there, and that his works were very familiar to them; for not only by the name of Josquinus, Jodoco del Prato, is he often mentioned by Franchinus, and all the musical writers of Italy in the next age, as a most excellent composer, but by miscellaneous writers, who only speak of music incidentally. As a proof of this, we need give no better authority than the following passage in Caliglione's admirable "Cortegiano."

This author, speaking of the operations of prejudice in favour of great names, tells us of the eugenes and delight with which a polite company of his acquaintance had read a copy of verses, supposing them to have been written by Sanzaro, who afterwards, when it was certain that they were not of his composition, thought them execrable. "So likewise," says one of the interlocutors, "a motet before the duchess of Urbino was unnoticed, till it was known to be the production of Josquin."

Franchinus, enumerating the great musicians of his time, specifies Tinctor, Guilmelms, Guarnermis, Josquin de Prat, Gasparr, Agricola, Lovet, Obrecht, Brumel, Isaac, and calls them most able composers.

The same author, in another work, lets us know that he had been personally acquainted with Josquin: for, speaking of some inaccuracies in the fesqualterate proportion, he says: "Di quelli inconvenienti ne avverte gia molti anni paffati Josquin Despriet et Gasparr dignifici Compositori." This was printed in 1508, so that "many years ago," must throw these composers far back into the fifteenth century; and, he adds, "though they acquiesced in my opinions, yet, having been corrupted by long habit, they were unable to adopt them."

Zarlino, who likewise speaks of him among the pratici peirit, gives another instance of predilection in favour of Josquin at Rome, "which," says he, "was at the expense of my friend, the admirable Adrian Willaert, who has often himself confirmed the fact." The motet "verbam bonum et fuave," for six voices, having been long performed in the pontifical chapel at Rome, on the festival of our Lady, as the production of Josquin, was thought to be one of the finest compositions of the time; but Willaert, having quitted Flinders, in order to visit Rome, in the time of Leo X. and finding that this motet was sung as the composition of Josquin, whose name was affixed to it in the chapel books, ventured to declare it to be his own work, and not that of the famous Josquin: but so great was the ignorance, envy, and prejudice of the fingers, that, after this declaration, the motet was never again performed in the pontifical chapel.

Adami, in his historical list of the fingers in the pope's chapel, mentions Josquin next to Guido, as one of the great cultivators and supporters of church music; he calls him "Uomo infigne per l'invenzione," and says that he was a finger in the pontifical chapel during the time of Sixtus IV.

After quitting Italy, he was appointed maestro di cappella to Lewis XII. of France, who reigned from 1498 to 1515; and it is hardly probable that such an honour should have been conferred upon him till he had arrived at great eminence in his profession; he must either have acquired the public favour by his works or performance, before he could be noticed by a sovereign; indeed the impediments to their approximation must have been reciprocal, and it has been well observed, that it is as difficult for a prince to get at a man of merit, as it is for a man of merit to approach a prince.

It is related, that when Josquin was first admitted into the service of Lewis, he had been promised a benefice by his majesty; but this prince, contrary to his usual custom, for he was in general both just and liberal, forgot the promise he had made to his maestro di cappella; when Josquin, after suffering great inconvenience from the shortness of his majesty's memory, ventured, by a singular expedient, to remind him publicly of his promise, without giving offence; for being commanded to compose a motet for the chapel royal, he chose part of the 19th Psalm: "Memor esto verbi tuo servus tuo;" "Oh think of thy servant, as concerning thy word:" which he set in so supplicating and exquisite a manner, that it was universally admired, particularly by the King.
JOQUIN.

king, who was not only charmed with the music, but felt
the force of the words so effectually, that he soon after
granted his petition, by conferring on him the promised pre-
ferment: for which act of justice and munificence, Josquin,
with equal felicity, composed, as a hymn of gratitude, an-
other part of the large Psalm: "Boniatem faciit cum fervo
tuo, Domine," "Oh Lord, thou hast dealt graciously with
thy servant."

Josquin seems to have been possessed of a certain vein of
wit and humour, as well as musical genius; of which Gla-
reanus has given his readers several instances, besides those
just related. In consequence of the long procrallination of
the performance of Lewis XII.'s prologue, relative to the be-
nefit, Josquin applied to a nobleman, in high favour at
court, to use his interest with this prince in his behalf, who,
encouraging his hopes with protestations of zeal for his ser-
vice, constantly ended with saying, "I shall take care of this
business, let me alone"—La fai faire moi (laifer me faire),
when, at length, Josquin, tired of this vain and fruitless af-
surance, turned it into solmization, and composed an entire
mass on these syllables of the hexachords La sol fa re mi;
which mass is among the productions of our author in the
British Museum, and is an admirable composition.

The following circumstance, which likewise happened
during Josquin's residence at the court of France, has been
recorded both by Glareanus and Merfennen. These writers
inform us, that Lewis, though music afforded him great
pleasure, had so weak and inlexible a voice, that he never
was able to sing a tune, and that he defied his maestro di cappella
to compose a piece of music in which it was possible
for him to bear a part. However the musician accepted the
challenge, and composed a canon for two voices, to which
he added two other parts, one of which had nothing more to
do than to sustain a single sound, and the other only the key
note, and its fifth, to be sung alternately. Josquin gave his
majesty the choice of these two parts, and beginning with
the long note, after some time, his royal scholar was enabled
to continue it, as a drone to the canon, in despite of nature,
which had never intended him for a finger.

Rabelais, in his prologue to the third book of Pantagruel,
places Josquin des Prez at the head of all the fifty-nine Joynis
Musiciens whom he had formerly heard. Josquin, among mu-
cicians, was the giant of his time, and seems to have arrived
at universal monarchy and dominion over the affections and
passions of the musical part of mankind. Indeed his com-
positions seem to have been as well known and as much prac-
ticed throughout Europe, at the beginning of the sixteenth
century, as Handel's were in England sixty years ago.

In the music book of prince Henry, afterwards Henry
VIII., which is preferred in the Pepys' collection, at
Cambridge, there are several of his compositions, and we are
told that Anne of Boleyn, during her residence in France,
had collected and learned a great number of them. In a
very beautiful MS. in the British Museum, consisting of
French songs of the 15th century, in three and four parts,
there are likewise many of Josquin's compositions. But the
most capital collection of his works, and of contemporary
contrapuntists who we believe is now sublimed, is in the
British Museum, consisting of the first and third of the
masses of Josquin, composed for the pope's chapel, during the
pontificate of Sixtus IV., who reigned from 1471 to 1484; with
masses by Pierre de la Rue, Ant. Fevin, John Moreton,
and.

All these were printed by Ottavio Petrucci da Foffom-
broie, under a patent from Leo X. signed by cardinal Bem-
bo, his secretary. These masses were the first musical pro-
ductions that issued from the press after the invention of
printing. And these very curious compositions must have
been studied, and frequently rehearsed, before their perform-
ance; for though no rapidity of execution is required, yet,
as there are no bars, and the value of the notes is frequently
changed by position, as well as by the modal signs, upon very
short notice, this, joined to the difficult solution of the
canons, must have made it impossible for them to have been
fugal at sight, even by those who were accustomed to the
notation.

Specimens of these compositions in score may be seen
in Burney's History of Music, vol. ii., and whoever examines
them will find that no notes have had admission by chance,
or for the sake of variety, but that, like the prints of Hogarth,
everything not only contributes to the principal design and
harmony of the whole, but has a specific character of its own.

But Josquin's masses, though more frequently cited and
celebrated by musical writers than those of any other author,
and indeed than any of his other works, seem inferior
to his motets in every respect; for these are not only com-
posed on subjects of his own invention, or in fragments of
the most beautiful and solemn chants of the church, but in a
style more clear and pleasing.

In the third and fourth collection of motets published
at the beginning of the sixteenth century, under the title of
"Mottetti della Corona," there are many by Josquin, which
are truly admirable, particularly a misérere for five voices,
which, as it consists of three movements, is too long to be
infected in a work of this kind, but appears to us a model
of choral composition, without instruments; as the subjects
of fugue and imitation are simple, and free from secular le-
vity; the style is grave and reverential; the harmony pure;
the imitations are ingenious, and all constructed upon a frag-
ment of canto fermo, to which the second tenor is wholly
confined; repeating it, in the first part, a note lower ever-
time, beginning at the fifth of the key, and descending to
its octave; in the second part, ascending in the same manner;
in the third part, beginning at the fifth, and descending to
the key note.

This species of labouriously composition has been frequent-
ly cenured, and stigmatized by the name of pedantry, and
Gothic barbarism, which, perhaps, it would now de-
serve, out of the church; but in the time of Josquin, when
there was little melody, and no grace in the arrangement, or
measure of single notes; the science of harmony, or inge-
nuity of contrivance in the combination of simultaneous
founds, or music in parts, as it was the chief employment of
the student, and ambition of the composer, fo the merit of
both, and the degree of regard beloveed upon them by pol-
ternity, should be proportioned to their fociouss, in what was
their chief object, and not in what had no existence at the
time in which these musicians lived.

With respect to fame of Josquin's contrivances, such as
augmentations, diminutions, and inversions of the melody,
ex-
pressed by the barbarous Latin verb cancertaria, from the
retrograde motion of the crad, they were certainly purused
an excees: but to fulldue difficulties has ever been attem-
med a merit of a certain kind, in all the arts, and treated with
respect by artiffs. Michael Angelo, in delineating the dif-
ficult attitudes into which he chose to throw many figures
in his works and which other artiffs had not courage, or
perhaps abilities to attempt, procured himself a great name
among the judges of correct drawing, and bold design,
though a great part of the spectator's pleasure in viewing
them must arise from reflecting on the difficulty of the under-
taking. There are different roads to the temple of Fame in
every art; and that which was followed by Josquin, and his
emulators,
JOS, or Joostje, in Mythology, an idol worshipped by the Chinese at some of their grand festivities, which they ob-serve by way of intercession for the sick at Batavia and elsewhere. To this idol they offer costly presents; and they also make a large vefiel of paper and combustible materials, adorning it with flags, and then letting it on fire till it is consumed. The name Joulfje, given to this idol by the Dutch, which the English feamen call Jots, is a Dutch nick-name for the devil, and was probably given to this idol by the Dutch, when they first faw it, either from its appearance, or from the principle that all idolatry is demonolatry.

JOSSELIN, in Geography, a town of France, in the department of Morbihan, and chief place of the commune, in the district of Plouer; 15 miles N.E. of Vannes. The place contains 2678, and the canton 14,157 inhabitants, on a territory of 215 kilometres, in 10 communes. N. lat. 47° 57'. W. long. 2° 24'.

JOSSELIKA, a town of Poland, in the palatinate of Samborin; 76 miles S.S.W. of Samborin.

JOSVO, a town of Hungary; 16 miles W. of Cafaellen.

JOTAKO, a small island in the Mediterranean; 2 miles E. of Tekhi.

JOTAN, a town of Asiatic Turkey, on the W. coast of Natolia, near cape Arbire; 10 miles N. of Mileses.

JOTAPATA, in Ancient Geography, a town of Phœnicia, situated in the vicinity of Ptolemais. It was defended by Josephus the historian, but at last taken by Vepidian, in the reign of Nero, A.D. 67. Its defence lasted for seven weeks, and 49,000 Jews were killed. Joseph. de Bel. Jud.

JOUAN de l'Isle, St., in Geography, a town of France, in the department of the North Coasts, and chief place of a canton, in the district of Dinan; 24 miles S. of St. Malo. The place contains 683, and the canton 8543 inhabitants, on a territory of 150 kilometres, in 8 communes. N. lat. 48° 12'. W. long. 2° 29'.

JOUBERT, Laurent, in Biography, a learned physician, and royal professor at Montpellier, was born at Valence, in the province of Dauphine, in France, on the 16th of December 1529, of a good family. After he had finished his school education, he went to Montpellier, where he was matriculated in the faculty of medicine on the 14th of March 1550, and took his degree of bachelor the following year. He afterwards studied at Padua, where he attended the lectures of the celebrated Fallopin, and at some other places; but returning to Montpellier, he finished his exercises, and received the degree of doctor in the year 1558. The manner in which he had performed his acts procured for him so much of the confidence and esteem of Honore Cafellan, that this profeflor, being summoned to court in the following year, to hold the office of first physician of Catharine de Medicis, queen of Henry II. he nominated Joubert to give the lectures in the schools during his absence; and his nomination met with the sanction of the faculty. Joubert showed himself worthy of the honourable appointment, and acquitted himself in so distinguished a manner, that on the death of professor Rondelet in 1566, he was immediately named his successor in the chair. He was likewise the second successor of Rondelet in the dignity of chancellor, having followed Saporta in 1574. He was called to Paris by Henry III. in 1579, who entertained hopes that Joubert would be able to cure the barrenness of Louisa de Lorraine, his queen. But his attempts proved unsuccessful; and he returned to Montpellier with the title of physician in ordinary to the king, and continued to practice his profession there to the end of his life, which happened
happened on the 21st of October 1583, when he was on the road from Thoulouze.

This physician was the author of several works, and wrote with much correctness and even elegance. A collection of his, which were written in the Latin language, has been frequently reprinted under the title of \"Operum Latinorum Tomus primus et secundus.\" The first edition is that of Lyons, in 1582, folio; the subsequent ones appeared at Paris, in 1599, 1645, and 1668, also in folio. The following have been published separately: \"Paradoxa Medica,\" Lyons, 1676; \"De Peste,\" Lyons, 1677; \"De Partibus,\" ibid. 1795, 8vo. The treasuries on the plague were published in 1581; \"De affectibus pilorum et cutis, praefertim capitis, et de Cephalaphia,\" ibid. 1651; \"De affectibus internis partium Thoraecis,\" Geneva, 1577. Lugd. 1577; 1578; \"Traité du Riz, son essence, ses causes et effets,\" Paris, 1574; 1579, 8vo.; \"Medicinae Practicae Libri tres,\" Lugd. 1577, 1578; \"Pharmacopoeia bonae Paulae, sanctissimum, edita,\" ibid. 1579, 8vo.; \"Traité des encubades,\" ibid. 1581. This, however, is the third edition; the work was several times printed, and contains very correct opinions and precepts respecting the nature of gun-shot wounds; \"Guindonis de Cauliaci Chirurgia Magna,\" ibid. 1585, with notes by the editor. The same work was translated into French, by Isac Joubert, his son, and went through nine or ten editions; \"Traité des Eaux,\" Paris, 1623, 12mo. But of all the works of Laurent Joubert, in which he ventured to raise his voice against popular medical errors, was the most distinguished; \"Erreurs populaires touchant la Médecine,\" Bourdeaux, 1579. This work made so great an impression upon the public mind, that it was printed ten successive times in the course of six months. Eloy. Dict. Hist. de la Med.

\textbf{JOUEUR des INSTRUMENTS. Fr. to play upon musical instruments.} The French say jouer du violon, de la harpe, du hautbois, de la flûte; toucher le clavecin, et les orgues; jouer la trompette; donner du cor; pincer la guitare. They play on the violin, the violoncello, the hautbois, and the flute; but they touch the harpichord and the organ; found the trumpet and French horn; and pincé the guitar.

\textbf{JOGUHOLES, in Mining,} is the name, in some parts of Derbyshire, for lenticular cavities, principally in the vertical joints or in the veins, which are lined with crystals. These are called tick-holes, druses, lochs, nafts, &c. in other situations. The manner in which these curious holes were formed and left is endeavoured to be explained in Mr. Fary's Report on Derbyshire, vol. i. p. 247.

\textbf{JOVIALE ARGACUM. See ARGACUM.}

\textbf{JOVIAN, in Biography.} A Roman emperor, born about the year 324, was a native of Singidunum, in Pannonia, and son of count Varrogon, who had a high reputation in the state; and who, being engaged, in honourable retirement, the fruit of his long services. The son had been brought up to arms, and had obtained so much reputation as a commander, that although an avowed Christian, the emperor Julian would not suffer him to resign, upon offering to do so rather than quit his religion. On the death of Julian, in his expedition against the Persian empire, June 363, Jovian, who was but the first of domestics, was nominated to the purple. At first a few voices only faluted him with the names of Emperor and Augustus. The tumultuary accusation was instantly repeated by the guards who surrounded the tent, and passed, in a few minutes, to the extremity of the line. No prince was ever raised to the throne under more critical circumstances. The Roman army, disaffected and dispirited, was retreating from the enemy's country towards its own frontiers, pursued and continually harassed by a much superior force. He made a disadvantageous peace with Persia, shut up the heathen temples, recalled the banished clergy, and from henceforth it was determined that Christianity should enjoy an uninterrupted triumph over heathenism. On arriving at Antioch he displayed his attachment to the orthodox doctrine, by restoring the churches to all the adherents of the council of Nice. At the same time, in order to quiet the minds of his subjects of the old religion, he lifted a decree of toleration, permitting the exercise of the ceremonies of the pagan worship. He left Antioch in the winter-beaF, and proceeded to Constantinople. He caused some ornaments to be added to the towns of Julian, at Parfa, as he passed. At Anticyra he allowed the title and enigmas of the cons十几hip, and conferred the fasce on his infant son. Daddato, an obscure town about an equal distance from Anticyra and Nice, was marked for the fatal term of his journey and his life. After indulging in a plentiful, perhaps an intemperate supper, he retired to rest, and in the next morning he was found dead in his bed. The body of the deceased emperor was sent to Constantinople to be interred with his predecessors. His sudden death was imputed either to the effects of an over-loaded stomach, or to the gas arising from burning charcoal, which had been placed in his chamber to dry the walls. This event happened in the eighth month of his reign, and in the thirty-third year of his age. Gibbon. Univ. Hist.

\textbf{JOVIUS. Paul,} an eminent historian, was born at Como, in Lombardy, in 1432. Having received a good education he went to Rome, where he wrote a work, entitled \"De Pictibus Romanis.\" He had a penmion from Francis I. king of France; and Clement VII. gave him the bishopric of Nocera, an office to which he did no credit on account of his debauched manner of living. He died at Florence in 1552. His principal work is a history of his own time, which was published at Stralsburgh in 1556. He also wrote the history of Switzerland. Morelli.

\textbf{JOULOTED, in Heraldry,} a term applied to the gills of a cock, when borne of a different tincture from his head.

\textbf{JOULTS, in Mining,} is applied in Derbyshire, to pieces of spar and lead ore intermixed, from the live of walnuts, to that of the fill. Sometimes these are called knockings, or hanaway. See Fary's Derbyshire Report, vol. i. p. 397.

\textbf{JOUNPORÄ, in Geography,} a town of Hindooistan, in Bahar; 25 miles S.W. of Patna.

\textbf{JOUR,} a barren island in the Grecian Archipelago, about 15 miles in circuit; 12 miles S.W. of Andros. N. lat. 37° 37'. E. long. 24° 49'.

\textbf{JOURKoup.} A town of Asiatic Turkey, in Cara mania; 50 miles E.N.E. of Akerfai.

\textbf{JOURNAL,} a day-book, register, or account of what passes daily. See DnRY.

\textbf{JOURNAL,} in Merchants' Accounts, is a book into which every particular article is posted out of the waste book, and made debitor. This is to be very closely worded, and fairly engrossed. See Book-keeping.

\textbf{JOURNAL,} in Sea Affairs, is a register kept by the pilot and others, wherein notice is taken of every thing that happens to the ship, from day to day, and from hour to hour, with regard to the winds, the swells, the rakes, the founders, &c. in order to enable him to adjust the reckoning, and determine the place where the ship is.
The day, or what is called the twenty-four hours, begins at noon, and is counted thence twenty-four hours to the next noon: the first twelve hours, from noon to midnight, are marked with P. M. signifying after mid-day; and the second twelve hours from midnight to noon are marked with A. M. signifying after midnight; so that the ship account is twelve hours earlier than the shore account of time. There are various ways of keeping journals, according to the different notions of mariners concerning the articles that are to be entered. Some writers direct the keeping such a kind of journal as is only an abstract of each day's transactions, specifying the weather, what ships or lands were seen, accidents on board, the latitude, longitude, meridional distance, course, and run. These particulars are to be drawn from the ship's log-book, or from that kept by the person himself. Other authors recommend the keeping only of one account, including the log-book, and all the work of each day, with the deductions drawn from it. The form of the latter kind of journal, with an example of the work of a single day, is as follows:

Journal is now a common name for newspapers, which detail the daily transactions of Europe. Journal is also used for the title of several books which come out at fixed times; and give abractts, accounts, &c., of the new books that are published, and the new improvements daily made in arts and sciences.

The first journal of this kind was, the "Journal des Scavans," printed at Paris; the design was set on foot for the sale of such as are too busy, or too lazy, to read the entire book themselves. It seems an excellent way of satisfying a man's curiosity, and becoming learned upon easy terms; and so useful has it been found, that it has been executed in most other countries, though under a great variety of titles.

Of this kind are the "Acta Eruditorum of Leipzic;" the "Nouvelles de la Republique des Lettres" of M. Bayle, &c.; the "Bibliotheque Universelle, Chofie, et Ancien Theodore;" of M. le Clerc; the "Memoires de Tre- voux, &c." In 1692, Juncker printed in Latin, an "Historical Treatise of the Journals of the Learned," published in the several parts of Europe; and Wulius, Struvius, Morhers, &c., have done something on the same kind. The "Philosophical Transactions of London," the "Memoirs of the Royal Academy of Sciences," the "Experiments of the Academy of Cimento;" the "Acta Philosophica Curiosa," or Memoirs of the Academy of Berlin; the "Commentaries of the Academy of Petrburg," the "Memoirs of the Institute at Bologna," the "Acta Literaria Sueciae," the "Memoirs of the Royal Academy at Stockholm," begun in 1740, the "Commentaries Societatis Regiae Gottingensis," begun in 1750, &c., are not so properly journals, though they are frequently ranked in the number. Juncker and Wolfius give the honour of the first invention of journals to Photius. His "Bibliotheca," however, is not altogether of the same nature with the modern journals; nor was his design the fame. It consists of abridgments, and extracts of books which he had read during his embassy in Persia. M. Salo first began the "Journal des Scavans," at Paris, in 1665, under the name of the Sieur de Hodouey; but his death soon after interrupted the work. The abbé Gallois then took it up, and he, in the year 1744, gave way to the abbé de la Roque, who continued it nine years, and was succeeded by M. Coutin, who carried it on till the year 1702, when the abbé Bignon instituted a new society, and committed the care of continuing the Journal to them, who improved and published it under a new form. The other French journals are the "Memoirs and Conferences of Arts and Sciences, by M. Denis, during the years 1672, 1673, and 1674;" "New Discoveries in all the Parts of Physic," by M. de Blegny; the "Journal de Physic," begun in 1681, and some others, discontinued almost as soon as begun. "Rezoier's Journal de Physic," begun in July, 1771; "Annales Chimiques," &c. &c. The "Nouvelles de la Republique des Lettres," News from the Republic of Letters, were begun by M. Bayle in 1684, and carried on by him till the year 1687, when M. Bayle being disabled by feckness, his friends, M. Bernard and M. de la Roque, took up the work, and continued it till 1690. After an interruption of nine years, M. Bernard resumed the work, and continued it till the year 1710. The "History of the Works of the Learned," by M. Bafnage, was begun in the year 1686, and ended in 1710. The "Universal Historical Library," by M. le Clerc, was continued to the year 1693, and contained twenty-five volumes. The "Bibliotheque Choife," of the same author, began in 1703. The "Meramy of France" is one of the most ancient journals of that country, and was continued by different hands; the "Memoirs of a History of Sciences and Arts," usually called "Memoires des Trevoix," from the place where they are printed, began in 1701. The "Philosophical Transactions" reached but to a twentieth volume in 1702, 1703, and 1704, and then only take notice of ancient authors. The "Journal Literaire," by father Hugo, began and ended in 1705. At Hamburg, they have made two attempts for a French journal, but the design failed; an "Ephemerides Scavantes" has also been undertaken, but that soon disappeared. A "Journal des Scavans," by M. Darts, appeared in 1694, and was dropped the year following. That of M. Chavun, begun at Berlin in 1696, held out three years, and an effuy of the same kind was made at Géneve. To these may be added, the "Journal Literaire," begun at the Hague in 1715, and that of Verdun, and the "Memoires des Sciences de la Grande Bretagne," by M. de la Roche; the "Bibliotheque Anglorum," and "Journal Britannique," which were confined to English books alone.

The Italian journals are that of abbé Nicarei, which lasted from 1668 to 1681, and was printed at Rome. That of Venice began in 1671, and ended at the same time with the others; the authors were Peter Moretti, and Francis Miletto. The "Journal de Parma," by Roberti and father Bocchini, was dropped in 1692, and revived again in 1692. The "Journal de Ferrara," by the abbé de la Torre, began and ended in 1691. "La Galeria di Muserba," begun in 1696, was the work of a society of men of letters. Seigneur Apol. Zeno, secretary to that society, began another journal in 1710, under the protection of the grand duke: it was printed at Venice, and several persons of distinction had a hand in it. The "Fatti Eruditi della Bibliotheque Volante," were published at Parma. There has appeared since, in Italy, the "Giornale del Letterati;" the principal among the Latin journals is that of Leipzic, kept under the title of "Acta Eruditorum," begun in 1681: P. P. Manzani began another at Parma. The "Nova Literaria Mariae Balthieci," firsted from 1706 to 1708. The "Nova Literaria Germania," collected at Hamburg, begun in 1703. The "Acta Literaria ex Manuscriptis," and the "Bibliotheque Curiosa," begun in 1705, and ended in 1707, are the work of Struvius. Melhus, Ruther and Sike, in 1697, began a "Bibliotheque Novorum Librorum," and continued it for two years. Since that time there have been many Latin journals; such, besides others, is the "Commentarii de Rebus in Scientia Naturali et Medicini Digest," by M. Ludwig. The Swisy journal, called "Nova Literaria Helvetia," was begun in 1702, by M. Schudter; and the "Acta Medica Hafnien," published by T. Bartholin, make five volumes, from the year 1671 to 1679.

There are two Low Dutch journals; the one under the title of "Boockzal van Europe;" it was begun at Rotterdam, in 1692, by Peter Rabbins; and continued from 1702 to 1705, by Sewell and Gavery; the other was done by a physician, called Ruther, who began in 1710. The German journals of last note are, the "Monatlichen Unter- redungen," which held from 1698 to 1698. The "Biblio- theque Curiosa," begun in 1704, and ended in 1707, by both M. Tenzel. The "Magazin d'Hamborg," begun in 1748; the "Physicallche Belufstigung," or "Philosophical Amusements," begun at Berlin in 1751. The "Journal of Hanover," begun in 1700, and continued for two years by M. Eecd, under the direction of M. Lichtenau, and afterwards...
JOURNALS, published by M. Loether, under the title of "Alter & Neusy," that is, Old and New. A third at Leipzig and Frankfort, the authors Melzer, Walterck, Krause, and Grochulitis, and a fourth at Hal, by M. Turk.

The Eighteenth Journals are, the "History of the Works of the Learned," begun at London, 1699. "Censor Temporid," in 1708. About the same time there appeared two new ones, the one under the title of "Memoirs of Literature," containing little more than an English translation of some articles in the foreign journals, by M. de la Roche; the other a collection of loose tracts, entitled "Bibliotheca Curiosa," or a Miscellany. These, however, with some others, are now no more; but are succeeded by the "Monthly Review," which began in the year 1749, and gives a character of all English literary publications, with the most considerable of the foreign ones; the "Critical Review," which began in 1756, nearly on the same plan: the "Anti-Jacobin Review," begun in 1798; the "American Review," in 1811; the "British Critic," in 1798; the "British Review," in 1811; the "Ecclectic Review," in 1802; the "Edinburgh Review," in 1802; the "Lon- don Medical Review," in 1808; the "Quarterly Review," in 1809. Besides these, we have several monthly pamphlets, called Magazines, which, together with a chronological series of occurrences, contain letters from correspondents, communicating extraordinary discoveries in nature and art, with controversial pieces on all subjects. Of these are the following: viz. the "Agricultural," begun in 1769; the "Baptist," in 1809; the "Botanical," in 1786; the "British Farmer," in 1811; the "European," in 1782; the "Laverdecl," in 1793; the "Farmers," in 1802; "Flower's Political," in 1807; "Free-thinkers," in 1811; "Gentlemans," in 1760; "Godly," in 1806; "Lady's," in 1771; "Monthly," in 1766; "Musical," in 1809; "Military," in 1811; "Philosophical," in 1768; "Politics," in 1792; "Universal," in 1747. To these may be added several other periodicals, under different titles, such as "Ackerman's Repository," begun in 1805; "Antiquarian Cabinent," in 1820; "Arcana," in 1821; "Army Life," in 1820; "Christian Observer," in 1802; "Christian Guardian," in 1809; "Divine Censor," in 1811; "Edinburgh Medical Journal," in 1803; "General Chronicle," in 1811; "Journal of Natural History," in 1796; "Monthly Repository," in 1806; "Military Chronicle," in 1816; "Naturalists Miscellaneous," in 1754; "Naval Chronicle," in 1799; "Nicholson's Journal," in 1803; "Pharmacist," in 1810; "Repository of Arts," in 1744; "Re- porter," in 1810; "Scientific," in 1822; or "Sower," in 1811, &c.

JOUR CHIPPERS, or our Old Writers, regrettors of many who formerly, perhaps, was called JOUR. They are mentioned in the flse. p. Hen. VI. c. 5.

JOURNET, Francois, in Biography, one of the greatest authors that appeared amongst the French authors of the eighteenth century. She was at first beloved for the felicity of her voice, her figure, and the elegance of her action. She had an air and carriage striking, and something so interesting and touching in her countenance, that she drew tears from those who only looked at her in the part of Philomena. She had eyes and arms which guided to the heart all the expression of what she had to paint.

She quitted the stage in 1720, after fifteen years applause and admiration, and died in 1722. Effais fur la Mutilite.

JOURNEY, in History, signifies as much ground as can be ploughed over in a day; though it is not applied in the same way in all districts, or has the same figuration, as in some it is used to express a much less proportion of labour. It often signifies the length of time the team is engaged in labour, either in ploughing or any other fort of work. With all horses under team labour, great attention should be paid by the person who has the care of them, in feeding and draying them. See Team.

JOURNEY, Sabbatical. See Sabbath.

JOURNEY-MAN, formed from the French journée, a day's work; anciently signified a person who wrought with another by the day; though now, by the statute, it extends to those likewise who covenant to work with another in their occupation or trade by the year.

JOUTRA, in Geography, a town of Sweden, in Tavalland; 65 miles N.E. of Vallhus.

JOUVENCY, Joseph, in Biography, a learned Jesuit, was born at Paris in 1673. He entered the society of Jesus in 1659, and was chosen professor of rhetoric in its seminaries, first at Caen, then at La Fleche, and finally at Paris, where he taught with great reputation for nearly twenty years. He was invited to Rome in 1699, to assist in writing the continuation of the history of the society, and died in that city in 1710. His part of the history of the Jesuits comprises the period from 1591 to 1616, and was printed in folio in the year 1710. As a philologist he is known by his "Latin Harangues delivered on different occasions," in two volumes, 12mo.: "Appendix de Diis et Heroibus Poeticis," which is a compendium of the heathen mythology: "Notes on Terence, Ovid, Horace, Petrus, Juvenal, Martial, and some of the works of Cicero." He gave also a Latin version of the first Philosophie of Democritus. He is said to have displayed, in his several works, great purity, elegance, and facility of style, for which he is much distinguished than for novelty or depth of thought. Moren.

JOUVENET, John, an historial painter, born at Rouen, in Normandy, in 1644. He received his first instructions from his father; but his principal teacher was Pouffin, and his most useful studies the works of that master.

He had a ready invention, and was therefore employed to adorn the apartments of Versailles and the Trianon. In the Hospital of the Invalids at Paris, he painted the twelve apsides; each figure 14 feet high. It must be acknowledged, however, that he failed in true taste. His style partakes too much of French flatness; the substitution of something striking for what is solid and good; and his colouring is heavy. It is said, that, being deprived of the use of his right hand by paralysis, he painted ever after with his left. He died in 1717.

JOUVEN, in Geography, a town of France, in the department of the Aube and Loire, and chief place of a canton, in the district of Magon. The place contains 1400, and the canton 10,491 inhabitants, on a territory of 165 kilo- meters, in 23 communes.

JOUX LA VILLE, a town of France, in the department of the Yonne; 5 miles N. of Avallon.

Joux, Mont, a part of mont Jura, near the source of the river Doubs, on the borders of Switzerland, and that part of the canton of Berne which borders on France.

Joux, a lake of Switzerland, in the canton of Berne, situated on a part of mont Jura; 4 miles W. of Romanschur.

JOWA TOWN, Lower, a town of North America, on the E. side
IPE

The little wrinkled root about the thicknefs of a moderate quilt, brought bitter from several parts of the Wef Indiais; much used as an emetic, and again in diarreheas and dysenteries.

The firft European who brought this root into ufe was an apothecary of Brazil, whose name was Michael Tribion. The book which the author published on this subject falling into the hands of the English, is translated into our language, and hands, among a number of like accounts, among Pur-"hah's Pilgrims.

He says it is an excellent remedy against dysenteries and fluxes of all kinds. He says also, in its description, that the stalks are a quarter of a yard long, and the roots nearly as much; and that the leaves grow only four or five upon a plant.

This agrees very well with all that we have since discovered of this plant: and the method of using it at that time, we find, was not as a vomit; but they bruised the fresh root, and steeped it about twelve hours in water, at the end of which time the physician drank the water early in the morning: it operated by vomit; but after its operation, the natural purging and voiding of blood ceased. This seems the original account we have of this drug. De Lact, from this, compiled his account, which is almost a literal translation of this into Latin: from his hint Pifo and Maggrav requiring after it more carefully upon the spot, and from them came the first accurate accounts we had of it; so that all teems, eb ort, ised, deduced from Michael Tribion's account of it. Miller apprehends that the plant which furnishes the true ipecacuanha belongs to the genus of Tribeum, or fefe ipecacuanhia. It is, as some have thought, the Pofbroteria erica of Linnaeus the younger. But the authority on which Masters received the information is not to be implicitly followed.

Pifo divides this root into two parts, the white and the brown; or, according to Gaufray, the Peruvian and Brazilian ipecacuanha: but three forte, says Dr Woodville, are distinguisable in our shops; viz. affh-coloured or grey, brown, and white. The ash-coloured is brought from Peru, and is a small wrinkled root, bent and contorted into a great variety of figures, brought over in short pieces full of wrinkles and deep circular fissures, down to a small white woody fibre that runs in the middle of each piece; the cortical part is compact, brittle, and appears smooth and reffinos upon breaking; it has very little smell, the taff is bittifer and sub-acid, covering the tongue, as it were, with a kind of mucilage. The brown is small, somewhat more wrinkled than the foregoing; of a brown or blackifh colour without, and white within; this is brought from Brazil. The white root is woody, has no wrinkle, and no perceptible bitterness in tafe. The first, that is, the ash-coloured or grey ipecacuanha, is that usually preferred for medicinal use. The brown has been sometimes observed, even in a small dose, to produce violent effects. The white, though taken in a large one, has scarcely any effect at all.

There are divers false species of ipecacuanha, or roots, which, on account of their external appearance, bear the denomination of ipecacuanha, and are sometimes sold for it. Dr. Douglas mentions two: the one white, resembling the true white, only larger in size, brighter, and softer to the touch; the other brown, of a deeper colour than the true brown, and sometimes mixed with red, whence it has been called red ipecacuanha. These are both produced in Maryland and Virginis, where they are sold as somitives by the lower fort. Sir Hans Sloane has discovered that the latter is no other than the root of a poisonous apomancy, described by him in his Natural History of Jamaica. See Phil. Trans. N 413.

The genuine ipecacuanha has scarcely any smell, while...
Ipecacuanha.

during its pulverization, or infusion in aqua fixa, when it emits a faint nauseous one. G revy observes, that in pulverizing the same quantities, the finer powder that flies off is apt to affect the operator with difficulty of breathing, a spitting of blood, a bleeding at the nose, or a swelling and inflammation of the eyes and face, and sometimes of the throat; which symptoms go off in a few days, spontaneously, or by the aid of resolution.

Dr. Tiralii, by experiments, that this root contains a gummy and resinous matter, and that the gum is much the greater proportion, and more powerfully emetic, than the resin; that the cortical part is more active than the brown, and that the whole root contains an antispetic and a greater power. He also found its emetic quality to be much less by infusion and by means of the aqueous, than in a powder of the powder taken in two ounces of water, proved only once worn.

The bark of ipecacuanha is said to be preferable to its root, as an emetic, acting equally well, and with equal safety, in a smaller dose, either intravenously, or injection. Six grains of the bark, infused for a night in an ounce and a half of old Rhum, proves a good emetic. See Phil. Trans. N. 279, sect. 10.

The brown ipecacuanha yields, by distillation, a smaller quantity of oil than the grey; and the left portion of the spirit which comes over with the oil, on urging the fire to the greatest violence, though it be considerably added to the tale, yet does not seem to retain lefts, but rather more volatile proceeds in the spirit drawn in the fame manner from the grey. On mixing the spirits of both kinds also with half of turpentine, the volatile parts of that from the brown escape with more rapidity than those from the spirit of the grey, and affect the stomach more feebly.

It is rational to conclude from hence, that if the brown ipecacuanha contains less oil than the grey, it also contains less vapor; and that as this last portion of spirit contained more volatile parts, it much naturally be expected that it would prove more violent in its operation than the grey. This observation also, which is counseled by fact, may in some degree favour the opinion of those who affirm, that the purgative virtues of medicines are excited by a volatile falt, and that they are more or less violent, as they contain more or less of this falt.

The brown ipecacuanha, as well as the grey, will afford two sorts of extracts, a resinous and a saline one; but both these are yielded in smaller quantity from the brown than from the grey, and consequently the rhubarb is always greener from the brown. Eight ounces of the grey ipecacuanha yield, with spirit of wine, ten drams of the resinous extract; the same quantity of the brown, treated in the face manner, yields only six drams. For in the reduction of the quantity of the grey kind, thus distilled only of its resinary the spirit there may be preserved, by a waters filter, two ounces of a saline extract; but the residue of this small quantity of the grey be left will yield only five or six drams of the extract, by the face treatment. The residue of the grey, thus distilled of its resinous and saline parts, will weigh five ounces, and the whole of the brown, after the same treatment, will weigh six ounces. Hence it is very evident, that the active virtues are much more abundant in the grey than in the brown kind of this useful root.

From one foot of ipecacuanha will yield three ounces of resinous matter, in which its virtue exhibit, by means of spirit of wine; and from the same quantity, by means of water, five ounces of gummy matter were extracted.

If the process of this analysis be varied, and the watery menstruum used first, the proportion of the saline extract will be greatly increased by it, and that of the resinous greatly diminished; eight ounces of the grey ipecacuanha, thus treated, yielding three ounces and a half of saline extract, and only thirty-six grains of the resinous one afterwards by spirit of wine; and the fame quantity of the brown yielding one ounce and three drams of the saline extract, and only twenty-four grains of the resinous one, by means of spirit of wine afterwards used. From all this it is easy to perceive, that the brown ipecacuanha contains much less of the active parts, and much more of the terrestrial than the grey; and yet it is equally certain from trial, that the brown is much a more violent in its operation than the grey.

This forms a perplexing sort of paradox; but to explain it we must remember, that the virtues of medicines are to be measured by their bulk or their weight, the most powerful of all acting in the smallest quantities. It has been observed, that the last portion of spirit drawn from the brown is more pungent and strong than that from the grey; and probably this part of the root has as much power to irritate the internal parts of the intestines as the resins parts.

The best menstruum for extracting the entire virtue of the root, appears to be a mixture of one part of pure spirit, with two or three parts of water. In the shops, wine is employed; in an ounce of the root is macerated or digested in a part of Canary, or fifteen ounces of mountain, to which some adds a quarter of an ounce of dried orange-peel. These tinctures, in doses of from half an ounce, or less, to an ounce and upwards, prove mildly emetic. Lewis Mat. Med.

It has been found by experience, that this is the mildest and safest emetic with which we are acquainted; having this peculiar advantage, that if it does not operate by vomiting, it readily passes on by the other excretions. It was first introduced to us with the character of an almost inoffensive remedy in dysenteries and other inveterate fluxes, as diarrhoea, menorrhagia, and febricula, and also in disorders proceeding from obstructions of long standing; nor has it lost much of its reputation by time. The use of ipecacuanha in these diseases is thought to depend upon its retarding perspiration; for in these cases, especially in diaphoretics and diarrhoea, the body is dry and tense; and while the common diaphoretic usually puts off by blood, small doses of this root have been administered with the best effects, proving both laxative and diaphoretic. Dr. Cullen attributes its good effects entirely to its negative power. In common cases of dysenteries, it is said soon to perform a cure, by bringing on a free diaphoretic, or plentiful sweat, after the patient has taken a pulse or two, and is covered up warm in bed. In patient or malignant dysenteries, it requires to be continued for several days, and repeated as an evacuant, with the assistance of rhubarb, cordial antispetic, and mild opiate, or anti gastrics. In cases of purging, frequent evacuation, or when the offending matter is lodged deep, Sir John Pringle recommends it to be given in small doses, and repeated at proper intervals, till vomiting and purging come on.

In the spasmodic asthma, Dr. Akenfide remarks, that when nothing contraindicates repeated vomiting, he knew no medicine so effectual as ipecacuanha. In violent paroxysms, a scruple procures immediate relief. When the complaint is habitual, from three to five grains every morning, or from five to ten every other morning, may be given for a month or six weeks. This medicine has been also usefully used in hemorrages. Several cases of menorrhagia are mentioned by Dahlberg, in which one-third or even one-fourth of a grain was given, but the dose must be increased in cases of chronic hemorrages, as that of an ounce is recorded in one case. Dr. Cullen gives an ounce of the spirit of ipecacuanha in doses of half an ounce. 

If vomiting does not occur, it may be given in a wine glass. It is a good remedy for the dropsy and other excretions, from the use of wine and spirits, and is said to be a good remedy for rheumatism and gout. It is a very good medicine for the stomach, and is said to be a good remedy for dyspepsia in the sick. It is a good remedy for the stomach when it is troubled with flatulency, and is said to be a good remedy for the stomach when it is troubled with flatulency. It is a good remedy for the stomach when it is troubled with flatulency, and is said to be a good remedy for the stomach when it is troubled with flatulency. It is a good remedy for the stomach when it is troubled with flatulency, and is said to be a good remedy for the stomach when it is troubled with flatulency.
I PH

Half of a grain was given every four hours, till it effected a cure. These small, dark, and unlike, found of great use in extraneous and external cases of cold, as well as in various cases of fever. Dr. Collins (Mat. Med. vol. ii.) informs us, that he knew a practitioner who cured intermittent by giving five grains of mercury, or enough to excite vomiting, an hour before the expiration of the fit was expected, and that Dr. Thompson, formerly of Monro's, proposed to cure this by the employment of enemics given at the time of acco

P H O

IPHOEN, in Geography, a town of Germany, in the district of Wurzburg; 13 miles E.S.E. of Wurzburg.

IPHAES, a town of South America, in the province of Popayan; 16 miles S. of Pallo.

Gen. Ch. Col. Periander inferior, oblong, small, in five deep segments, without any appendages, permanent. Cor. of one petal, funnel-shaped, or bell-shaped; tube somewhat cylindrical, very long; limb five-leaf, spreading, with five plaits. Stam. Filaments five, oval-shaped, nearly the length of the corolla; anthers roundish. Hyf. German superior, roundish; style thread-shaped, the length of the corolla; stigma capitate, nearly globose, in two or three lobes. Peric. Capsule roundish, of two or three cells. Seeds few, large, roundish, sometimes hairy. Eff. Ch. Calyx d-eply five-leaf, naked. Corolla with five plaits, somewhat funnel-shaped. Stigma capitate and globose, lobed. Capsule of two or three cells. Seeds two in each cell.

A large genus, more correctly distinguished from Convulvula by the globose form of its stigma, than by the more narrow or tubular shape of the corolla. For want of attending to this, Linnaeus and others have misplaced several species. Jacquin in his Col. Colchica, v. 3. 245, he called the description of botanists to this subject, and Mr. R. Brown in his Prodromus has recently thrown further light upon it, indicating, moreover, the want of bracts or appendages to the calyx in Ipomoea, which are found in Convulvula.

Examples of Ipomoea, eminent for their beauty, are:

1. Quamoclit, Linn. Sp. Pl. 237. Curt. Mag. t. 244. a native of the East Indies, remarkable for its finely pinnate leaves, and rich crimson blossoms. I. coccineus, Linn. Sp. Pl. 235. Curt. Mag. t. 220, found in the West Indies, and usually cultivated, as an annual, in our gardens. I. Lindera, Linn. Sp. Pl. 238. Curt. Mag. t. 221, found in the West Indies, and rarely seen with us. The flowers of the last are large and white; we should from this, as well as their appearance, guess them to be fragrant in the evening.

Ipomea, in Gardening, comprehends plants of the hibiscus flowery kinds, of which the species with cultivated wings-leafed ipomoea (I. quarnea), and the scarlet-flowed ipomoea (I. coccinea).

Of the second species there is a variety with orange-coloured flowers.

Method of Culture.—These plants are increased in bowing.

well-rooted seeds in small pots, plunged them in

315.
hot-bed, or in the earth of the bed, in the early spring months, proper air and water being given. When the plants have attained some growth, and in the first fort begin to climb, they should be removed, with balls of earth about their roots, into the places where they are to grow; or, which is better for the first kind, into separate large pots, replumping them in the bark hot-bed. They should have proper sticks set for them to twine about; some pots of the first kind being placed in the flowe, as being more tender in their nature.

The first fort affords variety in the flowe, and among other tender potted plants in the summer; and the latter, in the fronts of warm borders, as well as among the left tender potted flowering plants.

Gen. Ch. Cal. Perianth inferior, bell-shaped, membranous at the base; its limb in five, long, equal, linear, erect segments. Cor funnel-shaped; tube cylindrical; limb in five, deep, ovate, nearly equal segments. Stam. Filaments five, inserted into the upper part of the tube, awl-shaped, flatter than the limb, unions roundish, two lobed. Pet. Germen superior, ovate; style thread-shaped, about as long as the tube; stigma in three, deep, oblong, downy, spreading segments. Peric. Capsule rather shorter than the calyx, ovate, obtuse, of three cells, and three valves. Seeds several in each cell, in two rows, acutely angular.

1. l. elegans. Scarlet Ipomopsis. Michaux Amer. v. 1. 142. Sm. Exot. Bot. t. 13. (Ipomera rubra; Linn. Syll. Veg. ed. 14. 204. Polemonium rubrum; Linn. Sp. Pl. 231. Ca tua coropinafolia; Willd. Sp. Pl. v. 1. 879. Quamoclit pennaturn erectum, floribus in thyrsus digdéis; Dill. Esh. 321. t. 241.) "Stem erect, ston. Corolla thrice as long as the calyx."—A native of South Carolina, whence it was originally brought to Sherard’s garden at Eltham. It has occasionally been imported since from the same county, and was lately raised in great perfection at Miss Lee and Kennedy’s, where the excellent figure of exotic botany was drawn. It flowers in October, and consequent ripens feed with difficulty. According to all appearance this beautiful plant is a biennial. Root fibrous. Stem solitary, erect, becomingpanicled at the height of four or five feet, round, leafy, and clothed, like the whole herbage, with short, glandular, white hairs. Leaves pinnatifid; segments long and narrow, those of the radical leaves shorter and broader; floral leaves simple. Flowers on short stalks, drooping. Corolla equally cleft, of a bright scarlet, elegantly dotted on the inside. Stamens slender, red; anthers yellow. German (smooth), pale green. Capsule almost membranous, the partitions from the centre of the valves. Seeds in two rows, small, not winged.

Dr. Smith has observed, that this species serves to confirm the Ipomopsis of Michaux, with which it agrees so completely in every botanical character, that we find it not very easy to establish even a specific difference on sound principles; while, on the other hand, it flew that this different natural genus is from Cantus, and all others to which it has been referred. The fame author mentions a third species, I. albeda, gathered by Dombey, at Lima, much like this, but leafy; its leaves doubly pinnatifid, with somewhat elliptical lobes, and its flowers whitish.

IPPO, in Natural History. See Macassar Poison.

IPS, in Geography, a town of Austria, situated near the confluence of the Ips and Danube, on the site of the ancient Pons Tisc, on Ippontum; 48 miles W. of Vienna. N. lat. 48° 13′. E. long. 15° 52′.

IPSALA, or Skipislar, a town of European Turkey; in Macedonia; 53 miles S.W. of Adrianople.

IPSAR A, called by the ancient Pityre or Pityria, an island in the Grecian Archipelago, about six miles long and three wide; the sole is in general low, and afford no great fruits, though of considerable commerce. It, however, produces figs, grapes, a small quantity of cotton, and some corn, and red wine is an article of commerce. The inhabitants are chiefly Greeks, about 1200 in number, who pay a tribute of about 1000 crowns, and are subject to the cadi of Scio; six miles N.W. of Scio. N. lat. 38° 49′. E. long. 25° 35′. About a league from Ipsara lies a smaller and desert island, called "Anti-ipsara, scarcely two leagues in circumference. Between these two islands ships find a very good anchorage.

IPSHEIM, a town of Germany, in the principality of Cumbach; 17 miles N.N.W. of Ansbach.

IPSI, a small island in the gulf of Engia.

IPSUS, in Ancient Geography, a town and river of Asia, in Phrygia, S.E. of Syrmia; famous for a battle fought here in the year 300 B.C. between Antigonus and Demetrius, having an army of 70,000 foot, 10,000 horse, and 75 elephants, and the kings of Seleucia. Lythmachus and Caffandros, who had 74,000 infantry and 10,500 cavalry, 400 elephants, and 20 chariots of war. Antigonus was defeated and killed. Demetrius fled into Greece. The conquerors divided their lands between them.

IPSWICH, formerly called Gippswich, Gippswild, Gipps- wierc, &c., in Geography, a borough and the county town of Suffolk, England, is seated on the northern bank of the river Orwell, at the distance of 18 miles N.E. from Colchester, 54 S.W. of Yarmouth, 12 N.W. of Harwich, and 69 N.E. of London. In the year 1851, it contained 2221 houses, and 74,962 inhabitants. Near this place the river Gippen, or Gipping, unites its waters with the Orwell, which is navigable for 12 miles to the sea at Harwich, where is a commodious haven, or harbour. Ipswich appears to have been a town of some consequence during the Anglo-Saxon dynasty; for it was fortified with a vallum and fos when the Danes made their predatory incursions into this part of the island. Within the space of ten years they pillaged this town twice: first in, or near the year 691, and again in 1000. In the fifth year of King Æthelred’s reign, the fortifications were repaired and materially strengthened. The walls were provided with, at least, four fortified gates; which were respectively called, from their relative
relatives situations, Earl-Gate, Weat-Gate, North-Gate, and South-Gate; and the town was also divided into four loacts or wards. Some fragments and parts of the old walls are still remaining. Of the castle, no vestige is left, either to prove its site, or define its character. The liberties of the borough, however, extend beyond the walls, and comprehend the four hamlets of Stoke-Hall, Wikes-Ufford, Brooks-Hall, and Wikes-Biphop. The extent of these liberties comprises an area, measuring four miles from east to west, and nearly five miles in a transverse direction. The corporation has also jurisdiction and advantageous privileges by water, on the Orwell to the sea-port of Harwich. In the time of king Edward the Confessor, his queen held two parts of the borough, and her brother, earl Gurnet, a third part. When the Domesday book was made, Roger Bigot, earl of Norwich, possessed the half hundred of Gippewild. At the former period, there were 358 burgesses residing here, who paid custom to the king, but at the conquest there were only 110 burgesses, and in the Norman record it is stated, that "258 houses are now empty." The first charter granted to the borough is dated 25th of May 1109, 11th of king John; this grants to the burgesses, 1. The borough with all its appurtenances, liberties, &c., to be held by the king and his heirs by the payment of the right and usual annual farm, and 100 shillings more at the exchange. This sum is supposed to have amounted to sixty marks, or 420l. 2. The burgesses were also exempted from the payment of all taxes under the names of tholl, leitage, filillage, passage, pouage, and all other customs by land, and at sea-ports. 3. To have a merchant's gild, and have of their own, 4. No person to be quartered on them without consent, or any thing taken from them by force. 5. That they might hold their lands and recover their just dues from whomsoever they be owning which implies that the inhabitants were then constituted lawful subjects. 6. That they should hold their lands and tenures within the borough, according to the custom of the borough of Ipswich. 7. That none of them shall be fined or amerced, but according to the laws of the free-boroughs. 8. And that they might choose two bailiffs and four coroners out of the more lawful men of the said town. Suffolk Traveller. After this charter was ratified and obtained, the burgesses assembled in the church-yard of St. Mary at Tower, and there held their first great court; appointed officers, &c. Here they continued to transact their public business till the 17th year of Edward I.'s reign, when that monarch seized the borough, and held it in subordination for fix years. He then renewed and confirmed the charter, by public act, dated at Berwick, A.D. 1291. For liberty the burgesses were required to pay an annual rent of 100l. to the king. Another charter was granted by king Henry VI.; but the most material act of this kind was procured in the 17th year of king Charles II. Among the privileges conferred on the burgesses by these charters, is that of sending two members to parliament, who are elected by the votes of about 700 burgesses. The officers of thee, and who are entrusted with the civil government of the place, are two bailiffs, a recorder, 10 portmen, and 24 common-councillers. The borough is said to have returned members "ab origine." Like the generality of parliamentary boroughs, this has been the cause of much bribery, corruption, and litigation. A memorable instance of the latter occurred before a committee of the house of commons in 1780, when Mr. Cator, who had obtained a majority of votes by bribery, &c., was declared disqualified to take a seat in the house, and a new writ was issued to elect another person. The particulars of this case are fully narrated in Oldfield's "History of Boroughs," vol. II.

In addition to the privileges already noticed, the corporate officers of Ipswich are authorized to pass fines and recover try civil and criminal causes, and hold pleas of the crown. They also hold offices of wine, bread, beer, &c., and have an admiralty jurisdiction, whereby they are entitled to all waifs, lilies, and goods cast on shore. No Freeman can be compelled to serve on juries out of the town; and every burgess is entitled to several advantageous privileges on failing to different ports.

Ipswich at present contains twelve parish churches. In the Domesday book nine were specified: and in the year 1287, it is related in Stowe's Annals that four churches were to town, at Yarmouth, at Dunwich, &c., were destroyed by a violent storm, and by the waves of the agitated sea. The names of the present parishes, are, 1. St. Clement's, which is consolidated with St. Helen's, and has no church. 2. St. Helen's, or Hellen's, is a rectory. 3. St. Lawrence's church is said to have been begun by John Bottold, who died A.D. 1451. The chancel was erected by John Balcyn, who died in 1449; and a chantry was founded here, in 1514, by Edmund Dauntry, a poissman of this town, who also caused the market cross to be built. 4. St. Margaret's was improvident to the priory of the Holy Trinity, the church of which was formerly standing near St. Margaret's church-yard. 5. St. Mary's, at Elms: 6. St. Mary's, at Kay; 7. St. Mary's, at Stoke: 8. St. Mary's, at Tower: 9. St. Matthew: 10 St. Nicholas's: 11 St. Peter's: 12 St. Stephen's. Besides thee, the following churches are in the vicinity of the town: 1. Thurlerton: 2. Whittton: and 3. Welterfield. The monastic establishments within the town were formerly very numerous, and several houses, parts of buildings, and places, still retain the names of the respective societies. These were, 1. The Holy Trinity, or Christ Church, a priory of Black canons. 2. St. Peter and St. Paul, a priory of Black canons. 3. St. Mary Magdalene, and St. James, a hospital for leperous persons. 4. Dandy's Alms-houses. 5. A house of Austin friars. 6, 7, and 8. Black friars, Gray friars, and White friars. For accounts of these establishments, see Tanner's Notitia Monastica.

Ipswich formerly contained several large houses belonging to wealthy merchants and eminent persons. Of these a few remain in reduced and dilapidated conditions. Among these are walls and a brick gateway to a building called Wolley-college, which was appropriated and enlarged by Cardinal Wolley for a dean, 12 secular canons, & clerks, and 8 choiristers. To this college was annexed a grammar school: but before the founder's design was carried into execution he was arrested by King Henry VIII., and was supposed to have taken poison to escape an ignominious trial and execution. The site of the college comprised about six acres of land. The bishop of Norwich had a palace called Cur-"s house, in Silent-street. Sir Andrew Windsor, afterwards lord Windsor, had a house in the parish of St. Mary, at Stoke. The archdeacon of Suffolk possessed a house, called Place or Palace, in Upper Brook-street. Part of the ancient wall and gates lately remained. In the parish of St. Stephen were formerly two houses, or manors of considerable note: one of which belonged to, and was inhabited by Charles Brandon, duke of Suffolk; and the other to Sir Anthony Wingfield, knight of the Garter, vice-chamberlain, and privy-councillor to king Henry VIII. Some apartments of the latter still remain, and are curious examples of the style in which such manors were embellished. Several little houses in this town are embellished, both externally...
IPS

nally and internally, with carved and stuccoed devices; but there are chiefly of the age of James I. and Charles I.

The commerce and trade of Ipswich, though not upon a large scale, furnish employment to many of the poorer inhabitants, and fortunes to some who possess property to speculate with. Several vessels belong to this town, and many have been built here. Four building yards are attached to the port. The chief trade of the place is malting. Ipswich is supplied with five fairs annually, and five days out of the week are appropriated for markets. For the accommodation of those frequenting the place, a large commodious market-place has been erected from designs by Mr. Brown, an architect of this town. A series of buildings, on pillars, is disposed round two quadrangular courts, in which persons who frequent the market may be provided with shelter and accommodation for a small annual, or weekly rent. The plans are judicious, and admirably adapted to its purpose. In this town are five charity-schools for the education and clothing of poor children.

On the quay is a custom-house: it was determined in the reign of Edward III. that the bailiffs and burgesses of Ipswich had the full right to take custom-house duties for goods landed at the port of Harwich; whence it is inferred that the latter was a subordinate, and dependant port to the former. The tide commonly rises from 10 to 12 feet; but at low water the river is shallow and narrow. At Ipswich are the following public buildings: a town-hall, council-chamber, and mire-hall; a workhouse, or hospital, and some almshouses.

Adjoining the town is a park called Christchurch, occupying the site and lands of an ancient priory; and to the south of Ipswich are the following seats: Tattingstone-hall, Wolverstone-hall;—to the west are Cheyney, Sproughton, Buryhall, and Branford, Hintlesham-hall, Stokeshall, and Hillhouse. Among the eminent natives of this town, the name of Thomas Wolsey is particularly distinguished. He is said to have been the son of a butcher, but this is doubted by the editor of the second edition of "The Suffolk Traveller." It is evident, however, that he rapidly advanced from a low rank in society, to be even the master of his tyrannical and selfish monarch; and at length he fell a victim to his own ambition and to the caprice of his king. He was born here March 1434, and died at Leicester Nov. 29, 1530. Several memoirs and accounts of him have been published, but an "imperial life" of him is still a dissertation in English biographies. Chalmers, in his interesting "History of the Colleges and Halls, &c. of Oxford," has given a short and discriminative memoir of him, with references to, and insertions on the cardinal's different biographies. The following name occurs as "worthies" of Ipswich: Ralph Browning, D.D. and bishop of Exeter; William Butler, physician, who, according to Fuller, "Worthies of England," (vol. i. p. 145.) was the Eulogianus of the age. Mr. Raw, a respectable inhabitant of Ipswich, is printing a history of this town. "The Suffolk Traveller," 20d. vol. 1805. 1744. Ipswich, the Agamemnon of the Indians, a post-town and port of entry in America, pleasantly situated on both sides of Ipswich river, in Essex county, Massachusetts, 30 miles N.E. by N. of Boston, and about a mile from the sea. The township of Ipswich is divided into four parishes, and contains 612 acres, and 353 inhabited, who are chiefly farmers; a few weirs are employed in the millery, and some low trade to the West Indies. Fish, wool, and lace, and giant textiles, are manufactured here in large quantities, by women and children, and sold far and wide in Boston and other seacoast towns. Ipswich township was incorporated in 1634. It was formerly a place of consider|

IRA

able importance; but its decline is attributable to a barren harvest, and floods in the river. N. lat. 42° 43'. W. long. 70° 50'.

Ipswich, New, a township in Hillsborough county, Hampshire, containing 1360 inhabitants; situated on the W. side of Souhegan river, and separated from Whitebrook mountain by the N. line of Mainehuntefits; 56 miles N.W. of Bolton. It was incorporated in 1762, and has a florishing academy.

IQUEQUY, or Iquique, an island in the Pacific ocean, near the coast of Peru, about a mile in circumference, situated in a small gulf, which affords shelter for vessels, but no fresh water. It is inhabited by Indians and slaves belonging to the Spaniards, who are employed in collecting a yellow earth, formed by the dung of birds, as manure for vine, and with which eight or ten ships have been loaded annually for a century. S. lat. 20° 28'.

IQUISENOUI, one of the islands of Japan, situated near the S.E. coast of the island of Ximo. This island is very small. N. lat. 32° 50'.

IRABAD. See HIRABAD.

IRABATTY, a name given to the river Ava, in some part of its course.

IRAC, Araban, a country of Arabia Deserta, situated to the south of the Tigris and Euphrates; the ancient Babylonia and Chaldea. This country, towards the N.E., is watered by branches of the Euphrates, and is fertile, containing a number of cities and towns; towards the S.W., it is a dreary wilderness. One of the principal places in it is Buffala.

IRAC, or Iracjeini, a province of Peria, chiefly corresponding with the ancient Ecbatana; it is bounded on the N. by Ghilan and Mazanderan, on the E. and N.E. by Karakan, on the S. by Farillan, and on the W. by Khilfan or Chuilfan; and the Arabian Irac. This province contains part of ancient Media and Parthia: it is about 150 leagues in length, and 120 in breadth; and part of it consists of barren mountains, or sandy plains, which are altogether unproductive, but near the rivers there are extensive and fertile plains. The air is healthy, but very dry; the climate is hot; and it hardly ever rains in the summer for six months together. Mount Taurus, which traverses the province, furnishes the animal that yields maima, an exquisite whiteneys, is found in several places; galbanum is collected in the mountains near Yfpan; and in several places they cultivate grapes, some of which are dried, and others afford good wine. In this province are reckoned about 40 towns or cities. Yfpan, the capital of Peria, is the chief.

IRACOBO, a river of Guiana, which runs into the Atlantic. N. lat. 5° 33'. W. long. 54° 27'.

IRACUNDUS MUSCULI, in Anatomia, a name given by some authors to one of the muscles of the eye, called also the rectus exterior and abducens. It is one of the quartar recti of Albini, and is called by him and Douglas, as well as many others, the abductor.

IRAMALLY, in Geography, a town of Hindoostan, in the circuit of Dindigul; 30 miles W.N.W. of Dindigul.

IRAPUITY, a town of Hindoostan, in the Myfory country; 12 miles S.E. of Sankerdurgam.

IRASBURG, a township of America, in Orleans county, Vermont, situated on Black river; 12 miles S. of the Canada line; containing 15 inhabitants.

IRASCIBLE, in the Old Plishespy, a term applied to an apple, or a part of the fruit, where anger and the other passions, which animate us against things difficult, or others were expounded toside.
IRE

Of the eleven kinds of passions attributed to the soul, philosophers assign five to the irascible appetite; viz., wrath, bolder, fear, hope, and despair: the other six are charged on the concupiscible appetite; viz., pleasure, pain, desire, aversion, love, and hatred.

Philos divided the soul into three parts; the reasonable, irascible, and concupiscible parts. The two last, according to that philosopher, are the corporeal and mortal parts of the soul, which give rise to our passions.

Philos fixes the seat of the irascible appetite in the heart; and of the concupiscible in the liver, as the two sources of blood and spirits, which alone affect the mind.

IVAYAT, or IRAVAT, in Hindu Mythology, the name of an elephant on which Indra, the regent of the firmament, and prince of the beneficent genii rides. (See Page 26.) It is generally painted with three trunks, or proboscides, and is driven by India's charioter named Vashis. The Hindus assign vehicles, which they call vahans, to their different deities, male and female. Thus, the vahana of Indra is Iravat (see VAYAN); but not, it would appear, exclusively by Major Moore, in the Hind. Pantheon, p. 261, that the vahana which has been described in which other deities, Rama and Rahu, in particular, are mounted, on this favored animal. Indra being a personification of the visible heavens, his attributes and deceptions partake of especial affections. In his wars he employs many elephants, who are in fact clouds; and their names translated mean thunder, bear, black, rascal, rambler, greaser, etc. The chief of these is Iravat, which means thunder, the aqueous property of clouds being that most apparent; and we may, in this appropriate nomenclature, fancy that we discern some appearance of connection in the mythological machinery of the Hindus, generally at the first view to apparently anomalous and extravagant.

IREDEN, in GEOGRAPHY, a town of the duchy of Cornwall, on the coast of the Baltic; 18 miles E.N.E. of Windau.

IRBITSKAYA, a town of Russia, in the government of Perm, on the Irbit; 100 miles N.E. of Ekaterinburg.

IRCUNDA, a town of Hindostan, in the circuit of Chac 1; 20 miles S.W. of Ciscoc.

IRE HOMES, two islands among the Orkneys, a little to the W. of the island of Sanda.

IREB, Hirum or Mark-Jervis, a parish and market-town in the hundred of Allendale, in the county of Cumberland, England, is situated near the source of the river Ellen, 353 miles from London, and contains, according to the population return of the year 1831, 73 houses, and 339 inhabitants. Here are two annual fairs, and a weekly market of Thursday. The town, though not considerable, is of great antiquity, and was, in the opinion of Cicero, the "Athena of the Romans," where the Barcaric Tigrides were slain;" but however diffusent from this evidence, and afflicting, that no Roman antiquities were ever found here; and that the affinity of name has left force in this inference, as there is another Ireby in Lancashire, on the borders of Westmoreland and Yorkshire. This gentleman, with Mr. Ward, places the Arbroath at Mereby, where remains have been dug up, and the fact of a flattening is evident. Beauties of England and Wales, vol. iii.

IREDELL, a county of America, in Salisbury district, North Carolina, surrounded by Surry, Rowan, and Burke. The climate is delicious, the lands beautifully variegated with hills, and the soil rich. It contains 5761 inhabitants, of whom 1481 are slaves. Iredell court-house has a police-office; 25 miles from Salisbury.

IREGA, a town of Hindostan, in the circuit of Adoni; 50 miles W.N.W. of Adoni.

IREJ, a town of Hindostan, in the circuit of Gobud; 75 miles E. of Narwa. N. lat. 27° 37'. E. long. 79° 48'.

IRELANO, a town on the N. coast of the island of Sumatra. N. lat. 5° 6'. E. long. 96° 15'.

IRELAND, a large and fertile island in the Atlantic ocean, lying on the west of Great Britain, from which it is separated by the Irish sea, or St. George's Channel. It contains the most well-ordered in Europe, if we except Iceland, and it has no country between it and the coast of Labrador in North America. The sea which separates it from Great Britain, varies in breadth from 14 to 20 leagues; but is contracted between Scotland and the county of Down to a channel only five leagues wide, and farther north to a still narrower breath of less than four, between the N.E. point of the coast of Asturias and the Mull of Cantyre.

The general figure of Ireland somewhat resembles a parallelogram, the greatest length of which can be measured along a meridian, from Bally Forland Point, in the county of Down, to the Sings of Cork Harbour; this does not exceed 183 Irish, or 236 English miles. It is much indented on the east by the Irish sea, and on the west by the Atlantic ocean, so that its breadth is very unequal. Between Enniskillen, in May, and the mouth of Strangford lough, which is the greatest, there are 143 Irish (182 English) miles, whilst between the bays of Dublin and Galway there are but 43 Irish miles, and between Dunkirk and Ballyshannon no more than 75. It will not, therefore, appear surprising that there is not a spot in Ireland which is more than 50 miles distant from the sea. If a diagonal line be drawn from Fairhead, the north-eastern point, to Mirehead, the south-western point, it will measure 241 Irish, or 305 English miles, which is the greatest distance between any two points of the island. The number of Irish plantation acres is above 12 millions, which is nearly equal to 20 millions of English acres.

The situation of Ireland is peculiarly favourable for receiving and bowing the reciprocal benefits of external commerce. Its communication is open and direct with England, France, Spain, Portugal, the coast of Africa, the East Indies, South America, the West Indies, the United States of America, Newfoundland, Hudson's Bay, Greenland, &c., with by far the greatest part of the north, the most fertile, the most commercial, and the most mutually dependent countries in the world; with countries abounding in an endless variety of commodities, furnishing every material on which the varied wants of man can be employed, and presenting the most ample returns to the entreprenur trader. It seems destined by nature, says Mr. New-ham, to be the great emporium of the commodities of Europe and America; and, indeed, of those of almost every maritime country upon the surface of the globe.

The face of the country affords a pleasing variety. In some parts there are rich and fertile plains, watered by large and beautiful rivers; in others frequent hills produce that interesting succession of objects with which a flat country can never abound. In two or three counties, there are most romantic and picturesque scenes, whilst in others, extensive plains have been converted into woody morasses. A sufficient quantity of soil, however, is wanting in most parts to render the views as interesting as the general character of the country would lead us to expect. That this was not the case in former times, is evident from various accounts. Giraldus Cambrensis, quoted by Camden, Stubbs, and other old writers, speaks of it as covered with woods, which are also often referred to in acts of parliament, and other public documents.
IRELAND.

documents. These were partly cut down to deprive the natives of their fuel, and partly for the purpose of extending agriculture. In the reigns of James I. and Charles I., during the continuance of peace, a very extensive exportation took place, chiefly of pipe flaxes and other small timber; and besides what was consumed in domestic fuel, immense quantities were charred for the iron works which were carried on in different parts of the island. As no attention was paid to renewing them, the forests were speedily reduced.

Yet Boote, whose work was published about the middle of the eighteenth century, informs us that there still flourished great woods remaining in all the provinces, some of them many miles long and broad. All these have since been deforested, and there does not exist in Ireland any tract deserving the name of a forest; but the whole country is cleared for the purposes of agriculture, and retains none of the vast woods to be found in the savage state, yet Ireland is not destitute of woods that are both useful and ornamental. A spirit of planting has been prevalent for some years past, which has been powerfully encouraged by the premiums of the Dublin Society, as well as by several acts of parliament for the protection of timber, so that the country begins to assume a lea naked appearance, and will, perhaps, become more entitled to its old name of the Woody island.

Ireland has been celebrated for the fertility of its soil. The richest land is that which lies near the principal rivers, but there is not much which can be called good; and the proportion of that which is waste was not thought by Mr. Arthur Young, so long as ago as the year 1778, to be as great as in England. The most uncultivated tracts are the mountainous districts in all the western counties, which seem placed as barriers against the fury of the vail Atlantic. In every part of Ireland there is stone either near the surface or at no great depth, which Mr. Young considered as the greatest singularity of Ireland. "May we not recognize in this," he continues, "the hand of bounteous Providence, which has given, perhaps, the most fertile soil in Europe to the most infertile climate in it? If as much rain fell upon the clay of England, (a soil very rarely met with in Ireland, and never without much stone,) as falls upon the rocks of her fertile island, those lands could not be cultivated. But the rocks here are clothed with verdure; those of limestone, in particular, with only a thin covering of mould, have still more beautiful turf imaginable." Light sandy soil is seldom met with, and chalk has not been found in any part of the island, though there is a white limestone somewhere near Dublin.

The mountainous chains in Ireland are neither numerous nor important; but an upland ridge divides the country from the N.E. to the S.W., giving birth to several of the rivers. The Irish hills generally form short lines or detached groups, which are so dispersed through the country, that there is scarcely any part in which the prospect is not terminated by this species of majestic scenery. There are none, however, equal in height to several in Great Britain, the highest probably falling short of 3000 feet; yet there are a few, such as Mangerton and McGillicuddy's Reeks, near the lake of Killarney, and Brandon, near Dingle, in Kerry; Croagh Patrick and Neiph in Mayo; and Silver–Donard, one of the Mourne mountains, in the county of Down, which deliberate the attention of the naturalist, as they have been found to produce many of those plants peculiar to Alpine regions.

As the whole of the country is found to have stone near the surface, it was natural to expect that it contained valuable minerals; and we accordingly find that such an expectation was early formed, though, hitherto, much pains do not seem to have been taken to discover them, and render them useful. A plan was indeed recommended by Mr. Kirwan, which, if it had been adopted, would have established a complete mineralogical school in Ireland; and would thus have not only led to the discovery of the minerals, but have also instructed in the mode of procuring them with most advantage. As, latterly, attention has been excited to the subject, much progress may be shortly expected. The limestone quarries, which abound almost everywhere, are now generally worked, and afford a most valuable manure.

A great variety of marbles is found, some of which are uncommonly beautiful, and capable of a very high polish, so as to leave little to regret the difficulty of procuring Italian marbles. Gypsum, so valuable a material in the hands of the ornamental artist, is found in great abundance near Belfast, and fuller's-earth has been found in several counties. The mountains of granite in Wicklow and Carlow supply the capital with this useful stone for building; and slates of excellent quality are found in many parts of the island. The beds of coal, to be seen in various regions of Ireland, have not yet been properly explored. That of Kilkenny, found at Cashel–cover, is deservedly celebrated among minerals, its as the purest coal of the kind to which it belongs, which is the stone or unignitable coal. This is the kind generally found in the southern parts of Ireland; but in the counties of Tyrone and Antrim some mines of flint–coal have been worked. Iron ore is very abundant; and before the forests were consumed, there was a great number of iron works in various parts. Boote divides the iron mines of Ireland into three descriptions: 1. What he flyles the bog–mine, or, what is now termed lowland ore, found in moors and bogs; the ore resembling yellow clay, but mouldering into a blackish sand. 2. The rock mine; a bad fort; the ore intimately combined with stone. 3. That found in various mountains; the ore spheric and of a whitish grey colour; balls of the stone ore contained kernels full of small holes, whence the name honey–comb ore. Boote praises this iron as frequently rivalling that of Spain; and Mr. Kirwan affirmed, before the house of commons, that the Arigna iron was better than any iron made from any single species of ore in England. A defective supply of coal renders, however, the abundance of this ore of little avail. There are also valuable mines of lead, copper, and cobalt, some of which have been wrought to advantage; and gold has been found in the county of Wicklow, though not of such consequence as to promise much national advantage.

The bogs of Ireland form a very remarkable feature of the country. These are of different kinds, and in some places are very extensive. As trees, and even utensils of different kinds have been found in these bogs, they are supposed not to be of very great antiquity; and the most probable account seems to be, that when forests had been cut down, the trees were suffered to lie on the spot, and the cultivation of the ground neglected. Thrice these trees intercepted and confined straits of water with the various rubbish they brought with them; and became gradually covered with a vegetation of moss, fenly grafts, rubbish, and various aquatic plants. Notwithstanding attention was directed to the recovery of these extensive wastes more than a century ago, very little has yet been effectuated, which is rather to be attributed to want of proper exertion, than to such recovery being impracticable. In the year 1809, however, on the recommendation of the Right Hon. John Fuller, at that time chancellor of the exchequer, who will be long remembered as a zealous promoter of the interests of Ireland, when party anmosity will be forgotten, com-
milliners were appointed "to enquire into the nature and extent of the bogs of Ireland; and the practicability of draining and cultivating them." As the vast extent of these bogs has not enabled the commissioners to complete the task committed to them, it can only be observed, that the first of a number of districts contains 39,450 English acres of bog, and that the expense of the operations which a very able engineer deemed necessary for completely draining it, was 70,014l. 71. 3d. The bogs in the King's county alone, exceeding 530 acres each, contain at least 124,000 acres. The drainage of these bogs is, therefore, a matter of vast importance, not only to Ireland, but to the empire at large, as these lands, now of little or no value, would, when drained and properly cultivated, yield a vast supply of food, for which England has had to pay large sums in gold to her most bitter enemy. It has also been made evident, that this drainage would increase the quantity of turf fuel, so as to render it both more easily procurable and cheaper. At present only the small bogs, which it is not intended to drain, and the edges of the large ones, are accessible to the turf-digger, but the drainage would enable an approach to the interior parts of them; and such is the quantity, that after every exertion to reclaim, there will remain more for turf than an increased consumption can possibly exhaust in the course of ages. This is an observation of much importance, because the want of this excellent fuel would be very severely felt in a country where few coal mines are worked, and where the supply of coal is consequently uncertain and expensive. The instructions of the commissioners do not authorise them to examine the numerous boggy tracts on the sides of mountains, which not being in general deep, afford at times good pasturage. The best mode of reclaiming these would be to introduce the culture of Fitoria, as recommended by the Rev. Dr. Richardson, and thus render them good meadows.

Perhaps no country of the same extent is more bountifully watered by fine rivers and lakes, or more indented by noble harbours, than Ireland is, so as to poffefs, in an eminent degree, those great requisites for agriculture, manufactures, and the most extensive commerce. The rivers, besides abounding with an infinite variety of fish, communicate uncommon fertility to the lands which they beautify, and afford a multitude of the best situations for the machinery of manufactures, so that wind-mills are very rarely met with in this country. But though many of these rivers are very confiderable in point of fize, and run a prett}ng long course, and fome of them are capable of bearing large boats many miles above their fall into the sea; yet there are none which can be called navigable in the fame fene as the Thanes or the Severn. This is partly occasioned by rocks running across their beds, and thus forming cataracts; partly by the practice of breaking down the banks to make fords for the convenience of travellers, when bridges were less frequent than they are at present; and partly by weirs made either to serve mills, or for the sake of catching salmon. Much, however, may be done by labour, attention, and expense, to render the navigation both more commodious and more navigable; and so feasible was the Irish legislature of this, that a sum of money has been appropriated, under the direction of commissioners, for this purpose. The Shannon is the principal river of Ireland, which, rising in the northern part of Connaught, almost inflates that province and the country of Clare, and after a course of 150 miles, in which it expands into six different lakes, it flows into the Atlantic ocean, between the counties of Clare and Kerry, being navigable for large vessels as far as Limerick. The Suir, the Barrow, and the Nore, which are also described as three brothers, proceeding in different directions from Sleathbloom, a ridge of mountains between the King's and Queen's counties, and in the north of Tipperary, pour their united streams into the bay of Waterford.

The number of lakes or loughs in Ireland is very great, and some of them are large, and even magnificent. Many of these sheets of water, however, which are called by this name, are in reality arms of the sea, as Lough-Strule, Lough Foyle, and others. Of those which are, strictly speaking, lakes, Lough Neagh, Lough Erne, and Lough Corrib, are the most considerable in point of extent; as Lough Lene, or the lake of Killarney, is the most distinguished for its beauty. There are also many mineral springs in different parts, the most remarkable of which will be noticed under their respective counties.

The harbours of Ireland are very numerous. They have been divided into the principal havens, and the lesser or barred havens; but the distinction seems of little use, as they will deferve notice, rather on account of their being frequented, than on account of natural advantages. Those indeed which are most capacious, on the S. and S.W., have hitherto been little frequented, except by the smuggler, or by vessels unable to reach their defined port. Waterford and Cork harbours on the S.; Bantry and Dingle bays on the S.W.; the estuary of the Shannon, and the vast bay of Galway on the W.; that great opening on the N.W. of which the bay of Sligo is a part; Lough Swilly and Lough Foyle on the N., are the most confiderable. On the eastern side, there are none possessed of great natural advantages, yet from the greater improvement of the adjoining country and the vicinity of England, there are many which are much frequented, especially the harbours of Belfast and Newry, and the barred havens of Dublin, Drogheda, and Wexford. The principal commercial towns are Dublin, Cork, Belfast, Limerick, and Waterford.

With respect to the climate of Ireland, strangers soon perceive that it is in general less hot in summer, and less cold in winter than in England, and other countries in the same latitude; and that very hot or very cold weather, when it does take place, continues for a much shorter time. If, however, the climate be more temperate, it is also much damper, both on account of a greater fall of rain, and of a moisture in the atmosphere when there is no rain, which produces a very striking effect on the walls of houses, furniture, and various other articles. This prevalence of moisture seems to be occasioned by the winds blowing from the vast Atlantic ocean, and is more perceptible in the western and southern parts. Though the frequent showers answer very well for pasturage, and clothe the limestone rocks with verdure, yet they often interfere with the gathering of the harvest, and render expeditions on the part of the farmer, in using fine weather whilst in his power, more necessary. This short continuance of heat is not sufficient to ripen peaches, grapes, and other fruits, without great care and attention; but the broad-leaved myrtle (Myrtus communis) grows luxuriously, with very little care, in the southern counties, being seldom injured by the cold of winter; and the hydrangea, (Hydrangea laciniata) is not found as a native in any other country so far differing from the climate. Persea adscensus is a plant of an unfavourable climate in the climate, laying that it is much freer and more uncertain than it used to be; and an ingenious writer, Dr. W. Hamilton, in the 6th vol. of Transactions of the Royal Irish Academy, has stated some facts which appear to add credence to such complaints. The pine-tree, especially that species called the Scotch fir, formerly grew on many

Vol. XIX.
of the mountains of this island, and in parts of the northern and western coasts exceedingly bare and open to storms. Vast roots and noble trunks of this species of pine have been seen, and examined with attention, in situations where human industry cannot now rear a twig of the hardiest tree. The devastation occasioned by lands in some parts of the northern coast, and even in the south, and the greater influx of the tide, seem to prove the more frequent recurrence and greater violence of the Atlantic storms. The destruction of the forests may perhaps account satisfactorily for some of these facts, whilst others may have been occasioned by circumstances not yet sufficiently attended to. Dr. Parry, in his "Observations on the Climate of Ireland," has added many facts to controvert the opinion of a change; and the observations made a century and a half ago, are so applicable to the country at present, that it may be inferred the present feasons do not materially differ from former ones, and that the influence of the Atlantic has always been much the same. The winds most prevalent in Ireland are the west and south-west, which, contrary to the poetical description of sylphs, are frequently attended with rain and storms. Bitterly winds are less common, and are generally dry and keen; these are found prejudicial to health, and invalids avoid being expos'd to them. On the whole, if the climate of Ireland be not the most agreeable, it is found very wholesome; insufficience of longevity are frequent, and if peculiar circumstances occasion much fickness in many of the large towns, the peafantry are very healthful, and, in consequence of it, robust and hardy. The bags, which have supped to be wholesome, are of a very different nature from the morasses in other countries, which appears both from the timber preferred in them, and from the effect produced on the skins of animals unfortunately lost in them.

The productions of Ireland, and the animals found in it, do not differ much from those in England. The most valuable ones in both seem to have been imported from other countries, and the variety of these must be greater in England, on account of its superior cultivation. The domestic animals are the same, and from the care taken of late years to improve the breeds, it may be expected that our sheep and oxen will not be surpassed. Bede, who has commemorated the praise of Ireland for abundance of honey and milk, also mentions numerous herds of deer, which animal the progress of cultivation has now rendered rare. In various parts of Ireland are dug up enormous horns of deer, which some writers have imagined to be of the species called moose deer in America; but Mr. Pennant has demonstrated that the animal must have almost doubled in size the American monitor, which is sometimes found fourteen hands in height. The Irish horns have been found of the extent of fourteen feet from tip to tip, furnished with brow antlers, and weighing 300 pounds; the whole skeleton is frequently found with them. It is supposed that the animal must have been about twelve feet high. Wolves infelic the country formerly, but are said to have been extirpated by Oliver Cromwell. It has been asserted that no poisonous animal will live in Ireland, and even that no spiders will haunt Irish timber, which, as is said, was the cause why it was often employed in magnificent ceilings in the middle ages. "Whether it be owing to the soil or the climate," says Dr. Beaumont, "certain it is that in Ireland there are neither mice nor toads, nor any kind of serpents; and it is not a hundred years since frogs, of which there are now abundance, were first imported from England. But though the same experience has been made with snakes and vipers, it has happily been unsuccessful." The rivers, lakes, and seas are flocked with a great variety of fish, which yield a plentiful article of food to all ranks of people. The fisheries on the coast give employment to great numbers, and have become, in some instances, an object of national attention and legislative encouragement, though they have never yet been carried on as extensively as they might be, or there could have been no occasion for an importation of fish from foreign countries. Jephson Oddy, esq. in his prospectus of a western fishery company, mentions that the Nenagh bank, and others near the coast of Ireland, abound with the finest cod, hogs hake, milt, pollock, &c., and that the adjoining feas are frequented at different periods by mackerel and herrings in great quantities; and he forcibly urges that if this fishery was carried on with spirit, it would supply both England and Ireland with abundance of fish, so as to render importation unnecessary, whilst it would at the same time give employment to numbers, and prove a valuable nursery for seamen.

The native grasses are those esteemed most valuable by the farmers, so that Ireland has ever been celebrated for the excellence of its pastures; the number of cultivated vegetables is daily increasing; and in consequence of the attention lately paid to botanical knowledge, it appears that native plants have not been bettered with a sparing hand. The introduction of the potato, the value of which is universally acknowledged, and which forms the principal part of the food of the Irish paufantry, has been commonly attributed to Sir Walter Raleigh.

To this general and brief account of the natural state of Ireland, it may be proper to subjoin a list of the counties into which Ireland is divided. The population of each, as stated by Dr. Beaufort, is added; at the same time it must be observed, that this most probably falls far short of the real population, as in so many years as have elapsed since its publication, there must have been a considerable increase. It may serve, however, to give some idea of the comparative population of different counties, until more satisfactory documents than at present exist enable us to give a more correct statement. The number of counties is 32, which are contained in four provinces. A particular account of each will be found under their respective names.

Mr. Pinkerton is of opinion that Ireland was early discovered by the Phcenicians. "On the first dawn of history," he says, "when the north-west of Europe was as obscure to the Greeks, as the islands on the north-east of Siberia were recently to us, it would seem that Ireland constituted one of the Cathairides. The poets ascribed to Orphus deserve no credit, but it appears that the island was known to the Greeks by the name of Juveona, about two centuries before the birth of Christ. When Cesar made his expedition into Britain, he describes Hibernia as being about half the size of the island which he had explored; and while the Romans maintained their conquests in the latter region, Ireland continued, of course, to be well known to them, and Ptolemy has given a map of the island, which is superior, in accuracy, to that which represents Scotland. Towards the decline of the western empire, as the country had become more and more known, and had been peoples with various tribes, the Romans discovered that the ruling people in Ireland were the Scotti; and thenceforth the country began to be called Scotia, an appellation retained by the monastic writers till the seventh century, when the name Scotia having passed to modern Scotland, the ancient name of Hibernia began to re-affirm its honours. It is supposed that this name, and the Gothic denomination Ireland, are mere modifications of the native term Erin, implying the country of the sea.

"It is probable," says the same writer, "the attention to the subject of antiquities gives weight to his opinion, that the original population of Ireland passed from Gaul, and was afterwards increased by their brethren the Gauls from England. About the time that the Belgae settled on the south of England, it appears that kinsmen of these Gothic tribes passed to the north of Ireland. These are the Turbog of the Irish tradition; and appear to have been the same people whom the Romans denominated Scotti, after they had emerged to their notice by not only extending their conquests to the north and east of Ireland, but had begun to make maritime excursions around the Roman provinces in Britain. But Ireland had been for many centuries inhabited by tribes, expelled from the continent and Britania by the progress of the German Goths, that the Belgae added their native speech and distinct character; and from intermarriages, &c., became little distinguishable from the original population, except by superior ferocity, for which, the Scetti, or those who affected a descent from the Gothic colonies, were remarkable; while the original Gaelic had been an insipid people." Such is Mr. Pinkerton's account of the early state of Ireland, but as very different ones have been given respecting this, and as it still continues to be a subject of controversy, it will be proper to give a brief abstract of the principal opinions, and the authority on which they rest. The celebrated Edmund Spenser, in his 'View of the State of Ireland,' apposes it to have been first peopled by the Scythians, from whom the nation Scott was derived. These settled in Ulster, and a colony from them went to Scotland. Another nation came out of Spain to the west part of Ireland, and finding it waste, or weakly inhabited, professed it. These had letters in Spain, where they were introduced by the Phcenicians, and brought them to Ireland, where it is certain they were known at a very early period. From the Scythians, Spenser supposes the Irish to have derived, till the custom of keeping their cattle, and building themselves, for the main part of the year, in hooles or huts, pausing upon the mountains and waste wild places; and removing still to fresh land, as they had depopulated the former. This custom, which seems to have continued to Spenser's time, was very injurious. The huts were receptacles for outlaws and base people, who there evaded justice; and those who lived in them grew more barbarous, and lived more licentiously than they could in towns, using what manners they liked, and practising what mischief and villanies they would either against the government, or private individuals. Another Scythish custom was the wearing of mantles, and long glibbes, which is a thick curled bush of hair, hanging down over their eyes, and monstrously disguising them. These mantles Spenser describes as convenient for outlaws, rebels, and thieves. As the passenger is curious, and the work least known than it ought to be, the isolation of it may afford some entertainment to the reader. "First the outlaw being for his many crimes and villanies banished from the towns and hooles of honest men, and wandering in waste places, far from danger of law, maketh his mantle his hoole, and under it covereth himselfe from the wrath of heaven, from the offence of the earth, and from the fight of men. When it raineth, it is his pent-hoole; when it bloweth, it is his tent; when it freezeeth, it is his tabernacle.

In former he can wear it loose; in winter he can wrap it close; at all times he can use it; never heavy, never cumbersome. Likewise for a rebel it is as serviceable. For in his warre that he maketh, (if at least he desire the name of warre) where he followeth his fox, and hurketh in the woods, and where his hooles are not still, he is licensed, as he hath his household stuff. For the wood in his hooles and ill weather, and his mantle is his couch to sleep in. They in the wuth and hooles, round, and covereth himselfe against the gust, which in that country doth often surprise, which the wolves, and dore more firmly we use them than all our houses. As for spears, we can take some at a hoole, yea, and oftentimes in the hooles furnish them, when they are in need, being wapent about their left arm, instead of a target, for it is brought them with a fretted, besides it is set to twice, right to throw away, and being such, they commonly call it, but it is to them all. Lastly, for a thief it is to help him; as it may be, it was first invented for him, for whereas he may clear away his hoole, so that he may not only, but in his war, and when he goeth abroad in the night in free-loting, he is befell'd and furled friend; for being in such times together abroad to watch for the booty, that they can prettily thrust their fingers under a bush, or a bank side, till they may conveniently do their round; and when all is over, he can, in his mantle, pass through any town or company, being close covered over his head, as it were, from knowledge of any, to whom he is inpanded.

Mr. Pinkerton, i.e. any man that is disposed to mischief or villanies, may under his mantle go privily armed without
Ireland.

...sinipion of any, carry his head-peece, his hean or piloth if it please, to be always in readiness." In like manner he considers the long hair or glibbe as serving the purpose of concealment. The Irish cry, or habub as he calls it, which the Kerne or foldery use at their first encounter, he also considers of Scythian origin; and also the calling upon the name of some chiefain, as Ferrag, for instance, which he supposes to be the name of a chief under whom they fought successully against the Africans. To this he adds their lamentations at their burials, "with difficult out-cries and immoderate wailings," which favour greatly of the Scythian barbarism.

Our ingenious author next proceeds to shew that the Irish arms and weapons are Scythian, and the same arms as those used by the old Scots, who were of the same family, and that they long resembled the Scythians in their confused kind of march without order or array; and also in certain religious ceremonies. From all these circumstances he infers that the Irish are anciently deduced from the Scythians. He afterwards adduces customes derived from the Spaniards and Gauls in proof of colonys of them having been established in Ireland, but they are fewer in number and less remarkable. The use of saffron shirts, the giving the charge of all household affairs at home and abroad to the women, the manner in which they eat on horse-back, with a few others, are rated as of Spanish origin; whilst the use of long darts and wicker shields is mentioned as derived from the Gauls. Such is Spenser's opinion respectifying the origin of the Irish, founded, as may be seen, on conjectures, for the inferences drawn from customs can scarcely deferve any other name. The colony from Spain, which he admits, though he speaks doubtfully of the origin of the people, and gives no particulars, is laid great stress on by the advocates for the ancient glory of Ireland. "Not to speak of the original settlement by Partholom;" says Dr. Leland, "it is maintained that about 500 years before the Christian era, a colony of Scythians, immediately from Spain, settled in Ireland, and introduced the Phenician language and letters into this country; and that however it might have been peopled till earlier, yet Heber, Heramon, and Ith, the sons of Mileinus, gave a race of kings to the Irish, distinguished from their days by the names of Gadelians and Scuuts or Scots. Hence their writers trace a gradual refinement of their country from a state of barbarous feudal factions, and competitions; until the monarchs, celebrated in their annals by the name of Uillam-Fodla, established a regular form of government, ordained a grand seminary of learning, and erected the Fer, or triennial convention of provincial kings, princes, and poets, at Teamor or Tarch, in Meath, for the establishment of law and regulation of government. Kooting, the Irish historian, who transcribed his accounts from poetical records, mentions little more of this boasted assembly, than that its great object was to introduce civility, and to guard against those crimes which predominate in days of rudeness and violence. The magnificent detail of its grandeur and solemnity, the stupendous attention paid by its members to the national history, annals, and genealogies, are nothing more (as I am assured) than the interpolations of an ignorant and preposterous translator. But whatever were the infallibility of this monarch, it is acknowledged that they soon proved to work for the wildness and disorder of the time. To Kimber, one of his successors, the annals give the honour of reviving them; besides that of regulating Ull-r, his family province, and adorning it by the lately palace of Eamans, erected near Armagh." One of his successors, to secure his power, divided the island into twenty-five dynasties, instead of six; but the patriarchal government was restored about a century before the Christian era. Anarchy, sedition, and murder continued prevalent, notwithstanding the wise laws occasionally enacted; and an Irish chiefain is said to have addressed himself to Agricola, and to have encouraged him to make a descent on Ireland. Thence, however, who warmly contend for the honour of Ireland, lay that such descent would not have been effectual; and record with triumph that the Irish monarch of this time, instead of dreading an invasion of the Romans, failed to the assistance of the Picts, led an irruption into the Roman province, and returned in triumph laden with foreign spoils. After this, the old Parbois or Belgic inhabitants grew to powerful and turbulent as to establish a monarch of their own race, and to harass the country by what was called the Attaecic war. Tachtel, a Mileesian prince, restored the power of his family; and in the time of his grandson, in the third century. From the son of Combal, better known by the name of Fingal, is said to have lived, and to have been general of his troops. The succession of kings of the Mileesian family, to the year 1198, is said to have been 171.

General Vallancey, who has paid very great attention to the antiquities of Ireland, and whose great learning and personal responsibility, as well as his exertions for the good of society, should secure him from petulant and war upon abuse, has, in his "Vindication of the ancient History of Ireland," maintained the truth of the leading facts mentioned by Keating and others. The Scythians, by whom the country was peopled, were, according to him, not the Northerns, but Southern Scythians, the same people as the Phenicians, who are to be distinguished from the Cananites, and were the navigators of the latter, acknowledged as subjects, but never admitted to a share in the government, or to the rank of noblesse. They had the use of letters, a knowledge of astronomy, of marine astronomy in particular, and of navigation; but had no knowledge of the fine arts, their religion forbidding it. These Phenicians are supposed to have been originally Parbois or Indians, proceeding from that eastern district, the supposed source of all civilisation; and the late writers on Indian antiquities produce many circumstances tending to establish a knowledge of Ireland in that oriental people, and an intercourse with it at a very early period. It would occupy too much room than the nature of a Cyclopaedia would allow, to enter upon the arguments adduced by the learned general in support of his opinions. Suffice it to say, that they chiefly rely on the etymology of names, on a resemblance in certain words, and on a resemblance also in certain religious ceremonies and old customes, which are thought to have originated in fire-worship, which is supposed to have been once prevalent throughout Ireland. The Rev. Dr. Ledwich, author of an elaborate work on the "Antiquities of Ireland," endeavours, with all the eagerness of a partizan, to expose and ridicule all pretensions to early civilization. He contends that Ireland was first peopled from Great Britain by the Celts, who were wandering vagabones, of whom little is recorded, and that little proclaims their ignorance and barbarism. The Belgic and other northern tribes afterwards settled in it; and it had at no time arrived to a greater degree of improvement than when visited by the English under Henry II. To be qualified to form an opinion on the preceding subject, would require a long course of study, the acquisition of languages little used except to the antiquary, and the perusal of many volumes in the highest degree dry and uninteresting; and after all, such is the want of written documents of an early date, that the most we could arrive at would be probable conjecture. At the same time, it does not appear improbable, much less absurd to suppose, that the Phenic.
Ireland.

Theins might have colonized Ireland at an early period, and introduced their laws, customs, and knowledge, with a comparatively high state of civilization; and that these might have been gradually lost amidst the disturbances of the country, and at last completely destroyed by the invasions of the Ostrogoths, foes to have reduced Ireland to a barbarous state, previous to the English invasion.

The conversion of Ireland to Christianity is generally attributed to Patrick, who has been called the "patrician saint of Ireland." He is said to have landed in Ireland A.D. 430. The people were, however, prepared for his preaching by the labours of some former missionaries. Notwithstanding the introduction of Christianity, the petty princes and people retained their liberty of manners; and the abuses abound in horrid instances of robbery, and hideous effects of avarice and ambition. "Yet Christianity, as they taught," says Dr. Leland, "as though it could not eradicate, at least restrained the national vice. A numerous body of ecclesiastics, secular and regular, quickly swarmed over the whole country; frequently became bishops between contending chiefs; and when they could not confine them within the bounds of reason and religion, at least terrified them by denouncing vengeance against their excesses. An ignorant people listened to their tales of pretended miracles with a religious terror. In the midst of every province, contending bishops, and every day another bishop, were founded and inviolate. They soon learned to derive their own comfort from the public veneration. The infant church was everywhere amply endowed, and the prayers of many were paid by large donations. Some of the oldest remains of Irish literature, as they have been explained to me, inform us, that the people were taught to dedicate the first-born of all cattle to the church, as a matter of indispensible obligation. But if the clergy thus acquired riches, they applied them to the noblest purposes. The monks, says Mr. O'Connor, fixed their habitations in deserts, which they cultivated with their own hands, and rendered the most delightful spots in the kingdom. These deserts became cities; and it is remarkable enough, that to the monks owe we owe so useful an institution in Ireland, as bringing great numbers together into one civil community. In these cities the monks set up schools, in which they educated the youth, not only of the island, but of the neighboring nations. The testimony of Bede is unquestionable, that about the middle of the seventh century, in the days of the venerable prelates Finnian and Colman, many nobles and other orders of the Anglo-Saxons retired from their own country into Ireland, either for instruction, or for an opportunity of living in monasteries of stricter discipline; and that the Scots (as he styles the Irish) maintained them, taught them, and furnished them with books, without fee or reward—a most honourable testimony, says the elegant Sir Lyttelton, not only to the learning, but likewise to the hospitality and bounty of that nation! A conflux of foreigners to a retired island, at a time when Europe was in ignorance and confusion, gave peculiar lustre to this feat of learning; nor is it improbable or surprising that seven thousand students flocked at Armagh, agreeably to the accounts of Irish writers; though the saminary of Armagh was but one of those numerous colleges erected in Ireland. But the labours of the Irish clergy were not confined to their own country. Their missionaries were sent to the continent. They converted heathens; they confirmed believers; they erected convents; they established schools of learning; they taught the use of letters to the Saxons and Northmen; they converted the Picts, by the preaching of Columba, one of their renowned ecclesiastics. Burgundy, Germany, and other countries received their instructions; and Europe with gratitude confessed the superior knowledge, the piety, the zeal, the purity of the "Island of Saints." Such are the events on which Irish writers dwell with an enthusiastic delight. The first Christian missionaries seem to have indulgently avoided all unnecessary violence to the ancient manners of the Irish. Their poets they favoured and protected; the remains of the Druidical order were not perverted; and although divine vengeance was thundered against the worshippers of the sun, stars, and winds, it is evident that some Pagan superstitions were overlooked with too great indulgence, for they existed at this day in Ireland: fires are lighted at particular times, and the more ignorant Irish still drive their cattle through those fires, as an effectual means of preserving them from future accidents." Such is the abstract given by Leland, in his preliminary discourse of the introduction and establishment of Christianity. Dr. Ledwich, however, not only gives a different account of these, but even calls in question the existence of St. Patrick, regarding him as an ideal personage. He supposes, and with great appearance of reason, that Christianity, which has been brought to Gaul by Pothinus and Irenaeus, disciples of Polycarp, who had been himself instructed by John the Evangelist, from Gaul reached Britain, and from Britain was carried to Ireland, in the third or fourth century, as early as the suppression of St. Patrick, or even earlier. In such a strong circumstance in favour of this opinion, that the Irish Christian, or the Saxons converted by them, did not the knowledge the Roman pontiff till long after the rest of the Christian world; which would not have been the case, had their instruction proceeded from one font immediately from Rome to convert them, as Patrick is said to have been. If such a person as Patrick really preached Christianity in Ireland, it seems at least to be certain that not only the miracles assigned to him are monkish inventions; but that his episcopal dignity, and many other circumstances recorded, are without foundation. Columba appears to have been the founder of the Irish monasteries; and, like the Scotch, the Caledonian, was prevalent amongst them, and was not completely overthrown until pope Adrian, in the plenitude of his presumptuous, belloved Ireland on Henry II. in 1155. See CULDEES.

Ireland was divided into five separate kingdoms, and in each of these were powerful and fatactious dynasties. All indeed acknowledged one monarch, but his power was remarkably weakened; and if the people were not wretched, it was because the evils of their political constitution were in some measure corrected by the reverence paid to religion and learning. As the armies collected by such governments were too porary, they are ill calculated for repulsing a foreign invasion; and such was found to be the case in Ireland. Bede mentions, that, in 624, the general of Egfrid, king of Northumbia, made a descent on Ireland. But instead of mentioning any gallant resistance made by the natives, he intimates that they troubled more to prayers than arms; and in the plaintive style of compassion laments the miserable havoc of a people, infensive, and ever most friendly to the English. But Ireland experienced a still more formidable invasion, when the Danes, Norwegians, and other Scandinavian adventurers began to rove in search of new settlements. These were called Normans, Etterlings, or Olmen, and also Gallas or foreigners. Their pratical expeditions commenced about the end of the eighth century, and whilst they infested England and France, Ireland did not escape. Their first invasions were made in small parties for the sake of plunder, and were frequently repelled. By degrees the invaders, either by force or treaty, obtained...
obtained some small settlements; and at length Turgesius, a warlike Norwegian, in 815, landed with a powerful armament, and committed every kind of outrage. Having reduced the inhabitants to slavery, after a residence of 30 years, he was proclaimed monarch of the kingdom; but at length Melachlin, prince of Meath, contrived to force upon the tyrant in a time of apparent peace, and the Danes, surprised by a sudden insurrection, were massacred or dispersed. A new colony, however, arrived, and were allowed to settle in some maritime towns. These gradually strengthened themselves, and maintained their independence, though frequently engaged in wars with the Irish princes, and repeatedly overcome in battle. The most celebrated of these engagements was at Clontarf, near Dublin, in 1012, when the Irish were successful, but lost their monarch, Brian Boroume, at the age of 88, and his son Morkard. After this event Ireland continued to be divided by civil wars; and the situation of the people was as wretched as can almost be conceived; so that the island was rendered an easy prey to any daring invader.

It seems, therefore, probable, that the clergy of Ireland were of the Columban type, by which the Roman pontiff was not acknowledged. This is indeed matter of controversy; but it seems inadmissible, that they were irregular, and that it was an object with the pope to bring them to obedience. The pontificate, however, by the interest zeal of its numerous and active emissaries, at length contrived to extend its influence even to this remote island, alarmed the Irish clergy with fears of the irregularity of their ecclesiastical constitution, and persuaded them to submit to a reform, modelled and dictated by Rome Cardinal Papius, or Papefus, came to Ireland as legate in 1148; and in 1151, or 1152, summoned a council, which was attended by about 4000 ecclesiastics, and four pallots were solemnly received from the pope by the prelates of Armagh, Dublin, Cashel, and Tuam. At the same time, it is said that the celebration of Easter was adjusted according to the Roman decisions, and the communion of the clergy was enforced. Whether Adrian, at that time pope, did not think this submission of the Irish clergy sufficiently established, or, as an Englishman, was willing to gratify the English monarch, though at the expense of his newly acquired dependents, he issued a bull in 1155 confirming to the wishes and purposes of Henry, who, at the very commencement of his reign, meditated the subjugation of Ireland, and sent him chaplains to solicit the pope's compliance. For such an invasion to just pretence could be afforded. Ireland was entirely independent, and, though some had been founded in a former reign to the sons of Airagh, yet there had been for many years nothing which could be called a bishopric. It was alleged, indeed, that there had been 1000 or 1200 bishops in Ireland; but this was a name which each nation was equally involved, and was afterwards not to be urged to justify such an attempt. The depravity and barbarism of the Irish were, however, well known; the honour of God was to be promoted by the English at their request, and the pope was to receive the tribute of St Peter's pence as the reward of his compliance. A bull was accordingly issued, which, as Ireland observes, affords a striking instance of the profanity and impiety of papal degradation. Much had been said of the depraved state of the Irish at this period, but the accounts proceed from a very imperfect source, that whole object it was to defend the proceedings of the English monarch, and it may be questioned whether they were really worse than their neighbours, or to bad as those who have thus digimated them. But whatever their moral defects might be, their political ones were very great; they were truly a divided people. A monarch, little more than titular, depending on his own abilities and vigour for power and influence, was harassed by factions, and opposed by powerful rivals; whilst a number of provincial chieftains, who assumed the title and the rights of royalty, paid a precarious tribute to their superior, and united, if they were disposed to unite with him, as allies rather than subjects. This was in a great degree the state of France and some other countries; but in Ireland the monarchical dignity was not hereditary, and was the subject of frequent dispute. Favourable as such a state was to the wishes of Henry, yet it was long before he could avail himself of the bull he had received. In France and England he found full employment for many years; and fearing he had secured his dominions before he was involved in that contest with Becket, which kept him in a continual state of agitation. The circumstances which led to the accomplishment of his design, was the expulsion of Dermot, king of Leinster, from his dominions, and that prince's taking refuge in England. Dermot, a man of a turbulent and opprobrious spirit, had, by his pretences, provoked the vengeance of Roderic O'Connor, the monarch of Ireland, whilst his own immediate dependants deserted him in the hour of his distress. He applied to Henry for assistance to recover his dominions, but whether from the perplexity of his own affairs, or, as Sir John Davies supposes, a wish to avoid the expense, this monarch did not undertake the cause, but gave licence, by his letters patent, that such of his subjects might pass over into Ireland as would at their own charge become adventurers in that enterprise. Notwithstanding this permission, he did not for some months succeed in obtaining succour; but at length he prevailed on Richard, Earl of Pembroke, generally called Strongbow, to espouse the cause, promising him his daughter Eva in marriage, and with her the inheritance of his kingdom. And on his return to Ireland, to prepare for Strongbow's arrival, he engaged two Welsh leaders, Fitzstephen and Fitzgerald, with their followers, on the condition of ceding to them the town of Wexford, with a large adjoining territory, as foon, as by their assistance, he could be re-initiated in his rights. The invasion of Ireland was therefore the act of private adventurers. Fitzstephen and Fitzgerald first broke the ice with a party of 300 men in 1172. The Earl Strongbow followed them with 1200 more; and their good successes on the coast persuaded Leinster and Munster drew over the king in person, who landed at Waterford in 1175, with 500 knights and about 4000 soldiers. Strongbow immediately surrendered to him the city of Waterford, and did homage to him for the principality of Leinster, which he claimed in right of his wife, the daughter of Dermot, whose whole death had taken place in the preceding year. The neighbouring Irish princes in like manner submitted, and acknowledged his authority; and even Roderic, after some delay, thought it more prudent to follow their example. Henry assumed the title of Lord of Ireland, but his authority was very weak, and within five months after his arrival, he departed out of Ireland without striking one blow, or building one castle, or planting one garrison among the Irish. Such was the conquest of Ireland by Henry II, by which, as it was unjustifiable, so was it insufficient. As Sir John Davies observes, "though King Henry II. had the title of sovereign and lord over the Irish, yet did he not put those things in execution which are the true marks of sovereignty. For, to give laws unto a people; to institute magistrates and officers over them; to punish and pardon offenders; to have the sole authority of making war and peace, and the like, are true marks of sovereignty; which King Henry II. had not in the Irish countries; but the Irish lords did still retain all
for a till the though and they

If one ceaseion and dependeiic. " In the same way as the Welsh princes often did before for their subjection; and in the same way as Henry himself did homage to the king of France, as his liege lord for the vassal territories he held in France. Henry himself, in the treaty of agreement made in 1175, acknowledged Roderic as king of Connaught, and in his commission to William Fitz-Adele gave the Irish lords the title and style of kings. It is unnecessary to enter into a detail of the petty wars between the English settlers and Irish chieftains, or of the jealousy entertained of the former by their sovereigns, who, though prevented by family difficulties from going over, sent agents to watch and check them. Had Ireland been at this time subdued by a competent force, and the English laws introduced into every part of it, it would have contributed to the quiet and happiness of all classes; but as it was, the English settlers added to the confusion. Their only object appears to have been to acquire territories for themselves; and few abroad to the great rule and barbarous war, little, if at all, superior to those amongst whom they were. In 1182, Henry sent John, his youngest son, whom he had previously made lord of Ireland, to that country. This young prince, being but 15 years of age, with a train of young noblemen and gentlemen to the number of 200, but not with any considerable army, arrived at Waterford, and was attended there by the Irish chieftains, who, dnfused among themselves, and terrified by the representations of his force, backed to Waterford to pay their respects and do homage. But the youthful courtiers about the prince were not calculated to conciliate; they treated their visitors with the utmost scorn and contempt, and so highly ranked their indignation as to produce a general spirit of resistance. The original settlers, too, were ill used, and the English interest was with great difficulty maintained in the towns which they had fortified. Henry found it necessary to recall his son, and the government of Ireland was committed to John de Courcy, a valiant knight, who had already acquired considerable possessions in Ulster. "From this time forward," says that judicious writer Sir John Davies, "until the 12th year of King John, (which was a space of more than 50 years,) there was no army transmitted out of England to furnish the conquest. Howbeit, in the mean time, the English adventurers and colonies already planted in Ireland did win much ground upon the Irish; namely, the earl Strongbow, having married the daughter of Mac Morrogh in Leinster; the Lacies in Meath; the Giraldians and other adventurers in Munster; the Audrels, Gormons, Clintons, Reffes, and other volunteers of Sir John de Courcy's retaine in Ulster; and the Burke's (planted by William Fitz-Adele) in Connaught. Yet were the English reigned but part owners of Ireland at this time, as appears by the conviction of the pope's legate in the time of king Richard I., whereby he had power to exercise his faculties in England, Wales, and the part of Ireland in which John earl of Mortons has power and dominion, as it is recorded by Matthew Paris." During this interval, not only the Irish chieftains frequently revolted, but some of the great English settlers offended independence. This was particularly the case after the accession of John to the English throne, and the supposition of one of the was the exiled object of his visit to Ireland in the year 1216. He brought with him a considerale force, though not perhaps sufficient for the complete reduction of the island, even if he had remained a sufficient time to perform so great an action. This, however, he did not, for he arrived in June and returned in September the same year. The Irish lords, for the most part, submitted themselves to him, as they had done before to his father; "which," says Sir John Davies, "was but a mere mockery and imposition: for his back was no longer turned, but they returned to their former rebellion: and yet this was reputed a second con- quist. At this time twelve counties were established in Ulimer and Munster, and sheriffs appointed for them, and courts of judicature were also settled in Dublin, for the regular and effectual execution of the laws of England in that part of the island which acknowledged allegiance to the crown. Some cailons were built upon the borders of the English colonies, but the king carrying back with him the army he had brought, the former settlers were left to defend their possessions, and increase them in the best manner they were able.

The long and turbulent reign of Henry III. was distinguished by no remarkable change in the fate of Ireland. The families of Bourgh and Fitzgerald received a large accumulation of power and territory, and the clergy, though themselves oppressed by both the king and the pope, were not deficient in turbulence and persecution. Edward I., an active monarch, was too much engrossed in regulating the disordered state of England, and in reducing Wales and Scotland, to devote much attention to the affairs of Ireland. At the commencement of his reign, the English settlers experienced some heavy losses, and were nearly expelled from their southern possessions, but the Irish were not united, and the advantages gained in one year were often lost the next, through the dissensions of the conquerors. Many of the Irish were at this time anxious to share the protection of the English laws, for, to the disgrace of the English government, this advantage had been withheld, and whilst the mur- der of an Englishman by one of the mere Irish, as they were termed, was avenged with the utmost rigour, the murder of an Irishman was scarcely deemed a punishable offence. An application was made early in this reign to Ufford, the chief governor, offering the king 8000 marks, provided he would grant the free enjoyment of the laws of England to the Irish inhabitants. The petitioners must have been the Irish respecting within what was called the "English pale," for the red were so much attached to their own Irish laws, as to be averse to a change at a much later period; though it is probable that if the wise policy of alienating all the inhabitants had been now adopted, the objection to it would have been less, than at the time it was actually attempted. The king was well inclined to comply with the request of the petitioners, but this did not suit those, whose violence and oppression would have been thus controlled, and whose influence was great enough to counteract the intended measure. Individuals, however, of the Irish race left for, and obtained charters of protection, particularly on their intermarriage with the English. That such conduct irritated the old inhabitants cannot be surprising. "As long as they (the Irish) were out of the protection of the law," says Sir John Davies, "so as every Englishman might oppress, free, and kill them without control- lom, how was it possible they in old be other than outla\", and enough to the crown of England? If the king would not account them to the common of subjects, how could they learn to acknowledge and obey him as the supe- rior? When they might not converse or commerce with any civil men, nor enter into any town or city without paral
of their lives, whether shall they fly but into the woods and mountains, and there live in a wild and barbarous manner? If the English magistrates would not rule them by the law which doth punish murder, and treason, and theft with death, but leave them to be ruled by their own lords and laws, why should they not embrace their own Breton law, which punishes no offence, but with a fine or ericke? If the Irish be not permitted to purchase estates of freeholds or inheritance, which might defend to their children, according to the course of our common law, must they not continue their cullion of tamulity, which makes all their possessions uncertain, and brings confusion, barbarism, and insolvency? And in a word, if the English would neither in peace govern them by the law, nor in war root them out by the sword, must they not needs be prick’d in their eyes and thorns in their fides, till the world’s end.”

Sir John Wogan, appointed to the government in the year 1595, endeavoured to enforce the laws, and to keep in order the turbulent nobles of English extraction. For this purpose a parliament was summoned more regularly than such parliaments were used to be convened in Ireland. The regulations made by it, however, though calculated not to check the disorders of the time, were either of little avail, or their effect of short duration; and the country still continued in a disordered state. The weak government of the second Edward left the great lords at full liberty to pursue their respective schemes of private interest, when an invasion by Edward, the brother of Robert Bruce, now established king of Scotland, supported by the chieftains of Ulster, reduced them to the greatest distress. Bruce was even crowned king of Ireland at Dundalk, and proceeded into Munster, carrying devastation wherever he went. His troops, however, wasted away by pestilence and famine, were reduced to a small number, and in a battle, which he too eagerly fought, he was slain the third year after his landing in Ireland. On his defeat, matters reverted to the old channel, and so continued through the succeeding reign, until the appointment of Lionel, the king’s second son, to be chief governor in 1561. Before notice is taken of his proceedings, it will be necessary to observe, that in the reign of Edward II., Maurice Fitz-Thomas of Desmond, being chief commander against the Scots, began that extermination of coin and livery, which is called, in the old statutes, a damnable cyffon, and the imposing and taking of them declared high treason. These words imply that he and his army exacted food for themselves and their horses, and money at pleasure, without any ticket, or other satisfaction. And this was, after that time, the general fault of all the governors and commanders of the army in Ireland, though some were more cruel in the execution than others. “Befides,” says Davis, “the English colonies, being suffered in every province of that kingdom, were enforced to keep continual guards upon the borders and marches round about them; such guards, consisting of idle soldiers, were likewise imposed as a continual burden upon the poor English freeholders, whom they oppressed and impoverished in the same manner. And because the great English lords and captains had power to impose this charge, when and where they pleased, many of the poor freeholders were glad to give unto these lords a great part of their lands, to hold the rent free from that extortion; and many others, not being able to endure that intolerable oppression, did utterly quit their freeholds, and returned into England. By these means the English colonies grew poorer and weaker, though the English lords grew rich and mighty; for they placed Irish tenants upon the lands relinquished by the English; upon them they levied all Irish exactions; with them they married, and fostered, and made gophins; so as within one age the English, both lords and freeholders, became degenerate and mere Irish in their language, in their apparel, in their arms and manner of fight, and all other customs of life whatsoever.”

Lionel, soon after created duke of Clarence, was, in right of his wife, polvellled of a considerable territory in Ireland, and his full object seems to have been to recover parts of it from those who were now called rebels. His military proceedings were of no great moment, but he applied himself with zeal and diligence to the reformation of the English settlers. A parliament was summoned at Kilkenny, which was more respectable and numerous than any preceding one, and the result of the deliberation of which was that ordinance, known by the name of the Statute of Kilkenny; this was in 1597. The great object of this statute was to reduce the English colonies to obedience of the English law and magistrates. “The preamble of it recites, ‘(to use the abstract given of it by Dr. Leland,) ‘with a decision not without colour, but yet too general and indiscriminate, that the English of the realm of Ireland, before the arrival of the duke of Clarence were become mere Irish in their language, arms,grammar, and manner of living; had rejected the English laws, and submitted to those of the Irish, with whom they had united by marriage alliance to the ruin of the general well. It was, therefore, enacted, that marriage, mixture of infants, and gospeliziz with the Irish, should be considered and punished as high treason. Again, if any man of English race shall use an Irish name, the Irish language, or the Irish apparel, or any mode or custom of the Irish, the act provides that he shall forfeit lands and tenements, until he hath given security in the court of chancery to conform in every particular to the English manners. The Breton law was pronounced to be a pernicious custom and innovation lately introduced among the English subjects. It was, therefore, ordained, that in all their controversies they should be governed by the common law of England: and that whoever should submit to the Irish jurisdiction, was to be adjudged guilty of high treason. As the English had been accustomed to make war and peace with the bordering enemy at their pleasure, they were now expressly prohibited from levying war upon the Irish without special warrant from the state. It was also made highly penal to the English, to permit their Irish neighbours to graze their lands, to present them to ecclesiastical benefices, or to receive them into monasteries or religious houses; to entertain their bards, who perverted their imaginations by romantic tales; or their news-tellers, who seduced them by false reports. It was made felony to impose or confer any forces upon the English subject against his will. And as the royal liberties and franchises were become fundatories for malefactors, express power was given to the king’s sheriffs to enter into all franchises, and there to apprehend felons and traitors. Lastly, because the great lords, with their levied forces, for the public service, acted with brutality, and laid unequal burdens upon the subjects, it was ordained that four wardens of the peace in every county should adjudge what men and armour every lord and tenant should provide. The statute was promulgated with particular solemnity; and the spiritual lords, the better to enforce obedience, denounced an excommunication on those who should presume to violate it in any instance.” After observing that those institutions did not apply to any except the English settlers, Dr. Leland goes on to remark upon the want of equity and good policy towards the Irish. “Extensive views, liberal sentiments, and a generous zeal for public happiness would have prompted them to some measures for conciliating the affections as well as for subduing the petitions and polices...
factions of the Irish; would have led them to demonstrate that they were the protectors and benefactors, not the arbitrary masters of those Irish natives whom they held in subjection; and to convince the most obstinate insurgents, that an honourable submission to the king of England was the only means of rescuing them from the miseries of their own petty factions and tyrannies; a glorious exchange of the rudeness, the disorders, and difficulties of anarchy for the peace, the dignity, and the valuable advantages of social and civil life. 13

The next attempt that was made to reduce Ireland was by Richard II., who, in 1394, went there with an army of 40,000 men at arms, and 30,000 archers, attended by a number of the Irish nobility. The presence of such an army induced all the chiefstains to make submission in a formal manner, with which Richard was contented. By this expedition he did not extend the English jurisdiction, nor add to his revenue; and he had no sooner departed than the Irish lords laid aside their marks of humility, and learning the weak forces which the king had left behind him, began to inflect the borders, and in defiance of thefe, Martyn, the king's lieutenant, and heir apparent of the crown, was slain. To revenge his death, Richard went to Ireland a second time with a great force; but during his absence, an insurrection took place in England, which terminated in his deposition. During the reigns of Henry IV. and V., nothing was attempted beyond the defence of the English pale, including four counties, viz. Dublin, Kildare, Meath, and Louth; and during the early part of the reign of Henry VI., so much had the Irish, and those English who had adopted their customs, increased in strength, that the very defence of those counties was become a matter of great difficulty. Towards the latter end of the reign of Henry VI., Richard, duke of York, was appointed chief governor, who, though he gained little advantage over the Irish, succeeded in allaying himself not only the lords of the pale, but others of English race, numbers of whom engaged warmly in the support of his claim to the crown. An attachment to his descendants long continued to influence the Anglo-Irish, as was conspicuous in the reign of Henry VII. During the period of the civil wars, the state of Ireland was very bad, in consequence of the neglect of the English government; and the exaction of coin and livery, which grew excessive and intolerable. Such was the violence of faction, that the earl of Desmond, the most powerful nobleman in Ireland, was seized and beheaded under the pretext of offences which were generally committed with impunity. In 1474, the earl of Kildare, being lord deputy, formed an association of the principal noblemen and gentlemen within the pale for its defence against sudden invasion, called the "Brotherhood of St. George," and this continued till the tenth year of Henry VII. This prince, as soon as he found leisure to attend to the affairs of Ireland, was determined to break the power of those lords who, by their influence in the country, had hitherto managed every thing as suited their own private views. For this purpose he sent for Edward Poyning as lord deputy, accompanied by an English chancellor and treasurer, and English judges. In a parliament held at Drogheda, by this deputy in 1495, most of the statutes of Kildare were revived and confirmed, with many others tending to lessen the influence of the great lords, and to reform the manners of the pale. Amongst others was a statute, which has since been the subject of much discussion, under the name of Poyning's law. This enabled, that no parliament should be held without the king's previous permission, and that no act should be passed until they had been previously submittted to the king and his council in England, approved by them, and returned under the great seal of that realm. Some alteration was afterwards made in the mode of preparing and transmitting the bills, but the effect of this law, which was to render the Irish government more dependent on England, continued until the reign of his present majesty, King George III. At the time, and long after, this law was considered by the English settled in Ireland as a desirable check on the chief governors, who had frequently summoned parliaments, and given consent to various acts, not only without communication with the sovereign or his English council, but even contrary to his interest, and to serve their own private purposes. The vigorous administration of the earl of Kildare effectually preferred the pale, and though an ignominious tribute, which had been long paid to many Irish chiefstains, was not yet withdrawn, the holiness of such chiefstains were disarmed and chastised. The superiority of the English government over the whole of Ireland was once more asserted, and even some of the more rebellious chiefstains became the avowed friends of the English power. On the other hand, the old English settlers had become so connected with the Irish as to be scarcely distinguishable from them; they adopted their language and customs, and were even more adhering to the government than the native Irish. During the early part of the reign of Henry VIII., no material change took place in the state of Ireland, which Kildare, with some little interruption, continued to govern. The great possessions of this nobleman, and his connections in Ireland, especially with the house of Desmond, another branch of the Geraldine family, and with the great Irish kept of O'Neal, gave weight to his government, whilst his silence to some powerful English families strengthened his interest at court. Francis I. of France, having, however, sent an agent to tamper with Desmond, with a view to diffuse Henry, and this having been discovered, Kildare was ordered to arrest that nobleman, but was either unwilling or unable to effect it. This displeased the king and involved him in difficulties, and the rackets of his son having involved him in open rebellion, all the members of his family were put to death, except a youth of twelve years old, who escaped to Italy, and was protected by cardinal Pole, notwithstanding the king's efforts to destroy him. Whilst these disturbances took place in Ireland, the king, influenced by very unworthy motives, though his conduct was attended with the most happy effects, had thrown off the yoke of the pope, and had been declared by parliament, and by a convocation of the clergy, "supreme head, on earth, of the church of England." His new queen was partial to the reformation, and Cromwell, his prime minister, was active in promoting it. Henry was resolved to extend his new power to Ireland, and Browne, archbishop of Dublin, a creature of Cromwell's, was zealous in promoting his views. Ireland, however, was much less prepared for such measures than England had been. The continual rebellions in which all parties were engaged, prevented the progress of knowledge and civilization, even within the English pale, and the clergy, especially in remote parts, were amongst the most ignorant, and consequently the most bigoted, partisans of Rome. A decided opposition was therefore held to the acknowledgment of the king's supremacy by the private, and encouraged by the emigrations of the clergy. Fear indeed induced the parliament to put the project of Browne having pronounced, those who made any scruple of concurring with him, to have no right to be or treated as loyal subjects; but great reluctance was to the carrying of it into effect. Lord Leonard Grey, Not. XIX.
deputy, who had received the power of the Geraldines, now shewed equal activity in resuscring the advocates of Rome, and by a great concourse of O'Nial and his associates at Bellshane, put an end for a time to open resistance. The supression of the monasteries was carried into effect, and the most powerful and turbulent chieftains appeared earnest to express their attachment to the crown. Sir Anthony St. Leger affirmed his charge as governor in 1111, with the fairest pre-fages of tranquillity and public happiness. A parliament summoned by him declared Henry king of Ireland; this title, now first assumed, was acknowledged by O'Nial, and the other chieftains by indenture, and they at the same time renounced the papal authority in the fullest manner. Various regulations were passed for the government of Munster, where the laws of England, though formerly established, had been disused for 300 years. St. Leger also prevailed upon O'Nial, O'Brien, and the head of the Burkes called Mac William, to go into England, and present themselves to the king, who conferred on them the dignity of earls, and granted unto them their several counties by letters patent. He also granted to each a house and lands near Dublin, that they might, by frequent residence there, learn obedience and civility of manners. The reign of Edward VI., was chiefly occupied in endeavours to introduce the reformed liturgy, which was effected in Dublin and some other places, but was very generally disapproved. On the accession of Mary, popery was re instituted without any difficulty; except that occasioned by the alienation of church property in the preceding reigns; but the regulations which the change required occupied much time and attention. The districts of Leix and Offaly, which had been before reduced, were now made fers under the names of the Queen's and King's counties, and the native Irish were, in general, not adverse to a government which favoured their religion. The reign of Mary, however, was short, and her successor Elizabeth was friendly to the reformation. Before we proceed to notice the more interesting transactions of this long reign, it will be useful briefly to consider the state of the country. The inhabitants have been classed in four divisions: 1. The native, or, as they were called, the native Irish. They were descended from the ancient Irish, or from Irish chieftains who had intermarried with the Irish, and adopted their customs and language, so as to be scarcely distinguishable from them. They were alike governed by the Brehon law, for an account of which see the article BREHON; and alike used the mode of succession called Tamifly, for which see TANISTRY. 3. The English of blood, some of whom were polished of large estates, and though the situation of the country did not allow of much refinement; yet their occasional intercourse with England, or with the English constantly coming over, enabled them to keep up an exterior appearance of English manners. They chiefly resided within the pale. 4. The English of birth, sent over to fill the principal offices of state, and who generally acquiring property in the country, their descendants were continually forming an addition to the 3d class. These, who might have been called more English, as they were ever disposed to sacrifice the interest of Ireland to that of England, were the persons contemptu ed and disliked by the English government. Speaker the poet, who resided in Ireland for some years in this reign, has described several of the Irish customs in his dialogue on the state of Ireland; and, though it must be remembered that he saw everything through the eye of prejudice, yet a quotation or two may enable us to form a more correct idea of the licentiousness of manners of the Irish chieftains. Whatever opinion we may form of the impolicy and injustice of the English settlers and government at many occasions; it must be acknowledged that the Irish laws and customs were favourable to a savage wildness of manners inconsistent with the happiness of social and civil life. After noticing the barbarous manners of the Gallowglasses or infantry, of the Kernes or predatory cavalry, and of the horsemen, Spencer also describes two classes of men who contributed very much to the dissoluteness of the chieftains, viz., the Bards and the Carrows. "These Irish bards," he says, "are far from instructing young men in moral discipline, that they themselves do more deserve to be sharply disciplined; for they do not use to clothe upon themselves the doings of good men for the arguments of their poems, but whatsoever they find to be most licentious of life, most bold and lawless in his doing, most dangerous and preposterous in part of disobedience and rebellious dispositions, him they set up and glorify in their rhymes, him they praise to the people, and to young men make an example to follow." Then, having described the youth of one of these chieftains, he adds, in which, if he shall find any to praise him, and to give him encouragement, as these bards and rymem do for little reward, or a share of a stolen cow; then waxeth he most intemperate, and half mad with the love of himself and his own lawful deeds. And as for words, to set forth such lewdness, it is not hard for them to give a gladsly and painted show thereunto, borrowed even from the prose which are proper to virtue itself. As of a most notorious thief and wicked outlaw, who had lived all his lifetime of spoils and robberies, one of their bards in his prose will say, That he was none of the idle milkmates that was brought up by the fireside, but that most of his days he spent in arms and valiant enterprises, that he never eat his meat before he had won it with his sword; that he lay not all night flaying in a cabin under his mantle, but used commonly to keep others waking to defend their lives, and did light his candle at the flames of their houses, to lead him in the dark; that his day was his night, and the night his day; that he loved not to be long wooing of wenches to yield to him, but where he came, he took by force the spoil of other men's love, and left but lamentation to their lovers; that his music was not the harp, nor lays of love, but the cries of people, and the closeness of amour; and finally, that he died not beheld by many, but made many wail when he died that dearly bought his death." At the same time, in answer to a question respecting these poems, "Whether they be any thing witty or well favoured as poems should be," this excellent judge replies, "Yea truly, I have causeth divers of them to be translated unto me, that I might understand them, and surely they favoured of sweet wit and good invention, but skill'd not of the goodly ornaments of poetry; yet were they sprinkled with some pretty flowers of their natural device, which gave good grace and comeliness unto them, the which it is great pity to be rubb'd, to the gracing of wickedness and vice, which, with good estate, would serve to adorn and beautify virtue." These bards probably had as great effect in routling a spirited opposition to the English as the Welsh bards, whom the policy of the first Edward led him most iniquitously to destroy. As to the Carrows, they are "a kind of people that wander up and down to gentlemen's houses, living only upon cards and dice, the which, though they have little or no houf of their own, yet will they play for much money, whether, if they win, they waste most lightly, and if they lose, they pay as freely, but make recompense with one steal h or another, whose only hurt is not, that they themselves receive loblets, but that, through gaming, they draw others to like lewdness.
fewness and idleness. And to these may be added another fort of like loose fellows, which do pass up and down amongst gentlemen by the name of gentry, but are indeed notorious rogues, and partakers not only of many thefts, by getting forth other men's goods to be stolen, but also privy to many traitorous practices, and common carriers of news, with defire whereof you would wonder how much the Irish are fed."

Almost the whole of the two first classes, and the greater part of the third, were zealously and blindly attached to the doctrines and discipline of the church of Rome, in which they had been educated, and were therefore easily seduced to support Philip of Spain, a Catholic prince, to whom they had once been subject under their Protestant ministers. In 1562, the first parliament in this reign was assembled for the purpose of re-establishing the queen's supremacy and the reformed worship. The house of commons consisted of only 76 members, from those parts where the English interest was strongest, yet the change was not effected without much clamour and opposition. Laws, however, were passed, reforming ecclesiastical jurisdiction to the crown, enforcing the use of the common prayer, and obliging all subjects to attend the public service of the church. But though the deputy succeeded with parliament, the measures were very unpalatable. "The numerous partizans of Rome inveighed against the heretical queen, and her impious ministers. The clergy who refused to conform abandoned their cures; no reformed ministers could be found to supply their places; the churches fell to ruin; the people were left without any religious worship or instruction. Even in places of most civility, the statutes lately made were evaded or neglected with impunity. The ignorant were taught to abominate a government, which they heard confounded to all the terrors of the divine vengeance; were exhort to stand prepared for a glorious opportunity of afflicting the cause of religion; and affured of effectual support, both from the pope, whose authority had been profaned, and from the king of Spain, now particularly offended at Elizabeth." 

Besides the disorder occasioned by these efforts to force upon the people a religion they detested, much uneasiness was occasioned to the government by the rebels' turbulence of Shane or John O'Nial, the most powerful chieftain in Ireland. Sir Henry Sidney, to whom Elizabeth entrusted the government for many years, and who deserved her confidence, succeeded in attaching to him several inferior chieftains whom O'Nial had injured, and with their aid completely subdued him. But fearfully was the northern disturbance allayed, than another broke out in the south, headed by the earl of Desmond, which was of longer continuance. Sir John Perrott, president of Munster, an office lately instituted, not only supressed the rebellion, but enforced such a strict execution of English law, as to give an unfortunate appearance of peace, industry, and civility, to the whole province. Peace, however, was of short continuance, and an attempt of Sidney to raise a tax by order of council, without authority of parliament, excited a most determined opposition on the part of the nobility and gentry of the pale. These discontented were encouraged by the emigrations of Philip II.; a body of Spaniards landed in Kerry, who acted in concert with Desmond; and a protracted warfare was maintained, which, as usual, terminated in favour of the English. The numerous demeans of Desmond were forfeited, and divided amongst a number of English Undertakers, as they were called, who entered into a stipulation to plant a certain number of English families on their estates, in proportion to the number of acres, a stipulation frequently negatived to the great injury of the settlement. Amongst others who received portions, were Sir Walter Raleigh, who had served with reputation for bravery, though not without the lam of cruelty, and Edmund Spenser, the poet, who has introduced several allusions to Ireland into his Fairy Queen. In 1584, Sir John Perrott was sent over as chief governor, and as war and insurrection seemed to be then extinguished, he applied himself to the general extension of English law with considerable success. He nominated sheriffs for the counties of Connaught, and also for seven new counties instituted in Ulster, with other necessary officers; but his plans for more extensive improvement were thwarted in England from ill timed economy, and notwithstanding all his exertions, a parliament, summoned by him in the following year, rejected almost every measure proposed to them. The oppression of the natives by the English settlers, which Perrott in vain endeavoured to repress, supplied new causers of discontent; and this active governor was at length obliged to leave Ireland. A more general spirit of insurrection than at any former period was now excited, and Elizabeth found it necessary to make uncommon efforts, lest England should be placed between the forces of Spain collected in the Netherlands, and their naval strength and armaments stationed in the harbours of Ireland. The midcondemned of successive governors, especially of Elizabeth's favourite, the earl of Essex, who had an army of 23,000 men, increased the danger, and before the rebels were quelled, a Spanish army took possession of Kinsale, and a numeco arrived from the pope to instigate the friends of Rome to make every exertion. The abilities and exertions of Blount, lord Mountjoy, lord deputy, and of sir George Carew, president of Munster, assisted by considerable reinforcements from England, at length effected the surrender of the Spaniards, and the complete reduction of all the lords and chiefs, who, until then, had ruled in the island, after a war which lasted about seven years. Elizabeth did not live to see this event, the final capitulation not having been signed until a few days after her death, though before the news of it had reached Ireland.

The reign of James I. was one of at least comparative tranquility. All violent opposition to the authority of the English government and crown was put an end to. "The spirit of Irish refusal, to use the expression of sir John Davies, "was brayed, as it were, in a mortar, with the sword, famine, and pellicience altogether." Both the degenerated English and the native Irish were alike overcome. At the same time the power of the judges and of the English government was extensively fixed, the Irish laws and customs were abolished, and the English laws established in all cases, without exception, through the whole island. Numerous colonies were also sent from England and Scotland, especially from the latter, to occupy the forfeited estates, and seven entire northern counties were allotted to undertakers, which was called the "Plantation of Ulster," a measure which was certainly attended by the introduction of industry and order into that province. With a view to strengthen the Protestant party, great care was taken that these settlers should be Protestants, and they were chiefly Scotch Presbyterians, or English Puritans, the latter of whom found their situation at home uneasy, from James's zealous attachment to their adversaries. For the same purpose, many new boroughs were erected, so as to give a majority in parliament to the same party, which they could not otherwise have accomplished, and the county numbers were likely to be almost all Papists. It would have been at this time a wise and liberal policy to have completely united the two countries, so as to have
have but one parliament, which might have been easily affected at that time. This would have rendered such extraordinary proceedings entirely unnecessary, and would in all probability have prevented much of the mischief which afterwards occurred; but the settlers were considered as a colony, dependent on the mother country, to whose interest they were to be subservient, without presuming to interfere in any but the petty regulations of their own island, and all but the colony were regarded as secret enemies, who could not be too carefully watched, or too strictly kept in subjection. In confederations, the distinctions which had subsisted amongst them were in a great measure done away, and they were united in defence of a religion to which they were equally attached, and of rights which they conceived to be equally invaded. Such was the prevailing sentiment, when, after an interval of twenty-four years, a parliament, summoned by the king, met in 1647. The recusants, (as they were called, from their refusal to acknowledge the king's supremacy, and to attend the established worship,) were prepared to dispute every step, and were numerous in both houses, though their numbers in the upper were very inconsiderable. Such was their tenacity, that, although the bishops in the lower house, gave government a majority, it was found necessary to prorogue them until the following year, when acts for acknowledging the king's title, for levying taxes upon them a revenue, and for confirming the northern settlers, were passed. During the remainder of this reign, and for the early part of the succeeding one, the two contending parties often showed their rancour without proceeding to extremities, whilst the period of peace was employed by some in active exertions for the establishment of manufactures, and the extension of cultivation. In 1660, lord Shaftesbury, better known by his later title of earl of Strafford, commenced his administration. He treated Ireland with severity, as a conquered country, the subjects of which had forfeited the rights of men and citizens, and depended solely on the royal grace. The recusants and the Puritans were equally offended by his measures; yet, by artfully plying one party against the other, he contrived to manage a parliament which he summoned, and to perform many acts of severity with a vigour beyond the law.

At length the time arrived when Ireland was to be once more involved in war and bloodshed. The impeachment of lord Shaftesbury before the English parliament was one of the first steps to the overthrow of the royal authority. The severe restrictions imposed on the Catholic party, which, as before observed, included almost all the inhabitants, except the new settlers, led them to watch for an opportunity of revenge; and the distracted state of affairs in England afforded a favourable opportunity, a general insurrection was planned, and carried into execution on the 25th of October 1641; an event productive of the most baneful consequences to the peace, union, and prosperity of Ireland. This civil war, or rebellion, as it is justly called, even admitting the palliations that have been urged, was begun by the native Irish, and they were afterwards joined by most of the Catholics. Happy would it be for the country if the acts of violence then committed could be for ever buried in oblivion. The writers on both sides are charged with partiality by their opponents; yet what they admit respecting their own parties is enough to shew that there was on both sides much to blame, and much to lament. For eleven years Ireland was a scene of confusion, there being no less than five different parties, if whom it has been said, that each, in the course of the war, at one time or other, fought against the faction with which it had formerly allied. At length, in 1652, Cromwell assumed the command of the parliamentary army, to which he brought a considerable reinforcement, and soon completely reduced the whole island. The lands which had belonged to those who had been killed, or who were deprived of their possessions by force of arms, were now given to new colonists, of many of whom had been officers in the victorious army. Limits were assigned to the Irish, beyond which they were not to come; and these continued to be strictly enforced till the restoration. The Protestant and English interest was now more completely established than at any former time; but though the Catholics had lost the power to injure, they retained their animosity. At this period, indeed, the interest and power of the old native Irish, as a distinct class of inhabitants, was entirely broken, their numbers being from that time much exceeded by those of the old and new inhabitants of the British race.

On the restoration it was hoped that the king would have overturned all the measures of Cromwell; but he confirmed all the grants, and the situation of the Catholics was little, if at all, amended. The duke of Ormond, who had great influence in Irish affairs, was a steady Protestant; and whatever might be the king's private wishes, no steps were taken by the ministers of the opposite party till near the conclusion of his reign, when his brother the duke of York appears to have had great influence over him. On the accession of James II., the Roman party in Ireland were inspired with the most extravagant expectations; they fancied themselves already restored to the estates of their ancestors, and possessed of every advantage to be derived from a king of their own religion. "At length," says Mr. Newenham, "the intrepid James, yielding to the importunate counsels of men who, perhaps, might have governed a religious fraternity well, but who were utterly ignorant of the government of an empire; and taught to regard the Irish Roman Catholics as fit instruments for the accomplishment of his visionary and despotic projects, gradually raised, invigorated, and encouraged them. By the obstinate forbearance or constrained acquiescence of Clarendon, and the indefatigable exertions of the zealous and plenipotentiary Tyrconnell, they were once more prepared to renew the terrible conflict; and animated by an extraordinary combination of horrible motives, renewed to arms; after incautiously co-operating with their bigoted sovereign, in persecuting their Protestant countrymen without measure and without remorse; and, in some degree, justifying that severe retaliation which they themselves were soon after to experience.

Ehew,
Quam temere in nofrem legem fanguinis iniquam.

But England was not then, as on the preceding occasion paralyzed by internal commotions. The prince who had ascended the abdicated throne was an experienced general, and a found politician. The visionary James was greatly overmatched. The Irish Roman Catholics were, in consequence, completely vanquished; stripped of political power; hurled from every post of trust and emolument, and almost entirely disfranchised of their remaining lands. The work of vengeance, however, was not yet finished, nor could it perhaps have terminated thus, confoundingly with the weakness and wretchedness of human nature. The Irish Protestants, still horrified by the remembrance of the ferocious massacre of 1641; recollecting the havoc and misery of the long war which succeeded that event; dreading a repetition of the tyrannical measures, the relents, and, for the most part, unprompted persecution from which they had been recently rescued; and a renewal of those bloody scenes which they had just survived; yielding, in short, to the united impulse of revenge and fear, and thereby hurried be-
Ireland.

Beyond the bounds of political honour and prudence, as reported in the following reign, when they were rather encouraged to do so, to every expedient which legislative ingenuity could supply, however likely to prove ultimately detrimental to themselves, with a view of reducing their invertebrate enemies, the Roman Catholics, to absolute and irremediable political impotence. A code of defensive and preventive statutes, being the stamp of the passions by which it was originated, was in the end compiled: a code which was not merely limited to the prevention of hostility on the part of the Roman Catholics, but extended to the abolition of their venerable religion, which, in Ireland, had scarcely ever been fairly combated by the only weapons that ever should have been employed against it, the pen or tongues, and attractive examples of Protestants: a code which impeded the progress of the former in the paths of industry; thwarted every species of laudable ambition by which they might have been actuated; placed them in the footing of aliens in their native land; exposed them to various outrages and spoliations; reduced them almost to the condition of slaves; obstructed matrimonial alliances between them and the Protestants, from whence, it is probable, the happiest effects might have flowed; and, worse than all, held forth incitements to filial contumacy, to a violation of one of the commandments of God; and introduced amongst them principles of duplicity and treachery. A code, which, while it oppressed, and seemed to overwhelm the Roman Catholics, facilitated the obstruction of those jealous measures, those commercial restraints which had long been the effect of retaining one of the fairest portions of the globe in a state of poverty and political insignificance. The massacre of 1641, which had been industriously exhibited in the most horrifying colours, together with the cruel persecution experienced during the short reign of king James in Ireland, both still fresh in the recollection of the Protestant, needlessly heightened their animosity to the utmost; while repeated discomports and disasters, and aggravated oppression, together with the accumulated misery produced by this revengeful code, certainly inconsistent with the principles of found policy and true religion, naturally rendered the hatred of the Roman Catholics virulent beyond example. An unparalleled combination of irritating, maddening circumstances fomented, on both sides, the most rancorous malignity. The idea of a Protestant in the mind of a Roman Catholic, and that of the latter in the mind of the former, now became closely associated with every idea that could engender wrath, malice, and vengeance in the heart of man. Each abhorred the other; each longed for the extermination of the other.—“This among countrymen, among the friendly, cheerful, and hospitable people of Ireland, among Christians, among those who looked forward to eternal happiness through the mediation of the Saviour, among those who adored the same Trinity, among those who agreed in all the essential points of religion, the maintenance of a few different speculative articles, and the observance of a few different rites, became absolutely and insensibly a social and moral tenet, a piece of the self-same nature, whether discussed in the tefts, symbols, or distinctive characters of two parties inveterately and unappeasably hostile to each other, became at length, what in their natural unconnected state they could never possibly have become, alimentary to the most vehement detestation.”

Though we cannot agree with the respectful writer of the preceding passage in all his remarks, especially in those which seem to think lightly of the difference between the Protestant and Catholic faith; yet it, on the whole, contains so just and candid a representation of the unhappy differences between the parties, and is evidently written with such a desire of conciliation, that we have copied it without change, anxiously willing that all the gentlemen of Ireland, of every sect, saw the matter in the same light, and were equally desirous of improving past evils to prevent harmony.

The events peculiar to Ireland, excepting the penal code, will not require much notice during the four reigns succeeding the revolution. The uniform policy was to keep Ireland in a state of dependency, and to prevent her manufactures or commerce interfering with those of England.

Encouragement was indeed given to the linen manufacture, and it proved a source of great benefit to the country, but the woollen manufacture was kept down, and the restrictions on commerce shewed a most unwarrantable jealousy. As the dependence of Ireland on England was never lost sight of, so some occasions occurred in which the parliament of the latter directly exerted its authority. In the reign of William acts were passed, by which Ireland was bound. In the year 1698, Mr. Molyneux published a pamphlet, entitled “The Case of Ireland being bound by Acts of Parliament in England, stated,” in which he called in question their right to do so, and his sentiments were known to be those of the Irish parliament and people. This book was condemned by the English parliament, which addressed the king on the pernicious assertions it contained, and on the dangerous tendency of the proceedings of the Irish parliament, and promised to give his majesty their ready concurrence and assistance to preserve and maintain the dependence and subordination of Ireland to the imperial crown of this realm. William promised on his part to fulfil their wishes, and notwithstanding the discontent of the Irish people, such was their divided state, and such the apprehension each party entertained of the other, that they were obliged to submit. Another cause of controversy occurred in 1719, in consequence of an appeal being carried from the Irish to the English house of lords. The barons of the exchequer, who had carried into effect the decree of the Englısh house, were imprisoned by the Irish one, but the dispute terminated in a new act, by which it was enacted, “that the kingdom of Ireland is subordinate unto, and dependent upon, the imperial crown of Great Britain; and that the king’s majesty, by and with the consent of the lords and commons of Great Britain, has full power and authority to make laws and statutes to bind the people and the kingdom of Ireland.”

Soon after this, in 1723, a circumstance occurred, which deferves notice, both on account of the example it set, that the united, determined, and persevering voice of a people must be ultimately successful, and on account of the active part taken by the celebrated dean Swift, then resident in Dublin. This was the well known affair of Wood’s halfpence. A patent had been granted to a Mr. Wood, to supply Ireland with a certain quantity of copper halfpence and farthings for 14 years. It was alleged in Ireland, that this coin was greatly inferior in value to what it was made to pass for. The parliament of Ireland addressed the crown against the measure of lending the coin; and during their following biennial recess, great complaints continued to be made both by individuals and by public corporations. It would appear that though the badness of Wood’s halfpence was the pretext, the dispute was, in reality, a question of rights and independence. Dean Swift contributed much to the public discontent, by a series of letters signed A Draper, for discovering the author of the fourth of which, a reward of 300 pounds was offered. As such precautions
precations had been taken, that no evidence could be pro-
cured against the author, the printer was indicted, but the
government, instead of finding the bill, approved the publi-
cation. The ferment was so great, that if ministers had per-
feved, a new civil war would probably have arisen, though it,
like all preceding ones, would have only contributed, in
all probability, to rivet the chains of Ireland more firmly.
As it was, the patent was cancelled, and the ferment allayed.
At this time the complaints of the people, on other accounts,
were loud, of which dean Swift takes particular notice in his
"Short View of the State of Ireland," he compares Ireland
as a kingdom, in which a few placemen from England enjoyed
plentiful salaries, to an hospital, in which all the household
officers groan rich, while the poor, for whose fate it was
built, are almost starving for want of food and raiment.
Such are the principal events in Ireland, in the interval
between the revolution and the accession of his present ma-
jesty to the throne in 1763. The Catholics were under the
difficulties already stated, but the penal laws against them
were seldom, if ever, enforced; and as the distance of time
increased, the irritation occasioned by former events was
considerably abated. Many of that body acquired wealth in
the way of trade, and the nobility and gentry enjoyed their
efforts in quiet. The Protestants also gradually lost their
prejudices, and were taken up with the contests against
British sovrenity, which about this time gave a continual
interest to the proceedings of parliament, where some able
men distinguished themselves by their opposition to govern-
ment. This parliament was unchanged during the life of the
sovereign, and met every second year; and as the present
mode of obtaining seats was unknown, when a vacancy hap-
pened by death, the greatest exertions were used by the con-
tending parties, and the election was usually decided by the
majority of the house. The Irish government was pecu-
larly circumstanced. It was necessary that every act of par-
liament should have the function both of the British privy
council, i.e. of the British ministry, and of the Irish
parliament. It was therefore necessary for the former to be able
to influence a majority of the latter. To do this, places
and pensions were bestowed on those, whose power of elo-
quence, or whose parliamentary interest made them service-
able; and besides this, the ministry were obliged to gratify
the leading faction, by complying with such measures as
were for their private advantage, although inconvenient with
found policy, and the true interest of Ireland. Hence a num-
ber of parliamentary grants, which have been justly stig-
matised as jobs, and hence the determined conduct of the
British ministry respecting Irish measures, even on occasions
not long preceding the Union. The leading party in the
Irish parliament must be gratified, because otherwise the
public business would be at a stand. The lord lieuten-
ant was not resident, except during the parliamentary session;
and the management of affairs was, at other times, en-
trusted to lords justices, generally the prime, the chan-
celler, and the speaker of the house of commons; the two
former invariably Engilhmen, in whom confidence was
chiefly placed, and the last, a man always possessed of great
parliamentary influence from his talents and connections.
The first step to a change was the rendering parliaments
ostinual, which was moved by G. D. Lucas, and passed in
1763. The lord lieutenant now became constantly resident,
and the sittings were held every year. The spirit of the
Irish parliament increased; several men of great talents
sprung up, and whilst the British ministry were engaged in
their unhappy contest with America, they were obliged to
yield to the people of Ireland first a free trade, and after-
wards a repeal of the statutes which rendered Ireland de-
pendent. The volunteers, a body originally armed for the
defence of the country against French invasion, probably
contributed to these measures by the terror they occasioned
in the ministry, whilst the agitation in England towards the
defeate of the American war, and the unsettled state of ad-
ministration between the reign of lord North, and the ap-
pointment of Mr. Pitt, prevented that determined opposi-
tion which would have been made in a more settled state of
affairs. In 1778 the grievances of the Roman Catholics
began to receive attention, and that body was refreved
from many privileges, of which they had been harshly deprived.
This was the commencement, and since that time all the
most harassing disabilities have been removed, though some
still remain, which are frequently the subject of parlia-
montary discussion. The events of the last 20 years are too
recent to be enlarged on without that partiality from which
human nature is scarcely ever exempt, and the detail would
be perhaps unsuitable to a work of this general nature.
Notwithstanding the milery occasioned by the rebellion
of 1798, and the low state of many branches of trade and man-
ufacture, Ireland has rapidly improved within that period,
especially in agriculture, and should it be blessed with internal
peace and union, it will soon, under the fostering care of the
legislature, rise to a great degree of prosperity, and effentially
contribute to the welfare and happiness of the United Kingdom.
Newenham's State of Ireland, &c. &c.

IRELAND'S EY, a small island in the Irish sea, north of
the hill of Howth, in the county of Dublin, Ireland, about
a mile from the main land.

IRELAND, New, an island in the Pacific ocean, which is
a long slip of land stretching from N.W. to S.E. about 270
miles, and separated from New Britain (which see) by a
channel through which Capt Carteret paffed in 1767, who
gave its name to this island. This navigator founed the
nation very hoffile, baving lances headed with fint. Their
faces were fireacked with white, and their hair beprinkled
with powder of the fame colour. They are black, and fad
to be woolly-headed, but without the thick lips or flat nose
of the negro. Some of the canoes of this island were 90
feet in length, formed out of a fingle tree. Bougainville alfo
visited this country, and observed here the pepper-plant,
and that fingular insect, the walking leaf; among its numerous
birds was the great crowned pigeon. To the west of New
Ireland, and approaching New Guineas, a fuccelfin of little
archipelagos is founed; in which are the Portland ifles,
the Admiralty ifles, the Hermít and Exchequier ifles; all of
which prefent one principal ifland, the centre of the group,
of which the circumference is formed by a number of flat
ifles linked together by reefs. The principal ifland of the
Admiralty iflands (which fee) is mountaneous. The in-
habitants are not very black. Their phyfognomy is agree-
able, and differs but little from that of the Europeans; they
appear little fociable, and thieves; they have chiefs who ex-
cert great authority; they are armed with darts headed
with a volcanic glafs. They wear at the extremity of the
natural parts the shell "bulla ovum," and are otherwife
evilly named. The women have only a garment about the
wait. They live chiefly upon cocoa-nuts, of which these
ifles have abundance. Their hair is curly, and of a black
colour, which they fometimes reddien with oehre mixed with
oil; many parts of the body are allo thus painted, and espe-
cially the face. In thee ifles it was once hoped to find
La Peronc.

The archipeloage of Hermits is scarcely 14 leagues in cir-
cumference; it produces Cythlan apples, "spondia cy-
thera,"
IRELAND, one of the Bermuda islands.

IRENUS, in Biography, a native Greek, probably of Asia, and bishop of Lyons, in Gaul, in the second century. The time of his birth, and the precise place of his nativity, cannot be satisfactorily ascertained. Dodwell refers his birth to the reign of Nerva, A.D. 97, and thinks that he did not outlive the year 152. Grabe dates his birth about the year 108. Dupin says that he was born a little before the year 140, and died a martyr in 202. Tillemon thinks that he was born about the year 120, and died in 202. It is generally allowed that he was educated in the principles of the Christian religion, and that he was a disciple of St. Polycarp; and it has been supposed that he came to Rome with his master, in the time of Anicetus, about the year 157, and from hence passed into Gaul. He was first prefbyter of the church of Lyons, and succeeded Pothinus, after his martyrdom in the year 157, as bishop of that church. Tertullian mentions him as one of the most considerable writers of the Christian church, and says of him that he was a "diligent inquirer of all sorts of opinions;" meaning, probably, that he had well studied the tenets of the heathen philosophers, and of heretics, as well as the principles of the Christian religion. It has been commonly said that Irenus died a martyr; but from the silence of Tertullian and Eusebius, and others, concerning the manner of his death, it is justly argued (says Lardner) by Cave, Batshe, and Dodwell, that this supposition is not well founded, and that he closed his life in the ordinary course of nature. He was the author of many works, of which none are now extant besides his five books "Against Heresies," and fragments of some other pieces; and those five books, written by him in Greek, now exist only in an ancient Latin version, excepting some fragments preferred by Eusebius, and other Greek writers who have quoted them. In this large work "Against Heresies," Irenus has shown that he was well acquainted with heathen authors, and the aburd and intricate notions of heretics, as well as with the Scriptures of the Old and New Testament, which he has frequently and copiously cited with peculiar and very distinguished respect. In his writings "we have full, express, and abundant testimony to the four gospels, the acts of the apostles, and twelve of Paul's epistles." The omission of the epistle to Philemon may well be ascribed to its brevity. He knew the epistle to the Hebrews, but was not satisfied that it was Paul's. As for the Catholic epistles, we have express quotations of the first of Peter, and the first and second of John; and the reason of not quoting the third may be well allowed to be its brevity. But to the epistle of James, the second of Peter, and the epistle of Jude, there are none, or very obscure references, hardly any that can be reckoned material. Nevertheless, on account of a general passage concerning the writings of the apostles, it may be questioned, whether he did not also know them epistles of James and Jude. The book of the Revelation is expressly ascribed to John, the disciple of the Lord. His testimony for this book is so strong and full, that, considering the age of Irenus, he seems to put it beyond all question, that it is the work of John the apostle and evangelist.

Irenus appears to have been very humble and modest, and agreeable to his name (formed of ιρέω, peace) a lover of peace. This is manifest in his letter to Victor, on occasion of the controversy about the time of keeping Easter. Although his writings may not be free from imperfections, he has given such proofs of learning, integrity, and good sense in the main, that all good judges must allow him an ornament to the feet to which he belonged. The works of Irenus were first published at Bail by Erasius, in 1526, in folio; and they have since undergone various impressions. The most valuable of these are that of Grabe, published at Oxford in 1702, folio; and that of Maffett, a Benedictine of the congregation of St. Maur, published at Paris in 1718, folio. Fabricius Car. Dapin. Lardner, in his Works, vol. ii.

IRENARCHA, ιρεναρχες, composed of ιρέω, peace, and ιάρχω, prince, from αρχη, command, a military officer in the Greek empire, whose business was to provide for the peace, security, and tranquility of the provinces. In Justinian's code it is mentioned, that irenarcha are sent into the provinces to maintain the public peace, by punishing crimes, and putting the laws in execution.

Besides this there was another irenarcha in the cities, to whom belonged the preserving of peace, and quelling sedition among the citizens. This officer was sometimes called prefectus urbis.

The emperors Theodosius and Honorius suppressed the office of irenarcha, on account of their abusing their trust, and distressing and perplexing the people, instead of maintaining peace among them.

IRENE, in Biography, empress of Constantinople, born in the year 752, was an Athenian orphan, but being distinguished by her great accomplishments she was married, at the age of 17, to Leo, son of the emperor Constantine V. This prince afterwards sat upon the imperial throne as Leo IV. and at his death, in 780, left his wife guardian of their son, Constantine VI. then but 10 years old. During his childhood, Irene most ably and affidiously discharged, in her public administration, the duties of a faithful mother; and her zeal in the restoration of images, has given her the title and honour of a saint, which the full holds in the Greek church. As the young emperor attained the maturity of youth, the struggle for power between him and his mother was carried on with the utmost ardour. He listened to his favourites, who shared his pleasures, and were ambitious of his power, and was convinced of his right, and of his ability to reign, and determined to reward the services of his mother by a perpetual banishment to the isle of Sicily. She, on the other hand, sought to frustrate the pretensions of the prince, and to obtain the crown of the empire. But these patrocinia, says Gibbon, "were for the most part unsuccessfull; and their black ingratitude and ambition, on this occasion, the popular hatred and contempt. Railed, enriched, entreated with the first dignities of the empire, they safely conspir'd against their benefactor; the great treasurer Nicephorus was secretly invested with the purple; her successor was introduced into the palace, and crowned at St. Sophia by the
IRE

IRE

the venal patriarch. In their first interview, he capitulated with dignity the revolutions of her life, gently acceded the perjury of Nicephorus, intimated that he owed his life to her unfaithful connivance, and, for the throne and treasures which she had resigned, solicited a decent and honourable retreat. His avowal refuted this modist compensation; and, in her exile in the isle of Lebos, the empress earned a scanty subsistence by the labours of her distaff. In this dolorous condition she died in the succeeding year. Her zeal for orthodoxy, and her liberality to the church and the poor, have, in the eyes of ecclesiastical historians, almost wholly obliterated her favage cruelty and injustice towards her son. It is universally admitted that she was endowed with a strong understanding, and with great talents for government. Univ. Hill. Gibbon.

IRENE, in Botany, is derived from Video, wood, because this plant, when it bears fruit, is covered with a sort of wood helis. From cæsareus was the appellation of an olive-branch entwined with wool, such as was customary for the Greeks to hang up in their houses, in order to averce famine.—Linn. Gen. 521. Schreb. 687. Mart. Mill. Dict. v. 2. Browne Jan. 1578. Swartz Obf. 376. Jaff. 88. Lamarck Dict. v. 3. 292. Illustr. t. 515.—Cliffs and order, Dianca Por- tlandia. Nat. Ord. Holcneas. Linn. Amaranthus, Jaff.

Obi. Professor Swartz has remarked that he never found this plant but with hermaphrodite flowers. He is of opinion that the plant described by Browne might be a distinct species with discrecent flowers. Swartz also says that Irefine is so closely allied to Celosia, that it almost appears to be a species of this latter genus.

1. I. cefifolia. Linn. Sp. Pl. 1575. (Amaranthus paniculata flavicante grachi holotereace.) Sloan. Jan. v. 1. 142. t. 93. f. 2. — A native of Virginia and the West Indian islands, particularly Jamaica — Root perennial. Stems varying in height from two to ten or twelve feet, jointed, furrowed, divided at the top. Branches opposite, a little spreading. Leaves opposite, on foot-ilaiks, lanceolate or nearly ovate, acute, smooth. Panicles terminal. Flowers in a sort of spike, small, ovate, whitish, feally at their base. Filaments shorter than the corolla; anthers yellow. The calyx resembles a calf, inclining one or more black shining facets. A white wool is protruded from between the segments when the time of flowering is past.

We suspect that another species of this genus, with narrower leaves, is found in Jamaica.

IRETON, Henry, in Biography, a celebrated commander and statesman of the parliamentary party in the civil wars of Charles I., was defended of a good family, and brought up to the profession of the law. In the contest of the period in which he flourished, Ireton joined the parliament army, and by his superior talents, and the interest of Cromwell, whose daughter he married, rose to the high office of commissary-general. At the famous battle of Naseby he was wounded and taken prisoner. By his address he soon obtained his liberty, and had a great share in all those political transactions which threw the parliament into the power of the army, and afterwards changed the condition from a monarchy to a republic. His counsels had great influence with his father-in-law; and his education as a lawyer caused him to be employed in drawing up many of the public papers of his party. From his fugation, Cromwell secretly called, at Windfor, a council of the chief officers, in order to deliberate concerning the settlement of the nation, and the future disposal of the king's person, and he had a principal hand in framing the ordinance for the king's trial, at which he sat as one of the judges. Through his influence Fairfax put to death, by martial law, Lucas and Little, taken at the siege of Colchester. This unusual severity was loudly complained against by all the prisoners. Lord Capel reproached Ireton with it; and challenged him, as they were all engaged in the same honourable cause, to exercise the same impietous vengeance upon all. Ireton accompanied Cromwell to Ireland in 1649, and in the following year was left by him in that island as lord-deputy. Having finished his military career with the capture of Derry, he was seized with a pejulitical disease in that place, of which he died in November 1653; sincerely lamented by the republicans, who revered him as a fieldair, a statesman, and a saint. According to Hume, he was "fierce in his nature, though probably sincere in his intentions; he proposed, by arbitrary power, to establish liberty, and in the prosecution of his imagined religious purposes, he thought himself diffused from all the ordinary rules of morality, by which inferior mortals must allow themselves to be governed." And again he was "much celebrated for his vigilance, industry, and capacity, even for the strict execution of justice in that unlimited command which he possessed in Ireland. He was obviated to be inflexible in all his purposes, and it was believed by many that he was animated with a fierce and passionate love of liberty, and never could have been induced by any motive to submit to the smallest appearance of regal government. In gratitude for his great public services, the parliament voted an estate of 2000 guineas to his family, and honoured him with a magnificent funeral at Westminster Abbey, a circumstance which, if he could have foreseen, says Ludlow, "he would certainly have made it his desire that his body might have found a grave where his soul left it; so much did he despise those pompous and expensive vanities; having erected for himself a more glorious monument in the hearts of good men, by his affection to his country, his abilities of mind, his impartial justice, his diligence in the public service, and his other virtues." Ludlow's Memoirs. Hume Hill. Life of Cromwell in the Biog. Brit.

IREW, in Geography, a town on the S.E. coast of the island of Timor. S. lat. 45° E. long 126° 3'.

IRGANONG, a town of Hindoostan, in Baghara; 2 miles S.E. of Saleh Mouler.

IRGISKOE, a town of Raffia, in the government of Saratov, situated on the Iris, which runs into the Volga near Volfs; 96 miles E. of Volfs.

IRI, a town of Africa, in the kingdom of Congo.

IRJAB, a town of Candahar, taken by Timor Dec in 1598; 46 miles S.E. of Cabal. N. lat. 53° 50'. E. long. 69° 5'.

IRIARTE IGNACIO, in Biography, a Spanish painter of landscapes, of whom Murillo said, that he would only ascribe the beauty of his works to divine inspiration. He was secretary to the academy at Seville, where he died in 1658.

IRIDES, in Botany, the 18th natural order in Jussieu's System, and the 8th of his 9d clafs. It is equivalent to the Enfate of Limnae, which latter appellation is properly, in our opinion, retained by Mr. Gawler (now Ker), in his illustration
Illustration of this order; see ENSMATE.—Its characters are thus given, the character of the class being nanoscyphitaceae, with fimbriae inserted into the calyx or corolla.

Corella, which Jussieu terms calyx, superior, coloured, tubular at the base; its limb in five, more or less deep segments, equal or unequal. Stigmas three, inserted into the tube, opposite to three alternate segments of the flower, their stamens distinct, or rarely united into a tube embracing the filaments. Gynoecium inferior; with a single style and three-fold stigma. Calyx inferior, of three cells, and three valves, with many semi-circular, roundish, feelings.

Res. either fibrous, tuberous, or bulbous. Stem mostly herbaceous, leafy, rarely almost woody. Leaves alternate, simple, finely-haired, mostly sword-shaped. Flowers growing out of leaves, either solitary, or many toger, which blooms at the commencement of two valves.

The leading genera in Linnaeus and Jussieu are Staphyloma, Flora, Linn. Ginn. Antholyza, Cronus, &c., which Mr. Ker has greatly subdivided. See Helseranthia and Graminaceae.

IRIDIUM, in Chemistry, is a simple substance, and a metal. It was discovered by Mr. Smithson Tennant in 1809, and an account of it was published in the Phil. Trans. for 1824. It appears that previous to its publication, the same discovery was made, to a certain degree, by Defilet, which was afterwards taken up and enlarged upon by Fourerey and Vanucci.

Mr. Tennant found that the small black flakes existing in crude platinum, and which are left after the platinum has been dissolved, contained two metals which had not been previously noticed. (See Platinum.) He injected the above substance to the alternate action of potash and nitric acid, by which means he obtained two solutions. The black scales are heated to redness in a silver crucible, with their own weight of potash. When the heated mass has water added to it, the potash dissolves in combination with one of the metals, the solution being of an orange colour. The iridium being treated with nitric acid, a solution is obtained, which at first is blue, then becomes olive green, and ultimately of a red colour, combining of the acid unified to the oxide of the other metal. By the alternate treatment, the oxide of plumic, the other metal alluded to, is dissolved in the potash, and the oxide of iridum in the nitric acid. The acid solution, on being evaporated to dryness, affords cryllals of an octahedral form, which is, no doubt, a pure presulent of iridium. The solution of these particles is of a deep red colour. When a plate of zinc, or any other metal, having a greater affinity for oxygen than itself, is placed in the solution, a black powder is precipitated, which, on being heated, becomes red, and patens on metallic flurine. This metal, like gold and silver, has no little attraction for oxygen, that it may be obtained by exposing the cryllals of its mutil at a temperature. In this state it is called pure iridium. It is a white metal that gives the appearance of platinum. Owing to its great lightness, we are not acquainted with some of its physical properties, such as its specific gravity and malleability. It has not been purified by Mr. Tennant nor the Trans. chemists. It has, however, since been made to assume the liquid form, by means of the very intense heat produced by the large galvanic battery lately exhibited at the Royal Institution by Mr. Davy. This heat was so great, that at the same time the earth's sunbeam and xeromino were fused, and charcoal was volatilized.

Iridium forms stable alloys with several of the metals, a presumptive proof that it is itself malleable. Mr. Tennant found that it did not combine with arsenic, but that it easily united with lead, from which, like the noble metals, it may be separated by cupellation. It forms valuable alloys with copper and silver. Its alloy, with gold, differs little from pure gold, even when the iridium is in considerabe quantity. It appears to blend next above gold and platinum in its affinity for oxygen. It may be honored, from the change of colour in the acid solution, that it admits of at least two stages of oxidation. When the metal is in its pure state, it is attacked by any acid except the nitro-nitric, and even this acid, according to Fourerey and Vanucci, dissolves or volatilizes its weight. Its combinations with the alkalis, and with combustible bodies, have not been attended to.

IRIDIU, in Geography, a river of Guiana, which runs into the Atlantic, N lat. 5°. W. long. 51°. 30'.

IRINON. See Iron.

IRIS, in Anatomy. See Eye.

Iris, Platanus, or Prescientia s, in Surgery, denotes a protrusion of a piece of the iris through a wound, or ulcerated opening in the cornea, after the escape of the aqueous humour. To this desire several writers have applied the name of flaphyloma; though, in all probability, the influence of Scarpa will in future counterbalance the latter term to a morbid thickening and projection of the cornea itself, a caca which will be described in its proper place. See Staphyloma.

The prolusions of the iris is produced by fus wounds and ulcers of the cornea as penetrate the anterior chamber of the aqueous humour, and sometimes by blows, which have been so violent as to rupture the transparent membrane investing the face part of the eye. If the lips of a wound of the cornea (as, for instance, those of the incision practiced in the extraction of the cataract, or in opening an hypopium) are not immediately put into reciprocal contact, so as to keep the aqueous humour from running out of the anterior chamber, as fast as it is secreted, the iris, drawn by the current of this fluid towards the wound in the cornea, is urged between the lips of the incision, and, becoming elongated, projects upon the preceding membrane in the form of a small tumour. The same accident happens, when the globe of the eye receives a blow, or is too much compromised with a bandage, while a difunct wound of the corna exits. In such a case, likewise, the prolusions of the iris might be produced by a violent impulsion of the muscles of the eye, excervice and long continued vomiting, or repeated coughing. A prolusions of the iris arises even more frequently from ulcers which extend through the cornea, than from wounds of that membrane; and Scarpa affirms as a reason for this fact, the loss of substance always attending the former cases. The little swelling mult of coarse of the same colour as the iris, namely, brown or grey; and its base is surrounded by a small opaque circle, formed by the cornea that has been for some time divided.

Iridium assumes that more than one prolusions of the iris have taken place before, since it did not often occur that the same wound was not wounded in more than one place. However, we cannot imagine that the iris has ever protruded in several places at once: Scarpa has seen three distinct protrusions upon the same cornea, in consequence of three separate ulcers of that membrane.

Small as the tumour may be, (and, indeed, it is sometimes not larger than a fly's head,) it is nevertheless apt to give rise to very severe symptoms. Nor are we to wonder at this circumstance, as the iris is supplied with numerous blood-vessels and nervous filaments; and that part of it which is protruded is further excited irritation, as well from the friction of the eye-lids, as from the action of the air, tears, and other matter upon it. Besides, it is a fact, that the projection of the iris inflames, and swells from 14: after
IRIS.

After its production, and consequently it suffers a great deal more from the compression and irritation. The patient at first complains of a pain like that of a thorn in the eye, and is also afterwards affected with an acrid sensation of tightness or constriction of the organ. To these complaints are soon added an inflammation of the conjunctiva and eyelids, discharge of irritating tears, and an inability to bear the light. The protruded piece of the iris unavoidably drags towards the root of this membrane; and hence the shape of the pupil is changed from round to oval, and its situation undergoes an approximation to the wound or ulcer, through which the prolapsus of the iris has taken place.

When the disease has prevailed a considerable time, theidentity of the organ, with the pain, inflammation, and other symptoms, is sometimes lost, instead of increased. Scarpia informs us of such an example in a man, fifty years of age, who for ten weeks had had a prolapsus of the iris twice as large as a millet-seed. The patient bore the disease with the utmost indifference, being merely troubled with a slight chronic redness of the conjunctiva, and a difficulty in moving the eye-ball with freedom. The little tumour felt to the finger hard, and almost callous.

In the treatment of this disease, some practitioners have recommended pulling the iris back again into its natural situation, by means of a white-bone probe; and, in cases of this being found difficult of accomplishment, they have advised the wound or ulcer of the cornea to be dilated as far as necessary, in the same manner as the fissure of a strangulated hernia is divided, for the purpose of enabling the surgeon to reduce the protruded bowels. Others have suggested irritating the projecting portion of the iris, in order to make it contract and return into its proper place again; and, with the same intention, it has been proposed to expose the eye suddenly to a very vivid light. The experienced and judicious Scarpa, however, sets down all these methods as ineffectual, if not dangerous; for, says he, admitting that we could, in any of these ways, replace the iris, without lacerating or hurting it, still there would continue in the wound or ulcer of the cornea an opening, through which the aqueous humour would escape, and carry out with it again a fold of the iris.

It cannot be denied that a prolapsus of the iris is a most unpleasant kind of accident; but yet, as we are utterly unpossessed of any means whereby we can stop the escape of the aqueous humour through certain wounds and ulcers of the cornea, we ought, according to Scarpa, to consider the prolapsus of the iris a beneficial occurrence, and preventive of the total destruction of the eye, inasmuch as the protruded fold of this membrane, acting like a plug, prevents the entire loss of the aqueous humour, which soon collects again in the anterior chamber, and hinders a further protrusion of the iris. By separating this membrane from the cornea, and re-establishing the equilibrium between it and the other humours of the eye. Hence Scarpa reprobrates the foregoing plans as useless and dangerous.

The principles laid down by this eminent surgeon tend to establish two chief indications, in cases of recent prolapsus of the iris: one is to diminish the extreme sensibility of the piece of the iris projecting out of the cornea; the other is to effect a gradual diminution of the protruded portion of the iris, to such a depth as will render the wound or ulcer capable of healing, but not so deeply as to break the adhesion which the iris has contracted to the bottom of the breach in the cornea.

Both these indications may be fulfilled by touching the projecting part of the iris with the antimonium nitrum, or, with what is still preferable, the argentum nitrum. An affiant, standing behind the patient's head, is to keep the upper eyelid raised with Pollier's elevator; and the patient is to hold his eye as steady as possible, by fixing it on one object. While the affiant raises the upper eyelid, the surgeon is to depress the lower one with the index and middle fingers of his left hand, and with his right touch the protruded piece of the iris with the argentum nitrum, cut in the shape of a crayon. The cautery should be applied upon the centre of the little tumour, so as to form an escar of the proper depth. The pain suffered at this instant is exceedingly fierce; but it quickly subsides, as soon as the eye has been bathed with warm milk. The cautery expeditiously destroys the sensibility of the protruded part of the iris, and the escar prevents the effects of the friction of the eyelids, and hinders the air and tears from causing any irritation of the projecting portion of that membrane. Hence the pricking and painful tension, previously felt in the eye, are diminished; as likewise are the ophthalmia and secretion of teardrops.

The benefit thus produced lasts only as long as the escar continues adherent to the tumour formed by the iris. Immediately the escar is detached, all the annoying complaints again come on, though in a somewhat mitigated degree, in consequence of the projecting part of the iris not being quite so prominent as it was before the cautery was applied. The escar frequently separates on the second or third day; but whenever it happens, the painful symptoms recur; and the surgeon's duty is to use the argentum nitrum again without delay. The application is in this way to be repeated, until the protruded part of the iris is destroyed so deeply, that it can no longer hinder the wound or ulcer of the cornea from healing.

The employment of the argentum nitrum must not be continued, after the prolapsus of the iris has been sufficiently depressed; as we learn from Scarpa, that such a plan would bring on all the pain and inflammation again in an aggravated form. When the little tumour has been levelled as much as the indication requires, the cautery is not to be applied again; and the surgeon is simply to introduce between the eye and eyelids a collyrium, containing sulphate of zinc and mucilage of quince-seeds, and afterwards infuse a small quantity of the following ointment under the eyelids, every morning and evening:

This ointment must be at first weakened with twice or thrice its quantity of lard.

When the foregoing applications are not too stimulating, the ulcer is gradually diminished, and generally quite healed in about a fortnight.

As the union, which takes place in the course of the treatment, between the protruded piece of the iris and the internal edges of the wound, or ulcer, of the cornea, always continues after the cure is completed, the pupil must for ever remain of an oval shape, and a little inclined towards the eicatrix in the cornea. This must happen even when the treatment has been as successful as possible. It is pleasing, however, to learn from the experienced Scarpa, that such alteration in the situation and position of the pupil cauases little or no diminution of the power of seeing the most minute objects, and occasions much less impairment of the sight than might be supposed, unless it unfortunately happen that the scar in the cornea is in the middle of it. Besides, we are also assured by the same distinguished surgeon, that
IRIS.

that the power of different things is the Iris injured, insuf- much as the pupil, which was in the beginning of the diag- each narrow and oblong, becomes afterwards more capaci- This fact is likewise confirmed by Richter in his Oph. Chir. faticum. t. p. 82.

Scarpa has found the preceding treatment more successful than any other, not excepting the method of cutting off the protruded part of the iris with a pair of scissors. This last plan, he thinks, is only advantageous when the iris is strongly adherent to the internal lip of the wound or ulcer of the cornea, or when the prolapsus has existed a long while, and the projecting portion of the iris has become in- dured and callous, while its base, contracted by the edges of the wound, or ulcer of the cornea, not only adheres to them, but has put on the appearance of a kind of pedicle. Scarpa, indeed, has been one instance, where the little tumour fell off of itself in consequence of the compression made upon its neck by the edges of the ulcer of the cornea.

IRIS IMPERFECTA. See Cupr., Cloacue of.

Gen. Ch. Cal. Spathas of two valves, separating the flowers, permanent. Cor. in five deep segments, united by a tube of their narrow bales; each oblong, obtuse; the three outermost reflected, three inner erect and moist acute. Stam. Filaments three, awl-shaped, lying on the reflexed segments of the corolla, and not half so long; anthers vertical, oblong, straight, depreessed. Pfd. Germen inferior, oblong; style simple, closely enclosed by the tube of the corolla: filaments three, each with a petal-like, dilated, ob- long appendage, keeled on the inside, furrowed at the outer, lying over each stamen, two-lipped, the lower lip small and notched, upper larger, cloven, slightly reflexed, obtuse. Capsule oblong, angular, with three cells and three valves. Seeds several, large, more or less compressed and angular.

Obst. Botanists have differed about the really efficient part of the ligulas of the Iris. The whole petal-like expansion was supposed by Linnaeus, and his followers to be the actual flower, or at least they had no precise idea of the exclusive action of any particular part. The late Abbe Cavanilles conceived the pollen to be received into a tubular opening between the base of each filament and the extremity of the style, and there to perform its office. Holland and Sprengel, with much more probability, believe the upper or inner surface of the small lower lip of the petal-like expansion, which is glandular in that part, to be the real stigma, and the latter has curiously explained the mode in which bees convey the pollen to this spot. See Sims and König's An- nals of Botany, v. 1. 412. The ligula of several species of Moron comes very near that of Iris, and there has al- ways been some ambiguity between these two genera, which we shall endeavour to remove when we come to Moro- na.

Iris is a large and very natural genus. Tournefort subdivided it into several by the roots, which in some species are tubercular, in others bulbous. Some moreover have the upper surface of the reflexed segment of the corolla smooth, whilst in others that part is beautifully bearded.

In the species plantarum of Linnaeus are 22 species; in Syll. Veg. ed. 14, twice that number. Thunberg, who wrote a dissertation on this genus, having greatly augmented it. He has discovered many new species in his Siberian travels. Well-known is 54 in all. Mr. Freyfays from the latter in the arrangement of many of them, common names, which he reduces to Iris, and has fixed, beneficially by Mr. Drury, in a new edition of the Hortus Kewensis. The white iris is included in the species plantarum.

ROOT THICK, FLAT, HORIZONTAL. FLOWERS BROAD.

Of this the common English Iris, L. alba, t. 578, is the one most frequently alluded to Curt. Lond. 1. 1. 129, as an example. It grows in wet places, flowering in July, and like every known Iris is perennial. The flower is bright yellow, streaked with darker lines. * * * Root knobby. Flowers broad.

This contains only I. tuberosa, Fr. Græc. Sibth. t. 40, Curt. Mag. t. 551, known by its quadrangular leaves and singularly dark flower. * * * Root bulbous. Flowers broad.

Here are found the pretty I. Xiphium, Curt. Lond. t. 686, which decorates many a cottage garden with its sweet and yellow blossoms: I. profusa, Curt. Mag. t. 1, more richly banded: and, to some persons, exquisitely scented, though to others it is scentless; and I. Spurina, Curt. Mag. t. 13, found in America; as well as the well-known I. versicolor, I. floribunda, I. florentina, and germanica, natives of the south of Europe.

* * * Root bulbous. Flowers broad.

Iris, in Gardening, contains plants of the fibrous, tuberous, and bulbous-rooted, flowery, herbaceous, perennial kinds; of which the species cultivated are very numerous; but the following are some of the principal: the dwarf iris (I. pumila); the Chalcodonian iris (I. fulva); the Florentine irises (I. florentina); the twice-flowering iris (I. bifora); the leafless iris (I. affinis); the variegated iris (I. variegata); the German iris (I. germanica); the elder-scented iris (I. umbellata); the brown-flowered iris (I. lilacina); the crested iris (I. cribrata); the yellow-petalled iris (I. tricolor); the bulbous-rooted iris (I. xiphium); the common yellow, or water-iris (I. pseud-acorus); the bells iris (I. fistuliflora); the Virginian iris (I. virginica); the variouscoloured irises (I. verticillar); the pale-yellow iris (I. ochrolea); the spiral iris (I. versicolor, I. Pterafis); the long beaked iris (I. gramina); the spuria iris (I. spuria); the Siberian iris (I. Fabri); the Martinicus iris (I. martinius); the peacock iris (I. pavonia); and the fritschei's-head iris (I. tuberosa).

The first of these forms has varieties with white flowers; with fawn-coloured flowers; with pale-blue flowers; with bluish-coloured flowers; with yellow variable flowers; and with blue variable flowers.

The ninth form has likewise varieties with blue fawn-like and purple falls; with pale-purple standards; with white standards; and with a smaller flower.

The eleventh species also varies greatly in the size of the larger petals, as well as in the colours, as blue, purple, yellow, white, and spotted.

And the twelfth form furnishes varieties with blue flowers; with violet-coloured flowers; with white flowers; with pur-
ple flowers; with yellow flowers; with blue standard petals and white falls; with blue standards and yellow falls; with tripped flowers; the broad-leaved with blue flowers; the broad-leaved purple flowered; the sweet-scented blue flowered; the sweet-scented purple flowered, with various sweet-scented flowers, and the double flowered.

The eighteenth century, or Persian iris, is greatly esteemed for its heart-and-knee sweet-scented flowers, and as well as for its early appearance in the spring, being generally in perfection in February or the beginning of the following month, according to the lat. of the beduin. And Mistly notices that, unlike the heart and knee, it will blow without delay in winter, but later, but stronger in a long set of feet, and has many and that a few flowers will soon mix a whole garden.

H. de C. - Most of the flowers may be readily increased by pulling the roots, or separating the off-shoots from the bulbs, and putting them out in the situations where they are to flower; the first flower in the autumn, or very early in the spring, and the latter in the clove of flamme. when the leaves decay, managing them in the same manner as other bulbs. As they increase and spread rapidly in their ways, they should be divided and taken off every two or three years.

New varieties of the different sorts may be raised from seed, by flowering it in the autumn in a bed of light sandy mould. The plants come up in the following spring, and in the autumn may be transplanted where they are to grow. They flower a year or two afterwards in this climate.

The bulbous-rooted sorts succeed best in such soils as are of the light, sandy, loamy kind; but will succeed in any that are dry.

The fall of the flower is perfectly in such aspects as are towards the east, the roots being prevented from growing too deep in the ground.

As the second fall is liable to be injured by severe winters, a few should be planted in pots to have protection. This is well suited for forcing, in hothouses for the purpose.

When planted in the open ground, it requires a rather dry soil and situation to succeed in a proper manner.

The Cape sorts should be retained in the dry stone, and be propagated and managed in the same manner as other bulbous-rooted plants of the same kind.

All the sorts are proper for affording variety in the borders, clumps, and other parts of piafure grounds; and some of the more tender sorts among potted plants of similar growth and habits.

Iris, in the Materia Medica. The Iris florentina, Florentine iris, or Iris, is a native of Italy, and flowers in June; it was cultivated in England by Gerard in 1556, and is now commonly propagated by the florists; but the roots of the iris orris in this country have neither the odour, nor the other qualities of those of the warmer climates; so that for medicinal use they are not so much imported from England. In its recent state, the root is extremely hard, and when chewed, excites a pungent heat in the mouth, of several hours' duration. When dried, this acrimony is almost wholly dissipated. The taste is slightly bitter, and the smell is agreeable, approaching to that of violets. No essential oil has been hitherto obtained from this root; but spirituous tinctures of it contain more of its virtues than watery infusions. The fresh root is a powerful cathartic, and for this purpose it has been employed in the dose of a dram and upwards of finish &. It is now chiefly used in its dry state, and ranked as a piafural or expectorant; though there is no evidence of its expectorant powers; and therefore it is now considered as valuable only for the piafurness of the perfume, and the flavour which it communicates.

The Iris Flavicornis, or Florensis, or Iris pseudacorus, yellow water-flag, or yellow water-flower-delicace, is common in marshes, and on the banks of rivers, and renders very conspicuous by its large yellow flowers, which appear in the beginning of July. It had formerly a place in the London Pharmacopoeia, under the name of "Gladio/Us florentins/ "

The root has no stalk, but an acrid dry tuber, and its juice, quando lemped in the mouth, produces a burning heat in the mouth and throat, accompanied with a copious diarrhoea from these organs; and hence it is recommended both as an eructus and diuretic. This plant is also called a power of ancient times, that it has been used instead of garlic in the making of tea, particularly in Scotland. For this purpose, the common people cut some of the roots into thin threads, or boil or infuse them in water till the liquor is highly divided with blue; they then pour it clear off; and putting into it the blade of a knife, or any other piece of iron, they rub it hard with a rough white pebble, common there, and by degrees the liquor becomes black; they continue rubbing it till it is as deep a black as they require, and it is a tolerable good ink. (Phil. Trans. N. 117.)

This root has also been used for the purpose of dying black; and from this quality it has been successfully employed as a medicine for the cure of diarrhoea. When given with this intention, the root is to be well dried; for the fresh root and its juice are strongly cathartic, inasmuch that eighty drops of the latter produce repeated evacuations, after pila, gamboge, &c. had failed, and by continuing its use in an increased dose, it cured an intractable dysentery. Hence Bergius says, "virtus recent. hydargyra, pungens: iac. addirringa." The expressed juice is likewise said to be an useful application to erupitious eruptions and phlegethous tumours. (Woom. Med. Dof.)

The root of this plant is recommended by Brookes as a remedy for the tooth-ache.

Iris, Rainbow, in Physiology. The word is Greek, and, supposed by some to be derived from u, I speak, I tell, as being a meteor, that is supposed to foretell, or rather to declare, rain. See Rainbow.

Iris is also applied to these changeable colours which sometimes appear in the glass of telescopes, microscopes, &c. called from their similitude to a rainbow. The fame variability is also given to the coloured spectrum, which a triangular prismatic glass will project on a wall, when placed at a due angle in the funnel.

Iris is also a name given by some authors to a peculiar species of sprig crystal, remarkable for its giving the rainbow colours in reflection. This, however, being a property more or less found in all the kinds of sprig crystal, and these much resembling one another, it became applied to sprig crystal in general; and iris, instead of being the name of a peculiar species, was understood as a synonymous term for common crystal.

Iris Marina, the Sea-rainbow. This elegant appearance is generally seen after a violent storm, in which the sea-water has been in vast motions. The celestial rainbow has great advantage over the marine one in the brightness and variety of the colours, and in their distinctness one from the other; for in the sea-rainbow there are scarcely any other colours than a dark yellow on the part towards the sun, and a pale green on the opposite side. The other colours are not so bright or distinct as to be well determined, but the sea-rainbows are more frequent and more numerous than the others. It is not uncommon to see twenty or thirty of them at a time at noon-day. Obeserv. sur l'Aile, p. 252.
Iro.

Iron, in Natural History. In Dr. Grew's Catalogue of the Rarities of Gresham College, p. 274, he mentions a petrified ivy-root; a bone somewhat flat, but radiated from the central pith, the polished end of which, when wetted, showed these radiances very fine; this extraneous fossil probably belonged to the coralline tribe, instead of being a root. In Dr. Leight's account of the fossil plants, found in the coal-pits at Barnley in Lancashire, he mentions long narrow leaves, resembling those of flag, and so called in general, are common in coal strata; these kinds of leaves in the coal-deposits in Derbyshire are often called favors, from the resemblance of their impressions in the stone to that of the tooth of a sword.

Irish Sea. In Geography, the name of that part of the Atlantic ocean, which is between the coasts of Ireland and Great Britain.

Irish Terms. See Terminology.

IRKINEVAV, in Geography, a town of Russia, in the government of Tobolsk; 160 miles N.E. of Eminoff. Lat. lat. 50. E. long. 90.

IRKUTSK, a town of Russia, and capital of a government, to which it gives name, on the Angara, near the lake Baikal, the scene of a Greek archbishop, and a place of considerable commerce; the caravans which trade to China pass through it. N lat. 52 4'. E. long. 95.

IRKUTSKOI, a government of Russia, containing all that part of Siberia which lies beyond the 107th degree of east longitude; bounded on the N. by the Frozen sea, on the E. by the N. Pacific ocean, on the S. by Chinese Tartary, and on the W. by the governments of Kolyma and Tobolsk.

It is the most extensive, but least populous of all the Russian governments; and is divided into the four provinces of Irkutsk, Nertchinsk, Yakutsk, and Ochotsk, to which are added the four principal towns.

IRMAHSSAR. A town of Asiatic Turkey, in Nato- lion, 125 miles S.E. of Calaham.

IRNEEZ, a town of Hindoostan, in the circuit of Mahur; 58 miles N. of Mahur.

IRNERIUS, in Biography, sometimes called Wernerius, a celebrated jurist of the twelfth century, was probably born at Bohemia. He first taught philosophy in that city, and acquired much distinction by being the first who opened a school for lectures in the Roman law in Italy, after its introduction by the invasions of the barbaren nations. He also composed the famous De Romano legibus, not only upon the Code and Institution, but upon the Decree. He obtained great reputation by his labours; and the name of Wernerius, in a plea of the court of Matilda, in 1113, stands before that of any other of the lawyers. The fame circumstance is found in the pleas of the emperor Henry IV, from the year 1116 to 1118, which proves that he attended the court of that monarch in his profissional capacity. In 1118 he accompanied Henry to Rome, where he was ennobled, and confirmed the Roman law to the election of the anti-pope Burdin. He died about the year 1150; and is said to have introduced the degree of doctor into the universities of Bayle.

The use of this metal is of very high antiquity, though not so remote, there is reason to believe, as that of either gold, silver, or copper. The inferior brilliancy of its colour may, perhaps, in some degree, account for this circumstance; as well as the greater skill required to obtain it from its ores, and convert it to the purposes of art. It is mentioned frequently in the peritarchs; and was, in the time of the celebrated writer of that history, employed for the fabrication of swords, knives, and various other sharp-edged instruments. We may form some estimate of the value that was then attached to it, from an expression in the eighth chapter of Duteronomy, where Melch tells the Israelites, in his descriptive eulogy of the Land of Promise, that it is "a land whole rocks are iron, and out of whose hills" they may "dig brass." A circumstance, illustrative of the fame fact, at a later date, is furnished about 450 years subsequent to that period, when Aesopos proposed a ball of iron as one of the prizes to be distributed to the victors at the games instituted in honour of Parochus. (Pall. 7. 4.) The art of working it appears, in the course of a few succeeding centuries, to have arrived at considerable perfection; for, according to the information of Herodotos (Ch. xxv.), a fencer of the metal, very curiously inlayed, was presented by Alcyton, king of Lydia, to the Delphic oracle, which he says, "is of surprising workmanship, and as worthy of observation as any of the offerings preferred at Delphi." The durability of iron, and its dispensible affability in the preparation of every other metal, make it one of the most valuable possessions that has been bequeathed to the use of civilized man. "Without it," observes Fourrey, "agriculture could not have existed, nor could the plough have rendered the earth fertile. The philosopher, while he studies the progress of the human understanding, and compares the fortune and state of the different nations established on various portions of the surface of the globe, will remark, that their iron-works seem, in some measure, to be proportioned to their intelligence, to the advancement of reason amongst them, and the degree of perfection to which the arts have arrived. When we consider it in this point of view, as the agent by which men, in the variety of its uses, and the numerous wants it supplies, acquire enjoyments which would be unknown to them if they did not possess these products of their industry, iron must singularly contribute to extend their ideas, to multiply their knowledge, and to conduct their spirit towards that perfectibility, which nature has given no leis, as the character of the human species, than the source for all the advantages it can enjoy." Syll. vol. 6.

Iron is a malleable and ductile metal, of a bluish-white colour; is susceptible of a very high polish, and of the specific gravity, according to the tables of Mushenbroek, Swedenborg, and Bridson, of from 7.660 to 7.895, and even 8.166. It is soluble in most acids, and precipitable from its combination with them, by various re-agents, which will be hereafter pointed out. With the Prussic acid it forms that beautiful pigment known in commerce, and the arts, by the name of Prussian blue; and in a variety of other ways, constitutes the basis of many valuable preparations. The combinations under which it is exhibited to us in nature are detailed in the following section.

§ 1. ores of iron.

Its colour is lead-grey, passing to silver-white. Occurs only in a ramose form; the malleable alluded to by Brochant and others being now considered of meteoric origin. Surface thinning. Internally it is homogeneous; intermediate between thinning and glimmering, and its internal metallic. Fracture hazy. It is rather soft, is completely malleable, and flexible without being elastic. Sp. gr. 7-2.
A specimen from a mine near Kamfurdorf, in Saxony, yielded, according to Klaproth,

Iron 92.5
Lead 6.0
Copper 1.5
100.0

The variety which contain nickel are meteoric.

It is found in detached masses, which are usually covered with an oxidal of a brownish colour.

The places of its occurrence are Kamfurdorf and Eisen- flock, in Saxony; Oulles, near Grenoble, in France; and some others.

This very abundant mineral is divided by Werner into five sub-facies, common, radiated, capillary, hepatic, and cellular.

Subsp. 1. Common Pyrites.——Colour bronze-yellow, palling sometimes to gold-yellow. Occurs massive and disseminated. It is very frequently also crystallized. Its forms are the cube, either perfect or truncated, the octahedron, dodecahedron, and sometimes, though very rarely, the icosahedron. The crystals are in general small; except the cube, which is middle-sized. Their surface is either smooth or flaked, and varies from glimmering to splendent. Internally it is hinging or glimmerring; and its sulphur metallic. Fracture even; sometimes conchoidal. It is hard, brittle, rather easily fragible, and heavy. Sp. gr. from 4.080 to 4.81.

Exposed to the blow-pipe, it exaltes a strong odour of sulphur, and burns with a bluish flame. It afterwards passes into a globule, obedient to the magnet, of a brownish colour; and treated with glases of borax, communicates to it a tint of a dark dirty green. It appears to be composed of about 52.5 sulphur, and 47.5 iron.

Its occurrence is almost universal, both with reference to geographic arrangement, and the mineral formations in which it is prevalent.

Subsp. 2. Radiated Pyrites.——Colour bronze-yellow, of a paler hue than the preceding; palling sometimes to brassy-yellow. Surface tarnished. It is found massive and reniform, also uniform, globular, and crystallized. The shape of its crystals is cubic and octahedral; the latter being sometimes truncated on the angles. The external sulphur varies between splendid and glimmering. Internally it is glimmering and glimmerring. Fracture usually radiated; sometimes uneven and fibrous. Fragments uniform. Occurs in coarse and large-grained distinct concretions, also lamellated and columnar. It is hard, brittle, very easily fragible, and heavy, but less so than the foregoing sub-species. Emits a fulphureous odour when struck, or rubbed. Sp. gr. from 4.698 to 4.775.

Before the blow-pipe it exhibits the same appearances as common pyrites, and is constituted of about 54 parts of sulphur, and 46 of iron.

It is considerably rarer than the preceding, and is found in veins, particularly those which contain lead or silver.

The places of its occurrence are, amongst others, Cornwall and Derbyshire, in England; Arenal, in Norway; and in various districts of Suabia, Saxony, and Bohemia.

Subsp. 3. Capsular Pyrites.——Colour bronze-yellow, inclining more or less to steel-grey. Occurs in very fine capsular crystals. Luster shining or glimmering; metallic. Brittle, and in a small degree flexible. The smallness of its crystals precludes a more particular account being given of its character.

Its chemical properties are the same as those of common pyrites.

It is never met with but in very small quantity, and is most rarely of all the varieties of pyritic iron. It is most usually accompanied with quartz, lead-glance, or galena, and flour and calcareous spar.

It is found at Annaberg, Schneeberg, and Johanngeorgen- fladt, in Saxony; at Andreasberg, in the Hartz; and other places on the continent of Europe. The capillary pyrites, according to Klaproth's analysis, is not an iron-ore, but nickel, mixed with a small portion of cobalt and arsenic.

Subsp. 4. Hipatit Pyrites.——Its colour is intermediate between bronze-yellow and steel-grey, palling sometimes entirely to the latter. On exposure, the fresh fracture changes to a brown. It is found massive, and under a variety of other forms, as flakeitic, cellular, &c. also crystallized. The shape of its crystalline arrangement is pyramidal, pyramidal, and tabular, each with six sides. Luster glimmering, inclining to glimmering; metallic. Fracture even, palling sometimes to uneven and imperfectly conchoidal. Fragments indeterminate, sharp-edged. Hard, rather inclining to soft, brittle, easily fragible, and heavy.

This sub-species is said to contain arsenic. It decomposes very easily on exposure to air, which renders it very difficult to be retained in mineralogical collections.

It occurs only in veins, and in those principally which contain red silver ore, galena, blende, common pyrites, and pyrrhotite-iron. The earthy minerals that accompany it are, for the most part, quartz, sulphate of baryte, and calcareous and flour spar.

It is found in Derbyshire; at Joachimsthal in Bohemia; and Annaberg and Freyberg in Saxony; and in various parts of Sweden, Norway, and Siberia.

Subsp. 5. Cellular Pyrites.——Colour bronze-yellow, a good deal inclining to steel-grey. Tarnishes by exposure, and then becomes of a grey tint. Occurs massive; but its most common appearance is cellular. Cells usually on the surface. Luster glimmering. Fracture conchoidal. Fragments sharp-edged, indeterminate. Brittle, and in a flight degree flexible.

Its occurrence is in veins, where it is accompanied, according to the flamentation of professor Jamiezon, with hepatic and common pyrites, lead-glance, pyrrhotite-iron, nickel, iron-ochre, brown-fpar, heavy-fspar, flour-fspar, and quartz.

It is found at Johanngeorgenfladt, in the electorate of Saxony.

Colour copper-red, inclining much to bronze-yellow, and even to pinchbeck-black. Tarnishes by exposure, becoming then brown. Occurs massive and disintegrating; has never been found under any other form. Internal luster glimmering, or shining; metallic. Fracture uneven, and sometimes imperfectly conchoidal; when the latter, it has a luster bordering on splendent. Fragments indeterminate, rather blunt-edged. Intermediate between hard and flemish. It is brittle, easily fragible, and very heavy. Is attracted by the magnet. Sp. gr. 4.516.

Treated by the blow-pipe, it emits a light sulphureous odour, and melts with great facility into a greyish-black globule, which is attracted by the magnet, and colours brown-black. It is composed of 56.5 sulphur, and 43.5 iron.

It occurs only in the cliffs of rocks denominated primitive; and there only in beds. The minerals which usually accompany
IRON.

accompany it are galena, magnetic iron-oxide, arsenical pyrites and tin-oxide; with also quartz, garnet, jahralite, hornblende, &c.

Its geographic distribution is rather extensive. Amongst many other instances, the following may be enumerated: Moel Efnin, in Caernarvonshire, North Wales; Geyer, Bremenbrunn, &c. in Saxony; Badenmais, in Bavaria; and in different parts of Norway and Siberia.

Werner divides this into two subspecies: namely, common magnetic iron-flone, and magnetic iron-land.

Subsp. 1. **Magnetic Iron-flone.**—Colour iron-black, inclining sometimes to perfect black, and sometimes to fleck-grey. Occurs massive, disseminated and crystallized. The form of its crystals is the cube, perfect or truncated; the octahedron, which is also sometimes varied by truncation; the garnet dodecahedron, and the rectangular four-fold prism, terminated by four planes, placed on the lateral edges, as in the hvacinth. These crystals vary much in size. The dodecahedrons and octahedrons have their faces smooth; but the planes of the four-fold prism are transversely streaked. Lustrous externally finned; internally varying from glimmering to splendent. Fracture small and fine-grained, uneven, approaching sometimes to small conchoideal, and imperfect foliated. Fragments indeterminate, rather sharp-edged. Occurs sometimes in granular distinct concretions. It is semi-hard, passing to hard; brittle; when in crystals Difficulty friable, and heavy. Sp. gr. 4.600 to 4.939. It is attracted by the magnet; and is itself also magnetic.

Before the blow-pipe it becomes brown, and imparts a dark-green colour to borax. It is supposed to be an oxide of iron, nearly in a state of complete purity.

This species is very common in primitive mountains, especially in those of gneiss and micaceous schistus. In these situations it arranges itself in beds; but sometimes composes the entire mass of different mountains. The flint, or conchoidal, formations, as they are termed, are not free from it. It occurs in greenstones at Taberg; in hornblende in Smoland, and in basalt near Einbeck. It is usually associated with common hornblende, garnet, and granular limonite. Sometimes with actinolite, albite, &c.; but is most frequently found in the vicinity of magnetic pyrites, arsenical and copper pyrites, and common pyrites.

It is found in one of the Shetland isles; in Bohemia, Hungary, Saxony, Italy, France, Switzerland, Siberia, and South America. It is very abundant in Sweden, where it is employed for the manufacture of the iron imported to this country for the supply of the Sheffield market.

Its chemical characters are as the foregoing subspecies.

This is also divided into two subspecies: common iron-oxide, and micaceous iron-ore, or, as it is called by prof. Jameson, iron-mica.

Subsp. 1. **Common Iron-oxide.**—Colour fleck-grey of greater or less intensity, and sometimes red-dish. It occasionally passes into iron-black. Surface very often tarnished, and beautifully iridescent. Occurs massive, disseminated, and crystallized. The form of its crystals is various. The most common is the rhombohedral parallelopipedon; the cube, formed by the truncation of a double three-sided pyramid, and having three triangular faces instead of two of its angles opposite, and octagonal plates bounded by linear trapeziums, six in number, inclined alternately to different sides. Planes of the crystals sometimes smooth, and sometimes streaked. Externally it varies from glimmering to splendent; internally from glimmering to splendent; lustrous metallic. Fracture compact and foliated. The compact varieties are uneven, and sometimes small conchoideal. The foliated have a fourfold rectangular cleavage. Fragments octahedral or pyramidal; sometimes indeterminate. Edges rather blunt. Generally unseparated. Gives a deep cherry-red streak. It is hard, opaque, brittle, more or less easily friable, and heavy. Sp. gr. 4.910 to 5.218. It is magnetic, but less so than the preceding species.

Before the blow-pipe it is infallible, alone; but becomes white when heated on charcoal; and yields a dirty yellow-coloured ferric, with borax. Stated by Kirwan to contain from 65 to 80 per cent. of iron.

This species appears to be confined to primitive, and the subspecies to transition mountains. It has never been found in those of secondary formation. Its occurrence is in beds and veins, where it is usually accompanied with magnetic iron-oxide, common pyrites, compact red iron-oxide, hornblende, and quartz.

Sweden yields it very abundantly; as also does Norway. Some of the finest specimens are from the isle of Elba, where the ore is said to have been worked for upwards of three thousand years. It occurs in Bohemia, Saxony, Switzerland, France, England (in Lancashire and Cumberland), Hungary, South America, Siberia, &c.

The English specimens occur in cavities in compact red iron-oxide. The crystals are usually small; and the luster of their surface is particularly splendent.

Subsp. 2. **Iron-mica.**—Colour iron-black, passing sometimes to fleck-grey, and sometimes to deep-red. The latter is rather the colour of it, when held under the form of thin plates, between the eye and the light. Occurs massive, disseminated, and crystallized. When the latter, it appears in thin tables with six sides. Surface smooth and splendent. Internally it is also splendent, and its luster metallic. Fracture perfect curved foliated; cleavage simple. Fragments sometimes indeterminate, and sometimes tabular. The massive varieties occur in granular distinct concretions. Thin plates of it are translucent. Its streak is deep cherry-red. It is semi-hard, brittle, very easily friable, and heavy. Sp. gr. 4.57 to 5.27.

Before the blow-pipe it exhibits the same appearances as the preceding subspecies, except in conchoidal, and olive-green tinge to borax. The proportion of iron which it has is from 75 to 85 per cent.

It is exclusively confined to primitive mountains, and for the most part to those of a newer formation. It is found, like iron-oxide, in beds and veins, and is accompanied with other ores of the metal: calcareous and siliceous quartz, hornblende, &c.

Its geographic distribution is rather extensive. It occurs near Dunkeld, in Perthshire; at Dartmoor, in Devonshire;
IRON.

in one of the Shetland isles; in Norway, Sweden, Russia, France, Isle of Elba, and many districts of Germany.

Werner has divided this into four subspecies, which professor Jansezon, in conformity with the principles of the Wernerian nomenclature, has denominated red iron-flour, ochry-red iron-flour, compact red iron-flour, and red hematite.

Subsp. 1. Red Iron-flour.—Colour deep cherry-red, sometimes blood-red and brownish-red, and even inclining to steel-grey. Usually friable. Occurs sometimes massive and disseminated, and is composed of feyly parts which foul considerably. Lustré between glimmering and glittering; semi-metallic. Is greasy to the touch, and moderately heavy. Exposed to the blow-pipe alone, it blackens without melting, and communicates a bright green colour to borax. According to Haney, it is constituted of

It occurs generally in veins in primitive and transition mountains, accompanied with other ores of iron, copper pyrites, quartz, barytic spar, &c.

Although a rare variety of this metal, it is found rather plentifully in the neighbourhood of Ulverstone, Lancashire, and is also met with in Cornwall. It occurs too in Norway, the Hartz, Saxony, Sicily, Salzburg, Hungary, and South America.

It is rarely found alone; being generally accompanied with other species of iron-ore, and particularly with compact red iron-flour, and red hematite. It occurs in veins; and is distributed nearly as the two following subspecies.

Subsp. 3. Compact red Iron-flour.—Colour between brownish-red and dark steel-grey, passing sometimes to blood-red. Occurs massive, disseminated, and in various imitative forms, as reniform, cellular, &c. It is sometimes found crystallized, and appears either in cubes, or four-angled pyramids, the latter of which are truncated on their summits. The cube is found both perfect and truncated. Surface of the cubes smooth; of the pyramids rough and dull. Internal lustré between glimmering and dull; semi-metallic. Fracture for the most part even. It sometimes, however, paffes into coarse-grained, uneven, and large conchoidal. Fragments indeterminate, rather sharp-edged. Streak blood-red. Between hard and semi-hard. Somewhat brittle, and more or less easily fragmentible, heavy. Sp. gr. 3.423 to 3.76.

It assumes a darker colour before the blow-pipe; but is infusible, even with the afflilence of borax. This re-agent, however, is tinged of a yellowish-green by it.

Occurs in beds and veins with red hematite and the preceding subspecies; and is also accompanied with quartz, red-jasper, and hornflorne.

It is found very abundantly in Lancashire; in the Hartz, Saxony, Bohemia, Sifia, Siberia, and France.

It is frequently found in this country; and principally in those works which fabricate the variety of iron defined in the preceding part of this article, under the name of ferrum ochraceum. The richer ores, in fact, are incapable of yielding the most highly carbonized descriptions of iron; partly, perhaps, because they contain too little earthy matter to afford a sufficiently plentiful sider; and partly because their reduction is too immediate.

Subsp. 4. Red Hæmatite.—Colour intermediate between brownish-red and steel-grey; passing sometimes entirely to one or other of them, and even into blood-red. It is from the latter variety that the name of hematite (from sanguis, sanguine) is derived. Occurs massive and re-iform; also flake-like, globular, uniform, &c. External surface rough and glimmering; Internally glimmering, paffing into glimmering, lustré semi-metallic. Fracture always fibrous. Fragments usually wedge-shaped; sometimes flinty and indeterminate. In angular-granular distinct concretions. Streak a pale blood-red. Hard, inclining to semi-hard. Rather difficultly fragmentible. Brittle, and very heavy. Sp. gr. 4.74 to 5.05.

It exhibits the same chemical characters as the foregoing subspecies, and yields in the larger way about 60 per cent. of metal.

According to the recent analysis of M. D'Aubuisson, who has published a very interesting memoir in the 75th volume of the "Annales de Chimie," on the chemical constitution of certain iron ores which appear to have water as an essential ingredient, this mineral is composed of

<table>

</tbody>
</table>

Each of the above presented a trace of magnesia, and the latter a similar evidence of lime.

Its geographic situation is similar to the last. Lancashire yields it very plentifully, as well as the neighbouring parts of Cumberland. It is found, too, in considerable abundance in Saxony; and in Bohemia, France, Sifia, the Hartz, Siberia, &c.

It is one of the most common varieties of iron ore, and is very frequently employed in the melting furnace.

This, like the preceding, is divided into four subspecies, which have the same leading distinctions. They consist of brown iron-froth, ochry-brown iron-flour, compact brown iron-flour, and brown hematite.

Subsp.
The specific gravity of the specimen from Viecellos was 3.4.

It is always accompanied with some of the other sub-species; and frequently with quartz, calcareous and heavy spar, and pyrites.

It occurs in Maidhead, one of the Shetland isles; the Harz, Saxony, billia, Bohemia, Shabia, the Tyrol, France, Carinthia, &c.

Subsp. 4. Brown ferruginous. — Its colour, internally, is close-brown, which passes to yellowish-brown, and blackish-brown. It is exhibited under a great variety of other shades, as bluish or iron-black, brownish-brown, bronze-yellow, and sometimes iridescient. Occurs rarely massive; usually in some of the imitative forms before spoken of. It is sometimes found in pseudo-crystals of a pyramidal shape, with six acute-angled crystals. Surface sometimes smooth, and sometimes rough and dusty. Lustre shining or glinting. Internally it is from glinting to glinting; intermediate between silky and reddish. Fracture fibrous, passing sometimes to small conchoidal. Fragments usually flinty or wedge-shaped; rarely indeterminate. Occurs in distinct concretions. Strengthened-yellow-brown. Opaque. Semi-hard. Brittle. Very easily frangible, and heavy. Sp. gr. of the latter 3-5. The specimen from Viecellos afforded a very good trace of alumina.

It occurs in the newelt primitive, transition, and secondary mountains, but more frequently in the latter, where it is found lining cavities in veins or beds. Its usual attendant is black and sparry ironstone, calcareous spar, brown and heavy spar, and sometimes, though rarely, quartz. It is found in Voigltland, the Fichtelgebirge, Franconia, Helfia, and Naffan.

The specific gravity of the former was 3.8, and of the latter 3-9. The specimen from Viecellos afforded a very good trace of alumina.
but it is liable to great variation in the proportion of its ingredients. In a recent examination by Collet-Deforclis, the following result was afford

Annales de Chimie, t. 58.

The specific gravity of the specimen analysed in this case was 3.693; and its colour was brownish-yellow.

It occurs in primitive and secondary mountains; in the former, in veins; in the latter, in beds.

It is found sparingly in Britain; and not very abundantly in Sweden, Norway, Switzerland, Siberia, Bohemia, and Saxony. At Schmaldalen, in Hellia, however, there is a bed from 25 to 30 fathoms thick; and in different parts of Weifphalia, Soria, Carinthia, &c., it is very plentiful. A whole hill, in the province of Biscay, is composed of it, which is said to have been worked for several thousand years.

It is much valued as an ore of iron, and the metal produced from it is considered to be peculiarly favourable for steel-making; but whether this is any thing more than a mere prejudice, seems greatly to be questioned.

This is divided into two sub-species; compact black iron-stone, and black hematite.

This mineral had for a long time been classed as an ore of manganese, and was removed to the present genus from some particular definitions that were pointed out by Werner, between the compact grey manganese ore, of which it had usually been considered a variety, and the sub-species now under examination. M. D'Aubuisson, however, in the course of his late researches, has subjected a specimen of it to chemical analysis; and instead of finding iron to be its principal ingredient, has ascertained it to be almost wholly composed of manganese and flex. This would, perhaps, be a sufficient authority for transferring it to the latter genus again; but as the Wernerian classification has been uniformly adhered to in the present article, it has been deemed best to continue its enumeration here, and accompany the account of it with the particulars of M. D'Aubuisson's inquiry.

The specimen he examined came from Rauchen, in Saxony, and was of a blueish-black colour mixed with grey. It had a compact fracture, was semi-hard, approaching to hard, and of the specific gravity of 3.6. It consisted of:

Annales de Chimie, t. 75.

Considerable difference is very likely to exist in the chemical constitution of this mineral, and the total absence of iron, in the present case, may certainly be regarded as rather an extraordinary circumstance. Indeed, Werner's judgment is much too accurate to admit the supposition, that the varieties which have come under his inspection were delusive of it; but from the very great produce of manganese in the above analysis, and the general character of the species, in imparting a violet-blue colour to borax, there can be little doubt that this, if not both sub-species of black iron-stone, are properly. ones of the former metal.

Subsp. 2. Black Hematite. — Colour inclining more to steel-grey than the preceding sub-species. Occurs massive and reniform. Internally it is glimmering; lustre semi-metallic. Fracture delicately fibrous, passing into even. Fragments wedge-shaped. Occurs in granular distinct concretions. In other respects agrees with the preceding.

Before the blow-pipe, both the members of this species melt with borax into a violet-blue coloured glas. No exact analysis has yet been made of the black hematite; but its chemical constitution is in all probability very much similar to that of the former sub-species.

Black iron-stone is found in primitive and secondary mountains, accompanined with brown and fertiary iron-stone and quartz.

It occurs at Naila, in Bareuth; Rachau, in Saxony; Hellia, the Upper Palatinate, and the Hartz.

This widely distributed, and highly valuable mineral, is divided into seven sub-species; reddle, columnar clay iron-stone, tenticular clay iron-stone, jaspery clay iron-stone, common clay iron-stone, iron kidney, or kidney-shaped iron-ore, and pea ore, or pea-shaped iron-ore.

Subsp. 1. Redde. — Colour light brownish-red. Occurs only massive. Principal fracture slaty, glimmering. Crongs fracture earthy, dull. Fragments tabular, splintery or indeterminate. Streak lighter than the fracture surface, and more shining. Soils strongly, and may be written with. It is soft, and very brittle, easily fragmentable; strongly adherent to the tongue, meagre to the touch, and moderately heavy. Sp. gr. 3.193 to 3.231.

It decrепitates and blackens at a red heat, and, in a more elevated temperature, melts into a kind of pumice of a greenish-grey colour.

It most generally occurs in the newer clay strata; and is found in Thuringia, Saxony, Silesia, Salzburg, Hellia, and Siberia.

It is scarcely used for any other purpose than drawing.

Subsp. 2. Columnar Clay Iron-stone. — Colour brownish-red, passing sometimes to cherry-red. Occurs massive, and in pieces which are more or less angular. Surface rough and dull. Internally dull, and fracture earthy. It most usually occurs in columnar distinct concretions. Streak blood-red. It is soft, very easily fragmentable, brittle, meagre to the touch, adheres slightly to the tongue, and is moderately heavy.
It blackens before the blow-pipe, and imparts an olive-green colour to borax. It is but rarely met with, and appears to be, in some instances, of pseudo-volcanic origin. Its occurrence with porcelain jasper, and other minerals which are evidently of that class, gives considerable colour to the idea; but there are cases, as the one observed by Reufs in Bohemia, where it appeared in the centre of a boulder of clay-flate, that are equally opposed in their evidence.

It is found in the V of Arran, at Sobrusan, Hochnitz, Drient, and near Frauen, in Bohemia; at Dittweiler, in Saarbrücken; and Amberg, in the Upper Palatinate. It yields too small a proportion of metal, even where the mineral is sufficiently abundant, to be at all worked as an ore of iron.

Subsp. 3. *Lenticular Clays Iron-flone.*—Colour brownish-red, varying to reddish and yellowish-brown, and greyish-black. Occurs massive. Internally it is strongly glimmering, sometimes glittering, and always semi-metallic. Fracture fine earthy, and sometimes flaky. Fragments indeterminate, blunt-edged. Occurs in distinct concretions, which are frequently lenticular, but sometimes granular. The streak varies with the colour of the specimen; generally lighter. It is usually soft, sometimes very soft, and semi-hard. Scible, inclining to brittle; very easily frangible, and heavy.

Its composition, according to Lampadius, is:

- Of oxyd of iron: 64.
- Alumine: 23.
- Silex: 7.5.
- Water: 5.
- Lobs: 5.

The black varieties, which occur only in the canton of Berne, are said to yield 90 per cent. of iron. The red ore, which is found very abundantly in Bohemia, affords 60 per cent.

It is distributed in transition and flate mountains, and generally unmixed with other minerals.

Besides the situations already noticed, it is met with in Switzerland, the Netherlands, Bavaria, Franconia, and France.

It is fumted as an ore of iron, and the brown varieties of it, which contain from 20 to 25 per cent. of metal, are much valued on account of the excellent quality of the metal that is produced from them.

It has, hitherto, been only met with in a bed which belongs to the secondary or flate formation, between Vienna and Hungary.

Subsp. 5. *Common Clay Iron-flone.*—Colour light yellowish-grey, inclining to ash-grey, and passing into bluish and steel-grey, yellowish, reddish, and brown-black, brown-red, and brownish-red. These colours, particularly the lighter ones, undergo a change on exposure to the air, generally becoming darker. Occurs massive, and in a variety of extraneous forms, especially of shells and vegetables. Internally it is dull. Fracture earthy, sometimes conchoidal and flaky. Fragments indeterminate, blunt-edged; soft; rather brittle; adheres a little to the tongue; more or less easily frangible; meagre to the touch, and heavy. Sp. gr. from 2.039 to 3.471.

Exposed alone before the blow-pipe it blackens, but does not melt. With borax it enters into a sort of ebulition, and produces a glaze of a blackish olive-green colour. It varies considerably in the proportion of its ingredients. Some specimens of the mineral yield as much as 40 per cent. of oxyd of iron, whilst others do not afford more than 20 per cent., and many even less than that. The following, which will contribute to shew this, are the results of some analyses by Richter and Lampadius:

This sub-species is a very abundant one, and occurs in beds in the secondary or flate formation.

It is found very plentifully in different parts of England and Scotland; and is also met with in Wellphalia, Bohemia, Slovenia, the Upper Palatinate, Poland, Russia, Siberia, Italy, and Norway.

Subsp. 6. *Reset iron ore.*—Colour yellowish-brown, varying in intensity in the same specimen. The centre is the lightest, and not unfrequently includes a small kernel of an ochre-yellow tint. Occurs in masses from the fize of a walnut to that of a man's head, which are mostly commonly imbedded in clay or shale. Fractured towards the surface, even; in the interior fine earthy. Fragments indeterminate, rather sharp-edged. Internal luffe dull; externally glimmering, semi-metallic. It is composed of concentric, lamellar, distinct concretions, including a nodule, which is often bicoloured. Surface rough; external layers soft; those of the centre very soft; brittle; easily frangible; adheres to the tongue; is meagre to the touch, and moderately heavy. Sp. gr. 3.574.

It does not melt before the blow-pipe, when heated alone; but enters into fussion with borax, and communicates to it a dirty yellow colour.

Occurs in the most flate rocks, imbedded in the argillaceous frata that are intermixed on coal.

It is found abundantly in Derbyshire, and some of the neighbouring counties; in Scotland, Norway, Denmark, Bohemia, Slovenia, Transylvania, France, and Siberia.

The greatest proportion of the iron manufactured in the midland districts of England, as well as in many parts of Scotland, is obtained from the two foregoing sub-species. The metal which they afford, too, is, generally speaking, of the best quality. This is principally referable to the liberal supply of earthy matter in their composition; for, without a sufficient production of scoria, or cinder, in the blast-furnace, the highly carbonized, and consequently most valuable, varieties of iron cannot be formed. These subjects will be more fully discussed in a succeeding section of the article.

Subsp. 7. *Pilosperm iron-flone.*—Colour yellowish-brown, of different shades, passing sometimes to blackish-brown. This is its internal appearance. Externally, it varies according to the nature of the stratum in which it is imbedded, being reddish, yellowish, and liver-brown, and even yellowish-grey. Occurs in small spherical grains. Centre of the grain dull; lustre increasing towards the surface to a glittering. Internal fracture fine earthy; externally, even. Fragments indeterminate, somewhat sharp-edged.
The volatile matter, which so constantly forms a part of the results quoted from this chemist, almost exclusively consists of water; and it was with a view, indeed, of ascertaining the proportion of this ingredient, that his analytical labours were principally commenced. He supposes it to be an essential constituent of the different minerals he has examined, and proposes to arrange them under the clafs of hydrides.

The present species is found in some of the countries that afford it, and yields, in the large way, from 30 to 35 per cent. of metal.

It occurs in the newest formations, and is conceived to be continually deposited in marshy places, from the evaporation of the water that has held it in solution. The preceding sub-species are products of this process at different stages; and the order in which they are arranged is indicative of the date of their formation.

It is found in different parts of the Highlands of Scotland, the Hebrides, Orkney, and the Shetland islands. Poland and Prussia contain considerable quantities of it; as also do Brandenburg, Courland, Livonia, and Lithuania. Its occurrence is more frequent in the northern than in the southern countries of Europe.

Before it has been exposed to the air, its colour is greyish-white, but afterwards becomes indigo-blue of different shades, and sometimes smalt-blue. Occurs massive, and dilluminated; and is composed of dull, dusty particles, which are friable and cohering. Soils light. Feels meagre, and is moderately heavy.

Before the blow-pipe, it becomes of a reddish-brown, and afterwards melts into a brilliant black glassy bulb, which tinged borax of a deep yellow. It is readily fusible in acids. Bergmann had supposed it to be a native Prussian-blue; and it has received a place in many mineralogical systems, under that name, from the same belief; but an analytical examination of it by Klaproth seems to prove it to be a compound of phosphat of iron and alumine.

It occurs in nfts in clay-beds, amongst bog-iron ore, and enriching turf and peat.

It is found, under the latter circumstances, in the Shetland islands; it also appears in Iceland, S. Xony, Sicilia, Swabia, Bavaria, Poland, Rhen, and Sweden.

Colour pitch-black, passing to blackish-brown, and even deep reddish-brown. Occurs massive, and sometimes fine-grained, uneven. Internally it is glittering; lustre rufous. Fracture foliated, conchoidal, and sometimes sharp-edged. Sp. gr. 3.956.

It melts easily before the blow-pipe, and forms a black enamel. According to Vaquelin, it consists of

IRON.

which are without lustre. Fragments indeterminable; soils; is soft, and very soft. Sometimes friable. Magree to the touch. Lately fragrable, and moderately heavy.

Subsp. 2. Coeruleum green iron earth. — Colour rather darker than the last sub-species. Occurs massive, and corroded. Internally dull. Fracture fine earthy, paling into even, and sometimes into splintery. Fragments indeterminable; soft. Rather brittle, and inclining to heavy.

Before the blow-pipe, it becomes first red, and then of a dark brown; but does not melt. It tinges borax of a yellow colour, inclining to olive-green. No exact analysis has been made of this species; but it is supposed by Werner to have iron and phosphoric acid for its principal ingredients. It is a rare mineral, and has hitherto been only found at Braunsdorf and Schneeberg, in Saxony, where it occurs in veins; in the former place, accompanied with quartz and pyrites; and in the latter, with quartz and native bismuth.

Sp. 15. Cuba-ore. Worpsare. For arseneate.

Colour olive-green, of different degrees of intensity. Occurs massive, differentiated, and crystallized in small and very small cubes, which are sometimes flattened and truncated at the angles. Plates of the crystals smooth and spangled. Internally it is glistening, and its lustre between pearly and adamantine. Fracture imperfect foliated. Fragments indeterminable. Occurs in granular distinct concretions. It is translucent; soft; brittle, and gives a streak of a straw-yellow colour. Sp. gr. 3.000. It appears sometimes in the form of a reddish-yellow powder, which is thinly distributed over the surface.

Before the blow-pipe it swells up, and emits an arseneous odour; melting afterwards into a grey metallic globule, slightly tinged with yellow. From the analysis of Chenivix, it appears to be composed of

It occurs in veins, accompanied with some ores of copper, quartz, mica, and feldspar.

The only places that have, hitherto, afforded it, are the mines of Carraraich and Mutrell, in Cornwall.

Until the account published of this mineral by the count de Bournon, and Mr. Chenivix, in the Philosophical Transactions for 1801, it was mistaken for an arseneat of copper.

§ 2. Assay and Analysis.

Since the metal contained in every ore is of so much greater specific gravity than any other of its accompanying ingredients, it will be easy to form a tolerable idea of the value of an iron-ore by the weight of a given bulk.

Previously to working any iron-ore it should be very minutely assayed, both in the humid and dry way. By the humid process we shall ascertain the exact proportions of its constituents, without which it would be a mere work of chance to attempt to extract the iron in the metallic form.

When we are acquainted with the nature of the earthy matter in combination with the ore, we know with the greatest certainty what substances we ought to add in the crucible, for the purpose of eliminating the metal. All such substances are called fluxes, merely because they form fusible compounds with the earthy matter of the mineral. It is to this treatment of a small quantity of the ore that we give the name of assaying.

The process by which the component parts are ascertained, consists in subjecting a small quantity of the ore in fine powder to the action of an acid, and sometimes to an alkali. By this means the whole is dissolved, and the different materials of which it is composed are separately precipitated by different chemical reagents. The process, however, varies considerably with the nature of the ore to be examined.

Iron ores, as objects of analysis, are divided into three heads; namely, sulphurites, oxides, and filths.

The first are distinguished by their general bronze colour, but more particularly by the following fluid of sulphureous acid gas, which they afford by being heated to redness in the open air. The second consist of iron united with oxygen, and are by far the most common of all. Nearly the whole of the iron-ores in use are of this kind, containing also different proportions of earthy matter in their composition.

The third division comprehends such as consist of the oxide of iron combined with some acid, and hence are called filths. The principal varieties of these are the phosphates, sulphates, arseneates, and carbonates.

The apparatus employed in the humid analysis will be a lamp fitted up with different-sized sliding-bearers, a silver crucible, and small portable furnace, with a sand-bath, and one of water, for drying precipitates; capfuls of glabs and porcelain; precipitating glases, funnels, and filtering paper. For reducing the ore to powder, a mortar of hardened steel will be first necessary, and afterwards one of agate, to grind it very fine. Accurate weights and scales will be highly requisite, with cups of silver or platinum.

The re-agents wanted will be sulphuric, muriatic, and nitric acids. Pure potash, soda, and borax, in the solid form. Solutions of the same, and also the pure aqua ammonia. The fully triturated carbonates of all the alkalis, and the sulphur carbonates of the same. The triple prussian of potash and iron; and, when merely used as a test, a prussian of lime will answer. The analyt shou'd, also, have in his possession powders or solutions of all the separate substances of which the mineral is supposed to consist, for the purpose of comparing real results with those obtained in his experiments.

If the ore to be analysed be a pure sulphurite, 100 grains, or any other given weight, may be reduced to powder, observing to weigh it after the operation, to see if any of the mortar has been abraded, which, when the ore is very hard, is to be expected; and the increased weight must in that case be noted down.

Let this powder be boiled with nitric acid in a long narrow-mouthed glass vessel, which should be very thin at the bottom, to avoid cracking. By this method the sulphur of the ore will be converted into sulphuric acid; part of the nitric acid will be decomposed, and most of the remainder fly off, so that the result of this will principally consist of the iron diffused in sulphuric acid.

To this solution add the murinit of barytes, till a precipita- tion ceases to take place. When the precipitate has subsided, and the fluid is become perfectly clear, gently pour off the liquor, which is a solution now of iron in the muriatic acid. Let the precipitate, consisting of sulphate of barytes, be repeatedly washed with hot distilled water, till the liquid gives no precipitate with nitrate of silver, and afterwards add the washings to the fluid first poured off. After this white powder has been dried on the steam-bath, which is an apparatus constructed for this particular use, let it be weighed, and for every 100 grains of the substance allow 21.5 of sulphur. To the liquid parts which contain the oxide of iron, add
add a clear solution of the sub-carbonate of potash. Let it boil for a little time, and the oxyd of iron will subside. Wash it and dry it as above, afterwards weighing the product. The quantity of oxygen in the oxyd of iron thus obtained, may be known by the quantity of iron obtained from it in the process of assaying, which we shall afterwards give. If the ore consist of oxygen and iron only, it may, without any previous treatment, be referred to the dry process. When, however, earthy matter is combined with it, the humid analysis should be referred to, which requires a different mode of proceeding to that already given.

Let 100 grains of the ore be reduced to a fine powder, as above directed, observing to weight it afterwards, for the purpose of ascertaining whether any of the materials of the mortar be mixed with it. The matter so added, if it be acquired from the agate mortar, may be deemed pure flex. To this powder add 350 grains of dry potash, in a silver crucible, capable of holding about 6 or 7 ounces. Pour to the mixture a very little water, just sufficient to moisten the whole. Apply a gentle heat in the first instance, to prevent the mass from swelling too much, and gradually increase the temperature till the crucible is red-hot. The mass will now be in a state of fusion more or less perfect, according to the quantity of flex contained in the ore. If, from a gross proportion of a fluence being present, the fusion should be very imperfect, more potash must be added, and the heat continued and raised as high as the crucible will bear. When the crucible, with its contents, are sufficiently cooled, let both together be put into a capsule of porcelain, and nearly filled with distilled water. The whole should then be set upon a sand-bath, and boiled for some time, taking care to stir it very frequently. This will detach the matter adhering to the crucible, and if any flex remains unacted upon, it will be dissolved by the potash.

Let the whole be now saturated with muriatic acid, and even added a little in excess; and then gently boiled till all the liquid is evaporated. During this, the mixture must be constantly stirred; and particularly at the time the mass is becoming dry.

To this residuum let a large quantity of distilled water be poured. All the substances soluble in the acid will be now taken up. If it contain flex that will be left at the bottom. Let the whole be decanted into a narrow tall glass vessel, to suffer the flex to subside. Carefully pour off the clear liquor, and then add fresh hot distilled water, and continue to do till the fluid does not cause a precipitate with nitrat of silver; observing to save all the washings which are acted upon by that tell. The remaining water may now be evaporated from the flex, and the powder, being heated red-hot in a crucible of silver or platina, should be then weighed. If it be pure, it will be of a delicate white colour, not adhering to the fingers, as is the case with some of the other earths.

The solution containing the remaining substances should be evaporated to as small a quantity as possible, so that the fluid remain liquid and clear. To this let a saturated solution of the sub-carbonate of potash be added, and afterwards boiled a few minutes. By this means, the whole of the ingredients will be precipitated together, and when all of them have perfectly subsided, decant off the liquor, repeatedly washing it with hot water. The first decanted liquor, with the washings, may be thrown away. Lastly, evaporate the remaining water, till the solid matter is of a pulpy consistence. To this, in a capsule of good porcelain, add a solution of pure potash. The alumine will be thus 'dissolved, while all the other substances will remain untouched. Let this fluid be poured off, and fresh water mingled with it, to take away all the alumine. Then, to the mixture containing the alumine, add not only as much as will saturate the potash, but also a quantity sufficient to remove the alumine, when the liquid will be quite clear. Lastly, to this pour in carbonat of ammonia, till no more precipitate falls down. The precipitate, when washed and dried as above directed, and heated to redness in a silver crucible, may be considered as pure alumine.

The residuum from which the alumine was left taken is now to be dissolved in sulphuric acid, diluted with a large quantity of water, the acid being slowly in excess. This solution may contain magnesia, iron, and probably manganse. If lime were present, it will be left insoluble at the bottom of the vessel, in the state of sulphate of lime. The small portion of this substance dissolved by the fluid, may be precipitated by the addition of alcohol. The powder, when collected and dried at a dull red heat, must be weighed; allowing for every 100 parts 42 of pure lime. The solution from which the lime was separated, must next be saturated with a solution of the neutral carbonat of potash. In a few minutes the iron will be precipitated in the state of oxyd, while the magnesia and manganese will be dissolved by the carbo nic acid. The iron must be separated, dried, and weighed. If with the solution containing the magnesia and manganese a solution of hydro sulphuret of potash be mingled, the latter will be precipitated in the form of a sulphuret; and this being washed and heated till the sulphur is driven off, the oxyd of manganese will be left in sufficient purity.

The magnesia still held in solution may be precipitated by adding a sufficient quantity of pure potash. The product must be heated to redness, and weighed. The weights of the different substances being added together, will, if great care has been used, be within one or two per cent. of the quantity originally submitted to experiment. If the deficiency be considerable, some mistake must have been made, and it will be necessary to repeat the analysis.

In the examination of faults of iron, nothing more is requisite than to difforgage the acid with which the iron is combined. The arseniat of iron, for example, may be boiled with potash, which will separate the arsanic acid, and leave the oxyd of iron but very little acted upon. The arsanic acid may be afterwards precipitated by nitrat of lead; allowing for every 100 parts of the arsanic lead, when dried, 33 parts of arsine acid.

If the ore be a pure carbonat, to 100 grains in powder, add an equal quantity of sulphuric acid, in a glass vessel which can be placed over a lamp. Heat the mixture for some time, stirring it with a glass rod. The carbo nic acid will be thus expelled, and its quantity will be indicated by the loss of weight sustained. Care should, of course, be taken that the heat be not too great, otherwise the evaporation of fluid matter may create error in the experiment. The iron may be afterwards treated as in the analysis of the earthy ores, and its quantity ascertained, by the methods there described. Having learned the exact proportions of the ingredients united in the ore, we may, with some degree of certainty, proceed to the assay by the crucible and fluxes. If the ore consist of oxyd of iron simply, nothing more is necessary than to introduce it into a crucible with about half its weight of charcoal powder, and any substance susceptible of vitrification, so as to keep off the air. This may be either pounded glass, or equal parts of lime and clay. But perhaps the best substance that can be employed, is the most fusible part of the blast furnace cinder, which is the least coloured with oxyd of iron. This may be employed in quantity amounting
amounting to about half the weight of the mineral to be assayed.

The earthy iron ore must be treated according to the result of the humid analysis; such earth being added as a flux, as will make the most fusible compound with that found by analysis to be present. The carbonaceous matter may be from \( \frac{1}{4} \) to \( \frac{1}{3} \) the weight of oxide of iron.

The furnace belt calculated for these experiments is an affray furnace, and is capable of producing a great heat. See Furnaces.

The crucibles should be very small, not capable of holding more than three fluid ounces; and they should be provided with covers turned to them in a lathe before they are burned. The affray may be deemed finished when the whole is in a state of fusion, and the metallic button separated, which, being weighed, will give the per centage of iron in the ore.

§ 3: Reduction of Ores, and Manufacture of Pig-iron.

Although iron in its pure state is almost an infusible substance, it is capable of assuming the liquid form, by being combined with other matter. With sulphur it forms a fusible mass, of which we shall treat hereafter. It is also rendered fusible at a temperature something higher than that required to melt copper, by being combined with about \( \frac{1}{4} \) of its weight of carbon. It is to this compound in different proportions that the name of pig-iron is given, and it is so denominated, because it is cast into masses of a semi-cylindrical shape, called pigs.

The fusibility of this compound of iron and carbon, enables us to extract the metal from the ore to the greatest advantage. It is now common, particularly in our own country, to obtain the iron in this form, previous to making it into bar, or malleable iron. Formerly cast metal was not much in use, except for the manufacture of bar-iron and steel; while in the present day, a much greater proportion of it is consumed in that state than in any other; and the majority of our furnaces, too, are solely employed for this branch of manufacture.

The process by which pig-iron is obtained from the different iron ores is called smelting; and the furnaces employed for the purpose are called smelting, or blast furnaces. See Blast furnaces, and Blowing.

The ores of iron require different treatment in the smelting process, according to the quantity of heterogeneous matter with which the metal is combined.

In all the ores the iron is in the state of oxide, and would at least require a strong heat in contact with combustible matter for their reduction. In molten, the oxide of iron is combined with a considerable proportion of earthy matter, and they are then denominated iron-flakes. These may be generally divided into two classes: the one called argillaceous, from abounding with excess of alumina, or clay; and the other calcareous, from lime being their principal earthy constituent. The former of these iron-flakes is by far the most abundant in this country.

But, besides the earthy matter and oxygen in this class of metallic minerals, many of them contain sulphur, which is doubtless combined with the iron in the state of pyrites. Arfenic and manganese are also sometimes united with them. Of the above, the arfenic and sulphur are extricated, previously to smelting, by the process called roasting. For this purpose, the flue is burnt with refuse pit coal, and burnt in large heaps in the open air. The heat is sufficient to dissipate the greatest part of the above volatile materials, leaving behind the earth and oxys of iron; and also the manganese, when the ore abounds with that metal.

In the process of smelting, two things are absolutely essential to the separation of the iron. First, the metal itself must be rendered fluid, which will then, by its great specific gravity, descend to the lowest parts of the furnace, and some other compound must, at the same time, be eliminated in a liquid form, so as to float upon its surface, and defend it from the influence of the blast. If the ore consisted of iron and oxygen alone, the carbon of the coke would combine with the oxygen; and an excess of carbon would also unite with the iron to render it liquid at that temperature; but here would be a deficiency of the fluid vitreous matter necessary to the defence of the iron from the oxygen of the blast. Hence it will be necessary to employ some substance which shall be capable of forming a liquid scoria, or cinder, for the preservation of the carbonated iron when once obtained. So far as observation has dictated, it would seem that the cinder cannot be too perfectly fluid. The principles on which the fusibility of the cinder depends, are not simply confined to the materials used in the smelting of iron, but refer to all compound fusible matter with which we are acquainted. It may be observed, in general, and, indeed, almost without exception, that the fusibility of an alloy of two metals is fusible at a temperature much less than the arithmetical mean between the fusing points of the metals themselves. For instance, an alloy of lead and tin is more fusible than either of the metals composing it, and a similar mixture of copper and silver may be used as a folder for either silver or copper separately. This property is not, however, conspicuous in the earths. None of them in their pure state can be fused in our hottest furnaces; nor scarcely with a stream of oxygen gas; although certain proportions of them are, together, fusible at the heat of a moderate air-furnace. Lime and clay, when separately taken, may be considered as incapable of fusion at any degree of heat, yet produced in furnaces; and still, in certain proportions, they are too fusible to be made into even bricks or crucibles. It will appear, from these facts, that the iron-matter cannot pay too much attention to the subject of the relative fusibility of the earths in different proportions. Most of the iron-mines of this country are argillaceous; that is, contain, besides oxide of iron, a small quantity of illix or flint, and a large proportion of clay. Lime-stone has always been employed for luch ores, and, by combining with the clay and flint, as well as with a small portion of the oxide of iron, forms a scoria or cinder, easily capable of fusion. Since, however, the proportions of these earths in the ore cannot be uniform, the quantity of limestone to be added ought to vary according to circumstances. We may hence infer, that if the fusibility of the cinder depends upon the particular proportions of the earths present, the iron-maker ought to possess a very perfect knowledge of the relative fusibility of different combinations of these bodies, and being at the same time aware of the component parts of the ore to be reduced, he will not be at a loss what should be added in the furnace, for the purpose of producing the most fusible cinder. But it will be proper here to observe, that the earths present, however, accurate may be their proportions, will not of themselves form a cinder of sufficient fusibility, without the united aid of the oxide of iron. This fact will be very familiar to those who have had experience in the use of fire-bricks. Clays which are free from that ingredient do not burn of a red colour; and hence the white appearance of fire-bricks is a tolerable test of their goodness. But those, on the contrary, which exhibit a reddish on being fired, are easily fused, and unifi, consequnently, to be used in those situations which are exposed to great heat. The proportions of lime, clay, and oxide of iron, necessary to constitute the most fusible compound,
founded, has not; as we have yet heard, been directly ascertained by experiment. An inquiry, undertaken with this view, would, however, be of great importance to the iron-matter. It might be effected in two ways: first, by mixing different proportions of the materials employed; and, secondly, by a direct analysis of the most fusible part of the blast-furnace cinder, and that with which the beet and molten carbonated iron has been produced. The cinder which fuses at the lowest temperature will be helt known by its fracture after cooling. It may, in general, be deemed good in proportion to its earthy parts when cold, and particularly if the outer crust appear glossy and transparent. A reason may be given for this appearance, by reference to some facts announced by sir James Hall and Dr. Hope, in accounting for the opacity of the whin-dome. They found that when common flint-glasis, which is more fusible than the blast-furnace cinder, was allowed to cool slowly, the mass became opaque, and put on a flaky appearance. They hence concluded, that the whin-dome might have been transparent, and have poifonfed a glossy fracture, had it been cooled rapidly. The inference to be drawn from this will be obvious; for the more fusible the cinder, the longer it is in cooling, and consequently the more opaque. What strengthens this idea, too, is, that the exterior of a mass of cinder is more transparent, almost confluent, than the interior; and the centre of that in particular, under which the beet iron is made, having a flaky fracture, with a thin vitreous shell surrounding its outside. In beginning to work any new ore of iron, the first step is to anneal it, both in the dry and humid way. By the first, we get the per centage of iron in the one; and by the second, we become acquainted with the quantity and proportions of its earthy matter. The next step is to anneal the coal to be employed, for the purpose of ascertaining the quantity of carbon it contains, and also the nature and proportions of its earthy residua. These facts being clearly made out, there will be nothing needful but to add to these materials a proper mixture of such substance as will make the most fusible cinder. If the ore be argillaceous, or, in other words, if clay predominate, lime is to be the material employed. Indeed, ores of this description are so very common, that lime has been thought the only substance to be used, under all circumstances, for the purposes of a flux; and so completely have the iron-makers been of the philosophy of the proceeds, that it has even been attempted to be added when the ore has already abounded with calcareous principles. Keeping in view the principle we have just laid down, the management of the calcareous ore will be equally easy with the mode of working an argillaceous one; since, in each case, we have only to employ clay for the flux instead of lime. But the method would, perhaps, be, if the component parts of an argillaceous and a calcareous ore were sufficiently well known, to mix the two together in proper proportions.

What ever may be the substance employed, whether it be lime-dine for an argillaceous ore, or clay for a calcareous ore, it should be very minutely analysed, as these substances are scarcely ever found in a state of purity. The lime should, if possible, be the shell lime-dine. At all events, the magnesian eiratum should be avoided, since that substance tends much to lessen the fusibility of earthy compounds. Some substances, so which we give the name of clay, frequently consist of a large proportion of some other earth.

Another thing to be attended to, also, is the state of oxidation in which we find the iron-ore.

If it be highly oxidized, more of the carbonaceous matter will be required for its reduction, and in all probability a longer time; but, besides this, a greater quantity of the oxyd of iron will combine with the earthy matter, which, although it may contribute to the fusibility of the cinder, a large portion of the iron will be lost. On the contrary, when the iron is in a low state of oxidation, the whole of the iron may be apt to combine with the carbon, and the earthy matter may not get a sufficient quantity of the oxyd to render it, in a proper degree, fusible. In such case, it would be necessary to add some oxyd of iron, which might more easily vitrify and enter into the composition of the cinder.

The coal employed in the smelting of iron, for the purpose of being coked, is commonly laid in heaps in the open air, and afterwards set on fire. When the combustion has gone on to a certain degree, the fire is checked by covering it with dull and preventing all possible access of air. For farther particulars, see Coke.

It is essential that the coke should be harder than it can generally be made in the open air without considerable waste; and we recommend, therefore, the method employed in making the coke for melting fuel. The coal, which is very soft, is piled up in ovens of the shape of an erect frustum of a cone. The air is let in at an aperture near to the bottom, which is contracted in size as the combustion becomes rapid, and ultimately closed. The whole mass will, at this time have acquired such a degree of heat, as not only to drive off all the volatile matter, but to render the coke extremely hard. There is a considerable saving in this mode of coking, and the coke is not only more compact, but better adapted for the generality of ores of iron.

In smelting the argillaceous ore, the proportions of the roasted ore, and the lime-dine, are governed entirely by the coke employed. The latter is always a fixed quantity, and the ore and lime-dine are varied according to the quality of the iron to be made and the working order of the furnace. In proportion as more or less of lime and ore are added to the standard quantity of coke, the furnace is said to carry a greater or less burden.

It would be useless to give any precise proportions of the ore and lime-dine to a given quantity of the fuel, since they are found to vary with the nature of the coal in use; and, what is not a little remarkable, the proportions will frequently vary in two furnaces working with the same coal, and even in the same furnace at different times. The burden of the furnace will also vary with the quality of iron to be made, that is, it is required to contain more or less carbon. In making the dark-grey iron called N 1, and which contains the greatest proportion of carbon, the burden must be less than that required to make the lefs carburetted iron, commonly called white iron, or forge-pig.

To give a general idea of the proportions of the materials, we shall present in detail, the quantities used at a blast-furnace, making in general good melting iron, which is of an intermediate quality between N 1 and the forge-pig. The ore is argillaceous, containing about 27 per cent. of iron; the coal rather soft, but having a good proportion of carbonaceous materials; and the lime-dine good, being of the flinty kind before spoken of. The furnace is about 45 feet high, and 12 feet diameter in the widest part. It works with a bright Bayer, and receives from the blast about 2500 cubic feet of air in a minute, through a circular aperture of 24 inches in diameter.

The average charges of coke p. r. poun, as it is termed, or in the space of 12 hours, are 50 (each 24 cwt.), or nearly seven tons. The calcined ore for good melting iron is about the same quantity, and for forge-pig, or the lesl carburetted variety,
the most extensive, and will vary in its extent with the strength of the blast.

Since the combustion must be in proportion to the quantity of oxygen confined in a given time, the heat of the furnace will depend upon the quantity and velocity of the air blown into it to a certain extent. If the blast should have too great a velocity, the oxygen would pass through a greater space in the furnace than is desirable before it was disposed of, and the cementing portion would be lessened in consequence. On the contrary, if the velocity were too low, the heat would be confined to the vicinity of the tuyere, and the cementing, as well as the melting processes, would be retarded for want of heat.

When the blast is sufficient to generate the necessary heat for melting the cinder and the metal perfectly, the extent of the cementing portion will depend upon the height of the furnace. This gives us one very satisfactory reason, why a furnace is required to be higher for the use of coke, than when it is heated with charcoal; since the carbon of the latter enters into the composition of the iron with much more facility than that of the former.

According to experiment, it appears that the facility with which carbon enters into combination with iron, in a close vessel, is inversely as its aggregation or cohesion. Hence it is found, that the carbon obtained from animal substances, which is soft and porous, is best calculated to convert iron into a carburet.

It will appear from the last observation, and from what has been said on the nature of coke, that the carbon employed for cementation should be mechanically different from that required to generate the great and permanent heat necessary to the fusion of the materials. The one in the cementing portion should, therefore, if it were practicable, be surrounded with coke of the softest kind, while the materials within the vicinity of the blast, and occupying the melting portion, should be supplied with such as is harder.

In making the most highly carbonized iron, or what is called No. 1, it sometimes happens that 8 portion of the iron unites with a great excess of carbon, forming a substance, which, when cold, appears in bright shining scales. It is found to possess most of the properties of plumbago, differing from that substance only in containing less carbon. This carburet is no doubt in the liquid form in the furnace, and, being of much less specific gravity than the iron, floats upon its surface. It is so much more insusceptible than the metal, that before the iron enters the moulds of the pig-bed it is seen swimming at the top in the scaly form before mentioned.

This carburet is called by the workmen *pig*: and whenever it appears, is a certain sign that the furnace is working on the best sort of iron. So surely, indeed, is it the case, that No. 1, or the most highly carbonized metal, has received the epithet of *pig*, because *pig* is the common attendant on its production.

The most remarkable and anomalous circumstance presented in the melting of iron, is the difference in quantity and quality of the iron made in winter and in summer, when all other things are equal. It is a fact well ascertained, that in order to make the same quantity and quality of iron in summer as in winter, the furnace will not carry so great a burden, and, at the same time, the means of generating heat requires to be increased.

Various opinions have been given to explain this curious fact. Some have supposed that the proportion of the oxygen was less in the atmosphere in summer than in winter. Others, that
that the excess of moisture contained in the air in summer above that in the winter, might explain the phenomenon. Whatever may be the cause of this difference in the blast-furnace, the same may equally be referred to common fires, which, it is well known to every one, are much hotter in winter than in summer. If the Lavoisierian doctrine of combustion were true, we should not expect that the power of air to generate heat would vary with the temperature, since the same caloric which had contributed to dilate the oxygen in summer, would be given up when the oxygen combined with the carbon. Unfortunately for that doctrine, however, we find that the quantity of heat generated during the combination of oxygen, is directly as the quantity of oxygen, whatever may be its state, whether solid, liquid, or aeriform.

It appears from general observation, that the difference in the quantity and quality of the iron made in winter and summer may be, in a great measure, referred to changes arising from variation of temperature. The average result of this atmospheric influence is different with different blast-furnaces; and, indeed, with the materials employed; but, the general the quantity varies in winter and summer from 1/4th to 1/6th, besides the alteration of quality, which in some furnaces cannot be prevented by any change in the burthen.

If the whole of this difference depend upon the temperature of the blast sent into the furnace, we shall expect to find it either in the increased rarity of the air, or in the presence of moisture, which exists more abundantly in the atmosphere in summer than in winter; or, perhaps, it may be attributable to both these circumstances.

Soon after the constituent parts of water were discovered, some iron-masters attempted to produce combustion by blowing steam into the furnace. But, notwithstanding the great proportion of oxygen existing in aqueous vapour, their expectations were far from being realized, and the scheme was given up by them under a firm conviction that it never could succeed.

This experiment, however, served to shew that no more mischief might be expected from the vapour of water in the atmosphere, than its merely excluding a portion of oxygen. Conceiving it, therefore, to have no other influence in the furnace, we will submit some calculations to the reader, in order to shew the absolute difference in the quantity of oxygen sent into the furnace in winter and in summer, and to ascertain what share of the defect may be attributed to this circumstance, or whether the whole may not safely be referred to it.

We have much to regret that we are not in possession of more experiments as to the temperature of the air sent into the furnace at different times of the year. The more temperature of the atmosphere is not sufficient for this purpose, since the air gives out much heat by compression in the blowing cylinder. In a former part of this work (see Blast-furnace), a table of some observations was given, on which, as far as they go, reliance may confidently be placed. In this table the temperature of the air was at 75°, and in summer sent into the furnace in winter at 50°; and in winter at 00°, the difference will be 50°, and the variation in the quantity of oxygen will be proportionally as the increased volume of the air. It is found that elastic fluids are augmented in bulk by one degree of Fahrenheit .00208 of the whole. Therefore, the quantity of oxygen at 50° will be that at 100° as 1 + (.00208 x .50) : 1; and the oxygen, consequently, in summer will be .1045, or little more than 1/4th less than in winter.

The defect arising from the relative quantities of moisture contained in the air in winter and summer will be very trifling, except where the water-regulator is employed instead of the air vault or common regulator. (See Blast-furnace.) When the air does not come in contact with any thing moist after entering the blowing cylinder, in order to learn the quantity of water present, we have only to ascertain the relative proportions of vapour existing at the respective temperatures of the atmosphere in winter and summer. It appears from a theorem, which we have founded upon Mr. Dalton's ingenious experiments upon evaporation and the force of vapours, that the quantity of water in air at 32°, at which temperature we suppose it to enter the furnace in winter, is equal to .204 grams in each cubic foot. This, in weight, is 2.04 J. and in bulk, vapour being to air at 32° as 27.4 to 561, equal to .204 of the whole, or .0075. The summer air, which we take at 55°, contains 5.32 grams in a cubic foot; a quantity amounting in weight to 2.32 J., and in bulk to 5.32 J., or .019 of the whole. The difference .0115 is the deficiency of common air in summer, arising from the presence of aqueous vapour; and makes the total variation in the quantity of oxygen between summer and winter equal to .1155 = 23 J., or 3/4th nearly.

We here consider water as producing injury merely by displacing a certain proportion of oxygen, and not being prejudicial in itself, as is supposed by the generality of iron-masters. The reason given for its bad effects does not appear entitled to much weight. The opinion commonly entertained is, that the carburetted hydrogen set at liberty, carries off a greater quantity of heat than the nitrogen of atmospheric air. An effect which, if true, is inadequate to explain the appearances. When the air is received into a water-regulator, as is the case in many blast-furnace works, a much larger quantity of moisture may be expected to enter the furnace, than with the ordinary apparatus. In the above calculation, if the air had been received over water, we should find that its temperature in the receiving vessel in winter and summer would be 50° and 100°. The vapour in the former amounts to 4.67 grams in a cubic foot; in the latter, to 18.95 grams in the same quantity.

Hence, air at 100° will contain less oxygen than that at 50°, by .55 of the whole; which is a little more than 1/4th. This added to the loss by increased temperature alone, will be .159, or nearly 1/6th.

We may from this conclude, that the extra-quantity of moisture admitted by using the water-regulator, will at any rate increase the difference in the amount of oxygen from 3/6th to 1/6th, or thereabouts; which, in all probability, will more than counter-balance the good effects arising from its uniform preheating. There does not appear to be, in the present state of our knowledge, any means of effectually remediing this evil. Some good might accrue from admitting the exterior air as cold as possible, and not allowing it to come in contact with water after entering the blowing-cylinder. This may be done to a certain degree, by causing the
the air to ascend from a deep pit, by a pipe communicating with the blowing cylinder. This contrivance, however, should be abased from whenever the air of the atmosphere becomes colder than the average temperature of the earth.

With regard to the defect arising from increase of volume of the air in the summer months, the heat caused by the friction of the blowing piston will be found to contribute much to the evil. The air by this means gains an additional elas-
ticity, and if the same quantity of air be thrown into the furnace it must be effected by decreasing the preasure of the blast, or by increasing the aperture of the noz-pipe. If the compression of the air could be effected by any means which would avoid the friction of machinery, it would no doubt be a desideratum in the process of blowing. It will appear from these facts, that in summer, when the quantity of air is deficient from increase of volume, and from the presence of water, that a larger quantity of air should be made to enter the furnace, partly by increasing the velocity, and partly by using a noz-pipe of greater diameter. If the deficiency were made up by the increase of preasure only, the velocity would be too great for producing a maximum of combustion, where it is immediately wanted, independent of the mechanical evil it would be liable to produce. If, on the other hand, the aperture of the noz-pipe were increased in summer, to make the quantity equal to that of winter, the air would enter in a state of greater rarity, and the combustion would, from this cause, be of less intensity. This circumstance alone, perhaps, is sufficient to prevent a complete remedy of the evil, and will go far to explain the difference between the fractions resulting from calculation and experiment.

We shall conclude our account of this department of iron-manufaeture with some general observations upon the nature and properties of pig-iron, as it is applied to different purpouses.

When the iron has combined with its full dofe of carbon, constituting what is called in the trade, grey, or smooth-faced iron, and also N 1, it is admirably fitted for making the lighter and finer sort of castings, such as grates and other ornamental work. It is from iron of this quality that the cast-iron cutlery is manufactured, since no other would run sufficiently fluid for articles so small as the prongs of forks, and the bowls or rings of tife. This iron, however, is more the best for larger castings where strength and hardness are desirable, as in large wheels, for example, beams, pillars, railways, &c. The metal employed for these purposes contains a lesser proportion of carbon than the former, and is generally called melting-iron, or N 2.

The properies of pig-iron, however, which is combined with the smallest dose of any, is almost exclusively employed for making malleable iron, and is called, for that reason, forge-iron. We have given, in the next section, an account of the proportion of carbon presen in the different varieties; and it will appear from thence, that of all the combinations of iron and carbon, flleet contains the least, and grey, or N 1, pig-iron, the most of any of the compounds we are yet acquainted with.

As a proof that pig-iron only requires to lose its carbon to become malleable, we have at preant in this country manufactures upon a large scale, for converting cast metal goods, such as nails, cutlery, &c. into iron perfectly malleable, without even changing the figure given to them by casting. Nail's produced in this way are so malleable, even when cold, as to bear the hammer, and are capable of being bent to a right angle in a side.

But a stiler stronger proof that this metal assumed the form of iron is from the great heat it will bear. The prongs of a common fork made by this process can be welded together with the greatest facility. Pig-iron, until lately, has been considered a much more complex body than experience has warranted. We have been of its being supplied to contain flex, or, according to Mr. Davy, an mass to which it owes some of its grade qualities. But the pro-cces just mentioned is sufficient to refute the afection. Iron matters, even at this day, however, will talk about oxygenated pig-iron, meaning that which is built carbonated; but it must be clear to every one acquainted with the chemical qualities of those bodies, that the presence of carbon and oxygen in a liquid mafs is perfectly impossible, as they are incapable of existing together unaccompanied at any such elevated temperature. Hence we must regard pig-metal as a compound of iron and carbon only. Manganese may perhaps sometimes be preent in it, when particular ores are employed for smelting, but its union must be considered as incidental.

To make pure iron, therefore, we have, from these con-clusions, only to extricate the carbon. This may be done, in small masses, by straining the articles in a close vessel with some substance containing oxygen. The poorer iron ores, which are free from sulphur, are used in powder for this purpose; and after the materials have been exposed to a heat jut short of the fusion of the metal, the air being completely excluded, the carbon will be dissipated, and the iron left in a state of purity. See Casting and Foundery.

1. Bar, or wrought Iron — Iron, as obtained by the reduction of its ores in the bloom-furnace, contains, as we have before stated, a certain proportion of carbon, which renders the metal unfit for the various purposes of forging, but constitutes its principal value as applicable to the use of the founder. To deprive it of this ingredient certain pro-cesses are gone through, the object of which is, by the concurrent action of heat and air, to dissipate the carbon under the form of an elastic compound. The kind of iron chosen for the conversion is that designated by manufacturers forge-iron. It is the lowest quality made for the purposes of art; and, in consequence of its being combined with a smaller dose of carbon than any other, which thus enables it to bear a les price in the market, is doubly preferable for the end required.

The price of pig-iron is almost exclusively determined by the quantity of carbon which is in combination with it. The varieties usually distinguished are N 1, otherwise called grey, smooth-faced, or fife, metal; N 2 and 3, and forge-pig. The proportion of carbonaceous matter pre- sent in these varieties is differently flated by different experimentallists. Cloutet makes the highest proportion to amount to 5%; but from the results obtained by Mr. M. in combining iron directly with the doles of charcoal requisite to produce its various sub-carburetts, 1st appeared to be the maximum. Of this, the following table, published by him in the 13th vol. of the Philosophical Magazine, will afford the necessary proof.

The first step in the process of decarbonization, according to the more common mode of operating, is to expose the iron in a furnace.
iron.

furnace, called by some a refinery, but by others, to distinguish it from one hereafter to be described, a run-out furnace. It consists of a vessel open at the top, imbedded in stone or brick work, about two feet three inches long, two feet wide, and ten inches deep. This is generally, in part, constructed of cast iron; and, when so made, has an outer case about two or three inches distant from the inner one, which is constantly supplied with a stream of cold water to prevent the apparatus from melting. The iron to be decarbonized is placed in this receptacle, and kept in a continual state of fusion for three or four hours by the aid of a coke fire, which is heated to a considerable height above the level of the vessel, and extended proportionally on the hearth that surrounds it. The size of the hearth is mostly about three yards in length, and from two to three wide, and is completely covered by the funnel of the overhanging chimney. Bellows of considerable size are employed to carry on the process; and the current of air which issues from them is directed immediately on the surface of the iron by one or more tuyeres. These tuyeres are double, like the cafe, and continually cooled by the application of the same means. When the decarbonization is completed, the metal is let out at an opening in the side, which has been kept close during the operation by a flapping of sand. It flows into a groove about 18 inches wide, and six or seven feet long, constructed of stone in the floor that surrounds the furnace. The bottom of the vessel is so placed as to be nearly on a level with the floor; the only elevation given to it being what is merely sufficient to let the iron run out with facility. A considerable quantity of vitreous oxide is formed during the process; and the loss in the weight of metal, which is rated to amount to from 5th to 7th, is principally referable to this circumstance. The total quantity of carbon which the iron contains originally is not estimated at more than \( \frac{1}{8} \) th; and yet the approach of it to the pure state, or, in technical language, to the state of bar or wrought iron, after this operation, is very incomparable.

The cake of metal procured by these means is broken into lumps of a convenient size, and subjected, in a furnace of another description, to a process known in the art by the name of puddling. The furnace, which is also distinguished by the same term, is a variety of the reverberatory; and at the immediate point where the flame strikes upon the hearth, a shallow concavity is worked out, in which the melted iron is exposed. Opposite to it is a door, and through this the metal is kept in continual agitation, by means of a fort of rake, for the purpose of exhibiting fresh surfaces perpetually to the influence of the air. Water is likewise occasionally thrown in, which in some degree contributes to the decarbonization. With the loss of carbon, the iron also loses its fluidity, and about the middle stage of the operation appears in the form of small detached lumps, which scarcely seem to exert any affinity for each other. At length, however, by much stirring, and frequently propping them together, they cohere into a pulpy mass; and being gathered into pieces of a convenient size, are carried under rollers, where, after passing through four pairs, in succession, of a gradually diminishing gauge, they are produced into plates seven or eight inches wide, and three feet or more in length. Considerable quantities of matter are likewise expelled in the rolling, which principally consist of a vitreous kind of oxide. This is, for the most part, to be referred to the action carried on in the furnace; but some portion of it is, in all probability, created by the combustion of small pieces of fluid metal, which, engaged amongst the particles of the puddled mass, are hurled through the air in a state of vivid inflammation, by the compressive violence of the rollers. The total loss thus sustained is estimated at from 5th to 7th. The plates obtained by this treatment have a very incompact appearance; and if attempted to be worked in the state they are then presented under, would crumble almost wholly into small granulated lumps. To impart to them the necessary closeness and solidity, they are again heated in another kind of furnace, and beaten forcibly with a heavy hammer, which is raised by machinery.

Previously to being thus treated, they are broken up into cakes of small size, and placed upon circular flabs of stone from 8 to 12 inches in diameter. The size of the cakes is in a great measure determined by a particular effect of the hall pair of rollers that they are passed through: ribs, of a diamond shape, girding either one or both of them, on the whole extent of their surface, which leave a deep indentation on the plates, so as to render them easily frangible in that direction. The height to which these cakes are piled on the circular slab just spoken of, is generally about 12 inches; and when so prepared, they are placed on the hearth of a reverberatory furnace, which differs but little in form from that employed for puddling, except in being flat at the bottom instead of conical. The furnace is denominated a balling furnace; and the piles of metal, pies or balls. They are kept in this situation until they have arrived at a welding heat, and are then removed by large tongs under the stroke of the hammer. Near to the place a smith's forge is kept in blast, where long bars of iron are also urged to the welding point; and, after the first stroke or two of the hammer, united to the called malleys, to afford greater convenience in turning them. The malleys are beaten out into ingots of about three feet in length; and the bar hall mentioned being separated, they are divided deeply by an instrument termed a set, to facilitate their being afterwards broken; and the process is then completed. They are in this state called blooms, and have yet to undergo another operation, for the purpose of being made into bars or plates. Much loss is sustained by the last treatment, and principally from the same formation of oxyd as was noticed in the preceding cafe. The quantity thus lost, added to the waste occasioned in the bloomer, which comes next to be described, is usually considered as equal to 3th of the metal obtained by puddling; which will make the total deficiency, by all the operations, as nearly equivalent to \( \frac{1}{3} \). The ingots or blooms, which are received from the hammer, after being broken, over a small wedge-shaped block of iron called a tup, are placed in a species of reverberatory, very similar to the balling furnace, and denominated a blooming furnace, or bloomer. They are here heated to welding, and then submitted to the requisite pressure under rollers, which are either plain or grooved, according as the iron is wished to be obtained in plates or in bars. This completes the whole of the processess necessary for making the bolt mallable iron; and it results from the observations which have been premised, that, in order to procure one ton of it, five-and-thirty hundred weight of forged pig is previously required.

Two other modes of operating are at present in use; one of which omits the puddlings, and the other, that part of the foregoing process that concerns the fabrication of blooms. In the former, iron is exposed to the heat of a charcoal fire, in a species of furnace precisely similar to the one before described as a refinery, or run-out furnace; and is continued in that situation, until the metal is thought to be sufficiently decarbonized. It is very frequently stirred during the operation; and when brought into nature, to use the technical expression, is collected into malleys, and removed by
tongs under a large hammer, denominated, as applied to this particular use, a flanging hammer, where it is beaten into cakes, which are afterwards broken up, and treated in the balking furnace as before described. This is the old mode of working, and the iron obtained from it is by many conceived to be of very superior quality. The heat produced is considerably inferior to that afforded by coke in the run-out furnace; and the iron is left surrounded by the fuel than in the case just mentioned. The present charcoal fire is properly a refining, and not the one which is used merely as a preliminary to the process of puddling. Here, the burden of decomposition is at once completed; and the resulting metal is in the same state of purity as that yielded from the rollers, after it has been puddled by the other method. Balking and blooming follow in regular incision, and plates or bars are produced exactly as before.

According to the second mode of treatment, in which blooming is omitted, the malleable obtained from the balking furnace are reduced under the hammer into the form of solid, cubical blocks; and when their temperature is too much lowered to be capable of any further working, they are again heated in a fire called a chafery, which is urged by a powerful pair of bellows, and fiercely differs from a common smith's forge, except in being larger, and the cokes upon it being heated up to the unifnal height of at least two feet. In this situation they are railed to the point of welding, and afterwards hammered out into ingots of a flattened shape. Iron bars are united to them very shortly after they are brought from the balking furnace, to afford a greater facility of management, in the same manner as was described in the making of blooms and theirs, as before, are detached, when the ingot is sufficiently formed. The iron produced in this way is not considered so good as that afforded by either of the other processes, and is employed, for the most part, in the common services of art. Repeated rolling, or hammering, is the only means of imparting the fibrous texture so necessary to good bar iron; and as this treatment is less frequent in the present mode of operating, the deficiency of value in the material obtained may very probably be referable almost exclusively to this circumstance.

The above include the whole of the important variations that are presented in the manufacture of bar iron. Other shades of disfigurement may be traced in different works; but they are of a nature too trifling and unimportant to merit any particular enumeration. The art is still in its infancy; and the light of chemical science, by being brought to a focus here, cannot fail to disclose many improvements in the present modes of procedure, which will greatly abridge the expense now incident to this valuable branch of national industry. That the mere abstraction of about 4 per cent of carbon should require a sacrifice, in effecting it, of above 40 per cent of iron, appears monstrously beyond example: and as those who are connected with the art become more scientific in their views, we shall unquestionably find that it will be much more economically accomplished.

When iron has been completely freed from carbon, and has acquired its highest degree of malleability by repeated hammerings, it is by far the most tenacious of all the metals, and is capable of being drawn into the finest wire.

The tenacity of iron, as well as of all the rest of the malleable metals, varies considerably according to its softness. After iron has been kept in a red heat for some time, and suffered gradually to cool, it becomes remarkably changed in point of softness. By being hammered, drawn into wire, or rolled, it increases in hardeness to a certain extent; but, at the same time, partly loses its malleability. By this mechanical treatment, when cold, its strength or tenacity increases; and it may be taken at one point, when it will require a far greater weight to break it, than if it were hammered either more or less.

All the experiments yet published relative to the tenacity of iron, and the other metals, are on this account very defective. The writer of this article has seen an iron wire, when newly annealed, break with a weight of 50 pounds; but, after being drawn through two holes of a wire plate, bear above twice that weight, without sustaining injury. Iron, when properly annealed, will bear more bending backwards and forwards before it breaks, than in any other state; but the strength, or that power which refits a weight, exerted longitudinally to break it, is jointly as the half property and its hardeness. Hence the reason why its tenacity is increased with a certain degree of hardening. The specific gravity of malleable iron, according to Brijson, is 7.78; that of pig iron being 7.287. Iron, in a state of purity, requires to great a heat for its fusion, that the best crucibles are nearly ready to melt with it. It has, however, been fused, and cast into an ingot. It is paid to liquidity at 153 degrees of Wedgwood. Its malleability is greatly increased by heat; and by raising it to a very high temperature, it becomes exceedingly soft, and may be brought to bear absolute contact with another piece similarly heated, that they unite firmly together. This process is called welding. Its great affinity for oxygen, when heated to a welding point, would very soon reduce it to an oxide, if it were not for the vitreous matter filling its surface; and it may be fully more completely defended, by dipping it in powdered galls or sand. See Description of Plates at the end of the article.

2. Steel.—This substance, which is a compound of iron and carbon, but in less proportion than that of pig iron, is of such distinguished importance in most of the arts, that no other substance could be substituted, capable of supplying its united properties of hardness, tenacity, and elasticity. After the pig iron is totally deprived of carbon, and becomes malleable, the metal can be re-impregnated with that substance to a certain extent, without losing much of its malleable property.

It is curious to remark, that although we have made iron of excellent quality in this country, for all the nice purposes to which it is capable of being applied, yet, in attempting to convert it into steel, we have always failed; the steel being red-short, and otherwise bad. It, of late, however, has been so great a defect, that the obtaining steel from British ore, in consequence of our want of communication with Sweden and Russia, that several efforts have been lately made to bring about this desirable object, and not altogether without success. We may yet entertain a hope, therefore, that the time will arrive, when we shall not be dependent on other countries for this useful commodity.

The only steel at present, on which perfect reliance can be placed, is made from some of the best marks of Swedish iron. The bars are stilled with certain letters or characters, well known to the steel-makers; and some of them have preferred their character for making good steel during a long series of years.

The size of the bars varies from 5 inches broad and 1 1/2 inch thick, to about 2 broad by 1/2 thick. Nothing more is necessary to impregnate the bars of iron with carbon, by which they become steel, than to stratify them with powdered charcoal in a clove vessel, called a cementing pot; exposing the same to a degree of heat as little short of what would fuse the steel as possible.

The
The furnace in which the process of cementing bar iron is performed is called a converting furnace.

The pots are made of a peculiar stone called fire-lime, from its joint property of not being liable to crack by the heat, and its little disposition to enter into fusion. It is a fine grit, and occurs abundantly in the neighbourhood of Sheffield. The interior of these pots is in dimensions from 12 to 15 feet long, and from 2 feet to 30 inches square. Every furnace contains two of them; and they generally hold about 5 tons of iron each. The metal is stratified with the charcoal dust, in such a way that each bar may be completely covered; and the half rartum, which should be thicker than the rest, is kept close with a mixture of clay and sand, so as to prevent the charcoal beneath it from entering into combustion with the outer air.

The fire is then gradually applied, and the exterior surface of the pots continually enveloped with flame, till the whole mass has become of the heat required. This heat is kept up for a considerable time, so that from the commencement of firing to the maximum is about seven days. The fame space is afterwards required to allow the mass to cool. This rule, however, is not sufficient to tell when the cementation is perfect. A hole is generally left in the front of the furnace, passing through the wall to the interior of the pot. One or two bars are laid with their ends projecting into the opening, which is loosely filled with powdered charcoal. When the process is supposed to have gone on long enough, one of these bars is drawn out and examined.

All bar iron must, owing to the manner in which it is made from the pig, contain a small portion of oxyd of iron, as well as some remains of iron not completely deprived of its carbon. The long continued heat which this process requires, cannot fail to cause an union between the oxygen and carbon, accidentally existing in the bars; and we may expect, in consequence, that an elastic fluid will be formed, which must be either carbonic acid or the carbonic oxyd; but since the oxyd is in the flate of fiery cinder, we should rather conceive it to be the latter; and we believe experience warrants the conclusion.

This elastic fluid, when the metal is so near the fusible point, causes the surface of the bars to be covered with blisters, which are a sure sign that the cementation is complete; and it is from the number and size of these blisters, that the workmen know when to cease adding fuel to the furnace.

Steel is made of different degrees of hardnefs, by giving it more or less carbon; and this is effected by keeping up the heat a longer time, still having regard to the quantity and size of the blisters.

The fuel used for coach-springs contains the smallest quantity of carbon; a somewhat greater proportion is required for table knives, forks, carpenters' tools, and agricultural implements; and the largest dose of all is wanted for files, which can scarcely be too hard, if the fuel be sufficiently malleable to work.

Steel, in the state it comes from the cementing furnace, is called blighted steel, from the appearance we have just described. It is not used but for common purposes, although formerly we had no other kind. The bars of iron being formed under the forge hammer, and produced in a country not remarkable for the excellence of its machinery, the metal is found to abound with numerous flaws and flakes, which good workmanship might in a great measure avoid.

This evil is, however, very happily remedied, by making the blighted-steel into what is called shear-steel, and cold-steel.

Shear-steel has derived its name from the advantage with which it has been applied in the manufacture of shears-shears. Its admirable property of welding to iron, without the other qualities possessed being injured, renders it of great importance in all cases where the body of the edge-tool is constructed of iron, and the edge merely steel.

From having been first made at Newcastle-upon-Tyne, it has also been called Newcastle steel. The apparatus used for its manufacture consists of a pair of bellows, or other blowing machine, and a fire place similar to that of a smith's hearth, but upon a larger scale. The hammer for drawing the bars is larger than a forging hammer, but smaller than the one employed at an iron forge.

In order to make shear-steel, a number of bars of the best blighted-steel are laid together, and temporarily fastened. In this state they are introduced into the fire, and heated to a welding temperature; after which they are firmly united by means of the hammer, and drawn. At a second heat these masses are beaten down into bars about 1½ inch broad and 4ths of an inch thick. By this process the loose parts and faces of the bars are closed together, and the steel is rendered susceptible of a polish, of which before it was not capable. But these are not the only advantages. The additional hammering so far improves its malleability, that the tenacity it enjoys is much greater, while its hardness is very little less.

This steel is particularly adapted for springs of every description, and for all edge-tools requiring great tenacity rather than hardness.

Cold-steel is entirely free from the mechanical defects which belong to blighted-steel, and even, in some degree, to shear-steel; since it consists of the latter variety completely fused, and cast into ingots.

The furnaces employed for this purpose should possess all the advantages which can be given to air-furnaces, on account of the great heat requisite for the process. (See Furnace.) The crucibles, in which the steel is melted, are made of Stourbridge clay, mixed with a small quantity of powdered coke, which makes them less liable to crack in the heating or cooling; and, at the same time, gives to them a considerable degree of fluidity in the fire, when raised to the very great heat required. These crucibles are furnisht with covers, which are of rather more fusible clay than the body of the which, and, on that account, are soon partially vitrified; by which means they become closely luted at the time the steel is at a temperature sufficiently high to be destroyed by the oxygen of the atmosphere.

The fuel employed for melting steel, consists of the hardest cokes, and in all cases where long continued and high temperatures are necessary, cokes of this description should always be employed. Two advantages attend the use of them; for although the loft cokes produce a very great heat during a short space, yet the length of time required for melting steel would oblige the workman to charge the furnace too often; so that he would ultimately get a greater heat by the permanence of the hard coke; and the specific gravity of the latter is so much greater than the loft, that the fuel is more condened, and hence, allowing for the difference of cohesion, will give more concentrated heat, if the supply of air be sufficient.

The crucibles are of a size sufficient to hold about 30lbs. of steel; and, in general, each will bear charging three times, or even four; some would remain found ill longer than that, if the fires were continued; but they are seldom kept
IRON.

kept in more than twelve hours in the day, and this will not allow of more than three heats. For the best possible cast-steel, the bars of the cast-blistered-steel are broken into small pieces, it being, on coming from the cementing furnace, sufficiently brittle for this purpose. An inferior kind of cast-steel is made from the scabs, which consist of the waste of the manufactories. The heat required to melt steel is very great; and inversely as the quantity of carbon combined with it. Before cast-steel making was brought to great perfection, the quantity of carbon given to it was greater, in order to effect its more easy fusion. The crucibles and furnaces, however, are now so much improved, that the steel can be melted with much less carbon, and it is, in consequence, so fine, to use a technical phrase, as to weld with iron, and even to be capable of using two pieces of it together.

After the steel has become sufficiently fluid, it is poured into cast-iron moulds, which form it into ingots of an octagonal shape; and are about 30 inches long, each weighing about 70 lbs. Formerly, the great secret of making cast-steel was said to consist in using some peculiar flux. No fusibility, however, from what has been observed, can increase the fusibility of the steel, but an additional dose of carbon, which is improper after a certain quantity has been united with it. The only fusibility, therefore, which can be employed to any advantage, must be some fusible vitreous matter, capable of floating upon the surface of the metal, and defending it from the contact of air.

The flux at present used, and the most proper for this purpose, is the blast-furnace cinder. But pounded glafs, or any vitreous substance which fuses a little before the metal melts, will answer equally well.

The ingots of cast-steel, as well as the bars of blistered-steel, and sheet-steel, are drawn into rods ready for forging into various articles, by a piece of machinery called a forge or tilting-mill. (See Tilting-Mill.) By this hammer, the cast-steel can be drawn down to the size of 1 inch square. But in reducing smaller than that, it would be liable to be injured in its fabric. It is drawn into rods of smaller size by hand, for the purpose of making gravers, and watch-makers' tools; and for still more delicate articles, it is manufactured into wire. The blistered-steel will not bear drawing to a smaller size, on account of the looseness of its texture.

Steel is of a mean specific gravity between wrought and pig-iron; and, like the former, it increases its property in this respect by hammering. Like iron, too, it becomes softer on being annealed, but never becomes so soft as that metal. When of good quality, and at a certain degree of hardness, it is stronger than iron; that is, when fitched longitudinally by a weight; but, byudden bending or twisting, it is more liable to break short. In working it with the hammer, it will not bear so great a heat as iron; since the temperature iron and its combinations fullain without melting, is invariably as their dose of carbon.

This property of bearing heat, is, however, in a still less ratio in cast-steel. This is owing to its having entirely lost its fibrous form in the melting. Hence there is less danger in heating it after it has been hammered.

In welding steel to iron, or steel to steel, the fire ought to be very free from sulphur, or other extraneous matter; and the heated parts of the rods should be frequently supplied with either sand, or sand mixed with the scales which come from the hammered iron. This fuses upon the surface and keeps off the air. See Forge.

The most singular property which belongs to steel, is that of its hardening by being heated red-hot, and cooling rapidly. This change is greater the hotter the steel, and the colder the fluid into which it is plunged. (See Cutting.) Water, in general, is employed for this purpose; and spring-water is better than any other. If the water abound with animal or vegetable matter, the hot steel cools more slowly. This is occasioned by a film of the matter in solution forming and remaining upon the surface, and, being a bad conductor of heat, prevents the steel from cooling. File-makers say, that the fault which is inevitable in their hardening water, makes the steel harder, and they sometimes put sulphuric acid into it for the same purpose.

In hardening steel in thin plates, such as saws, particularly when of cast-steel, quenching in water would cause them to crack, and make them so hard as not to be useful. They have, in consequence, recourse to some substance which is not so good a conductor of heat. Oil, with tallow, bees' wax, and resin dissolved in it, is generally employed for these articles. (See the article Saw.) If the steel be heated red-hot, it mostly returns to its original state. This, however, is sometimes not the case with thin plates of cast-steel. In giving various degrees of heat from the hard state, it becomes more soft and less elastic. See Cutting.

This curious and valuable property which it possesses might, at first view, appear to be caused by an increase of density; but the specific gravity of hardened steel is less than before it is hardened. It has been said to depend upon a certain crystalline arrangement of its particles; but this is a mere apology for ignorance. The most plausible theory we have heard of is mentioned in one of Dr. Darwin's notes to his "Botanic Garden," and was the idea of a very ingenious friend of that celebrated author. This theory was equally applied to the singular property possessed by the glass toys known by the name of Prince Rupert's Drops. It is as follows. When the heated steel or glass is plunged into water, the external stratum becomes so hard and solid, as not to be capable of shrinking; and the succeeding layer is to a certain degree placed in the same situation. When caloric leaves a body slowly, it contracts in its dimensions, until it assumes something near its original volume. But if any force prevent the parts from approximating, the molecules will attract each other with a power equal to the repelling energy of the caloric that caused the expansion. So soon, however, as the outer stratum is broken, the whole of the others are destroyed in succession. This is most glaringly the case with the glass drops before spoken of, and, to a certain extent, with annealed glass, and hardened steel.

With respect to the latter, however, it is confined to large masses, and particularly of cast-steel. The rollers employed by jewellers and others are of cast-steel, and are very liable to break in the hardening, although about half the mass in the middle is pure iron. They do not always crack at the time, but at different periods afterwards, and frequently, when no violence is applied to them, some have been known to fly six months after being finished. Sometimes they break with great report, and what strengthens the above opinion as to the cause is, that the figure of the roller is frequently changed from a round to an elliptical shape. For farther particulars, see Steel.

§ 5. Chemical Properties.

When a piece of polished iron is exposed to the air, it soon loses its luster; and if the atmosphere be humid, it becomes covered with red spots called rust. When it is exposed at 400 degrees Fahrenheit, it changes to a yellow colour. The temperature being increased, the colour gradually turns to a brown, and at the heat of about 600 it becomes of a beautiful blue tint. This change of colour arises from the combination of oxygen; the
the quantity increasing with the temperature. If the surface be defended by a coating of chalk and a solution of glue, no change of colour takes place when the heat is applied. In the art of blueing steel, advantage is taken of this method to make the blue ornamental.

In a higher temperature the surface becomes covered with a scaly crust, which is composed of oxygen and iron; and in the heat of a smith's forge, it combines with oxygen so rapidly as to burn, throwing off sparks in bright corruca-
tions. If small iron wire be exposed in pure oxygen gas, the end being ignited with a bit of greased cotton, the metal enders into brilliant combustion, and a globule of melted matter is formed at the end of it. The iron so burnt loses all its metallic properties, by combining with the oxygen; and during this change the phenomena of burning take place. The globule is so brittle as to be capable of being reduced to powder, and is called the black or vitreous oxyd of iron.

Iron has no great attraction for oxygen, that it decomposes water even in the cold. When filings of that metal are mixed with water in a vessel connected with a pneumatic apparatus, an elastic fluid is evolved, which is found to be hydrogen. The iron loses its metallic lustre, and ultimately is converted into the black oxyd before spoken of.

If this mixture be in a retort, and the boiling heat applied, the iron combines with the oxygen of the water with much greater rapidity; and, of course, a much greater quantity of hydrogen is eliminated. This method has been employed to obtain the black oxyd of iron, which was formerly called Martial Elbow. Iron decomposes water with very great rapidity, when the sulphuric or muriatic acid is present. The acid takes up the oxyd as it is formed by the agency of the water, and a new surface is constantly presented. A large quantity of hydrogen is in this process dissipated, and it is by the present method that this gas is procured for filling aerostatic machines, and for other purposes. If the oxyd which is taken up by the acid be precipitated by an alkali, and dried instantly, it will exhibit a similar appearance to that obtained by the action of water alone. When first separated it has a green appearance, which it owes to the presence of water; and this being dissipated by heat, it is left of a dark-grey colour. This oxyd, formed by either of the above processes, is called the prot-oxyd of iron, because it is combined with the first or smallest dose of oxygen. According to Proust and Lavoisier, it consists of 73 of iron, and 27 of oxygen.

If the prot-oxyd of iron is exposed to the air in a red heat for a length of time, it affords a red colour, and constitutes the substance known in the arts by the names coccus and colofacar. This change of colour is found to have been caused by its combining with an additional dose of oxygen, and the product is denominated the peroxyd, according to Proust, of 52 iron, and 48 oxygen. From the best chemical authorities, it appears that iron unites with oxygen only in two fixed proportions, constituting the prot-oxyd and the peroxyd; although it has been held by some that there are more varieties.

If a bar of iron be heated red-hot, and a flick of sulphur applied to it, a fluid substance will drop from its end, which is found to be composed of sulphur and iron, and in chemistry is called sulphuret of iron. The fusion of sulphur and iron-filings, in a crucible, gives a similar product. The attraction between these substances is so great, that their union in nature is very common.

Iron-filings, mixed with sulphur, and made into a paste with water, in a certain time become very hot and even produce flame. The mixture is sometimes buried under ground to produce an artificial volcano. This phenomenon, however, does not depend upon the immediate combination of the sulphur with the iron. The water, which is a considerable agent, is decomposed; the oxygen uniting with the iron to form an oxyd of iron, and with the sulphur to form the sulphuric acid, while the hydrogen combines with another portion of the sulphur producing sulphuretted hydrogen, which occasions the flame in the experiment.

When iron-filings are heated with sulphur, even where oxygen is not present, at a little heat, or the temperature of red heat, they combine and produce flame. We are indebted to the associated Dutch chemists for this fact, as well as a similar experiment with sulphur and copper.

The artificial compound of sulphur and iron, from the experiments of Proust, is composed of 62:5 sulphur and 37:5 iron.

The native sulphuret is found to contain a greater proportion of sulphur. When heated in a close vessel, some of the sulphuret sublimes, and may be collected in a proper apparatus. By this treatment, it is reduced to the state of common sulphuret, and loses 20 per cent. of its weight. It is hence composed of 59:6 sulphur and 49:4 iron.

According to some experiments made by Mr. Hatchett, however, these proportions are not regular in specimens where the crystalline form varies. This ingenious chemist has found a native species agreeing in the proportion of its constituents with the artificial sulphuret. It is what has been called magnetic pyrites; and is by this teat of the magnet distinguished from the common pyrites, which does not possess that property. It has also another peculiar character. If dilute sulphuric or muriatic acid be poured upon it, a rapid action takes place, and sulphuretted hydrogen is evolved. This is not the case with the super-sulphuret till it has been exposed to heat, when it loses its excess of sulphur. The common sulphuret of iron has been employed to make artificial magnets. Mr. Hatchett found that not only the sulphures, phosphures, and carbures, were separately magnetic; but suspects that certain proportions of all these may constitute a maximum of magnetic virtue.

It is highly probable that the iron is the only substance possessing magnetism; and that the facility with which these compound substances become magnetic, may arise from the greater ease with which the particles of iron assume the peculiar arrangement on which this curious property depends. That some arrangement, though perhaps equally mysterious with crystallization, may be the cause of magnetism, there is much reason to believe. By mixing iron-filings with melted resin, and inclosing them in a brass tube, if a magnet be brought near to the tube, while the mass is still liquid, the whole, when cold, will become a magnet. During the coating of a piece of steel to make it magnetic, there is little doubt but that a new and peculiar disposition takes place amongst the particles, notwithstanding the cold state of the metal. The particles of bodies appear to be free to motion in the cold form. We find that iron combines with carbon, while both bodies are in that state; and what is still more curious, the compound assumes a different crystalline structure, according to the proportions of the two bodies. Oxygen appears, in some instances, to alter the internal arrangement of solid bodies. If brafs, for example, were to be kept in a damp room, but more particularly where the flames of
of acids are present, the metal, although previously very tenacious and ductile, becomes so brittle, as not to bear bending to a right angle; at the same time that the broken surfaces exhibit a crystalline fracture. That species of form, therefore, under which magnetism exists, may be brought about by various means. All iron instruments, kept in one position for a length of time, become magnetic; especially if that position coincide with the magnetic meridian. We regret that so little is known on this interesting subject; and for farther particulars refer to the article MAGNETISM.

Iron combines with several of the metals forming alloys, none of which have so striking or useful properties. The alloy of iron and gold has been examined by Mr. Hatchett, who found that one part of gold to 70 of iron formed a malleable alloy, remarkably ductile, so as to roll into plates, and be capable of being stamped into coin. The colour was of a pale yellowish-grey, and it was of the specific gravity of 16.885. The most singular property of this alloy is its increase of volume by combination. Before the union, the bulk was 2799; and afterwards, 2843. The very contrary is the case with most of the other alloys of metals, and agreeably to Berthollet's doctrine of affinity, we find that the mean specific gravity of bodies by experiment, is greater than the arithmetical mean, directly as the affinity of the bodies. We should, therefore, in this instance conclude, that either the affinity of the metals is trivial, or that the above law is not general.

The alloy of pure iron with platinum has not been effected from the great insufficiency of the two metals. Dr. Lewis allowed calf iron with platinum, as well as steel. The specific gravity of this alloy, contrary to the latter, was greater than the arithmetical mean. It was very hard and tenacious, possessing some degree of ductility.

After being kept ten years, it was little tarnished. Iron is easily alloyed with silver. In equal parts they form a compound of considerable ductility, of the colour of the latter metal, but much harder; and is attracted by the magnet. The metals separate, in some degree, when kept in fusion; but, according to the experiments of Moreau, not completely; the silver retaining some of the iron, and the iron some of the silver, by which its quality, as a metal, is much improved. Iron is not easily combined with copper in large quantity. We find, however, that these metals are capable of uniting, and the alloy is, in some degree, magnetic. Indeed, in forming certain instruments of braids, where the magnetic needle is employed, they are frequently defective from this circumstance. To free copper entirely from iron, it should be redissolved in an acid. The oxdy, after precipitation, should be dissolved in aqua ammonia, and the alkali then distilled from it. This being afterwards treated in a clofe vessel with some inflammable matter, the metal will be obtained pure. The alloys of tin and iron, and that of iron with zinc, may be formed by mixing clean iron-filings, or turnings, with those metals while in a state of fusion. These compounds are not of any use. Iron may be folded with several of the metals. Copper, gold, and silver, unite to it with great facility; but require the presence of borax to keep off the air.

The most permanent folder for iron is the carburet of the same metal, called N 1, pig-iron. The pig-iron loses some of its brittleness, and the malleable metal becomes much harder. It does not appear improbable that steel might be formed by uniting these two substances together in certain proportions.

We have next to treat of the alts of iron, or its combinations with acids.

Vol. XIX.

**Sulphate of Iron.**—Sulphuric acid does not combine with iron in its metallic form; in conformity with the general law that no acid unites with a metal till the latter is previously oxidated. Iron is but slightly acted upon by this acid in the cold; but with a degree of heat far short of boiling, the iron takes from it a portion of oxygen, converting it into the fulphurous acid, which escapes in the form of gas. The iron, thus oxidized, combines with another portion, and forms the sulphate of iron.

When water is added to the iron and the acid, a much more rapid action takes place. The metal seizes the oxygen of the water; hydrogen is evolved; and the acid unites with the oxyd forming the salt in question. When the product obtained by this means is more than the water can diffuse, it assumes the form of green crystals, which, when separated, are the same with those known in commerce and the arts by the names of green wuicl and copperas.

In the action of iron upon the concentrated sulphuric acid, it appears anomalous, that the metal should not be oxidized with more facility by this acid, when water is f rapidly decomposed, the elements of which have so strong an attraction for each other. It may appear equally strange that the water is not decomposed when the acid is not present. When it is recollected, however, that the oxd of iron is not soluble in water, nor sulphate of iron, the acid, it will appear very clear that the two substances are both essential to the effect; the acid promoting the decomposition of the water by taking away the oxd, and the water taking up the salt, which would be equally obtrusive to the procels.

This salt is not commonly obtained by the above processes. The sulphuret of iron, above described, already consists of two of its elements, namely, sulphur and iron; the oxygen and water of crystallization being alone wanting to complete the salt under inquiry. For this purpose, the natural combination of it, or pyrites, is first roasted, and then exposed in large heaps under fields. These heaps are frequently moistened with water, by which, together with the presence of the air, the iron and the sulphur become oxidated, and crystals of the sulphate begin to form. The water, which is thrown on from time to time, diffuses the salt, and runs into large reservoirs, which are also under fields, to prevent the rain falling into them. This solution, however, does not contain the salt in a fit state for crystallization, being too highly charged with oxygen. The liquid is transferred into large boilers, and pieces of old iron put into it, which, by taking up the excess of oxygen, change the solution from a red to a green colour. When the evaporation has gone on to a certain point, the salt crystallizes, and the green crystals being separated, are fit for sale.

When the crystals are obtained from a clear solution, and are well defined, exhibiting transparent rhomboidal prisms, the specific gravity of which is 1.8, the salt may be deemed in a state of purity. It diffuses in its own weight of boiling water, and twice its weight of water at 60°. When kept dry, it is not liable to change in the air; but if moistened it becomes covered with red spots by the absorption of oxygen, and if it be dissolved in water, it returns to the same in which it existed before boiling with the metallic iron. When the crystals are heated, the salt at first fuses, then assumes the form of white powder, by losing its water of crystallization. At a red heat the acid begins to fly off; and ultimately a fine red oxd is left behind. It is in this way the crocus of commerce is prepared.

According to the analysis of Bergmann, this salt is composed of

$$\text{FeSO}_4 \cdot \text{nH}_2\text{O}$$

Acid
Acid - - 39
Peroxyd of iron - - 23
Water - - 38

According to Kirwan:

Acid - - 26
Oxyd - - 28
Water - - 46

It is decomposed by the alkalies and alkaline earths; and by all the salts forming insoluble compounds with sulphuric acid.

Oxy-sulphat of iron.—This salt consists of the sulphuric acid united to the peroxyd of iron. Its solution in water is of a deep reddish-brown colour. It is insoluble in crystallization. Hence, the green crystals separated in making copperas are perfectly distinct in their nature from the salt which is left in the remaining liquid. When the sulphat is exposed in a flat of solution for a length of time, it assumes a red colour, and is converted into this salt; for we never find the common sulphat in mineral waters, but the oxy-sulphat. This change may be more speedily brought about by heating it with nitric acid. A quantity of nitrous gas is evolved, and, according to Mr. Davy, ammonia also; if the former from the decomposition of the acid, the latter from the decomposition of both the acid and water. The fluid gradually assumes a deep brown colour. It has a strong astrigent taste, much resembling the juice of fowls. When this salt is formed without the addition of water, it is exceedingly heavy, and concentrated, and of a deep brown tint, approaching to blackness. If concentrated sulphuric acid be poured into it suddenly, it lefes its brown colour, and becomes of a clear white, having the consistency of thick cream. It is so soluble in water, that when evaporated slowly, instead of crystallizing, it assumes the form of syrup. If too much heat be applied, however, the oxyd either precipitates, or it assumes the form of a ful-melt, and becomes insoluble.

Since the oxy-sulphat differs from the sulphat in the proportion of oxygen only, several substances reconvert it into that salt, by abstracting the excess of oxygen. If it be kept, for instance, for some time in a close-topped bottle with iron-filings, the metal becomes oxydized, and the whole is changed to the simple sulphat.

Gay-Lussac has lately shewn that the quantity of acid in any metallic salt is in proportion to the quantity of oxygen in the metal. (Memoires d'Arcueil, t. ii. p. 175.) Hence no additional acid is required in converting this salt into the sulphat.

Iron, and several other metals, produce the same effect. The excess of oxygen may instantly be taken away by paffing sulphured hydrogen gas through theoxy-sulphat. This gas reduces the oxyd exactly to a minimum of oxydation, to the state of protoxyd; and hence the reason why this gas does not precipitate iron from its solutions.

The oxy-sulphat may be easily separated from the sulphat; the former being insoluble in alcohol, which the latter is not.

From the method required to form this oxy-salt, it will appear that there are several substances which may be employed to give their oxygen to the sulphat of iron. Of these are the nitric and oxy-muriatic acids. And by pouring a solution of gold into a solution of this sulphat, the oxy-sulphat is produced, and the gold becomes metallic.

Dr. Thomson enumerates several triple salts, formed by the sulphuric acid with iron and other metals.
1. Sulphat of iron and copper.
2. Sulphat of iron and zinc.
3. Sulphat of iron and nickel.

The former of these sometimes exists in the blue vitriol of commerce, which is a very great evil to colour-makers. The iron precipitates with the copper, and destroys the beauty of the latter. In order to ascertain whether iron be present in blue vitriol, dissolve a small quantity in a wine-glass, and add aqua ammonia till it smells strongly of the latter. The oxyd of copper will be dissolved, and the oxyd of iron left at the bottom. By standing for some time, the precipitate becomes yellow and very conspicuous. It is even said that some of these salts have triple bases. The two hitherto observed are as follows:
1. Sulphat of iron, zinc, and nickel.
2. Sulphat of iron, copper, and nickel.

Sulphate of iron.—Berthollet has given us an account of a compound of iron with the sulphuric acid. When iron is exposed to the action of this acid, it becomes speedily oxydized; but what is singular, not at the expense of the water, as is the case with the sulphuric acid; but it appears that the acid is decomposed, the oxygen uniting with the iron, while the sulphur combines with the salt. Hence this sulphat of iron is always contaminated with sulphur. The sulphuric acid has a less affinity for iron than the sulphuric; and if the latter be added to the sulphat, its acid is diffused in the form of gas.

Nitrat of iron.—The nitric acid has very violent action upon iron, and an abundance of the red flames of nitric oxyd are diffused. The same thing in some measure takes place with this acid, as has been remarked with regard to the sulphuric. If it be more than a certain strength the action is feeble, until a certain portion of water is added. The same explanation will answer in both instances. The nitric acid does not diffusely the nitrat at first formed, the presence of which interrupts the future progress of the operation. When the solution is made with much water the iron is oxydized to a minimum, and the salt formed is the proper nitrat. It is of a pale green colour. The vessel in which this solution is made should be kept in water as cold as possible, else it will absorb too much oxygen, and pass to the oxy-nitrat.

Oxy-nitrat of iron.—When iron is acted upon by the last diluted acid, and with heat, the salt formed is the oxy-nitrat. The solution is of a deep brown, resembling the oxy-sulphat. It has a strong astrigent taste, and turns vegetable blues red. When the solution is boiled the oxyd is partially precipitated; nor will it afterwards diffusely in the nitric acid. This has furnished one means of separating iron from other substances in the analysis of minerals.

We are indebted to Vauquelin for a method of obtaining this salt in a crystallized state. The method he recommends, is to keep the black oxyd of iron and two nitric acid together for a length of time, till the crystals appear. They have an acid taste, and are delicate scent. The form of them is that of a four-sided prism.

The alkaline precipitate the oxyd of iron from this salt, of a fine yellow colour, and yield a product which is valuable to painters.

Muriat of iron.—The muriatic acid, like the sulphuric and nitric, acts feebly upon iron, except it be diluted to a certain extent with water. It differs from the latter, and
agrees with the former, in not being decomposed; but merely takes up the oxyd formed by the oxygen of the water, the hydrogen being given out in the flate of gas.

The solution is of a green colour; and, on evaporation, it affords crystals presenting the same appearance. Mr. Davy has given us several useful facts relative to this salt. It was employed by him to great advantage in making some eudometrical experiments. He found that a solution of it absorbs a large quantity of the nitric oxyd gas, which, in this situation, is better fitted for absorbing oxygen than by mixing the two gases together. By absorbing this gas it attains a brown colour, and acquires an all refrigent tyle. When the compound is heated, it appears that the gas is decomposed as well as a portion of water; since the iron becomes more highly oxidized, and ammonia is formed.

Mr. Davy recommends an infallible method of forming this salt, by adding muriatic acid to sulphuret of iron. The sulphuretted hydrogen prevents the muriat from becoming oxy-muriat, which has not the property of absorbing the nitric oxyd. Muriat of iron is very soluble in water and in alcohol. It is decomposed by the alkaline and alkaline earths, and all the salts, the bases of which form infusible compounds with muriatic acid; such as silver and mercury.

Oxy-muriat of Iron.—The muriat of iron, like the sulphat and nitrat, is converted into the oxy-muriat, by the oxyd of iron passing from the state of prot-oxyd to that of per-oxyd. It slowly undergoes this change by exposure to the air; and rapidly, by the agency of these bodies which afford oxygen with greater facility, as the nitric and oxy-muriatic acids. The solution is of a deep brown, but does not afford crystals by evaporation. It has a powerful, all refrigent tyle, and a peculiar odour. When this salt is distilled it affords oxy-muriatic acid, leaving in the retort the prot-oxyd of iron.

If the heat be applied rapidly, the salt sublimes; not in the state of oxy-muriat, but of muriat of iron.

There is also a triple salt formed by the muriatic acid with iron and ammonia. This may be prepared by adding iron-filings to muriat of ammonia. It may either be obtained in crystals by evaporation, or it may be sublimed. In the latter state it is known in medicine by the name of Flora Muriat.

Phosphat of Iron.—The phosphoric acid has little action upon iron; but the acid unites with the prot-oxyd, and forms this compound.

It is prepared by adding a solution of sulphat of iron to a fluid mixture of phosphat of potash. The salt precipitates in the form of a blue powder, which is infusible in water, and does not lose its colour by exposure to the air.

The brilliancy known by the name of native Prussian blue, is a phosphat of iron; but, what is remarkable, it has little colour when dug out of the earth, becoming deeper on exposure to the atmosphere. A crystallized specimen, lately brought from Brazil, has been analysed by Vauquelin, and is composed of

Oxy-phosphat of Iron.—This salt is formed by taking advantage of some oxy-foul of iron and phosphat that is to be had; as, for instance, by adding together the oxy-foulphat, or oxy-muriat of iron, and the phosphat of soda or of potash, a white powder will be precipitated, which is the oxy-phosphat of iron.

This salt is insoluble in water, but dissolves in the muriatic or sulphuric acids; from which it may be precipitated, unchanged, by pure ammonia.

Sub-oxy-phosphat of Iron.—The salt above described is not decomposed by the alkalis like the metallic salts in general. The alkali combines with a portion of the acid only, leaving the salt with an excess of base, which is the sub-oxy-phosphat of iron. This sub-oxy-phosphat does not dissolve in water, or scarcely in acid; but it has the singular property of dissolving in alkumum, or the white of eggs; and if an alkali be present, which is the case with the albumen in the form of blood, it assumes a reddish-brown colour, and is suppurated, therefore, to be the principal colouring matter of the red blood of animals.

Flux of Iron.—The liquid fluorid attacks iron, or rather takes its oxyd, which is formed by the oxygen of the water, while hydrogen gas is evolved. It has no etking properties, or any which it may be important to describe.

Borat of Iron.—This salt, being insoluble in water, is obtained by mixing solutions of borat of soda and sulphat of iron together. It appears in the form of a yellowish powder, and melts into glass before the blow-pipe.

If the oxy-phosphat of iron be employed, an oxy-borat will be obtained.

Carbonat of Iron.—When iron-filings are mixed with the liquid carboonic acid, and suffered to remain for some time, the water will acquire a perceptible tyle of iron. If it be exposed to the air, a precipitation takes place, either from the gas flying off, or from the salt assuming the state of sub-carbonat. The precipitate is of a yellow colour. This salt is frequently found in mineral waters, to which it gives a peculiar odour. The water, by standing a little while, is not fusible to any of the salts of iron; but a yellow precipitate is found at the bottom of the vessel.

When a solution of neutral carbonat of potash is added to a solution of sulphat of iron, a large quantity of iron is dissolved by the carboonic acid, giving to the fluid a strong inky tyle.

This salt is also found native in the solid form, of which we have already spoken in the mineralogical part of this article.

The common rust of iron, formed by exposing iron to the air, may be proved to be a carbonat of this metal by its efficiency with acids. It is, no doubt, from the solubility of this salt, that iron becomes perceptible by exposure to the weather.

The sub-carbonat of this species, according to Bergman, is composed of

It appears from some experiments of Bucbolz, that the native carbonat, by heating red-hot, becomes magnetic.

Acetat of Iron.—The acetic acid, when of moderate strength, added to iron-filings, causes the iron to be oxidized by the decomposition of the water, while the hydrogen is set at liberty. The solution has a freshness, though inky tyle, and emits the odour of vinegar. The boldest way of forming this salt is by mixing acetat of lead and phosphat of iron together. The phosphat of lead becomes infusible, and the acetat of iron remains in the liquid. Mr. Davy obtained this salt by digesting the sulphuret of iron with acetic acid. It afforded him crystals in small prisms.

Oxy-acetat of Iron.—If the oxy-sulphat of iron be mixed with acetic acid lead, the latter is precipitated in white crystals.
of lead is precipitated, and an oxy-acetat is held in solution of a beautiful reddish-brown colour. This salt does not afford crys'tals. It has the smell of vinegar; and, when in solution, affords an excellent test for arsenic. The arsenic forms an insoleuble compound with the iron, of a brilliant orange tint. The pyroligneous acid, which is an impure acetic acid, unites with iron, and yields a very cheap acetat of iron, which is used by dyers and calico printers as a mordant.

Succinat of Iron — When the solutions of succinat of potash or soda, and sulphat of iron are mixed together, a brownish-red insoleuble precipitate is formed, which is the succinat of iron. The soluble succinat may hence be employed to separate iron from other substances.

It is composed of

The oxalat, tartarat, citrat, molat, benzoat, and fuberat of iron are but little known. They are all, however, soluble in water.

Gallat of Iron.— When the gallic acid is added to any solution of iron, the oxyd being at a minimum of oxidation, a fine purple precipitate will be produced. If the acid be entirely freed from tann, the purple colour is much more conspicuous. The pure gallic acid, therefore, is much better as a test for iron, than the mere infusion of gall.

The tann may be separated from this acid by means of gelatine, which does not precipitate the gallic acid. By this treatment a solution may be obtained colourless and limpid.

If the gallic acid be added to a salt of iron, in which the oxygen is at a maximum, the precipitate is a very complete black; but the oxyd soon separates, and falls to the bottom in the form of a red powder. This property renders these salts of iron unfit for making writing ink. When the oxyd is in the state of prot-oxyd, the combination is permanent; and although it is not so black when first used, it soon becomes dark by exposure to the air. We may hence learn, that while ink is in use, it should not be kept exposed to air; since it passes to the state of oxy-gallat, and the oxyd will fall down.

Prussic Acid or Prussia Mure. — When the triple prussic salt of potash and iron is poured into a solution of the latter substance, the oxyd being at a minimum of oxidation, a white powder is precipitated, which is the prussic acid of iron. If this powder be exposed to the air, it changes to a blue; and in this state is called the oxy-prussic acid of iron.

Oxy-prussic Acid. — This salt is formed by the fume of the soluble prussic salt being added to the oxy-sulphat of iron, and constitutes the beautiful blue pigment, known by the name of Prussic blue. It is generally, however, adulterated with alunine. See PRUSSIAN BLUE and PRUSSIC ACID.

Arsenie of Iron.— The native arsenie has been already described in the mineralogical part of this article. Arsenie of potash, or ammonium, being added to the sulphat of iron, an insoleuble powder precipitates, which is the artificial arsenie of iron.

Oxy-arsenie of Iron.— The arsenie of iron, in common with all the other salts of this metal, combines with an extra dose of oxygen, constituting the oxy-arsenie. The precipitate formed by the arsenie acid and the oxy-acetat of iron is of a blueish-white colour. The oxy-arsenie of iron, from the analysis of Chenevix, is composed of

Arsenite of Iron.— The arseneous acid, or the common white arsenic of commerce, forms with iron peculiar compounds, which have been but little examined. It does not take the oxyd of iron from the sulphat, but decomposes the acetic acid, forming with the protoxyd a sublimate of a greenish-yellow colour; the precipitate from the oxy-acetat being of a bright orange. If either of the acetats contain the least portion of the sulphat of iron, it prevents the precipitation of the arsenite.

Chromat of Iron.— See Chrome.

Most of the other acids combine with iron; but they form compounds which are but little known. Certain alkaline salts act upon iron, and produce triple compounds, which have not received a particular examination. When the nitrat of potash is fused in contact with that metal, the acid is decomposed, and the iron oxydized to a maximum. This melted mass, after the acid is completely disipated, is of a red colour. If, before it becomes depho, which takes place from the presence of the alkali, it be thrown into water, the alkali dissolves a quantity of iron, forming a solution of a deep splendid purple tint. The colour remains permanent for some time, if the air be excluded; but, if exposed in an open vessel, it changes quickly to a green, and the oxyd ultimately precipitates, leaving the liquid clear and colourless. The precipitated oxyd is of a deep red colour.

Description of Plates.

Plate I. fig. 1, a plan of an iron forge; fig. 2, an elevation of the same. In fig. 1, A is a water-wheel, which gives motion to the stamping hammer E; G, the mill-dam; H, the tail water course; I is a small water-wheel, to give motion to the blowing machinery; L, fig. 1, is another water-wheel, which works the hammer O, for drawing the balls, &c. into bars; K is the mill-dam for supplying all the wheels.

Q, in fig. 1, is a refinery, technically called a fumery; in fig. 2, is the elevation. It is blown by the double blowing cylinders, e, e. R, the chafery for heating the masses of iron a second time after hammering; S, S, plans of balling furnaces, and similar to the puddling furnace.

Plate II. fig. 1, is a front view of the finery, as seen fig. 2. Plate 1; fig. 2, being a side view. K, the hearth on which the pig-iron and charcoal is placed; G, the chimney; f, the air-pipe; g, a cock to regulate the blast; b, a leathern pipe connecting the main-pipe with the nole-pipe; i, fig. 3, an enlarged view of the tuyere-iron, into which the nole-pipe i is inserted, and which enters the hearth at a, fig. 1; m and n are two iron pipes, terminating in, and forming a part of the tuyere-iron. The pipe m communicates with a cifier of water, which conveys a stream of cold water, for the purpose of keeping the tuyere-iron cool, and which is discharged at n, into the cifier o, fig. 4, where the whole of this apparatus is seen. The furnace called the run-out furnace is very similar to the finery. The hearth of the finery is surrounded with cast-metal plates, having a cavity under the bottom plate, to throw water from time to time to keep the bottom plate cool. The run-out furnace differs from this, in being surrounded on three sides with water. This furnace, and its use, has already been described. The chafery is also similar to the finery,
finey, except in the hearth being more like the smith’s forge.

Fig. 5. exhibits tongs for taking the balls from the furnace to the hammer; and fig. 7, an iron ladle, employed to throw water into the puddling furnace, to oxidate the iron.

Fig. 8, the face of the hammering hammer, which is made to be taken out occasionally.

Fig. 9, the face of the hammer employed for drawing out the bars: b is the part used to extend the bars in length with; the part a being employed for softening or finishing the bar.

Figs. 10 and 11, are different views of the balling furnace: a is the fire-grate; b, the hole where the fuel is admitted; d, d, the roof made of fire-brick; e, the door through which the balls are admitted; and b b, the hearth on which the balls are laid to be heated, by the flame which is carried by the draught of the chimney G. This furnace is bound on all sides by bars of iron, secured by bolts.

The puddling furnace is so nearly similar to this, as not to require a separate drawing. The hearth is more concave opposite the door, for the purpose of containing the metal which is liquid, previous to its affining its malleable state. The door of this furnace, for heating the balls, consists of a frame of wrought iron containing fire-bricks, to prevent the escape of heat. It fluts and opens upon the hole, by being attached to the end of a lever; its weight being counterpoised at the other end. See fig. 1. Plate IV., where R is the lever; k, the door; and f, the part by which it is raised.

The door of the puddling furnace consists of a solid piece of cast-iron, about 3 inches thick, having a small hole through it, for the purpose of inspecting the process, and introducing the puddling instruments.

Plate III. figs. 1 and 7, are views of the reverberatory furnace, used by the cast-iron founders, for melting large quantities of metal at once. This furnace, like the lat, is heated with flame from its fire place a, the fuel being introduced at B; d is a sloping hearth, on which the pigs or other pieces of metal are laid; b, the door where it is introduced; and g, the chimney. The melted metal runs down to the part a, where it is accumulated, and is let out at f, or a door may be opened at e above, and the melted metal carried out in ladles, to be poured into the moulds.

Fig. 2, is a section of a cupola, in which a is the interior of the furnace containing the metal and cokes; c, the tap hole; b, the nose-pipe; d, a leather pipe connecting the air-pipe, which comes from the blowing cylinder, with the furnace; c, a float-cock to regulate or turn off the blast.

It generally contains four plates of cast-iron, firmly bolted together; the interior being lined with fire-brick. This furnace is generally employed for the best kind of work, and will melt many charges in a day, according to the nature of the metal exposed in it.

Plate IV. figs. 1. and 2. are two views of forge-hammer machinery, erected by the celebrated Smeaton. A is the water-wheel; F, a fly-wheel; D, wheel-work to open the flute by a little at once, for the purpose of adjusting the quantity of water; F, a cog-wheel to give motion to the wheel G; at the other end, I, are a number of cogs, which lift the hammer K, fig. 2, by palling under its shaft, or helve, as it is sometimes termed; L, a large beam of wood inserted into the pole M, and palling horizontally over the hammer. Into the poles, M and N, is inserted a piece of soft-wood to, against which the hammer K strikes in its ascent, and by its elasticity re-acts upon the hammer, and gives it a greater defending velocity than would be produced by gravity alone. O is a number of heavy pieces of metal laid upon the beam L, to increase its vis inertia, and will, in consequence, receive kefs motion from the hammer. (See Mill-Work and Water-Wheel.) The hammer here described has been much improved, so far as regards the spring at a.

That already mentioned in the plate is much preferred. The whole of it is made of cast-iron, and its weight is about 35 cwt. It acts simply by its gravity; its extra force, therefore, or the common one, consists in its greater quantity of matter. It is made exceedingly malleable near the centre of motion, by which means its centre of oscillation is thrown nearer to that point, and it consequently defends with greater velocity. Although this is an advantage with respect to the number of strokes in a given time, it is a disadvantage in another way; since the centre of oscillation is also the centre of percussion, or the point where the greatest stroke is made. Could the velocity be obtained without this evil, the advantage would be material. See TILLING-MILL.

Iron, in the Materia Medica, is said to have greater virtues than any of the other metals, which is not to be wondered at, as being the only one that is in a manner soluble in the human body. All the other metals, whether hard or soft, poisonous or salutary, may even fluid mercury itself, swallowed in their crude states, pass out of the body again unaltered; but this is not the case with iron, its crude filings are often taken as a medicine, and are always so much acted upon by their juices, as to produce considerable effects. It is so easily wrought upon out of the body also by fire, and by different manures, that it becomes an aperient or altrigent, as it is differently treated; and is, under proper management, greatly superior to all other medicines in chronic cases.

Iron or steel, that is, the ferrum or chalybium, may be employed indifferently, as Cullen suggests, in the preparation of the rubigo: but he thinks that, upon the whole, the preference is due to the iron in its soft malleable state, or in that which is called “forged iron.” As iron, says this medical writer, like all other metals, in its solid and entire state, is not active with regard to our bodies, without being corroded or dissolved by saline matters, he is of opinion, that it is rendered active only by being combined with acids. It has indeed been common to give the entire metal, brought by filing into a fine powder, and with very good effects, as a medicine. But this he does not consider as an exception to his general rule; because he is persuaded that there is constantly present in the human stomach a quantity of acid capable of dissolving iron; and as a proof of it he alleges that he never knew iron given in its metallic or slightly corroded state, without producing a blackness in the stools, which affairs a preformation of a previous solution of the iron in acids. As this combination with acids is necessary, physicians and chemists have diversified this combination in a variety of ways; Dr. Cullen observes, that he has not known a preparation of iron for the purpose of medicine, that has not been prepared by a combination with acids, or by bringing the iron into a state that rendered it readily soluble by the acid of the stomach, and Dr. Lewis very properly remarks, that Prussian blue, though truly containing a quantity of iron, as it is not soluble in any acid, is the least promising of all the medicinal preparations.

Its virtues internally were not unknown to the ancients; Dioscorides attributes both an altrigency and aperitency to it, and prescribes it in hemorrhages. He also recommends its ruit, or cressus maris, in suppurations of the members; though
though he, on the other hand, prescribes wine or water, in which red-hot iron has been quenched, as an astringent in dysenteries, diarrheae, and weakness of the stomach.

Iron combined with acids becomes an astringent substance; and hence its great medicinal virtue is caused by its tonic and strengthening qualities; for by increasing the tone of the vessels, it increases their vigour and activity. It produces a slight and gentle irritation of the fibres, the effect of which is to constringe the sensitive organic parts upon which it acts, and so increase their force and elasticity. Iron particularly acts upon the fibres, and the vessels of the stomach and intestines; hence it produces excellent effects in all difaees which proceed from laxity and inactivity of the digestive organs. Such are crudities, bad digestion, accompanied with diarrheae, flatulencies, flatulent colics, &c. &c. in difaees which proceed from the former, as many hysterical, hypochondriacal, melancholic affections, intermittent fevers, tertian and quartan, &c. In those cases iron quickens the circulation and raises the pulse; renders the blood more fluid, and as it were expands and rarefies the juices, promoting, when they are deficient, and restraining, when immoderate, the secretions that are made from the blood, as perspiration, urine, and the uterine purgations. By the same corroborating power, which renders it serviceable in promoting deficiency, and restraining redundant discharges, where the suppurations or flux arises from debility and relaxation, it increases, on the contrary, fluxes, and confirms obstructions; when they proceed from tension, rigidity, or spasmotie shrivelled states of the vessels. Where either the circulation is quick, or the habit phlegmatic, by increasing the velocity of the blood, and the plethoric symptoms, it produces heaviness, dulness, vague heats and flushings, or kindles more dangerous fevers or inflammations, or bursts some of the over-distended small vessels. In some conditions, where iron is proper and salutary, particularly in hysterical and hypochondriacal cases, and where the stomach is very weak, it is apt at first to occasion great fickleness and perturbation; to remedy these inconveniences, Sydenham advises, to begin with very small doses, and to administer it for a while at bed-time, in conjunction with a light opiate. In other circumstances, it is commonly taken in the morning and afternoon, and moderate exercise used to promote its action. In all cases the dose should be small and repeated; a grain, or half a grain of the metal dissolved, or in a soluble state, is generally a sufficient dose. Its effects are known by minute exhilarations, and by the alpine faces being tinged of a black colour.

Stahl, and several other modern chemists and physicians, acknowledge only the tonic and strengthening qualities of iron. The cases in which iron has produced a relieving and aperient effect are those, in which the obstructions, and the defect of secretions and excreta, have proceeded from weakness and relaxation of the fibres, and of the vessels, rather than from a profusion of humours, as in the chlorosis, in some kinds of jaundice, and other difaees of the same fort.

The same preparation, as Dr. Lewis has judiciously observed, may sometimes exert an aperient, and sometimes an astringent, power, according to the state of the body to which they are applied. E.g. If a retention of mucus depends upon a weakness in the vessels of the uterus, chalybte medicine, by invigorating the force of the vessels, may cure the diffaee, and may thereby appear to be aperient; and, on the contrary, in a menorrhagia, when the diffaee depends upon a laxity of the extreme vessels of the uterus, iron exhibited, by restoring the tone of the vessels, may give an astringent operation. However, it is probable, that in the cases of suppurations depending upon a contraction of the extremities of the vessels of the uterus, the same tonic powers may not be so properly employed. By considerations of this kind, the inutility or propriety of the medicinal preparations of iron may be determined. In all cases of active hemorrhage they must be hurtful; and in cases of hemorrhage from external violence, Dr. Cullen would judge them to be useless; if not hurtful. In cases of a general fuscidity, as it is frequently marked under the title of “Cachexy,” and in all cases of evacuations from laxity, whether gastrine or enteric, they are likely to be the most effectual remedies. The good effects of the preparations of iron, as Dr. Cullen apprehends, have been often misfied by their being given in too small doses. The false preparations, in large dosages, are ready to irritate the stomach; and for this reason, and some others, it must be always proper to begin with small doses, and to increase them by degrees; but he has often found, that no great benefit is to be obtained but when large quantities, either by the size of the doses, or by the long continuance of them, have been thrown in. He says, that he has found the simple ruit as effectual as any other preparation, and the stomach has borne it better than any other. He begins with a dose of five grains, but gradually increases it to what the stomach easily bears. Some are led to have given it to the quantity of six drams in one day; but he has hardly found any stomach that would bear the third part of that quantity without much sickness. He thinks that the stomach bears it better by joining with it some aromatic.

The preparations of iron that have been in more frequent use, and some of which are at present continued under different names, are, 1. The crude filings reduced to an impalpable powder; this is an excellent form for administering iron in female disorders, in which the body is weak, languid, and full of acidities; the dose of the filings is from two or three grains to a scruple or more. 2. “Mars facchaturas,” which is the filings candied with sugar, by dissolving two parts of fine sugar in water, and boiling it down to a candied confection, and adding, by little and little, one part of the cleaned filings in a kettle over a gentle fire; the veffel being continually shaken, that the filings may be crumbled over with the sugar. In order to prevent the mixture from running into lumps, a little starch is previously mixed with the sugar, in the proportion of a dram to a pound. 3. “Linn. Martis preperata,” or “Chalybys rubigo preperata,” is formed by mellowing the filings with vinegar or water, and expelling them to a molt air, or occasionally mellowing them afire, which soon change in great part into rust; this rust may be separated from the uncorroded part, by grinding and washing over the fine powder with water. This is given in the same dose as the crude filings.

This preparation, which was denominated “Chalybis rubigo preperata” in the London Pharmacopeia of 1745; and “terri rubigo” in that of 1787, is now called “terri carbonas,” or carbonate of iron. It is formed of sulphate of iron, eight ounces; sub-carbonate of soda, ten ounces; and a gallon of boiling water. Dissolve the sulphate of iron and sub-carbonate of soda separately, each in four parts of water; then mix the solutions together, and set by the mixture, that the precipitated powder may sulfide; having poured off the supernatant liquor, wash the carbonate of iron with hot water, and dry it upon bibulous paper in a gentle heat. There are two oxys of iron, both of which are combined with acids, and form different modifications of the same salt, a distinction that ought to be particularly regarded in
in medicine; they have been named, from their colour, black and red oxyds; the former, which is black, or (if formed as in the present instance, by precipitation from water) greenish, consists of iron 73, and oxygen 27, according to Lavoisier. It may be formed in various ways; as by exposure of a part of iron-filings and water to the air; by heating together one part of red oxyd of iron, and two parts of iron-filings; and by adding a solution of alkali to one part of green sulphate of iron, and drying the precipitate quickly without exposure to air; and it is kept as a separate article in the Edinburgh Pharmacopoeia, under the name of "Ferri oxysuln nigirum purificatum." The latter, or red oxyd, consists, according to Proult, of iron 52, oxygen 48, and in its relation to black oxyd is composed of 60.5 of that oxyd, and 33.5 of additional oxygen. Some chemists have opposed the existence of other gradations of combination of iron and oxygen, but the above are all that are generally admitted, or that require particular notice; this latter is also kept in the Edinb. Pharmacopoeia, under the name of "oxydum ferri rubrum." Salts containing the black oxyd, on exposure to air, pass to the state of red oxyd, by attracting oxygen from it, and in the process of drying, the same change happens here to the oxyd in the fus-carbonate, which, at the time of its first precipitation, is a black oxyd. The same substance, more imperfectly prepared, constituted the rust of iron (ferri rubra) of the former Pharmacopoeia, for which, in all the processes into which it entered, this precipitate is now substituted. The red oxyd of the Edinburgh college is the old "Coelecorrh viridul." and formed by exposure of common sulphate of iron to a strong heat, sufficient to drive over its sulphuric acid, when the red oxyd remains behind, as in the process which was formerly in use for obtaining that acid. Sub-carbonate of lods is preferred for the precipitation to that of potash, on account of the greater solubility of the sulphate of the former than of the latter alkali, and the consequent facility with which it may be washed away. The salt is a fus-carbonate, but as only one of the compounds is kept, the relation is not expressed. The dose of the "ferri carbonas" is from two to ten grains.

4. "Mars sulpharatus," prepared by mixing iron filings with twice their weight of flower of brimstone, and as much water as will make them into a paste, which in a few hours swells up, and is then pulverized, and put into a heated crucible to deferate, and kept constantly till it is of an iron grey, until it falls into a deep black powder; this powder is frequently used in the making of tinctures, and is called "Crocus martis arenosus et astringens." The salt or vitroil of iron, "ferrum vitroileatum," called "Sal martis," is now difused. See Crocus Martis.

This is the "ferri fulhas," sulphate of iron, of the Lond. Pharm. of 1809; and is composed of iron and sulphuric acid, of each by weight eight ounces, and four pints of water. The sulphuric acid and water are mixed together in a glass vell, and the iron is added; then, after the effervescence has ceased, the solution is filtered through paper, and evaporated, so that the crystals may form as it cools. The water is afterwards poured away, and the crystals are dried upon a porcelain paper. Upon a large scale this salt is formed from native sulphuret of iron (pyrites) by middling, and expelling it to the open air. The sulphate of iron is afterwards dissolved in water and crystallized by evaporation. Sulphuric and with unite either with the black or red oxyd; the first of these is the salt here intended for internal use, and upon this point great stress ought to be laid; as the last is the state in which the sulphate of iron is naturally found, and which, for medical purposes, is a very distinct and inferior thing. Its crystals are transparent rhomboidal prisms, of a light green colour; its taste is afflicting and strong, and it reddens vegetable blues. One part is soluble in two of cold, and in three-fourths of boiling water. It is insoluble in alcohol, in which menstrua the red sulphate is soluble, and this affords a method of ascertaining the existence of the latter with the former, as also of separating it. On exposure to air it is gradually converted into red sulphate; it confits, according to Kirwan, of acid 26, iron 28, and water 49, parts. Heat drives off the water of crystallization, and the salt remains white; if it be further, it drives over the acid, and leaves first a red sulphate, and at last a red oxyd of iron. The dose of the "ferri fulhas" is from one to five grains. 7. "Tinctura martis in spiritu falsis," P. L. 1745. 8. "Tinctura ferri muriatica," P. L. 1787, or "Tinctura ferri muriatica," tincture of muriate of iron, P. L. 1809. This is formed by pouring the muriatic acid, in the proportion of a pint, upon half a pound of carbonate of iron, in a glass vessel, and shaking it occasionally for three days; then letting it by that the face of there be any, may be filtered; pouring off the solution and taking the residue of rectified spirit. This salt is prepared by adding to an oxymuriatic at of the red oxyd of iron employed before, on its combination with the acid, black oxyd, and giving over its superabundant oxygen to the muriatic acid. This appears to its state, because sulphuric acid added to it detaches oxymuriatic acid, and heat drives over oxymuriatic acid; and in the latter instance, although the red oxyd was used for its preparation, the black oxyd remains behind. The salt, evaporated to dryness, yields an orange-coloured mass, which is unctuous, and of a deep red or black, and is soluble in alcohol. The tincture has a brownish yellow colour, and very astringent taste.

5. "Flowers martsiales," P. L. 1745. flowers of iron (see Flores), "Ens Venosi," P. L. 1720. "Perrum ammoniacale," P. L. 1758, or "Ferrum ammoniacum," "Tinctura muriatica," P. L. 1809, is composed of intimately mixing carbonate of iron and muriate of ammonia, of each a pound, and subliming by immediate exposure to a strong fire, and, that the sublimed ammonical iron to powder. This substance contains of red muriate of iron, mixed by sublimation with muriate of ammonia. It is orange-coloured, with a smell resembling that of laurel, and soluble in alcohol. The residue, which is deliquecent, contains also of red muriate of iron, and was formerly kept under the name of "lixivium martis." The dose is from three to fifteen grains. 9. "Tinctura muriatica," P. L. 1745. "Tinctura martis Menschiti," P. L. 1720. "Tinctura ferri ammoniacals," P. L. 1757, or "Tinctura ferri ammoniacal." tincture of ammoniated iron, P. L. 1809, is formed by dissolving four ounces of ammoniated iron in a pint of proof spirit, and then boiling it. This is an elegant chalybeate, and may be given in doses of a teaspoonful. 10. "Ferrum tartarizatum," or tartarized iron, P. L. 1787 and 1809, called also "Mars solahhii," and "Chalybs tartarizatum," consists of iron, a pound, superparturate of potash, powdered, two pounds, and a pint of water. Rub them together, and expel them to the air in a broad glass vell, for eight days, then dry the residue in a sand bath, and add two more pounds of powdered potash to the powder a pint more of water, and expose it for eight days longer, then dry it, and reduce it to a very fine powder. This is a triple salt, in which the iron is first oxidized by being middled, and exposed to air, and then combines with the superabundant acid of the superparturate of potash; and it is therefore a tartarate of potash and iron. It may be dissolved in water and crystallized. This elegant and useful chalybeate may be given either in a solid or liquid form, from 8 to
grains to a ferule. It has been usually distinguished in the shops by the name of its inventor, Dr. Willis. 11. "Liquor ferri alkalini," or solution of alkaline iron, is composed of 2½ rins of iron, two fluid-ounces of nitric acid, six fluid-ounces of distilled water, and six fluid-ounces of the solution of subcarbonate of potash. Having mixed the acid and water, pour them upon the iron, and when the effervescence has ceased, pour off the clear acid solution; add this gradually, and at intervals, to the solution of subcarbonate of potash, occasionally shaking it, until it has assumed a deep brown-red colour, and no further effervescence takes place. Lastly, let it by for six hours, and pour off the clear solution. This preparation was first described by Stahl, and called "tinctura marta marta alkalina," and it is for the first time introduced into the London Pharmacopeia of 1809, as affording a combination of iron distinct from any other, and often applicable to practice. It seems to be a triple salt, formed by the union of nitric acid with red oxyz of iron, and with potash. Dr. Lewis has observed, that alkaline solutions of iron are ill adapted for medicinal use, and on that account, he says, they have been wholly neglected in modern practice. 12. "Vinum ferri," wine of iron, P.L. 1787 and 1809, "Vinum chalybeatum," P.L. 1745, consists of two ounces of iron-filings mixed in two pints of wine. The mixture is set by for a month, occasionally shaking it, and it is then filtered through paper. Lewis Mat. Med. Cullen Mat. Med. London Pharm. 1809. See Chemical Properties of Iron, Chalybeates, and Mineral, &c. Waters.

Iron, Cafe-hardening of, a process by which a superificial hardnes is given to various articles made of iron. It is found by experience that pure iron is not susceptible of a very fine polish, and that, when it is exposed to the air, it very soon changes. All iron utensils, therefore, such as fire irons, and many other articles, having the appearance of polished steel, are cafe-hardened, for the purpose of giving them a finer polish, as well as rendering their colour more permanent. The goods to be cafe-hardened should be finit with the exception of polishing, since, if the process be well managed, the most delicate workmanship will not be injured. A box of wrought iron must be provided, which is perfectly found in every part, having a lid of the same metal, to fit very tight. In this box the articles are to be stratified with powdered carbon, that of animal sublimates being the belt, for reasons given in the article Iron, in the section on Steel. The box being perfectly filled with these materials, let the lid be fitted on, and luted all round with a paste made of equal parts of pipe-clay and Calais sand. The whole is now to be surrounded by bricks loosely built up, a little higher than the top of the box, leaving about four inches on each side for fuel. This may be done either upon a smith's hearth or in the open air. The most proper fuel is the refuse-cokes from any fires where pit-coal is burnt. The fire being kindled, and the space filled up with this fuel, the heat will be applied gradually, owing to the moulder combution. As soon as the box appears of a light red heat, let it remain about half an hour, or more time if the box be large, in the same temperature. The lid may now be taken off, and the box inverted with the contents emptied over a culler of cold water. If the box be suffered to cool without being opened, the goods will be perfectly white and metallic when taken out, if they are now heated red-hot, and quenched in cold water, they acquire the same hardnes as if turned out of the box red-hot into the water. If the articles are very delicate, so as to be injured by the air in heating a second time, they may be preferred, by dipping them into a mixture of a satu rated solution of salt (muriate of soda) with any vegetable matter to give it a pulpy consistence. During the time of heating it red-hot, the salt fuses upon the surface of the metal, defending it from the oxygen, so that after it is quenched in the water, and brushed, it will be perfectly clean.

The size of the iron box should not be very large; it is better to do the work at two or three proceedes. Charcoal is a very bad conductor of heat, and if the mafs to be heated were large, those articles near the fides would be over done, by combining with too much carbon, while those in the middle would be too little carbonated.

People in the habit of cafe-hardening, have generally some secret receipt for the proceedes, on which they let great value. All, however, agree in using carbon, the only thing necessary: some add to this salt-petre; others fat ammoniac, and other articles, to which they very knowingly attribute their relative success. We can, however, assure the moft fage of these perfons, that if they make their box perfectly air-tight, by the rules above given, straffitifying the articles with animal carbon alone, they will, with proper heat and time, produce the greatest possible effect.

Animal carbon may be produced from moft animal sublimates: among these are blood, hoofs, and leather. These sublimates should be pressed into an iron pot, which can be heated red-hot, covered clofe, with a small open tube inserted into the cover. The volatile matter that escapes may be fet on fire, which will in a great measure destroy the fmiell; or a receiver may be adapted, and the crude ammonia divided off. When the volatile sublimates have come over, the re fidual will be fine animal carbon, which requires only to be reduced to powder.

This animal carbon is fo fitted for combining with iron, that if it be made into a pulp with a satured solution of salt, and laid upon the surface of iron; upon being heated red-hot, and quenched in cold water with this coating upon it, the surface will become hard. Any part of an iron artice, not wished to be cafe-hardened, may be prevented from undergoing the change, by covering the part with pipe-clay. Iron, For the bluing of, see Bluing.

Iron Furnace. See Blast-Furnace, and Iron, supra.

Iron, Harping. See Harping.

Iron-liquor, in Calico Printing and Dyeing, is a solution of iron in the acetic acid, used as a mordant for certain colours. It is employed as a sublitute for the fulphat of iron, and is preferred, in those proceedes, to the latter. The oxyd of iron, which is the effential ingredient, is more easily attracted by the fluid from the acetic than the sulphuric acid, and, besides, the texture is not so liable to be injured by the acce tat as the sulphat of iron. In order to make this sublitute cheap, the acid diffiluted from wood, called pyroligic acid, and now found to be impure acetic acid, is used as a sublitute for vinegar. See Pyroligic Acid, and the last section of the article Iron.

Iron moulds are marks or flains produced on sublimates, particularly linen and cotton, by the oxyd of iron. The affinity of these vegetable sublimates for the oxyd of iron is so great, as not only to take it from the surface of iron, but from any acid with which it may be combined. We find, hence, that very few acids are capable of removing iron moulds. From the well known fact that the attration of acids for oxyds of metals is more feeble as the latter contain more...
more oxygen, we are enabled to account for iron-moulds being easier to remove, as they are more recent. The flain iron acquires an orange-red colour, by absorbing oxygen, and is with more difficulty extracted. Various means are employed by the laundresses for removing flains of iron, the most general of which is the citric acid, commonly called salt of lemons. The muriatic acid is frequently employed by the bleachers, and it is by far the most rapid and effectual procet; but the great caution necessary, in suddenly washing the spot after the flain has disappeared, lessens its utility for domestic use. When the spot is dipped into the clear muriatic acid, the iron almost instantly disappears, and it is at that instant the part should be plunged into a quantity of clean water, and washed as quick as possible; the washing being continued for a considerable time.

In order to render the oxyd of iron more easily soluble by any acid, let the part stained be steeped for some time in a solution of fulphured of potash, or, what is more easily obtained, fulphured of lime, running it afterwards in clean water. The oxyd will be deprived of one of its oxygens, and may be removed by almost any acid, when it is dilute, even, as not to injure the flain, however long it may remain in it. It may be proper here to observe, that the tarsatic and oxalic acids remove iron-moulds equally well with the citric acid.

When the substance iron-moulded is printed calico, and of a buff colour, or any other colour in which iron is employed as a mordant; it will be found that, in removing the iron-mould, the proper colour will also disappear. In this case there is no effectual remedy.

Most of the iron-moulds are produced in the washing, for want of sufficient caution. In those utensils in which metal is at all necessary, copper or tin should be employed instead of iron. With care, however, iron vessels may be safely used. When they are not in use, the surface of the iron should, after being made clean and dry, be varnished over with oil and tallow, and rubbed dry at the time they are used.

Iron-moulds, yellow lumps of earth or flain, found in chalk-pits about the Chiltern, in Oxfordshire, and elsewhere, being in reality a kind of pyrites, or indigelled iron-ore.

Iron-blot, in Mineralogy, is a term applied by Mr. Jameson (Geognost. vol. iii. p. 47. 1590) to luch rocks and flaines as are coloured or clouded by the oxyds of iron. Ferruginous is a more common name for this very common appearance in the strata.

Iron-fleck, a Nautical Term, signifying the decay of the iron fastenings by its corrosion with the sea water, by which the continuity of the parts is gnawed away by degrees, whereby the vessel is not only rendered weak, but leaky.

Iron-flume, is that species of iron ore which abounds with a considerable proportion of earth, such as lime, or alumins, and is the ore most common in this country. See Iron.

The manner of getting iron-flume is divided into three departments: 1. By flail-work; 2. By bell-pits; and 3. By open-work. The first of these methods is employed when the flain lies at a considerable depth. After sinking a shaft to the lower part of the strata, the ground is excavated in an horizontal direction, leaving at intervals certain parts standing to support the roof of the excavation. The spaces between these piles are called flail-pits.

The bell-pits are employed when the iron-flume lies at some distance from the strata, and where the ground is not sufficiently firm to a set of flail-work. These pits, when first opened, are narrow, but become wider below, diminishing the shape of a bell.

IROQUOIS. See Six Nations.

IROQUOIS, National Myths. Claude Perrault, an unbeliever in the harmony or counterpart of the ancients, tells us, in his "Physical Ellayas," that Louis XIV., near the end of his reign, when some of the Iroquois nation were brought into France, wishing to hear them sing, that he might form some idea of their music, many of the most their wild melodies in unison and octaves, while others accompanied them in grating like pipes; regularly, however, marking the measure by a violent jolt. And thus they attenuated the acute voices by the mixture of the grave grants and rhythmical pulsations of the others.

Perrault imagines, from the description which Caffandros gives of harmony, or singing together, which the ancients called symphony, that Roman harmony resembled that of the Iroquois.

IRRADIATION, signifies an emanation or shooting out of rays, or subtle effluvia, from any body. See EMANATION, RAYS, EFFLUVA, and QUALITY.

IRRATIONAL Numbers, the name as first numbers. See SURD and NUMBERS.

IRRATIONAL Quantities. See RATIONAL Quantities.

IRRATIONAL Soul. See SOUL.

IRRREDUCIBLE CASE, in Algebra, is an expression arising from the solution of certain equations of the third degree, which always appears under an imaginary form, notwithstanding it is, in fact, a real quantity, but the reduction of it to a rational, or irrational finite expression, has at present refuted the united efforts of many of the most celebrated mathematicians of Europe. Every cubic equation may be reduced to the form $x^3 + ax = b'$; and then, according to the common rule,

$$x = \sqrt[3]{\frac{b'}{2} + \sqrt{\frac{b'^2}{4} + \frac{a^3}{27}}} - \sqrt[3]{\frac{b'}{2} - \sqrt{\frac{b'^2}{4} + \frac{a^3}{27}}}.$$ 

See EQUATIONS.

Now, when $a$ is negative, $a^3$ is also negative; and, therefore, when $\frac{b'}{2} > \frac{a^3}{27}$, the quantity under the inferior radical, viz. $\sqrt[3]{\frac{b'}{2} - \frac{a^3}{27}}$, is imaginary; because we cannot extract the square root of a negative quantity; and this is what constitutes that which is generally called the irreducible case. This difficulty soon presented itself to Cardan, after Tartalea had communicated to him his method for the solution of cubic equations, which rule is now commonly, though very improperly, attributed to the former. Cardan informs Tartalea, in a letter dated August 4th, 1539, that he understood the solution of the equation $x^3 + ax = b'$, and also of $x^3 - ax = b'$, when $\frac{b'}{2} > \frac{a^3}{27}$; but when $\frac{b'}{2} < \frac{a^3}{27}$, his attempts always failed; and he therefore begged of Tartalea to clear up his difficulty, by lending him the solution of the equation $x^3 - 9x = 10$. Tartalea was himself perfectly aware of this difficulty, but he was by no means satisfied with Cardan's conduct, whom he at that time suspected to be about publishing as his own the rules he had taught him; and, therefore, instead of giving him an explicit answer, he writes to him in the following terms:—"M. Tirronime, I have received your letter, in which you write, that you understand the rule for the case $x^3 - ax = b'$, when $\frac{b'}{2}$ is greater than $\frac{a^3}{27}$, but when $\frac{b'}{2}$ exceeds $\frac{a^3}{27}$, you cannot resolve the equation; and, therefore, you request me to send you the solution of the equation $x^3 - 9x = 10$. To which, I reply, that you have not used a good method in this case; and that your whole proceed is entirely false. As to resolving you the equation you have sent, I must say that I am very sorry that I have already given you so much as I have done; for I have been informed by a credible person, that you are about to publish an algebraic work, and that you have been bolding through Milan of having discovered some new rules in algebra. But take notice, that if you break your faith with me, I shall certainly keep my word with you, and, if I even affaire to do more than I promised." (Dr. Hutton's Mathematical Dictionary, article ALGEBRA.) Tartalea, however, notwithstanding what he says in this letter, was himself well aware of the difficulty in question, as appears from some of his private memoranda; and from that time to the present, which is near 300 years, the fame impediment remains, notwithstanding the repeated attempts of many very distinguished mathematicians; in fact, there is great reason to suppose, independently of the failure of so many ingenious attempts, that the formula is inexplicable in any other finite form, than that under which it naturally arises by the solution. See EQUATIONS.

Notwithstanding, however, that no analytical solution can be given to the case in question, every equation of this form has three real roots, which are obtainable by other methods, such as by means of a table of sines and tangents, infinite series, continued fractions, and a new method lately published by Mr. Barlow in the Mathematical Repository, which seems by far the readiest and most accurate of any that has been at present discovered; the rationale of which is as follows:

1. Every cubic equation may be reduced to the form $x^3 - ax = b'$, by the known rules in algebra; but when the equation is in the irreducible case, this ambiguous form ceases, and the equation becomes $x^3 - ax = b'$; the solution of which, by the following method, is the same for either sign of $b'$; only when $b'$ is positive, the root first found will be positive, and when $b'$ is negative, the root will be negative also; it will, therefore, be sufficient to consider the case $x^3 - ax = b'$, in which $\frac{b'}{2} < \frac{a^3}{27}$, as we have before seen.

Now, every equation of the form $x^3 - ax = b'$, may be transformed to another dependent equation, in which the co-efficient of the second term shall be unity; that is, to another of the form $y^3 - y = c$. For, if $x = \frac{y}{z}$, then the equation becomes $\frac{y^3}{z^3} - \frac{ay}{z} = b'$; or $y^3 - ay = b'z^3$;

new take $az^3 = 1$, or $z = \frac{1}{z}$; and, consequently, $b'z^3 = \frac{b'a^3}{a}$; whence we have $y^3 - y = \frac{b'a^3}{a^2}$; or putting $b'a^3 = c$, it becomes $y^3 - y = c$, as required.

And the value of $y$ being found in this reduced equation, we immediately obtain that of $x$, in the original one, by means of the expression $x = \frac{y}{z}$, or $x = y \sqrt[3]{a}$.

Now, the original equation being by hypothesis of the irreducible form, the transformed equation must necessarily be fo
IRREDUCIBLE CASE.

Therefore $x = a \pm \sqrt[3]{a}$.

and $x = a \pm \sqrt[3]{a}$ as required.

Ex. 2.—Required the value of $x$ in the equation

$x^3 = 7 + y$.

First $\frac{\sqrt[3]{7}}{x} = \frac{32395954}{3}$.

Next 32396279, 32396279.

As 28568 2 08873 934.

Therefore the value of $y$ is 1.15389294.

and $\sqrt[3]{y} = 1.13389342 \times 2.6345713 = 2.999999999$, as will be found by the operation; which answer is true to the 10th place, the real root being 3, as is obvious from the equation. It will be unnecessary to give any other examples, as the same method is pursued in all cases, and the same accuracy may be depended upon in the results. The reader who will trouble himself to compare the rule here laid down, with any other that has been before given by other writers, will soon be convinced of the immense labour that is saved by the following table; at the same time, that the number of figures in the result are nearly double the few that can be safely obtained by the tables of sines and tangents.

For the method of finding the other two roots after one is obtained, see Equations; for the solution of cubic equations by the inflection of an angle, see Bonnycastle's Trigonometry; and for the method by infinite series, see Philosophical Transactions, vol. lxvii. and lxx.

IRREDUCIBLE CASE.


IRREGORARE, Ital. in Ecclesiastical Music. Modes are called irregular in canto fermo, when the compass is extended beyond its usual limits, or its regular scale is in some unatural manner, violated.

A cadence, or close, used to be termed irregular when the harmony did not close on the key note. (See Disfounded Cadence.) But Ramnau has given this title to a particular cadence of his own system, in which the fundamental base rises a 5th, or falls a 4th after the chord of the 3rd to the 4th of the key. See Cadence.

IRREGULAR, something that deviates from the common forms or rules.

Thus we say, an irregular fortification, an irregular building, &c. See Building, Fortification, Bastion, and Place.

Irregular Figures, in Geometry, is that whose sides and angles are not equal. See Regular.

Irregulars, in Grammar, are such inflexions of words as vary from the general rule, or pattern.

Irregular, among the Caffiirs, is applied to a person who is unqualified for entering into orders, as being a bastard, maid, married, &c. or to an ecclesiastical, who is interdicted, suspended, or confined, and by that means rendered incapable of holding a benefice, or discharging any of the sacred functions.

Irregular Bodies, are solids not terminated by equal and similar surfaces.

Irregular, in the Art of Building, is applied not only to the parts of an edifice which deviate from the proportions established by antique monuments, and confirmed by architects; as when a Doric column is made nine modules high, or a Corinthian eleven; but also to the places and figures of buildings, where the angles and sides are made unequal, as in most of the ancient castles; where, without any necessity or confinement from the situation, they effected such irregularity.

A column is also said to be irregular, not only when it deviates from the proportions of any of the five orders, but when its ornaments, whether in the shafts, or the capitals, are absurd and ill chosen.

Irregular Leap, in Music. See Leap.

Irregular Temperament, or irregular doucezaires, or sytems of twelve notes in the octave, are such as have more than two kinds of tempered fifths, or where the wolf, resulting or bearing fifth, does not fall between G and E, as Mr. Farey has shown in the Phil. Mag. vol. xxxvi. p. 30 and 47. The systems of Lord Stanhope, M. Kirnberger, Mr. Hawke's doucezaires, and many others, are irregular systems; a former division of the systems of temperament used to be into equal and unequal, but as there could be but one equal temperament, such a division answered little purpose; the equal temperament is a regular doucezaire, wherein the wolf is equal to each of the temperaments of the fifths, as shown in the 6th folio, in Mr. Facy's paper above referred to.

Irregular Diatonic Intervals, are such as, when expressed in any notation by three very small intervals, and arranged in a table, do not increase pretty regularly in each of their three terms.

Irregular Measurers, in Mining, are variable measures of strata in thicknefs, sometimes called Girdles (see that article); and according to Mr. William Martin (Outlines, p. 171.) include also strata that take a different direction in their dip from that of their attendant strata: in which latter case, we apprehend, that observers have mostly overlooked some faults which ranges between the irregular strata and their attendant strata, and have detached and altered their positions, or that the strata, or folia (of which this author takes no notice), that often cross beds of fossil oblique to their strata-planes or way-boards, have been mistaken for the latter, as often has happened. Numerous instances of variable or irregular measures have been noticed by Mr. Farey in his Survey of Derbyshire and its Environs, and are particularized in his Agricultural and Mineral Report to the Board of Agriculture, vol. 1. p. 176. 238. 276, &c. Others have been observed by Mr. James Kirk, in Shaw's History of Staffordshire; and in Mr. Weigharth Foster's Treatise on a section of Intra. They are indeed very important geological phenomena.

IRREGULARITIES in the Moon's Motion. See Moon.

Irreplevable Return, See Return.

Irreplevable, or Irreplevable, in Common Law, signifies what may not be reprieved, or let at large upon quarter.

Irrigation, in Agriculture, the art of covering meadow or grafs-lands with water, so as to render them more highly productive and beneficial. It may be noticed, that there are two methods of effecting improvements on lands by covering them with water; one of which is by applying it so as to cover the surface when in the state of grafs or fward; the other by communicating it to the soil of such grounds as have been broken by means of cultivation. The first is the method that has been principally introduced into practice in this kingdom, and which, by a late writer, has been termed the "European practice of irrigation." But though the history of the origin of this means of improvement is involved in much difficulty, and not capable of being early traced; it was probably introduced at a very early period from eastern countries, where the practice of covering the lands with water, in order to protect them from the injurious effects of excessive heat, has prevailed for ages; yet by some it is thought to have been brought to the attention of the farmer in this country in another way, for the benefit of natural floods, to the grafs-lands which they occasionally overflowed, being evident, and in some instances great, the means of producing artificial floods, and of spreading them over lands, not liable in their natural situation to be overflowed, would become, of course, it is supposed, a desirable object. And that as the most obvious effect of floods, or the overflows of rivers and brooks on the lands over which they spread, is that of depositing their feculent particles; whereby operating as a vehicle of manure; it is likewise evident to common observation, that foul waters, as those of floods, let fall their feculenws, most freely, in a flagrant facet. Further, that "it is also equally evident, that the state of stagnation of the waters of floods, or a state that approaches it, is caused by some obstruction of the current below the place of stagnation." And that "from these circumstances being seen, and they could not well be missed by any one who gave the subject a second thought, the means of managing lands with water, artificially, were given: in situations it is meant which would admit of the requisite obstructions." And it is further suggested, that "the bottoms, dyes, or valles, which abound, more or less, in every part of the kingdom, would naturally be the most apt subjects for flooding artificially with foul waters, on the principle of managing the land with their sediment." For on "a bank or dry land, being made across the valley, below the part to be managed, the rivulet which generally accompanies a valley of this kind, especially after heavy rains, the only time when flooding on this principle could be practised, would of course be obstructed; and its waters, fouled, perhaps, with the richest particles..."
IRRIGATION.

particles of arable lands, be spread over the bottom of the valley, to an extent proportioned to the height of the bank, and its own flatsness: a valve or flood-gate being fixed in the bed of the rivulet to let off the waters, when the *wholesale* of their foulnesses were deposited; thus gaining a principal advantage over natural flooding: in which the groser particles only are let fall; the finer, and perhaps most valuable escaping to the river, and thence to the sea, before they be precipitated or let fall upon the land. It is conceived that on these principles, it is evident, some of the meadowlands of the midland districts have formerly been flooded; and that it is not probable, that to evident a method of improving meadow-lands should have been confined to a particular district; but may have been common to other parts of the island. And it is further stated by the same writer, that the *annient* method of enriching grass-lands, by the means of *flagrant* water, could no longer prevail, than until the superior effects of running water, on such lands, were discovered and ascertained. And that this important discovery must have been made by *observation*, on the comparative effects of running and standing waters, in the natural and artificial flooding spoken of above; and must have been ascertained by a long course of *experience*: as it is not likely that *repose* should have had any share in striking out the modern method of improving grass-lands by running water. For even now, when the reality of the improvement appears to be fully established, there seems to be no full or satisfactory *theory* to account for it: though many of the effects thus produced have lately been more clearly explained and better understood, as will be seen below. The *warmth* communicated by running water to the grass it flows over, is one great reason added for the good effect of running water on this sort of land. But even after this discovery was made, and the effect fully established, it would be some length of time before the art arrived at its present high degree of perfection. As it may, in its present state, be safely deemed the most useful and scientific operation, that has entered into the common practice of husbandry. And the memory of the inventor, or inventors, deserves the highest praise and admiration.

It has likewise been remarked, that the great degree of verdure and luxuriance which almost immediately succeeds the occasional covering of grass-lands with water, sufficiently demonstrates the power which it possesses in promoting vegetation: and that it is a means of fertility that has been employed for ages in more warm climates, with the most beneficial consequences in increasing the quantity of vegetable produce. But that although it has been long in use in other countries, and of late more particularly attended to, in this, the principle on which it produces its effects are not yet fully explained.

In considering manner as the nourishment or food of plants, some of the properties of water, that may be beneficial in the vegetable economy when absorbed or taken up by the fibrous roots of plants, have been mentioned; and there are other ways in which it may be advantageous in forwarding the growth of grass herbage when applied over the surface. It is conceived that in climates where the heat is considerable, it may be of much utility, not only by keeping the fine fibrous *roots* of the grass or other plants in a moist putative state, the most proper for the purposes of absorption, but in such a temperature or flux of heat, from the cooling effect produced by the continual evaporation that is taking place near the surface of the ground, as is the most suitable for their healthy and vigorous growth. It is probably in this way that garden plants are principally benefited by the application of water in the hot summer seasons in our own climate: as when the waterings are not constantly kept up injury rather than good is mostly experienced. But that another and more beneficial way in which grasses produce may be immediately increased, and the fertility of the lands more permanently improved in this country by the floating or covering them with water, is from the waters of the rivers or brooks that are turned upon them, containing, either in the state of solution or diffusion, a variety of different sorts of enriching materials which they gradually and evenly deposit upon the surface while they rest upon or slowly flow over it. This must, it is imagined, be the case in all those instances where the rivers or streamslets either at increased waterings, of over beds of chalk, marle, or other calcareous strata: as in their passage they become highly impregnated with the fine particles of these different substances. And where they are fed by the small runlets which receive the waters that proceed from the higher and more elevated lands, they must often, especially after heavy rain, be loaded with a large proportion of fine rich materials of the animal, vegetable, or other kinds, which they deposit in a regular manner in their tardy trickling course over the surfaces of the fields below.

It would appear that waters thus impregnated produce the most beneficial effects, particularly when not in flood, on the lands that are the nearest to the fountains whence they become principally impregnated with their fertilizing principles; as when they have flowed to some distance they have, in a great measure, deposited and left fall such enriching substances, and are become too pure for affording advantage in the way of deposition. It is only in the time of floods that they can produce much utility in this way at any great distance. It was found by an able philosophical writer, Dr. Darwin, that the water of the Derwent, though it flows for several miles near Matlock, through calcareous strata, contained no impregnation of this fort on its reaching Derby, although the springs in that neighbourhood had a large proportion of it in their composition. And the same author has ingeniously suggested another mode in which water may prove serviceable in floating grounds in this climate, which is that already stated of protecting the grass or other plants from the too severe effects of cold during the winter, or early spring season. In this view it is observed, that the water of strong springs, which in this country have constantly the temperature of forty-eight degrees of Fahrenheit's thermometer, is to be preferred to that of rivers, where it can be procured in a sufficient proportion, as the degree of cold in these is in the same ratio with that of the atmosphere, till it declines to the freezing point, or that of thirty-two. Though both, when spread out, forming a thin sheet of ice on the surface of the land, are beneficial in defending the roots of the grass plants from too intense degrees of cold, and of thus preserving them in a more healthy condition; and it is added, that those of some forts of grasses are fupposed even to vegetate beneath the ice, as the reindeer mose in Siberia mostly vegetates beneath the snow, in a degree of heat of about forty, which is the medium between that of the inferior surface of the dissolving snow, or that of thirty-two, and that of the common heat of the internal parts of the earth, which is forty-eight; and in this manner the grasses produce in this cold country be considerably increased, so as, under proper management, to nearly double the usual annual quantity under other circumstances.

In further illustration of these principles it may be observed, that the water issuing from springs where they abound with particles of gravel, or a flat, mouldering kind of rock, containing a large proportion of calcareous earth, are known from experience to be better adapted to the purpose
pose than that which arises from others that do not contain such materials. The difference in the effects, often so vividly produced, has been accounted for, from watering one field from a spring issuing out of a chalky soil, over whose which take their rise in another, similar in every respect and management, except that the water applied arises in, or flows through, a swamp or morass, composed chiefly of peat earth, or proceeds from situations known to contain none of these substances. However, the fact is unquestionably established, that the water of rivers which run through comparatively level and fertile countries, is not only better than that of such as have their courses through mountainous, unproductive tracts, but superior to all others, as every different dreamlet adds a new accession of fertilizing materials, which, being dispersed over the surface of the meadows, in their fine and attenuated state, cannot avoid adding a considerable degree of improvement to the lands.

It is conceived by Mr. Marshall, that if the art, as it now stands, were struck out on principle, it must have been on that of animal circulation; to which the operation of meliorating gras-land, with water, through the means of floats and drains, is perfectly analogous. The floats are arteries, conveying the circulating fluid to every part of the subject, imbuing every atom: the drains, veins, collecting the scattered fluid, and conveying it back to its natural channel. But that, in a figurative language, the floats may be considered as trenches, receiving, by the means of flood-gates, as occasion requires, the water of a river, brook, or rivulet, and conveying it along the upper margin, and upon the tops of the natural or artificial swells of the field of improvement—the drains, counter-trenches, stretching along the lower margin, and winding in the ditches and hollows, to receive the waters spread over the surface by the floats.

Each set of trenches, whether of floats or drains, bears more or less resemblance to a tree, with its trunk and branches; the branches of the floats increasing in number, and diminishing in size, as they proceed from the river or other source: those of the drains, on the contrary, diminishing in number, and increasing in size, as they approach the receptacle or place at which the water is to be discharged. And it is further remarked, that when the water is at work, as it is properly enough termed, the entire surface, supposing the operation to be perfect, is covered with one continued sheet of living water, pouring slowly and evenly over every part, an inch or more deep. If the grass be very short, the water is seen, and has a beautiful as well as a profitable effect: if not, it steals, unseen, among the herbage, or flows in, if, partially: it being imperceptible, in practice, to render the sheet throughtout of uniform depth or thickness, as it must naturally pass off quicker in some situations than others.

From this general idea of the method of watering gras-lands, on the modern principle, it is clearly shown that a dead flat, a perfect level, is, of all others, the least adapted to the practice. A perfect level, however, seldom occurs in nature; inequalities, sufficiently to promote a circulation of water on the turfy surface, may generally he discovered, if judiciously sought. In the midland counties, Mr. Marshall has, in the practice of a superior manager a beautifully simple expedient practised, to find out the inequalities of a piece of ground nearly flat: which is that of covering it with water, and preserving the level by the means of levelling pegs, hillocks or piles driven down in various parts to a level with the surface of the water; so that, after the water was let off, the level still remained. The parts last covered were, of course, the proper ground for the floats; the parts last freed for the drains; art being used, where wanted, to give additional advantage to the natural inequalities which may be present. But situations in general (water-formed lands excepted), abound, he thinks, sufficiently with inequalities of surface: either natural, as the swells and hollows of lands, lying out of the way of floods, and having never been ploughed; or artificial, as those which have been raised by the plough into ridge and furrow: in this case the ridges receive the floats, the furrows the drains: in that, the platnum is the guide to the floats; the water they throw out, to the drains or cuts to be formed.

The same writer adds, that, in the above district, he has seen the site of a hill watered with rain-water, from a road running along the top of it: the same trench, in this cafe, acting as float and drain, running a zig-zag along the face of the slope, the lower falls, bringing the water spread out by the upper; and that he has likewise observed several instances of ridges and furrows being watered from similar sources. In these cases, whether the natural defect of the lands was little or great, the floats were opened upon the ridges with clods of turf cut out of the trenches, placed at distances proportioned to the defect, to check the current sufficiently, to force the water out of the trench above, yet leaving it a sufficient passage, to suffer it to carry down a supply to the parts below. He has also met with one or more inlets in which ridges and furrows have been levelled at an excessive cost, by paring off the turf, throwing down the ridges by hand, and replacing turf, giving the surface one regular gentle declivity; and this, notwithstanding it is allowed by those who may be bolder in matters in the art, that the quicker the circulation the more beneficial the effect. Upon the whole, it appears pretty evident, that the operation, though scientific, can seldom be rendered mechanical. Straight lines and plain surfaces can seldom be had, but at a great, and, frequently, an unnecessary expense. The given situation of the ground should be consulted and maturely studied before the work be let about. Every case may be said to require a different arrangement of trenches. Of course, no man ought to set about a work of so difficult a nature until he has studied its principles, and made himself master of its theory; nor then, without the affilience of practice in himself, or others whom he can employ for the purpose.

It is conceived that to expiate on the utility of watering gras-lands would be a waste of words. In situations where a sufficient supply of water, of a fertilizing quality, can be commanded at all seasons, it ranks indubitably among the highest classes of improvements. Much, however, it is supposed, depends on the quality of the water; not on its colour or清澈, but the specific quality of the suspended particles. Waters, in their natural state (not purified by distillation), more especially spring waters, though perfectly transparent and pure to the eye, are as various in quality as foils, owing to earthy and other particles being suspended in them imperceptibly to the eye, requiring the aid of chemist to detect them; hence hard water, sweet water, wholesome waters, medicinal waters, &c. The effects of clear spring water have been found strikingly evident in various cases of this sort of management in different places in this country.

But although very much depends on the quality of water for the purpose of meliorating gras-lands, much also depends on the quantity; on having a sufficient supply at all seasons. With this there are, perhaps, few waters which might not be rendered beneficial to gras-land, if thrown over it at proper seasons, and in proper quantity. Without it, the benefit, it is possible, may not be adequate to the expence. The most obvious advantage of watering gras-
IRRIGATION.

Lands, it is conceived, arise in a dry season; and if the supply fall in such seasons, as frequently happens in many situations, the intention is in part frustrated; the winter and early spring waterings being in this case all that can be commanded for the purpose. This is given by way of caution; not as a discouragement to the practice. There are, it is well observed, in this island, situations immeasurable, in which the advantages arising from the practice, properly conducted, would far exceed the expence of obtaining them; and to ascertain them is an object of the first magnitude to the owners and occupiers of grass-lands, and in many instances, probably in those of the arable kind likewise.

Hence it may be safely concluded, that this mode of improving grass, or other lands, where it can be had recourse to, is of the greatest importance, and of the most valuable kind; and it is probably capable of being applied in a greatly more extensive manner than has yet been the case, by the persons employed in conducting the business fully availing themselves of the various occasional falls of rivers, streams, and, in particular seasons, of canals, as in this way water may often be provided for the purpose of distributing over extensive tracts of land that have hitherto been thought incapable of admitting of such means of melioration and improvement. In other circumstances and situations, by having recourse to damming up the water, and the occasional use of wooden pipes in the conveying it where necessary, it may be easily raised to heights sufficient for conducting it over many elevated lands, and by such means promote their vegetation and produce to a degree that cannot be easily calculated or conceived.

And, from what has been already done in this way, it is evident, that, on heathy moors, and other mountainous tracts, it may often be applied with the prospect of great advantage. In traversing such hills, instances are daily occurring of little rivulets or rills, which are insufficient to form a regular course, spreading their waters on particular parts, and thus providing a most beautiful verdure; which affords sufficient proof of what may be effected by the judicious application of water in such situations. The same principles may be applied, in many situations, in conveying the rich liquor collected in ponds and reservoirs about the farm yards and buildings, that are too frequently wasted by evaporation or other means, over the adjoining fields, as has been practised in Cheshire by Mr. Fenwick.

To this system of improving grass-lands, the chief objection is, the first expence of the work; but if it be conducted in a judicious manner, and by persons acquainted with the business, this will seldom be so considerable as is commonly supposed, or form any material impediment; as the increase of produce, which is almost immediately the consequence, will amply repay the improver. It has been objected to by some on the ground of cutting the land, but this is of little consequence if additional supplies of food be thereby afforded for the support of live stock, and the gradual improvement of the soil at the same time effected.

It may be debated that winter and spring are the two seasons when grounds of the grass kind are usually irrigated or watered, as from the month of November till the beginning of March. The experience of the operator will, in a great measure, regulate this proceeding as to the length of time they should remain under water. In some districts it is the practice to allow the water to flow over the fields for several weeks together, with only the interval of a day or two occasionally; while in others the custom is to cover them alternately each other week. When frosts set in, the work is usually suspended; but it has been remarked, that in such cases the succeeding crop of grass is less plentiful. As the spring season advances, much less floating is found to be requisite. However, in every case where floating is performed to advantage, the land should be laid dry between every time of covering it with water.

It has been advised in the beginning to lay the water on in the early part of November, suffuring it to overflow from 10 to 14 days, and then taken off; repeating the same process in the two following months; giving in February also two waterings of from five to seven days each; and in March three, of from three to five days each, according to the state of the weather, constantly permitting the water to continue longer upon the land in cool than warm weather; and it is likewise generally advised, that on the sandy, gravelly, and drier kinds of lands, the water should not remain so long at a time as in those of the heavier kinds; and in the latter forts, Mr. Wright considers three weeks as long enough; but Mr. Bofwell thinks it may continue on a month, or even six weeks in the first waterings, about November, and a something shorter time for those of the former fort of lands. Mr. Wright also recommends, in December and February, the land to be let dry, for the purpose of air for a few days, and that in February particular attention is necessary, not to permit the water to flow over the ground many days together, without being taken off, as there may be danger from white scum being formed; and by the land being left exposed to frost in its wet state, it may be injured that way. These inconveniences, it is supposed, however, by Mr. Wright, may be avoided by taking the water off the day in the way, and turning it upon the lands only during the night time. But Mr. Bofwell, who has had extensive experience in this way, does not seem to apprehend any danger from this circumstance to the land.

Towards the beginning of the spring, as about March, and sometimes sooner, there is mostly a sufficient bite of grass to admit the lands to be fed by flocks. The water should in this case be turned off for a fortnight or more, in order to give it a sufficient degree of firmness before the animals are turned upon it. During the following months, it is observed that the grazes may be eaten close, but not later; as continuing it even for a few days in May would greatly injure the hay produce which is to be obtained, both in quantity and quality. In this month, when the grass has been fed down, the water should, according to Mr. Wright, be again turned over the lands for a few days, by which they are so moistened as to produce a full crop of hay. It is not improbable but that, with less close feeding, two crops of hay from such watered lands might frequently be taken with benefit. It is remarked by this writer, that the first crop of hay from watered lands, when cut sufficiently early, is equally good with that of most other forts, but that when let stand too long, it becomes coarse and unfit for the purpose of fodder.

A late philosophical writer has suggested, that where the flooding of lands is continued some time, the water should only be suffered to trickle or flow over it gently from the higher parts, and not flagrantly upon it; as, in the latter case, the grass roots are soon destroyed in the spring, and that when such materials begin to decay underneath the water, a white scum arises in consequence of the air set free by the beginning putrefaction, which has been suspected as prejudicial to the grass, but which is rather the effect than the cause of the mischief, and demonstrates that the water has remained too long in a flagrant state upon the ground, and requires to be removed, or to have a fresh supply from the stream; but the former is probably the better practice. The necessity of continuing the irrigation,
IRR

or watering of land, after it has been once begin in hot
climates and seafons, has been already shewn, and it is sugg-
ested that there may be injury done to the grafs plants by
the sudden application of much water under such circumstances
in some cases.

It is usefully inculcated by a late writer that, before any
serious expence is incurred in works of this kind, the nature
and effects of the water that is to be employed should be
fully ascertained by the establishment of trial grounds, which,
if it be proper and beneficial for the purpos, will be shewn
by the superiority in the growth, verdure, and general ap-
pearance of the grafs towards the latter end of March, or
the beginning of the following month. The quantity of
water, as well as the extent of ground that can be covered by it much
likewise be jointly taken into consideration before any im-
provement of this fort can with propriety be undertaken.

And in every instance it is advised that due estimations, and a
calculation of profit, be formed on the following principles.
First calculating the probable advantages that may arise every
year from hay and pasturage, and an annually increasing
supply of manure and dung; then taking the interest at six
per centum on the estimated colt of the works that may be
required to produce them, together with the amount of the
estimated annual expence of labour, and necessary re-
pairs.

A great number of interrelling instances of successful irri-
gation, or application of water over lands, in the midland
districts, have been related by the same author. And in this
cafe, as in many others, Mr. Bakewell finds this an im-
prover of grafs-lands. It is flated that, formerly, a fuit
of meadows, lying by the banks of the Soar, received con-
ferable benefit from the water of the river being spread over
them judiciously in the time of floods. But now, not only
these meadows, but near an hundred acres, he believes, of
higher lands lying entirely out of the way of natural floods,
are watered on the modern principle.

And it is remarced that the ingenious improver just noticed,
like a man of experience in buifiness, before he let about this
great work, studied the art in the principal fce of prac-
tice, the well of England, where he fpent fome days with
the ingenious Mr. Bofwell, who, not many years ago, pub-
lifhed a tratife on the subject. And that the great Ifroke of
management in this department of his practice, which marks
his genius in strong character, is that of diverting to his
purpofe a rivulet or small brook, whole natural channel flirs
the farther boundary of his farm, falling, with a con-
derable defcent, down a narrow valley, in which its utility, as
a fource of improvement to land, was confined. This riv-
ulet, being turned at the highest place that could be com-
manded, and carried, in the canal manner, round the point of a
fwell, which lies between its natural bed and the farmery:
by the execution of this admirable thought, not only com-
manding the flirts of the hill, as a fource of improvement by
watering; but fupplying, by this artificial brook, the house
and farm-offices with water: filling, from it, a drinking-
pool, for horses and cattle; a wash-pool, for sheep; and
converting it into a multitude of other purpofes: acqui-
sitions which, Mr. Marshall fays, many other circumftances in
the island are capable of affording. One of these purpofes is
worthy of being mentioned as deferving the attention of the
practical farmer. After endeavouring to invent a flat-bot-
tomed boat or barge, to navigate upon this canal; for the
purpofe, moft particularly, of conveying his turnips from the
field to the cattle-sheds; and finding it not easily practicable,
his great mind struck out, or rather caught, the beautifully
simple idea of launching the turnips themselves into the
water; and letting them flow down fingly with the current.

"We throw them in," says he, "and bid them meet at
the barn's end!" in which circumftance he was then (October,
1789) contriving a refervoir, or dry dock, for them to fall in:
with a grate at the bottom, to let out the water, and
retain the turnips; which will there be laid up, clean washed,
and freight-free, as a supply in ftrong weather.

The improvements effected in this department of rural
affairs, by this able improver, are, it is obferved, not only
extensive, but highly interellng, and are rendered the more
ftriking, by "proof pieces," (a good term for experimental
patches,) left in each leme of improvement.

In the art of irri gating or watering grafs-lands, on the
modern principle, Mr. Paget, of l/bitock, is also mentioned.
This manner, it is flated, cuts a considerabie quantity of
hay, annually, from lands which have received no other ma-
nure than water, during the left forty years. A flinking
incidence, it is suppos'd, that water is not merely a stimulant
or force, as fome men conceive it to be, but communicates fome
real nutriment to the herbage or grafs plants. In the prac-
tice of this improver, one circumftance occurred, which
ought to be mentioned by way of caution. He found that
in watering an orchard with the washings of the drefet and
yards of a neighboring village (a defirable species of water)
the fruit-trees were greatly injured. A fimilar circum-
fstance also took place in the practice of Mr. Bakewell. It is
well known that surface water is in all circumstances highly inju-
rious to fruit-trees of the apple kind. Also, near Appleby,
in Yorkshire, Mr. Moor has executed a confiderable work on
this kind in a judicious manner, cutting a fresh channel on
one fide of the fite of improvement, for a rivulet which
wound through its middle; in order to prevent its overflow-
ng at an improper fenton; and converting the old channel
(partially filled up) into a main float; an expedient which
may be frequently practifed with good effect, in different situa-
tions. The fame species of improvement has likewise been car-
ried on with much fpirit and fuccefs by Mr. Wilks of Me-
efham; and in other inftances the practice has not been atten-
ded with lefs fuccefs, though under different circumftances.

According to the agricultural survey of the county of
Devon, Mr. Temple, of Stover, has experienced from this
method of husbandry very confiderable beneficial effects on a
tract of marly land on the borders of his canal. It had for-
merly produced from five to ten thilings an acre. After
having it drained and levelled, by forming conduits for the
overplus water of the canal during the winter floods, and
distributing it by well arranged fluces, so as to throw the en-
riching particles upon the surface, he converted these marlles
into valuable, verdant meadow-land. The method that was
adopted in condueting the distributing fluces was by having
a number of trunks placed at various distances, to each of
which a plug was fitted, and when the flood foled the

canal above the level require for navigation, the plugs were
taken out, and the water immediately overflowed the surface
of the meadow-lands, being at any time capable of being
caully restrained by replacing the plugs: similar fuccefs is
likewise allracted to have attended a like proceed on lands in
the upper line of the canal.

Besides thef, in Yorkshire, Cheenef, Wales, and the
more northern parts of Scotland, as well as in the different
districts in which the practice of irri gation has been long com-
mon, various improvements have been effected by the appli-
cation of water to the surface of grafs-lands, which will be,
particularly noticed under the proper head, and also the moat
approved methods of accomplishing the buifiness under dif-
ferent circumstances of soil and situation. See Watering of
Lands.

IRRITABILITY, in Phlyctere, denotes, in its most ge-

eral,
neral sense, the capability of being irritated or excited, or that property by which living parts are enabled to execute their functions: when thus employed, it is synonymous with excitability, and may be regarded as denoting the most characteristic peculiarity of living matter. It is very commonly employed, in a more limited acceptance, to express the property by which muscles are enabled to contract, either in obedience to the will, or to any mechanical or chemical stimuli. In either case, this word is to be understood as signifying merely a property of living bodies, the real nature of which is as entirely unknown to us as that of attraction or chemical affinity. All the speculations which have been entertained on the subject of its nature, supposing it to be a peculiar subtle matter like thou (whole existence, be it observed, rests also on supposition) of electricity common or Voltaic, of magnetism or light, or considering it as identical with oxygen, may be dismissed without any formal refutation, as they are completely gratuitous assumptions. See Life, Muscle, and Nerve.

IRRITATION, in Medicine, signifies a state of feverishness and inequidity, in which the functions are impeded, and the strength gradually impaired, arising either from internal or external causes, but principally from the former. It is synonymous with the erethimos, in Greek, of the Greek writers. Irritation is produced, in different influences, by extraneous substances in the cavities or organs of the body, as calculi in the bladder, kidneys, or ureters; worms in the stomatch or intestines, &c.; or by chronic disease in the vificera, such as feirrhux of the liver, of the meenteric glands, &c.; or flow inflammation in any part; or by the prevalence of any depresing passion, as grief and anxiety; or by long watching; and various other causes. In febrile diseases, from whatever origin, a state of irritation is more readily produced; i.e. the same stimuli which excite little effect in the state of health, tend to aggravate the feverish symptoms, such as external heat, strong light, noises, muscular or mental exertion, and the like: whence, in every fever, whether idiopathic or symptomatic, the removal of every source of irritation is an indication constantly to be kept in view.

IRRSUMIT, in Geography, a town of East Greenland. N. lat. 61° 10'; W. long. 45° 35'.

IRSOA, a small island near the coast of Portugal, on the south side of the mouth of the Minho. N. lat. 41° 50'; W. long. 8° 36'.

IRTISCH, or IRTISH, a river of Russia, which rises in the Chinicle Scogoria, flows through the lake Norfisian, in N. lat. 46° 30', then enters the Russian territory, and after meandering through a large tract of country, throws itself, in N. lat. 61°, and E. long. 56°, into the Oby. In its way it takes up several smaller rivers, and forms several islands, of which some occasionally disappear, and their places are supplied by others; and the intervals in which it is navigable are perpetually changing. Its water in the inferior regions is whitish and light, so that it should seem to flow over a bottom comprising chiefly of calcareous marle. It swarms with fish, and its surgeons have a peculiar delicate flavour.

IRVINE, or IRWINE, a sea-port town and royal borough in the bailiwick of Cunningham, and county of Ayr, Scotland, is seated on the northern bank of the river Irvine, the eulogy of which forms the harbour. On the southern side of the river is a row of houses uniformly built; and these, with others, are hamlets to the parish of Dundonald. The town appears to have been chartered at an early period; for in a grant from Alexander II., reference is made to previous charters. The magistracy of this town had formerly extensive jurisdiction, but this has been abridged; but it still derives an ample revenue from a large tract of land near the town. Here is a commodious harbour, which has 10 or 12 feet of water on the bar at springs. Several vessels, called bulges, were formerly employed in the herring-fishery: at present the coal-trade is the chief object with the inhabitants. Above 24,000 tons have been shipped from this port in one year. Attached to the town is a dock-yard for ship-building, a large tan-yard, rope-ground, and a bleach-field. Many of the inhabitants are also engaged in the manufacture of carpets, muslins, silk, lawns, and other articles. In the year 1800, the town contained 760 houses, and 4594 inhabitants; though its population was estimated, in 1790, at 4700. The town is 61 miles W. by S. from Edinburgh. The church is described as a prominent object of beauty and interest in the town. Bowtree hill, in the vicinity of Irvine, is a seat of the honourable Mr. Hamilton; and near it is an old castle, belonging to the earl of Eglintown, who has a seat in the neighbouring parish of Kilwinning. In the parish of Irvine it is said that a religious sect called Buchanites, from the name of the founder, had its origin. Sinclair's Statistical Account of Scotland, vol. vii. p. 169, &c. by the Rev. James Richmond.

ISA, in Hindu Mythology, one of the thousand names of Siva, the personification of the destructive or regenerative power of the deity. (See Siva.) With the epithet Mahâ, or great, prefixed, Mahâsa is formed, another of Siva's names. In this form, the name of his consort or fakii (see SAKTII) is Ii. Under these names Sir William Jones recognizes the Ofirs and Iis of Egypt. Iiwarâ seems but another mode of writing and pronouncing Ia; and the deducition of Ofirs from that found is no strained etymology, especially when confirmed by many historical and characteristic coincidences. Ia and Ii are both personifications of the moon; for with the Hindus, that luminary is both male and female: and here we find Parvati (of whom Ii is only another form and name) again corresponding with the Diana of the Greeks, one of whose names is Luna.

ISAAC, in Scripture Biography, the son of Abraham and Sarah, was born at Gerar, in the country of the Philistines, B.C. 1866, when his father was 100, and his mother 90 years of age. His birth was previously announced to Abraham, as the son of covenant and promissie, in whose seed all the nations of the earth should be blessed. His name, according to its Hebrew etymology, which denotes "he has laughed, or shall laugh," expresses the pleasure with which his parents received the prediction of his birth, and angred the honour that awaited his posterity. A circumstance, however, occurred, which tended to abate their joy; and this was a divine command to offer Iaac as a sacrifice. (See ABRAHAM.) At the age of 40 years, Iaac married Rebecca, the daughter of Nahor, Abraham's brother; and by her he had two twin-sons, Esau and Jacob. (See their articles.) This venerable patriarch, for whose history we refer to the book of Genesis, ch. xviii.-xxxv., died at the age of 180 years, B.C. 1716, and was buried with his parents in the cave of Machpelah.

ISAAC I. COMENIUS, in Biography, emperor of the East, son of Manuel, was the first of the noble family of Commeni who arrived at the imperial throne. Iaac and his brother John were bequeathed by an affectionate father, confidens of his own defects in the service of his country, to the gratitude and favour of his sovereign. The noble youths were carefully trained in the learning of the times, the arts of the palace, and the exercises of the camp; and had become extremely popular with the people and the army. On the ele-
vation of Michael VI., the discontent of the folkyria was
openly manifested. The generals, who confedered them-
selves infall by the election of Michael, secretly assembled
in the fastty of St. Sophia, and would have chosen the
venerable and valiant Catacalon, if the modesty of the
veteran had not suggested the importance of birth as well
as merit in the choice of a sovereign. Upon his refusal of the
dignity, Isaac Comnenus was approved by general consent.
Comnenus, then, in Paphlagonia, soon learnt the decision of
the military fynod; and invested with the imperial insignis,
marched to Nice, which he took by surprize; but being en-
countered in the neighbourhood of that city by Michael’s
generals, he entirely defeated them, and proceeded to
Constatinople. The dethroned emperor resigned his dignity,
and retired to a monastery; and Isaac was solemnly crowned,
September 1, 1057. His short reign was undisturbed by
foreign enemies; he fell into a declining state of health,
which took as an admiration to retire from the world.
John, whom he would gladly have invested with the im-
perial purple, refused to accept the toil, and it was con-
ferred upon Constantine Ducas; and Isaac ended his reign
of two years and three months in a monastery. Isaac in
a great measure recovered his health, and survived two years
his voluntary abdication. At the command of his abbot,
he observed the rule of St. Basil, and executed the most
fervile offices of the convent; but he was gratified by the
frequent and respectful visits of the reigning monarch, who
revered in his person the character of a benefactor and
ISAAC II. ANGELOS, emperor of the East, was raised
to that dignity by the fall of Andronicus, the laft of the
Commenian family who reigned at Constatinople. The re-
volution which hurled him from the throne, faved and ex-
alted Isaac Angelus, who defended by the female line from
the fame imperial dynasty. “The successor of a second
Nero,” says the historian, “might have found it an easy
task to deferve the eftem and affiflion of his fubjects;
nevertheless they fometimes had reafon to regret the ad-
miniftration of Andronicus.” Isaac abandoned himfelf to
frivulous amufements and luxurious indulgences, and op-
prefed his people by the lavish expenses of his household.
“Isaac,” fays Mr. Gibbon, “fept on the throne, and was
awakened only by the sound of pleasure; his vacant hours
were amufed by comedians and buffoons, and even to thee
the emperor was an object of contempt: his feals and
buildings exceeded the examples of royal luxury; the num-
er of his eunuchs and domestic fervices amounted to twenty
thousand.” His generals were fuccesful in expelling the
Sicilian invaders; but Isaac disgraced himfelf by the cruelty
with which he treated the captives. Constatinople was
besieged, and the weak emperor put all his truft in an image
of the Virgin Mary, and the prayers of the monks. A re-
volt of the Bulgarians proved a lafling injury to the empire;
and it became neceffary to fuffer them to eftablitb an inde-
pendent kingdom. Isaac drew upon himself various acts of
hostility from Frederic Barbarofla, who was the friend and
ally of the Crusaders. At length the peridy of his own
brother Alexius was more fatal to him than foreign violence.
In 1195, he feized upon the throne, during the abfence of
Isaac on a hunting party; and obtaining poifon of his
perfon, deprived him of his fight, and flung him up in a
lonefome prifon. His fon Alexius efcape, and engaged the
western powers in his behalf; who, in 1203, took Con-
fiatantinople, and replaced Isaac upon the throne in conjunc-
tion with his fon. Another revolution, in 1264, effected
by Alexius Ducas, deprived them of their feat; and the
death of Isaac very foon followed, or perhaps preceded,
ISAAC, Henry, a German composer of great renowm in
Italy, during the fifteenth century, under the name of
Arrigo Tedesco; by which title he is celebrated by Poli-
tian. Quadrio, tom. ii. p. 321, says that he was maeftro
di cappella of the church of San Giovanni, in Florence;
and that who, in different ballad-airs, set the songs of
Lorenzo il Magnifico, in three parts, for a proceffional
masquerade. Fe flourished about 1475. Glareanus, in his
“Dodecachordon,” says that “Henry Isaac chiefly cul-
tivated the church fyle; and in his works may be perceived
a natural force and majesty, superior, in general, to any
thing that can be found in the compositions of our times;
though his fyle may be faid to be somewhat rough. He
was fond of long notes in one of his middle parts, while
the reft of the voices were in a manner playing round it, as
the wind plays when it puts the waves in motion round a
rock.”
ISABAD, in Geography, a town of Perfa, in the pro-
vince of Irac; 50 miles S. of Hamadan.
ISABE, a town of Japan, in the inland of Niphon; 50
miles N.W. of Jedo.
ISABELL, St., one of the iflands of Solomon, in the
Pacific ocean, 200 miles in circumference, S. lat. 7° 30',
about 160 leagues weft of Lima, discovered by Mendana
in 1567. The inhabitants are cannibals, and worship fer-
pents, toads, and other animals. Their complexion is
brown, their hair woolly, and they wear no covering but
round their wait. They are divided into tribes, and are
contantly at war with each other.
ISABELLA, in Biography, queen of Cathile, born in
1471, was the daughter of John II. She passed the early
part of her life in great obfcurity, and without any proceffs
of a crown; but the Cathilians having confpired againft her
brother Henry IV., obliged him to declare Isabella heirs to
the kingdom. In 1469 the married Ferdinand king of
Arragon; and upon the death of Henry in 1474, they were
conjointly declared king and queen of Cathile. They were
proclaimed at Segovia, amidst loud acclamations; and the
fidelity of their new fubjects enabled them to defeat all the
defeins of their enemies, who had declared in behalf of
Joanna, the fupposed daughter of Henry. Alphonfo IV.,
king of Portugal, efponed the perfon and the cause of the
latter, and took up arms in her defence and his own. The
defeat at the battle of Toro, in 1475, was fatal to his pre-
tensions; and by a peace concluded in 1479, the right of
Isabella and her husband was fully acknowledged, and
Joanna retired into a monastery. In this fame year, the
crown of Arragon fell to Ferdinand; and from that period
the kingdoms of Cathile and Arragon were infeperably
united, comprifing the whole of Spain not poifofled by the
Moors. (See FERDINAND.) Religious zeal was a leading
feature in her character; and the defire of propagating the
Christian faith in parts of the world where it was yet un-
known, was the chief motive of the encouragement she gave
to the projects of Columbus, which eventually added so
much to the Spanish monarchy. Her merits towards the
church were rewarded by the title of “The Catholic”
conferred by Innocent VIII. on both the royal partners,
and their successors in the Spanish crown. Isabella died
with the great regret of her fubjects, in November 1504,
in the 43d year of her age. Univer. Hift. Robertson’s
Hist. of America.
ISABELLA, in Conchology, the name given by the French
naturalists.
naturalise to the beautiful pale-brown voluta, so much esteemed in the Dutch cabinets.

Isabella, in Geography, a small island near the coast of Brazil; 25 miles S.W. from the mouth of the river St. Francisco.—Alto, a town on the north coast of the island Hispaniola, built by Christopher Columbus in the year 1493. N. lat. 18° 54' W. long. 73° 0'. Isabella Point forms the N.E. side of the bay of the same name. Here Columbus formed the first Spanish settlement, naming it after his patroness Queen Isabella. He was driven hither by a tempest in the night.

Isabella, St., a town of Brazil, in the government of St. Salvador, near the coast. S. lat. 17° 10'.

A genus of smooth grasses, growing in wetty places. Leaves flat, their sheaths bearded at the top. Flower panicled. —They have great affinity to Panicum, and the aspect of P. coloratum. It appears by Hermann's herbarium that his Memeritana, Fl. Zeyl. 24, is of this genus.

Isokus, in Biography, an orator of Chalde, in Euboa, who flourished about the end of the Peloponnesian war, the fourth century before the Christian era. When he came to Athens, he put himself under the instruction of the orator Lyfias, from whom he obtained the fame purity, accuracy, conciseness and perfticuity of style, which distinguished his matter, with more force and vigour. He was celebrated for popular eloquence, and had the honour of being the instructor of Demophenes. It has been said that he was disfigured in early life, but that as he attained to years of maturity, he became illustrious by the practice of the opposite virtues. He lived to the time of king Philip. He was author of sixty-four orations, of which ten only are now remaining, which are to be found among the Orators veteres Graci. These have been translated by Sir William Jones, and were given to the world in 1779. There was another Greek orator of this name, who came to Rome in the first century of the Christian era, and who is mentioned with great applause by Pliny the younger, who observes that he always spoke temperately, and wrote with elegance, unlaboured cafe, and great correctness.

Isago, in Geography, a country of Africa. N.W. of Benin.

Isagon, in Geometry, is sometimes used for a figure consisting of equal angles.

Isaiah, or the Prophecy of Isaiah, a canonical book of the Old Testament. Isaiah is the first of the four greater prophets; the other three being Jeremiah, Ezekiel, and Daniel. This prophet was of royal blood, his father Amos being brother, as some have said, to Azariah, or Uzziah, king of Judah.

The first appointment of Isaiah to the exercise of the prophetic office is supposed to have taken place in the last year of Uzziah's reign, or 758 B.C., at which time he is supposed to have been about 25 years of age; and if he lived to the reign of Manasseh B.C. 696, by which order, according to a tradition of the Jews, he was born in 1852 A.D., the duration of his office must have extended to 61 or 62 years. But this Jewish tradition is uncertain; and one of their principal rabbins (Aben Ezra, Comm. in II. i.) seems rather to think that he died before Hezekiah, which opinion is received as the most probable. It is certain, however, that he lived at least to the 15th or 16th year of Hezekiah; and this makes the least possible term of the duration of his prophetic office, about 47 or 48 years; so that he prophesied in the reigns of Uzziah, Jotham, Ahaz, and Hezekiah. The time of the delivery of some of the prophecies is either expressly marked in, or easily deducible from, the history to which they relate; that of a few others may, with some probability, be inferred from expressions, descriptions, and circumstances interwoven in the predictions themselves. The prophecy contained in the first chapter stands singed and unconnected; and contains a severe reproof against the corruptions prevailing among the Jews of that time; powerful exhortations to repentance; grievous threatenings to the impenitent; and gracious promises of better times, when the nation shall have been reformed by the just judgments of God. The expreffion is upon the whole clear; the connection of the several parts easy; and in regard to the images, sentiments, and style, it gives a beautiful example of the prophet's elegant manner of writing; though perhaps it may not be equal in these respects to many of the following prophecies. The prophecy contained in the second, third, and fourth chapters, makes one continued discourse. The five verses of the second chapter foretell the kingdom of the Messiah, the conversion of the Gentiles, and their admission into it. From the 6th verse to the end of the 2d chapter, it is foretold the punishment of the unbelieving Jews for their idolatrous practices, their self-confidence and distrust of God's protection; and moreover the destruction of idolatry, in consequence of the establishment of Messiah's kingdom. The whole third chapter, with the first verse of the fourth, is a prophecy of the calamities of the Babylonian invasion and captivity; with a particular amplification of the diverts of the proud and luxurious daughter of Zion. Chapter iv. 2-6, promises to the remnant, which shall have escaped this severe purgation, a future restoration to the favour and protection of God. The prophecy was probably delivered in the time of Jotham, or perhaps in that of Uzziah. The 5th chapter is unconnected with that which precedes, and with that which follows it; and the subject of it, like that of the first chapter, is a general reproof of the Jews for their wickedness; but it exceeds that chapter in force, in severity, in variety, and in elegance; and it adds a more express declaration of vengeance, by the Babylonian invasion. The vision in the 6th chapter seems to contain a solemn designation of Isaiah to the prophetic office, and it is therefore thought by most interpreters to be the first in order of his prophecies. Bishop Lowth, however, conjectures that this may not be the case; because Isaiah is said to have prophesied in the time of Uzziah, but as Isaiah's prophecies are not placed in exact order of time, the 2d, 3d, 4th, and 5th chapters seem to be antecedent to the 6th chapter, and to suit the time of Uzziah, or the former part of Jotham's reign, whereas the 6th chapter can hardly be earlier than the last years of Jotham. Accordingly this might be a new designation, to introduce more solemnly a general declaration of the whole course of God's dispensations in regard to his people, and the fates of the nation; which are even now still depending, and will not be fully accomplished till the final restoration of Israel. The 7th chapter begins with an historical account of the occasion of this prophecy; and then
ISAIAH.

then follows a prediction of the ill success of the designs of the Ishmaelites and Syrians against Judah; and a denunciation of the calamities to be brought upon the king and people of Judah by the Assyrians, whom they had now hired to assist them. The 8th chapter is closely connected with the foregoing, and contains a confirmation of the prophecy before given of the approaching destruction of the kingdoms of Israel and Syria by the Assyrians, of the denunciation of the invasion of Judah by the same Assyrians; together with a repeated general assurance, that all the designs of God's people shall be in the end disappointed and brought to naught, concluding, after admonitions and threatenings, with an illustrious prophecy of the manifestation of the Messiah, the transcendent dignity of his character, and the unfealility and eternal duration of his kingdom. This prophecy concludes at the 6th verse of the 9th chapter. The whole passage from chapter ix. 7. to chapter x. 4., contains a distinct prophecy, and a full poem; remarkable for the regularity of its disposition and the elegance of its plan; it is addressed exclusively to the kingdom of Israel, and the subject of it is a denunciation of vengeance awaiting their enemies. The 4th verse of the 10th chapter begins with a new and distinct prophecy, which is continued to the end of the 11th chapter. It appears that it was delivered after the taking of Samaria by Shalmanezer, in the 6th year of the reign of Hezekiah, and as the former part of it foretells the invasion of Senacherib, and the destruction of his army, which makes the whole subject of this chapter, it must have been delivered before the 14th year of the same reign. Then, according to Isaiah's usual method, he takes occasion, from the mention of a great temporal deliverance by the destruction of the Assyrian army, to launch out into the display of the spiritual deliverance of God's people by the Messiah, to whom this prophecy relates. (See Rom. xvi. 12.) The hymn in the 12th chapter Seems, by its whole tenor, as well as by many expressions in it, much better calculated for the use of the Christian church, than for the Jewish in any circumstances, or at any time, that can be ascribed; and the Jews themselves seem to have applied it to the times of the Messiah. The 13th and 14th chapters (excluding the five last verses of the latter, which belong to a quite different subject) contain one entire prophecy, foretelling the destruction of Babylon by the Medes and Persians; delivered probably in the reign of Ahaz (see Vitringa, i. 350.) about 200 years before the completion of it. The former part of this prophecy, says bishop Lowth, is one of the most beautiful examples, that can be given, of elegance of composition, variety of imagery, and fulness of sentiment and diction in the prophetic style; and the latter part consists of an ode of supreme and singular excellence. The 15th and 16th chapters, which ought not to have been separated, taken together, make one entire prophecy, delivered, most probably, soon after the foregoing, in the 18th year of Hezekiah, and accomplished in his 6th year, when Shalmanezer invaded the kingdom of Israel. The prophecy in the 17th chapter comprehends the kingdom of Samaria and the Ishmaelites, confederated with Damascus and the Assyrians, against the kingdom of Judah. It was delivered, most probably, soon after the prophecies of the 7th and 8th chapters, in the beginning of the reign of Ahaz, and was fulfilled by Tiglath-Pileser's taking Damascus, (2 Kings, xvi. 9.) overrunning a great part of the kingdom of Israel, and carrying a great number of the Ishmaelites also captive to Assyria; and full more fully in regard to Israel, by the conquest of the kingdom, and the captivity of the people, effected a few years after by Shalmanezer. The prophecy in the 18th chapter is in all its circumstances obscure and doubtful. In the 19th chapter the prophet seems to have had in view the conquest of the Persians by Alexander, which was in fact a deliverance to Egypt, together with other preceding and collateral incidents, and the favour granted to the Jews by Alexander and the Persians. The 20th chapter refers to the taking of Ashdod or Azotus, and warns the Jews agains't depending too much on the assistance of Egypt. The ten first verses of the 21st chapter contain a prediction of the capture of Babylon by the Medes and Persians; the remaining prediction is obscure. The prophecy, ending with the 14th verse of the 22d chapter, foretells the invasion of Jerusalem by the Assyrians under Senacherib, or by the Chaldeans under Nebuchadnezzar. Vitringa thinks that the prophet had both in view; that of the Chaldeans in the first part, verse 1—5, and that of the Assyrians in the latter part, verses 8—11. The prophecy in the 23d chapter denounces the destruction of Tyre by Nebuchadnezzar. From the 15th chapter to the 23d inclusive, the fate of several cities and nations is denounced; of Babylon, of the Philistines, Moab, Damascus, Syria, Egypt, Tyre. The prophesy then proceeds, in the 24th and three following chapters, to declare the judgments impending upon the people of God themselves, for their wickedness and apostacy; and the defolation that shall be brought on them. The whole chapter, as far as the 26th verse, relates to the Ishmaelites, and manifestly denounces their destruction by Shalmanezer. It then turns to the two tribes of Judah and Benjamin, the remnant of God's people, who were to continue a kingdom after the final captivity of the Ishmaelites. It begins with a favourable prognostication of their affairs under Hezekiah; but soon changes to reproofs and threatenings, for their intemperance, disobedience, and profaneness. The subject of the 26th and four following chapters is the invasion of Senacherib; the great distress of the Jews while it continued; their unexpected and sudden deliverance by God's intervention in their favour; the subsequent prosperous state of the kingdom under Hezekiah; intermixed with reproofs and threatenings, and also with promises of better times. The 34th and 35th chapters make another distinct prophecy; an entire, regular, and beautiful poem, consisting of two parts; the first containing a denunciation of divine vengeance against the enemies of the people, or church of God; the second describing the flourishing state of the church of God, consequent upon the execution of those judgments. The 36th chapter contains a history of the invasion of Senacherib, and of the miraculous destruction of his army, as a proper introduction to the prophecy in the 37th chapter, which is the answer of God to Hezekiah's prayer, which could not be well understood without it. The narration of the 38th and 39th chapters seems to be in some parts an abridgment of that of 2 Kings, xx. The course of prophecies which follow from the 40th chapter to the end of the book, and which, taken together, constitute the most elegant part of the writings of the Old Testament.
tament, interspersed also with many passages of the highest sublimity, was probably delivered in the latter part of the reign of Hezekiah. They are chiefly of the consolatory kind; and therefore they are opened with the promise of the restoration of the kingdom, and the return of the people from their captivity, by the merciful interposition of God in their favour. The prophet, however, extends their views to the fulfillment of God's promises of establishing a more glorious and an everlasting kingdom, under the Messiah to be born of the tribe of Judah, and of the family of David. He connects these two events together, and hardly ever treats of the former without throwing in some intimations of the latter.

Isaiah has been, with peculiar propriety, denominated the "evangelical prophet," on account of the number and variety of his predictions concerning the advent and character, the ministry and preaching, the sufferings and death, and extensive permanent kingdom of the Messiah. His predictions are, indeed, so explicit and determinate, as well as so numerous, that no one can be at a loss in applying them to the mission and character of Christ, and the events that are cited in his history by the New Testament writers. The whole book of Isaiah, some few passages excepted, which, if brought together, would not at most exceed the bulk of five or six chapters, is confirmed by Bishop Lowth as poetical. (See the article Prophetic Poetry.) "He abounds," says this learned critic, "in such transcendental excellencies, that he may be properly said to afford the most perfect model of the prophetical poetry. He is at once elegant and sublime, forcible and ornamental; he unites energy with copiousness, and dignity with variety. In his sentiments there is uncommon elevation and majesty; in his imagery the utmost propriety, elegance, dignity, and divinity; in his language uncommon beauty and energy; and, notwithstanding the obscurity of his subjects, a surprising degree of clearness and simplicity. To these we may add, there is such sweetness in the poetical composition of his sentences, whether it proceed from art or genius, that if the Hebrew poetry at present is possessed of any remnants of its native grace and harmony, we shall chiefly find them in the writings of Isaiah: so that the saying of Ezekiel (xxviii. 12) may most justly be applied to this prophet:"

"Thou art the confirmed example of measures, Full of wisdom, and perfect in beauty."

Isaiah greatly excels, too, in all the graces of method, order, connection, and arrangement; though in afflicting this we must not forget the nature of the prophetic impulse, which bears away the mind with irresistible violence, and frequently in rapid transitions from near to remote objects, from human to divine; we must also be careful in remarking the limits of particular predictions, since, as they are now extant, they are often improperly connected, without any marks of discrimination, which injudicious arrangement, on some occasions, creates almost insuperable difficulties." Bishop Lowth has selected as a specimen of the kind of poetry in the language of which Isaiah delivers his prophecies, the prediction contained in the thirty-fourth and thirty-fifth chapters; and pointed out the beauties that eminently distinguish the simple, regular, and perfect poem, as he denotes this prophecy. The latter part of the book, commencing at the fortieth chapter, is, perhaps, the same excellent judge, "the most elegant specimen remaining of inspired composition, and yet, in this respect, is attended with considerable difficulty. It is, in fact, a body or collection of different prophecies, nearly allied to each other as to the subject, which, for that reason, having a sort of connection, are not to be separated but with the utmost difficulty. The general subject is the restoration of the church. Its deliverance from captivity; the destruction of idolatry; the vindication of the divine power and truth; the consolation of the Israelites, the divine invitation which is extended to them, their incredulity, impiety, and rejection; the calling in of the gentiles; the restoration of the chosen people; the glory and fidelity of the church in its perfect state; and the ultimate destruction of the wicked, are all set forth with a sufficient respect to order and method. If we read these passages with attention, and duly regard the nature and genius of the mystical allegory; at the same time remembering, that all these points have been frequently touched upon in other prophecies promulged at different times, we shall neither find any irregularity in the arrangement of the whole, nor any want of order and connection as to matter or sentiment in the different parts. Grotius calls Isaiah the Demotic of the Hebrews, and bishop Lowth ranks him with Homer. (See Jeremiah.) As a commentator on this book, the learned are under great obligations to Vitringa in his excellent commentary in 2 vols. fol. Amongst the English translations, the first place will be allowed to bishop Lowth for his admirable work, abounding so much with learned criticism and correct taste, entitled "Isaiah; a new Translation, with a Preliminary Dissertation, and Notes, critical, philological, and explanatory," first published in 1778, 4to. In which the author has surmounted the numerical arrangement. The late Michael Dodson, etq. also published in prose "A New Translation of Isaiah; with Notes supplementary to those of Dr. Lowth, late Bishop of London, and containing Remarks in many parts of his Translation and Notes, by a Layman," 1790, 8vo. We have lately had a valuable translation of the prophecies of Isaiah by Dr. Stock, bishop of Killala. See the works already cited, and Lowth's Preludiones de Sac. Poef. Heb. N. xx.—xxi.

ISAASAL, in Geography, a town of Asiatic Turkey, in Caramania; 12 miles N.W. of Akheh.

ISAASQUVA, a town of European Turkey, in Moldavia; 60 miles N.E. of Jassy.

ISAASZI, a town of European Turkey, on the Dnube; 26 miles W. of Ismail. N. lat. 45° 18'. E. long. 29° 9'.

ISAAMSBLUCIS, in Natural History, the name of a genus of fowls of the class of the felenes, but of the columnar, not the rhomboidal kind.

The feline of this genus consist of six sides, and two obtuse or abrupt ends; and all their sides being very nearly of the same breadth, they much resemble broken pieces of the columns of spire-cystal.

The bodies of this genus, as well as the rest of the columnar feline, are subject to a longitudinal crack, which sometimes admitting a small quantity of clay, shapes it into the figure of an ear of grafs. Hill's Hist. of Zool. p. 121. See the article Selene.

ISANDORAS, in Geography, a town of Angola, on the Coensa; 25 miles S. of Loanda.

ISANI, in Mythology, one of the many names of the Hindoo deity, Siva; also of his fakti, or comfort Purvati; it seems nearly similar with 11a. (See under those articles.) The Hindoos reckon eight of their principal deities, as regents or supporters of the eight cardinal and intermediate points of the heavens. Of these regents, called Maruts, or winds, Indra is the chief, and rules the East. (See Indra and Marut.) Huani or Siva, in that form, is by some mythologists, but not by all, reckoned another, and ruler of the north-east. See Moore's Hindoo Pantecon, under Indra in the index.

ISANTHUS, in Botany, so called by Michaux, from ἵνα ἃνθινον, a flower, because this plant, unlike
rooth others of the class Didynamia, has a regular cleft. —
Michaux Amer. v. 2.3. t. 35. Clasf and order, Didynamia

Gen. Ch. Cal. Persicaria belf-shaped, rather spreading, 
clown half way down into five, nearly equal, lanceolate
segments; the two lower ones, especially after the clefts 
has fallen off, more close than the rest. Car. nearly equal 
with the cleft, almost regular, tine franghitate, narre, cylindricall, limb somewhat wheel-shaped, five-cleft; each
segment oval and familiar, with two spots at the base. Stem.
Filaments four, nearly equal, a little shorter than the cleft, 
perfecty erect; anthers oblique, clown below; cells ovate, 
diverging nearly at a right angle. Pfl. Germs superior, 
four-cleft; style the length of the flang, recurved at top; 
figmas two, recurved and much spreading, linear tongue-
shaped; the lower one rather the longest. Peric. none, 
except the permanent, spreading tube of the calyx. Seed
four, obovate, ruged and reticulated, connected only at 
their base, felling the calyx.

Eff. Ch. Calyx five-cleft. Corolla nearly equal, five-
cleft. Stamens erect. Anthers with divericate legs.
1. I. carillus. Blue Indianus.—Michaux Amer. v. 2.
t. 38. A native of Virginia and Carolina, in a chalky soil.
The whole plant is rather viscid and hairy. Root annual.
Stem about a foot high, erect, round, branched. Leaves
opposite, on short stalks, ovate, acuminate, ribbed or nervesd, 
fringed. Flowers of a pale blue.

We are only acquainted with this plant from the defec-
ption and figure of Michaux. It is without doubt very nearly 
allied to the Asperifolia, though we have followed that author 
in referring to it the clasf Didynamia.

ISARIA, in Geography, a town of Naples, in Calabria
Ultra; eight miles E. of Nicaftro.

ISARIA, a town of Naples, in Calabria Ultra; 11
miles S. of Squillace.

ISATIS, in Botany, is the 1.3exis of Dioscoridcs, and
Itatis of Pliny, but its derivation is totally unknown. Weed
t. 554. Gaut. t. 142. Clasf and order, Tetradynamia Schil-

Gen. Ch. Cal. Perianth of four, ovate, spreading, 
coloured, decisioned leaver-shaped. Car. of four, petals, cross-
shaped; petals oblong, obtuse, spreading, by degrees 
attemuated into class. Stem. Filaments six, slightly spreading,
the length of the corolla; two of them shorter; anthers 
long, lateral. Pfl. Germs superior, oblong, two-
edged, compressed, as long as the shorter flang; style 
short; flang obtuse, capitale. Peric. Pouch oblong, lan-
ceolate, obtuse, compressed, two-edged, of one cell, not 
gaping, tw-valved, decisioned; the valves are boat-like, 
compressed and carinated. Seed solitary, ovate, central.

Eff. Ch. Pouch lanceolate, one-celled, fingle-fed, 
decidence, with two boat-like valves.
t. 97. Mart. Fl. Ruh. t. 41. "Radical leaves creanted,
stem-leaves arrow-shaped. Pouch oblong, smooth."
— Rather a scarce plant in Britain, flowering in July, and 
found in fields. It was not originally a native of this island,
but has become naturalized from its frequent culture for 
the purpose of dyeing blue. It is also a bafis for several 
other colours. Pliny says the ancient Britons flamed their 
bodies with wood, but from the circumstance of this plant 
having been introduced into this country from the shores of 
the Baltic, Spain, Italy, &c. Mr. Miller concludes that

Vol. XIX.

Wool (Rudes Lutea), and not Wool, was fed by her 
ancestors for the puip of above relation. But if the plant 
in question can be identified with Pl. 95, it is naturally a 
native. Root biennial. Stem erect, black, furnished 
with stamens, somewhat lanceolate leaves; the radical ones 
long, foot-tallks, and are cleft, the calyx as well as 
the corolla of a yellow colour. Stem and leaves occasionally 
contracts with a few hairs.

Linnam enumerates the other species of Icatis, Hirtalis, 
armer, and variformis, the best of which is very properly 
removed by Willd. to Calce of Gardiner. Violin and 
Albani mention another species under the name of alpinis. 
This genus was very unaccountably placed by Linnam in 
his order of Silicula, together with Diders and Crassae; 
but its near affinity to Debra, Legumin., 2c. in the shape 
and fize of its pouch, sufficiently warrant Professor Schre-
ber's placing it among the Silicula.

ISATIS, in Zoology. See LAGORUS.

ISATODES, a word used by Hippocrates, and some 
others of the old writers, to express a greenish colour of 
the bile discovered in the fluids, which resemble the colour 
of the herb Icatis, or wood. This was esteemed an indication 
of a highly depraved bile.

ISATORIA, in Antics Geography, a town of Afia Minor, 
ear Pidida. Its inhabitants were merely occupied in 
plunder, when Servius made war upon them and conquered 
them. Hence he bestowed the name of the "Haurian." 
Its chief town was "Hauria," or "Husnopolis," which 
were repeatedly destroyed and rebuilt. Under the Greek 
emperors, Husn became a considerable province at the 
expense of the neighbouring provinces. Hierocho, in 
his "Notitia," reckons in it 23 episcopal towns, and Leon-
Sagge enumerates 29.

ISBARTHEL, in Geography, a town of Asiatic Turkey, 
in Nautolis, the residence of a Pacha; and in the taxaboires 
are four Greek churches, 92 miles S. of Klita, N. lat.
37° 45'. E. long. 30° 56'.

ISBASTER, one of the smaller Shetland islands. N. lat.
60° 34'. W. long. 0° 58'.

ISCA, or ISA Danmerorum, in Ancient Geography, a 
town of Albion or England, the capital of the Danemorum,
and most probably Exeter.

ISCA Silurus, the capital of the Silures, now Caerleon in 
Monmouthshire. Here the second legion of the Romans, 
which had contributed greatly to the reduction of the Saxons, 
was placed in garrison (as some antiquaries have imagined) 
by Julius Frontinus, to keep that people in obedience. It 
is certain, however, that this legion was very early and 
very long stationed at this place. Icsea Silurus was, in 
the time of the Romans, a city not only of great strength, 
but also of great beauty and magnificence. This appears from 
the description which is given of its ruins by Gildinus Cam-
brensis, in his topography of Wales, written in the 12th 
century, soon after it had been destroyed and abandoned.

ISCALES, a town of Britain, in the country of the 
Belgic, generally placed at Ilchester in Somersetshire.

ISCARIOTH, a place of Judas, in the tribe of Ephraim, 
whence Judas, who betrayed our Saviour, is supposed to 
have derived his surname.

ISCHÄMUM, in Botany, from icox, to repref, and 
wox, wood, because it was supposed to profe the virtue 
of topping hemorrhages from recent wounds. In this 
true the name was originally applied to the Pankium fangia
deum of Linnæus, called, for the same reason, Sanguinaria 
by some writers; and is now retained for a genus of grases 
bearing some resemblance to that, but the reputed virtue 
mentioned can scarcely be thought to have any founda-

Gen. Ch. Cal. Glume two-flowered, of two cartilagineous nearly equal valves, situated tranferrely; the outer almost ovate, tumid, cloth and acute at the top, the upper part of the back flattened, frilled, bordered; inner oblong, boat-like, pointed or awned at the top, furnished with a longitudinal dorsal membrane below the extremity. Florets shorter than the calyx, the outer one male, inner hermaphrodite. Quire. (in the hermaphrodite floret) of two thin, membranous, pellucid glumes; the outer swelling, either bearded or awned, clothed to the insertion of the awn, acute; even long, slender, bent, twisted in the lower part; inner glume lanceolate, acute, its margin folded together; (in the male floret) of two rather firmer, pellucid, somewhat coloured glumes; the outer oblong, swelling, contracted upwards, acute, bearded; inner oblong, obtuse, concave at the back, thinner and acute at the margin: Nodary in each of two small, spatulate, abrupt, notched leaves. Stem. Filaments three, capillary, short; anthers oblong, clothed at each end. Pist. (in the hermaphrodite floret) Germin oblong; flys two, capillary, erect, shorter than the corolla; ligmas oblong, feathery, spreading, prominent. Peric. none, except the unchanged calyx and corolla. Scod (in the hermaphrodite floret) solitary, oblong, linear, convex at one side.

El. Ch. Calyx of two valves, two-flowered, placed in pairs, laterally, on a jointed flake; outer valve flattened. Corolla of two valves, shorter than the calyx. Stigmas feathery. One floret male, or neuter.

Linnæus describes two species only, I. muticum, Sp. Pl. 1467, and I. ariflum, ibid. The first is destitute of awns, and is the Tagda of Rheede Hort. Mal. v. 12. 91. t. 49, found in every kind of soil in Malabar, but not of any particular use, except as a grass in general. The root is permanent. Stems about a foot high, round, smooth, reed-like; leafy. Leaves lanceolate, pointed, broad at the base. Spike terminal, double, short, cleft, shining. I. ariflum, distinguished by its awns, was gathered by Oliveck in China, and has narrower leaves.

I. rigifolium, Schick. t. 12. t. 1. Hort. 27;—"External barren glumes tranferrely rough; one of the fertile ones, whether male or female, awned."—Found by Koenig in the borders of rice fields in the East Indies. This is very remarkable for the strong wrinkles or furrows of its glumes. Linnæus was inclined to make it a new genus by the name of Ciceraria. Mr. Salibury cultivated it in his flower at Chapel Allerton before 1795.

Mr. Brown in his Prodromus has added six new species to Iteælanum, and also justly refers to this genus the Callodan of Cavanilles. 10. c. 57. 1360.

TSCHENIA, 1769, in Antiquity, anniversary sports celebrated at Olympia, in memory of Iheusus, the grand-son of Mercur and Hera; who, in a time of famine, devoted himself to be a harvester for his country, and was honoured with a monument near the Olympic stedium.

TSCHIA, in Geography, a volcanic island, situated at the eastermost entrance of the gulf of Naples, about 18 miles in circuit; the seat of a bishop, suffragan of that of Naples, and containing three parishes, and a convent of nuns. The volcanic substances of which this island is entirely composed, prove, beyond the possibility of doubt, says Spallanzani, that it owes its origin to fire. The caille of the city of Iechia, as it is called, is built on a rock surrounded by the sea, and a little more than a quarter of a mile in circuit. The two component substances of this rock are lava and tufa. About a mile to the west is a torrent of lava, called the "Arô" or burnt ground, which is the most recent of any in the island, since it flowed in 1302. This lava, though it flowed five centuries ago, is absolutely fleck by producing not a single blade of grass, and only affording, in some places, a few arid and leafless plants of the lichen, or liverwort. On the surface, and for a little depth, it is light and spongy, and easily crumbles; but deeper, it becomes dense and harder. This lava is of the hornestone bafe, and has an earthy ground; varying in colour from that of iron to a reddish-black, and having incorporated in it very numerous feltfars. M. Dolumieu says, that the eruption of the Arô, though it continued two years, never produced any pumice, but only black fécirix; but Spallanzani observes, that the hornestone, by a violent fire, may be changed into a true pumice. Though this transmutation rarely happens, no part of the island, however, abunds so much with pumices as the Rotarou, a mountain situated between Cafamieciola and the city of Iechia. This mountain is of a conical shape, and composed of tufa, pumices, and enamels. The extent of the pumices is more than a mile. The Rotaro is the only place in Iechia which affords enamels. The mountain of St. Niccola, which in earlier times was called Epopeo, and which is in the centre of the island, was, as Spallanzani says, without doubt, the first that towered above the waves. The constituent substances of this mountain are of various kinds. The sulphate of alumine (abum) was formerly extracted in Iechia for commercial purposes; and the manufacture was principally carried on at Catrico, a place situated above Lacco, on the higher eminences of the Epopeo. But a careful observer has not been able recently to discover any remaining vestige of this substance. Spallanzani concludes from experiments on different lavas, that this valuable substance might be obtained at Iechia. This ingenious naturalist covered the island and examined various mountains that occupy the lower part of it. He began with the Vico, which is partly formed of tufa, and partly of two currents of lava, which descend into the sea. The base of both these lavas is hornestone, and they abound in feltfars. He then proceeded to Monte Zaro, formed, towards the sea, by a river of lava, extending a mile in length, and nearly two breadth. The base of this lava is hornestone, and it contains micaceous feltfars. From the termination of Monte Zaro to the commencement of Monte Imperatore, is a long and ample tract, almost entirely tufaceous, scattered over with fragments of pumice. The Monte Imperatore presents different sorts of lava, the base of which is hornestone, intermixed with abundance of feltfars. In many parts of the island our author found a ferruginous sand, which not only moves the magnetic needle, but is strongly attracted by the lodestone. This island, our author apprehends, when it was first produced by conflagrations in ancient, and to us unknown, times, must have been of much greater extent than it is at present. Time has also produced a great alteration in the interior parts of the island. From the summit of Epopeo, a number of conical eminences may be seen; but their internal craters no longer exist: nor can be found in Iechia incalculable traces of a single one, since those deeps and ample cavities, those resemblances of theatres and amphitheatres, which may be every where observed, may be equally the effect of fire or water. The substances, our author conveys, which have furnished aliment to the different conflagrations of Iechia, have had their centre in those argillaceous rocks, which, by the above-mentioned eruption in 1302, flowed that they were not then exhausted. See Spallanzani's Travels in the Two Sicilies, &c. vol. i.

Along the coast of this island a few pretty villages are developed;
ISC

dispersal; and detached habitations are scattered over the surface of the whole island, and are to be found even at an elevation where the culture of the soil must cease. The white color of the houses forms an agreeable contrast with the verdure of the vines and gardens in which they are embosomed. At the summit of the mountain, which forms this island, a hermitage, composed of a chapel, and three cells, has been excavated out of the volcanic rock. The cells are inhabited by as many hermits. One of them goes around through the island twice a week, and brings back bread, oil, eggs, and every thing necessary for the service of the altar. The inhabitants give him alms with joy, and recommend themselves to his prayers. They make a pilgrimage annually to this chapel.

This island enjoys a propitious climate, and the sky is seldom obscured with clouds. The winters are mild, the reptiles harmless, and the springs cure various diseases. The government is likewise mild, and the island is exempt from taxes. The king pays it a visit every year, and gives portions to the indigent young females.

An hospital is established here at the expense of a charitable society at Naples. Some hundreds of sick receive attendance and relief during the bathing-season. Several banks are daily employed in removing the convalescents to Naples, and bringing back other patients to the hospital. The lame, who are cured of their infirmities, leave behind them their crutches, which they consecrate to the Madonna, or to some particular patron. The trees, shrubs, and plants which prefer volcanic soils, thrive surprizingly in this island.

Here and there are seen groves of oak and chestnut trees; which are suffer'd to grow only 10 years. The orange, pomegranate, fig, Napolitan medlar, and arbutus, are the most common trees in the gardens. Of wild shrubs, the myrtle and the mastic are the most numerous. The inhabitants have something peculiar in their language, their figure, and their dress. In their conversation, they scarcely ever use the word man, that of Christan being substituted for it; and with them Christan is synonymous with Catholic in their pious expressions they seldom go higher than the Mother of God. It is to our Lady they recommend you, when they leave you, and they wish you a holy night (sanctissima nox.) To her they appy when afflicted with disease.

At the death of an adult they pray for the repose of his soul. The death of a child is regarded as an happy event. Religious festivals are with them days of rejoicing. N. lat. 40° 50'. E. long. 13° 46'.

The soil feeds no animals besides asses and goats. The roofs of the houses throughout the island are flat, and are used for drying fruits and other purposes.

ISCHIADICUS MORENUS, in Surgery. See Diphys of Hip-joint.

ISCIAS. See Diphys of Hip-joint and Sciatica.

ISCATHIC, in Anatomy, an epithet applied to certain parts of the body situated near the kidney; as the thicatic artery and nerve. See Artery and Nerve.

ISCHIATOCELE, in Surgery, a hernia taking place at the ischiatic orificium. See Hernia.

ISCHIUM, in Geography, a town of Russus, in the government of Tobol, on the river Ichim, which runs into the Iriluch, N. lat. 57° 45'. E. long. 92°; 105 miles S. of Tobolok. N. lat. 56° 15'. E. long. 69° 14'.

ISCHIMSKOIL, a town of Russus, in the government of Tobol, at the confluence of the Ichim and Oby; 112 miles E. of Tobolok.

ISCHIO-CVERNOSUS, in Anatomy, a name given by Winlow and others to the erector penis muscle. See Generation.

ISCHIOCOCCYGUS, in Anatomy, a name for the coccygeus muscle; which see.

ISCHIUM, one of the divisions of the os innominatum. See Extremities.

ISCION, or Ischion of, in Surgery. See Fracture.

ISCHNAMBUS, in Natural History, the name of a genus of fossils of the class of the Ichthyophi, but one of those which are of a columnar form, not of the common rhomboidal one.

The word is derived from the Greek, οσθος, ως, an hip bone, and οιος, a knee, and expresses a bone in the form of a thin flattened column, with obtuse ends. The bones of this genus are of an ovoidal figure, consisting of six long planes and about two short ends. The top and bottom planes are broader than the rest. The crack which runs through the whole length of bodies of this genus is often filled with clay, which spreads itself into the form of an ear of some gracles; of this genus there are only four known species. Hill.

ISCHNOPHONIA, in Medicine, from ικθος, thin, and γραφο, the voice, a term which seems to have been first originally to denote a certain tenuity or smallness of the voice; but the most common acceptation of the word is in the sense of hoarseness of speech.

ISCHURIA, from ικθος, lip, and υρα, urine, signifies an entire suppression or retention of the urine.

The dischage of urine may be altogether prevented or suppressed for a time, from four different sets of causes; whence Dr. Cullen has, with great judgment, arranged the forty-three varieties of ischuria, described by Sauvages after Cullen, under four heads or species. There are, 1. Ischuria noxialis, in which the impediment to the excretion of urine is in the kidneys themselves; 2. Ischuria ureterica, in which the impediment consists in an obstruction of the canal of the ureters, through which the urine should pass into the bladder; 3. Ischuria vesicalis, in which the urine, secreted by the kidneys, and transmitted through the ureters, is retained in the bladder from disease in that receptacle itself; and, 4. Ischuria urethralis, in which the impediment is occasioned by some obstruction in the canal of the urethra, through which the contents of the bladder are discharged. See Cullen. Synop. Nofof. Method. Clas. iv. Ord. 5. Sauvages, Clas. x. Ord. 3.

The real ischuria, in which there is little or no secretion of urine effected by the kidneys, is to be distinguished by the following circumstances: It supersedes upon some previous affection of the kidneys, and is accompanied by pain or an uneasy sense of weight in the region of the kidneys, while, at the same time, there is no tumour in the hypogastrium, or lower portion of the belly, such as a distended bladder would occasion, nor any desire to make water. The ischuria, from obstructed ureters, is accompanied by painful symptoms, except that the pain or uneasiness is felt in the course of the ureter; it is likewise more occasioned by injury received to our, or desire to pass urine. The most frequent causes of these two forms of retention of urine are inflammation of the kidneys or of the ureters, or the presence of calculous concretions in the two; but other causes have been occasionally observed to produce the dischage, such as gumrous blood, impacted in the fume parts, and purulent matter, or masts, obstructing the passages. It may be remarked, that some writers have confined the term retention of urine to the real form of the dischage, as if they would affirm, that when the name was not heard, it was retained in the blood; and they name the other forms...
of the disease by the term *suppression* of urine:—a false hypo-
thesis, but the terms may be retained as expressing the facts.
When the retention is connected with inflammation of the
kidney or ureter, its cure will depend upon the removal of
that inflammatory state. (See *Nephritis.*) And when
accompanied from imperfect use has, it must be treated
with the remedies referred to in other citations. See *Nephritis.*

The two other species of ischuria, originating from impedi-
ments to the evacuation of the bladder, by diseases of that
organ itself, or of its outlet, the urethra, are to be
distinguished, by the common term of the hypogastrium,
above the glands and by the frequent urging to make water,
accompanied with pain in the neck of the bladder, in the
one case; and in some part of the urethra in the other.
The causes which give rise to this partial suppression of urine,
are inflammation of the neck of the bladder; stone in the
bladder; spasm of the sphincter, partly extending to the
bladder; over-dilatation of its fibres, from retaining the
urine too long; purulent matter, mucus, or granulous blood,
 lodged in the neck of the bladder; and tumours of the
neighbouring parts comprizing the neck of the bladder.
Such as hardened faces in the rectum, or calculi concre-
tions, inflamed, inflamnation, abscess, or hemorrhoidal swellings
in the same bowel, and also the gravid uterus, or other en-
largements of that viscus. The causes of impediment in the
channel of the urethra, which occasion suppression of urine,
are inflammation of that passage; pus, mucus, or granulous blood
impacted in it; fracture; tumours in the perineum;
phimosis, &c.

The means by which these causes of suppression of urine
are chiefly to be removed, and the diseased to be cured, are
principally surgical. See *Suppression of Urine.*

*Ischuria, in Surgery.* See *Retention of Urine.*

ISENHOVORD, in Geography, a large bay or gulf of
Denmark, on the N. coast of the island of Zealand; the mouth
of which lies in N. lat. 55° 50'. E. long. 11° 50'.

ISELASTICS, isellantia, a kind of games, or com-
bats, celebrated in the cities of Greece and Asia, in the
time of the Roman emperors.

The victors at these games had very considerable privile-
leges conferred on them; after the example of Augustus,
and the Athenians, who did the like to the conquerors at
the Olympic, Pythian, and Isthmian games. They were
crowned on the spot, immediately after their victory; had
pensions allowed them; were furnished with provision; at the
passing of which they were allowed to enter the city
through a breach in the walls; whence
their adoption from * Venus, * to enter.

ISEN, N. JAMES CHRISTOPHER, in Biography, an
eminent physician and divine, was born at Basel in 1681, and
having had a good foundation in grammar and logic, he was
admitted to his academic chair at 13, and at 15 he distinguished himself by a Latin poem on
"The Palace of the Rhine" by the French, which
obtained for him great applause. In 1701 he was ordained
minister, and on that occasion published a dissertation on the
Evolution of the Revelations, in answer to the bishop of
Notre. In 1714 he accepted the chair of eloquence and
history in the university of Marburg, which he occupied
with great reputation for two years. In 1756 he was
appointed professor of history and metaphysics at Basel, and in
1711 he was made doctor in theology, and appointed to teach
that science. He was invited to lecte at Paris, which he
declined, and the French academy elected him to the place of
honorary member, vacant by the death of Cicer. This
honour was conferred upon him in return for the pains
he had taken to comply with the king's request of ob-
taining for him copies of the acts of the council held at
Basel in the fifteenth century. He died in 1737, and his
memory was honoured by a great number of eulogies in
Latin and German. The works of M. Iseis consist of
orations, dissertations, and detached tracts on a variety of
subjects, philosophical, theological, and miscellaneous. Moreri.

ISEN, ISAAC, was born at Basel in 1728. He received
his academic education at Göttingen, where he paid great
attention to jurisprudence and Natural philosophy under the able
professors. He undertook the task of reducing the juris-
prudence of the Swiss confederation into a system, of which
he published a specimen in his theses, when he obtained
the degree of doctor, under the title of "Tentamen Juris
publici Helvetica." When he had completed his studies
he went to Paris, and obtained the acquaintance and friendship
of the most eminent men of letters in that capital. After
his return, he applied with great diligence to the
study of jurisprudence, and in 1756 he was appointed to
the important office of secretary to the grand council
of his native city. Soon after he published his first work,
titled the "Dream of Mankind," which has gone through
many editions. He next gave the world a work, entitled
"Free Thoughts on the Depopulation of my native City,"
in which he recommended the admission of new citizens. But
his most important work was his "History of Mankind,"
in which he traces the progress of the human mind from
a state of rudeness to that of refinement, and shows in what
manner nations have emerged from obscurity, and have been
completely civilized by the introduction of arts and
manufactures. Iseis was the author also of a periodical
work, entitled "Ephemeresis of Mankind." He carried on
an extensive correspondence both in Switzerland and foreign
countries, and he wrote many excellent critiques in the
"Deutsche Bibliothek," which are said to be distinguished by
their acuteness, modesty, and adherence to truth. He
died in the year 1782, at the age of 54. Iseis's writings
abound with exalted ideas and ingenious thoughts, and dis-
play great knowledge of human nature, ardent patriotism,

ISEN, in Geography, a town of Bavaria; 24 miles E.N.E.
of Munich.

ISENBERG, UPPER, County of, a principality of Germany, bounded in the Wetterau, about 30 miles long and 10 broad. The town of Iseburg is divided into several
branches, taking their surnames respectively from towns
in the slate.

ISENBERG, Lower, a county of Germany, in the circle of the Lower Rhine, formerly governed by courts of its
own, as a list of the electorate of Treves.

ISENBRUG, a town of Germany, giving name to the
county, situated on the Iser, and surrounded by high
ramps, on one of which is a castle built by Charlemagne; 10 miles N. of Coblenz. N. lat. 50° 30'. E. long. 7° 35'.

ISENBRUNN, a town of Germany, in the county of
Iseburg, bounded by French subjects; 5 miles S. of Frank-
fort-on-Main. N. lat. 50° 30'. E. long. 8° 30'.

ISENHAUSEN, a town of Westphalia, in the prin-
cipality of Lippe; 24 miles E.N.E. of Zelle.

ISEO, a town of Italy, in the department of the Benaco,
on a lake to which it gives name, through which the river
Oglio takes its course: the town was anciently called "Sab-
ino;" 12 miles N.W. of Brescia.

ISE, a river of the Tyrhenian, which rises about 5 miles
N. of Lago, and, passing by Munich, Landshut, Landau,
&c. runs into the Danube, 2 miles below Deckendorf.

ISE, a river which rises in the Alps, about 12 miles from
from mount Cenis, in a mountain called "Leran," in the
duchy of Savoy, and, after entering France, passes by
Grenoble, etc., and joins the Rhone about 3 miles above
Valence; navigable for boats as far as Montmélian.

Serre, formerly Gevaudan and Fiennes, one of the 11
departments of the eastern region of France, so called
from the river here, which crooks it; situated in N lat. 45° 35';
W. of Mont Blanc; containing 452 square leagues, and
441,208 inhabitants, and divided into four districts, etc.,
Vienne, including 104,059 inhabitants; Tour-du-Pin, having
90,553; Grenoble, 106,023; and St. Marcellin, 67,843
inhabitants. Its number of carts is 44, and that of
commodions 59. The annual contributions amount to
354,689 francs, and the expenses charged upon it to
338,824 francs 37 cents. This department consists of
barren and marshy plains, deep valleys, and high mountains
partially wooded. The chief products are grain, hemp,
roots, good warm wine, and excellent pastures. It has
mines of iron, copper, lead, coal, quarries, and mineral springs.
Its capital is Grenoble.

ISERINE, in Mineralogy. See TITANUM.

ISERLOHN, or LEIS, in Geography, a town of Ger-
many, in the county of Mark, inhabited by Lutherans, Cal-
vinists, and Roman Catholics, who allowed their separate
worship. Its manufactures are considerable in iron, tin,
rubens, velvets, silk, flax, &c.; 32 miles N.E. of Cologne.
N. lat. 51° 18'. E. long. 4° 39'.

ISERNIA, a town of Naples, in the Molise, situated at
the foot of the Apennines, the site of a bishop; 12 miles
W.S.W. of Molise. N. lat. 41° 38'. E. long. 41° 24'.

ISERTIA, in Botany, was so named in honour of Mr.
Hert, a German botanist, and burgher of the district, on
Robinet, S. Fillian.

Gen. Ch. Col. Perianth of one leaf, superior, colored,
four or six-toothed, permanent, i.e. of one petal bicol-
slashed; tube long, cylindrical, slightly curved, and di-
vided into six, subovate, rather erect, villous segments.
Stam. Filaments six, very short, within the throat of
the corolla; anthers linear, united to the base, erect. Pet.
German inferior, reflexed; style three-angled, surrounded
by a glabrous, at the base; stigma-falciform. Pedic. Fruit
pulpy. Somewhat glabrous, crowded by the calyx, fixed-
scutum, the edge of the cells of the bract. Seeds numerous,
small, angled, fleshy.

E. Ch. Calyx superior, fixed-toothed. Corolla funnel-
shaped, falciform. Stigma falciform. Fruit fixed, many-
seeded.

1. I coccinea. Wildl. n. t. (Guettarda coccinea; Aubl.
Guian. v. 3 t. 123)—Leaves lanceolate-elliptical, clothed
with hairy pubescence, acuminate, acute at each end.
Throat branches branched, bicol. A native of woods in
Guiana, flowering and bearing fruit at all seasons.—This
tree rises to the height of ten or twelve feet, is clothed
with erect, knotty, tquare branches. Leaves opposite, large,
large, ovate, acute, green above, downy beneath, dark-coloured,
with reddish nectaries. Stipulae long, broad, acute, deciduous.
Flowers racemose, erect, terminal; their partial-branches
opposite, furnished with two small flacks. Calyx purplish.
Tube yellow. Fruit red.

2. I. parviflora. Wildl. n. 2.—"Leaves oblong, the
lower one forked at heart-shaped at the base. Bunch of
flowers ovate." Found in the island of Trinidad.-Leaves
generally smooth, sometimes rather villous beneath.

ISETSK, in Geography, a town of Russia, in the govern-
ment of Tobolsk, on the Itel, which runs into the Tobol,
near Valutorovsk; 44 miles W.S.W. of Valutorovsk.

ISGAARD, a town of Denmark, in North Jutland,
situated on a peninsula in the Baltic; seven miles E.N.E. of
Aarhus.

ISGARU, or Esisara, anciently called "Dis-
cesia's," and "Seutopolis," a town of Mingrelia, on
the E. coast of the Black sea, with a road for ships, which
in summer is tolerably good. In 1672 it was burned down
by the Abkalas, who were invited by the prince of Mingrelia
to assist him against the Turks. N. lat. 43° 18'. E. long.
40° 32'.

ISMAELITES, in Ancient Geography and History, the
defendants of Ishmael, the son of Abraham by Hagar, his
Egyptian bondmaid. Ishmael was born in the year B.C.
1910, and his name, founded on a circumstance which afforded
relief to his mother, when she was wandering from her master's
house towards Egypt, her native country, is derived from the Hebrew
ISMAEL, formed of IS, ISHMAEL, to hear, and 
E, of, God, and denoting "the Lord hath
hearkened!" The heavenly messenger who appeared to
Hagar in the wilderness, and instructed her by what name
she ought to call her future son, predicted also that he and his posterity
would prove fierce and warlike, engaged in repeated holli-
dties, and yet able to maintain their independence. Hagar,
deriving encouragement from this circumstance, returned to the
house of Abraham, and was soon delivered of her pre-
mised son. The father regarded Ishmael as the heir of
his wealth, till Sarah had the promise of her son Isaac.

After the birth of Isaac, Abraham was persuaded by his wife to
return to the land of the Hebrews, and the patriarch probably
retumed for his substance in some distant situation, where
they could not endure, on the ground of his own other
possession. Having wandered for some time in the wlderness of Beer-sheba,
they proceeded further to the wilderness of Paran, which
borders on Arabia, and here Ishmael arrived at maturity,
and became an expert archer, or a hunter and warrior. In
pursuit of some of his herds, he came upon a man engaged in a
field, by whom he had twelve flocks, who eventually estab-
lished themselves as the heads of 50 to many distinct Arabian
tribes. Accordingly the defendants of Ishmael are men-
cioned in history, under the general name of Aramites and
Arabs. Of Ishmael's personal history, we merely learn from the scattered writings,
that he joined with his brother Isaac in paying the half tribute to respect to the
remains of his father; and that he died at the age of 137
years (B.C. 1773) Gen. xxxv. 18. His descendants,
according to the Scripture account, spread themselves from
Havilah to Kedar, that is before Egypt, as thou goest into
Arabia." From this brief statement, we may conjecture
how far their territory extended; for Havilah, according to
the generality of writers, was situated near the confines
of the Tigris and Euphrates, and Shinar, on the isles
which separate Arabia from Egypt, now called the island
of Suez. From thence we may well imagine, that
they spread themselves on both sides so far as to have taken
possession of the greatest part of Arabia; and, indeed,
Josephus (Antiq. l. i c. 13.) does not scruple to style
their progenitor the founder of the Arabian nation. See
ARABIA.

ISA, in Hindu Mythology, is a name of the goddess
Parvati, consort of Siva, in the form of Lata, which is c.
1818, leaves and fruits anciently solemnized in
honour of the goddess Isis.

The Isis were full of the most abominable impurities; and
for that reason, those who were initiated into them were
were obliged to take an oath of secrecy. They held for nine days successively, but grew so scandalous, that the female abolitionists at Rome, under the confuence of Piso and Gabinius. They were re-established by Augustus, and the emperor Commodus himself afflicted at them, appearing among the priests of this goddess with his head shaved, and carrying the Anubis.

*ISIAC Table* is one of the most remarkable monuments of antiquity, being a plate of copper or brass, discovered at Rome, in 1525, and supposed by the various figures in has relief upon it, to represent the facts of Isis, and other Egyptian deities.

With regard to the history of this monument, we may observe, that the copper or brass ground was overlaid with a black enamel, artificially intermixed with small plates of silver. When, in the year 1525, the constable of Bourbon took the city of Rome, aocksmith bought it from a folder, and then folded it to cardinal Bembo, after whose death it came into the hands of the duke of Mantua, and was kept in that family till it was locked up in the taking of that city by the Imperialists in the year 1630, nor has it been ever heard of since. By good fortune it had been engraved in its full proportion, and with all possible exactness, by Aemus Vico of Parma. This tablet was divided into three horizontal compartments, in each of which were different scenes, containing different actions. Those compartments are, as it were, different cartouches distinguished sometimes by lion strokes only, but oftener by a very large fascia, which is full of hieroglyphics, that is, of that mysterious writing, conferred by the ancient Egyptians to the mysteries of religion. The four sides of the tablet were inclosed with a border, filled up, like the ground, with several figures of the Egyptian gods, and with a great number of hieroglyphics. There have been various opinions as to the antiquity of this monument: some have supposed that it was engraved long before the time when the Egyptians worshipped the figures of men and women. Others, among whom is bishop Warburton, apprehend, that it was made at Rome, by persons attached to the worship of Isis. Dr. Warburton considers it as one of the most modern of the Egyptian monuments, on account of the great mixture of hieroglyphic characters which it bears.

It has been a question, whatever may be thought of the antiquity of this tablet, whether it only represents the mysteries of Isis, whose figure, placed in a sort of niche, occupies the centre, or whether it contains the principal points of the Egyptian theology, since all their gods are here represented. Pignorius, Kircher, and Chifflet, have offered their various conjectures concerning the design and meaning of this monument. The abbe Banier (in his *Mythology, &c.* vol. 1. p. 567.) declared it to be his opinion, that it was a votive table, which some prince, or private person, had consecrated to Isis, as an acknowledgment for some benefit which he believed she had conferred upon him. That goddess occupies the principal place in it, and the design of varying her attitudes and symbols, must have been to point out to us, in how many different modes she was worshipped, as well as the different sacrifices that were offered to her. Accordingly, three forms of these are there to be observed, one of animals, another of plants, and a third of libations. Perhaps the person who had consecrated this tablet to Isis, had offered to her all these forms of sacrifices, either for having been cured of some severe disease, or for having been delivered from some great danger, to which he had been exposed by sea; for that goddes was equally invoked in diseases, and when people were entering upon a long voyage; since the epithets of "Salutaris" and "Pelagia" were added to her name. Nothing was more common than the votive tables, consecrated to Isis. All the temples of this goddess were full of them; and works of that sort procured a living to great numbers of painters, as we learn from Juvenal (Sat. 18.).

"Et quam votiva tellantur fano tabellæ Phraima, Pictures quis nescit ab Ifide paece?" *ISIACI,* priests of the goddess Isis. Dioscorides tells us, that they bore a branch of anis-wood in their hands instead of olive. They sung the praises of the goddess twice a day, &c. at the rising of the sun, when they opened her temple; after which they begged alms the rest of the day, and returning at night, repeated their orisons, and shut up the temple.

Such was the life and office of the *ISIACI*; they never covered their feet with any thing but the thin bark of the plant papyrus, which occasioned Prudentius and others to say they went bare-footed. They wore no garments but linen, because Isis was the first who taught mankind the culture of this commodity. See Diodorus Siculus, and Plutarch's *Isis and Osiris.*

*ISIDORE of Pelusum,* in *Biography,* a celebrated director of St. John Chrysoflom, and distinguished in the Greek and Roman calendars by the epithet of "Saint," was by birth an Egyptian; and flourished, as the contemporary of Nonnius, and, according to Cave, about the year 412. As his name does not occur after the year 433, he probably died before the middle of the fifth century. He embraced the moral life at Pelusum, and acquired, by his abilities and indefatigable application to literary studies, high reputation for facility, learning, and eloquence, so that he was honoured by the Greeks with the appellation of "the famous." Faenodius says, that he wrote 2000 epitaphs for the edification of the church; and Suidas ascribes to him 3000, explanatory of the scriptures. Of these there are still extant 2012, in five books; of which Mollison speaks in terms of high commendation: laying of them, that though they are short, they are admirably written, both with respect to the solidity of the matter, and the purity and elegance of their style. He adds, that they manifest more piety, genius, erudition, and wisdom, than are to be found in the voluminous productions of many other writers, and that they call a confiderable degree of light upon several parts of scripture. Dr. Lardner, citing a dissertation of Dr. Heumann on *Isidore of Pelusum* (apud Pimianus Gottingenses, Hanover, 1758, 4to.), informs us, that this learned writer argues, that most of Isidore's letters are fictitious, and not a real correspondence; and, says Lardner, he seems to have proved what he advances. Isidore has largely quoted all, or most of the canonical books of the Old Testament; but he very seldom quotes any apocryphal books. He also often cites the four gospels, the acts of the apostles, and all St. Paul's epistles; except that to Philémon. He likewise quotes and explains passages of the epistle of James, the first and second epistles of Peter, and the first epistle of John. He explains the 5th verse of the second epistle of John, and there is no reason to doubt he has wronged the other. He explains a passage of the epistle of Jude, and uses several expressions that seem to have been taken from the book of Revellion: so that, upon the whole, his sense of scripture was the same as our's. Isidore had a great respect for the scriptures, and often recommends the perusal of them. The best edition of his works was published at Paris, in Greek and Latin, 1638, folio. Cave. Dapin. Mollison. Lardner.

*ISIDORE of Seville,* was an eminent bishop of this city in Spain.
Spain for 40 years, from the year 591 or 596 to 636. He was the son of Severianus, governor of Carthagena, and brother of Leander, bishop of Seville, who had the care of his education. He preceded at a council held in Seville in 620, and at another in Toledo in 625, to which we refer for the restoration of the lax state of ecclesiastical discipline and manners in Spain. He was a voluminous writer, and his works are enumerated by Dupin and Lardner; and the best edition of them was published at Paris, in 1601, by Father James du Bauld, a Benedictine monk, in folio. As a writer, he is characterized more by learning and pedantry, than by judgment, taste or accuracy. Mulheim reckons him among those authors, who gave rise, by their collections, to that species of divinity, which was afterwards distinguished by the Latins under the denomination of "pulito theolog." Dupin, though he represents him as a prodigy of learning, and an orator, admits that he wanted genius, and a discriminating judgment; and that his opinions are often false, and his remarks trivial, and frequently erroneous; and the style is rather periphteric than eloquent or polished. Tindor received all the fame books of the New Testament which we receive; and he speaks of them with great respect, setting that they contain the precepts of life and the rule of faith, and that they may be profitably read by all sorts of men. This Tindor is sometimes called "the 'younger,'" to distinguish him from Tindor, bishop of Cordova, in the fifth century, who wrote "Commentaries on the two Books of Kings," which he dedicated to Paul Orosius, the bishop of St. Augustine. Cave, Momign. Dupin. Lardner.

Tindor was a man of great and extensive learning, but particularly, as it is said, in geometry, music, and astrology, which, in the time of Tindor, was another name for astronomy.

His book on the holy offices contains the principal points of discipline and ecclesiastical polity. He is frequently ranked among musical writers. In his treatise on the divine offices, much curious information occurs concerning cantus firmus, and music in general; but particularly its introduction into the church, the institution of the four times by St. Ambrose, and the extension of that number to eight by St. Gregory. In treating of ecclesiastical music, he has a short chapter on each of the following subjects of music, and its name: of its invention; its definition of its three constituent parts, melody, rhythm, and metre; of musical numbers, of the three-fold divisions of music; of the harmonic division of music; of the organic or instrumental division; of the rhythmic division. These chapters are very short, and contain little more than compendious definitions of musical terms. In enumerating the seven liberal arts, chap. ii, he ranks them in the following manner: grammar, rhetoric, logic, arithmetic, music, geometry, astronomy. Tindor died in the year 636, and is enrolled among the saints of the Roman calendar.

Tindor, Mercatour, or Piccatour, the name given to the author of a collection of coins, which for some time were attributed to Tindor of Seville, is supposed to have flourished towards the close of the eighth century. This collection contains the pretended decretals of more than sixty popes, which are followed by the canons of the councils which were held in Greece, Africa, France, and Spain. They are generally considered as spurious, of which there is abundant internal evidence, arising from the style, the incorrectness of their dates, and from many historical, geographical, and chronological errors. They were invented for the purpose of strengthening the already overgrown power of the church, and to enforce the belief that the bishop of Rome was constituted and appointed by John the Baptist as supreme legatarius and judge of the church universal; and that, therefore, the bishops derived all their authority from the Pope at Rome, nor could the councils determine any thing without his permission and consent. Though the forgery was manifested to every thinking person, yet with the great mass of the people it produced the intended effect, and contributed to enrich and aggrandize the Roman pontiffs, and exalt them above all human authority and jurisdiction. Morel. Molheim.

I-fisok of Charax, a Greek author, in the time of Ptolemy Lagus, about three centuries before the Christian era, composed several historical works, and a description of Parthia, which has been published by Heichius, and likewise, at Oxford, among the collection of the later geographers. It is entitled "M. fisok Parthica." ISIDORO, Sr., in Geography, a town of California; 15 miles N.W. of Loreto.

ISIGNY, a town of France, in the department of Calvados, and chief place of a canton, in the district of Bayeux; 29 miles W.N.W. of Caen. The place contains 1839, and the canton 13,651 inhabitants, on a territory of 230 square kilometres, in 20 communes. N lat. 49 19. W long. 1. — Also, a town of France, in the department of the Channel, and chief place of a canton, in the district of Mortain; 9 miles W. of Mortain. The place contains 359, and the canton 7280 inhabitants, on a territory of 75 square kilometres, in 17 communes.

ISIKOV, a town of Japan, in the island of Nippon; 20 miles S.S.W. of Kanazawa.

ISIMA, a town of France, in the department of the Dora; 10 miles E. of Aosta.

ISIMIE, a town of Thibet; 25 miles E. of Harachar.

ISINDI, in Ancient Geography, an episcopal town of Asia, in the second Paphlagonia. ISINDUS, or ISINDA, a town of Asia, in Ionia.

ISINGLASS, a name given to Mufcow, and to Ichthyodes, which see. See also GLUE.

ISINGLASS, Fiphs, in Ichthyodes. See AMFENES and H. J.

ISIS, in Ancient Geography, Tellur, a river of Asia, in the Colchis, which, according to Arrian, was navigable; and he places it between the mouth of the Aeacida and that of Murg, about 90 stades from the one and the other.

Isis, in Geography, a name frequently given to the river Thames, before it joins the Thames at Dorchester; but this river is only a branch of the Thames, which rises near Mincinghamp in Gloucestershire, and joins the main stream near Lechlade.

Isis, in Mythology, a goddess of the ancient Egyptians, worshipped by them and many other nations.

Isis, according to Icon, is synonymous with Neith, ancient or aged, an expression which, in the Egyptian theology, was appropriated to the moon, on account of her eternal birth. According to others, and particularly Janouki, (Pantheon Egyptianum, vol. ii.) Isis, in the Egyptian language, signified the "cause of abundance:" and it was applied by the Egyptian priests to the moon, because they supposed, in consequence of attention to the phenomena of nature, that the moon has a direct influence on the atmosphere, the winds, and the rains; and therefore they regarded it, like the sun (which they called Osiris), as one of the sources of the foundation of the Nile. Hence they were led to characterize this beneficial effect, by denominating the cause of it "Isis." This is said to have happened 2500 years after the Exodus of the Israelites; at which period they bestowed the names "Isis and Moon," proper to their discoveries, and presented the people with a new theo-
According to Herodotus and all the ancients, Isis and Osiris were the two great deities of the Egyptians, and the most generally worshipped in the whole country; and, indeed, almost the whole mythology of these ancient people is comprehended under what their priests called Isis and Osiris. The Greek and Latin authors extend still further the Egyptian mythology concerning Isis and Osiris. It is, according to them, comprehended all nature, and all the gods of that ancient people. According to Herodotus, the Egyptians took Isis for Ceres, and believed that Apollo and Diana were her children, and that Latona had only been their nurse; differing from the Greeks, who regarded her as their mother. According to the same author, Apollo and Orus, Diana and Daphnis, Ceres and Isis, are the same; and hence it is, he says, that Aeschylus makes Diana the daughter of Ceres. Moreover, the mythologists assert, that Isis and Osiris included, under different names, all the gods of paganism; hence, according to them, Isis is Terra, Ceres, Juno, the Moon, Minerva, Cybele, Venus, Diana, and, in one word, all nature; and, as they pretend, this goddess was called Myrionyma, that is, who has a thousand names. Ofiris also, in their opinion, is Bacchus or Dionysius, the Sun, Scarpis, Pluto, Ammon, Pan, Apis, Adonis, &c. It is difficult to ascertain the real origin of Isis amidst these mythological fables. Some have pretended that the fable of Isis came originally from Greece; and they have confounded that goddess with Io, the daughter of Inachus, king of Argos. The fable of Io is recited by Ovid in his "Metamorphosis." (l. 35.) and this fable has been differently understood and explained by various authors. It is allowed that there was in Greece a princess named Io, the daughter of Inachus, or, as Servius says, of Japhus; and the Greeks took occasion to confound Isis and Io, in consequence of the introduction of the worship of Isis into Greece, especially into the city of Argos. Inachus taught the Greeks to pay honour to Isis, and hence they looked upon her as their daughter. Jablonowski says, that the Egyptians, from remote antiquity, worshipped the moon, under her proper name of "Leb," which, in the Egyptian language, signifies the moon; and that Inachus, the first king of Argos, carried this worship into Greece, nearly 300 years before the birth of Moses. It is there, says Eutathius, that a cow is the symbol of Io, or the moon; for in the Argian language, the moon is called Io. The Grecian fable, on the other hand, makes Io cross the sea from Greece, metamorphosed into a cow, and conducts her into Egypt, where she receives the name of Isis. Accordingly, Lucian, well versed in ancient mythology, puts these words into the mouth of Jupiter, "Conduct Io to the banks of the Nile, across the waves of the sea. Let her become Isis: let her be the goddess of the Egyptians; let her augment the waters of the river, and let loofe the winds." As the Nile began to increase at the new moon which follows the full-moon, the Egyptian priests, who regarded this planet as the mother of the winds, decreed to her the honour of this phenomenon. "Istis," says Servius, (Obs. on the Aeneid. l. 8.) "is the genius of the Nile. The fillets she bears in her hand indicates the increase and the flowing of the waters; the vase she holds in her left mark their abundance in all the canals." Temples were erected to her in the different provinces, and the bad altars and facades throughout the whole country. "Coptos," says Eutathius, "is a city of the Thebais, where Io is adored under the name of Isis. It is on her festivals that they celebrate with the fillets the increase of the Nile." The people, from the allegorical language of the priests, imagined that they owed this bounty to the tears of that divinity. The Egyptians, according to Pausanias, were prevailed that the tears of Isis had the virtue to augment the Nile, and to make it rise up into the country. Savar, in his "Letters on Egypt," says, that the Copts are not yet cured of this superstition.

Notwithstanding the fabulous pretensions of the Greeks with regard to the origin of Isis, and their attempts to identify her with their Io, the Egyptians, according to Diodorus Siculus (l. i.) and Plutarch De It. et Oisr, affort that this princess was born in their country; that she married Osiris, that they lived together in perfect harmony, and that they continued in their endeavours to polish and civilize their subjects, to teach agriculture, and to spread other necessary arts of life. Diodorus adds, that Osiris, determining on an expedition to India for purposes of civilization, settled this regent of his kingdom. (See Bacchus.) On his return to Egypt he found that his brother Typhon had formed a party against the government. Typhon, however, relented the gentle means used by Osiris for furnishing his ambitious spirit, and, under a pretence of hospitality, confined him in a chief exquisitely wroght, and threw it into the Nile. When Isis heard of her husband's tragic end, the made diligent search for the corpse, and having found it in Phocis, was assured by the king of Byblos to carry it away to Egypt. Having emenated over it, she at length caused it to be interred by Abydes, a town situated to the west of the Nile. In the mean time Typhon was contriving to secure his new empire, but Isis, being recovered from her distress, collected her troops, and placed them under the command of Orus, her son, who pursued the tyrant, and vanquished him in two pitched battles. (See Typhon.) Isis hamin died some time after her son's victory over Typhon, the Egyptians paid adoration to her with her husband Osiris, as to divinities; and because they had applied themselves, during their own reigns, to teach agriculture, the oil and the rice became the symbols. Festivals were instituted to their honour, in which certain infamous rites were afterwards introduced. Then the infamous image of the Pharaoh is, in the ceremonies, was carried in procession, and it became the symbol of fruitfulnes; though in its original meanings it had only been the mark of Isis's passion for Osiris her husband. Diodorus Siculus has recorded the following inscription upon an ancient monument, by which Isis was characterized. "I, Isis, am the queen of this country. And I had Mercury for my prime minister. None had power to hinder the execution of my orders. I am the eldest daughter of Saturn, the youngest of the gods. I am the sister and the wife of king Orus. I am the mother of king Orus. I am the who resides in the dog-star. The city of Bubasta was built in honour to me. Rejoice, O Egypt, thou that hast been to me instead of a nurse, and mother." The following inscription, according to Plutarch (De It. et Oisit,) was engraved upon the pavement of Minerva's temple. "I am all that has been, that is, and that shall be, and none among mortals has hitherto taken off my veil."

The Egyptians, having called the moon Isis, or the cause of abundance, applied this epithet to the earth, as the mother of fruits. We know, says Macrobins (Saturn. l. i.), that Osiris is the sun, and Isis the earth. Isis, in the Egyptian language, adds Servius, means the earth. In this point of view, she has a striking affinity to the Ceres of the Greeks; and this agrees with the account given by her by Herodotus (l. ii.). Plutarch informs us, that the priests honoured only with the name of Isis that part of Egypt which was watered by the Nile, and in allusion only to her fecundity; he adds, that, in the sacred language, they termed the inundation, the marriage of Osiris with Isis.

Isis is reported by Diodorus Siculus to have invented many excellent
excellent medicines: and hence, says he, after she was received among the number of the deities, she was applied to for the cure of distempers; and frequently indicated remedies by dreams. Galen takes notice of some plasters which bear her name. Banier's Mythology, vol. i. Savary's Letters on Egypt, vol. ii. See Belastis, Orus, Osiris, and Sotiris.

Istis, in Zoology, a genus of Zoophytes of a ramose or plant-like form, the stem and branches of which are composed of fleshy articulations, longitudinally fluted, united by spongy or horny junctures, and covered, when living, in a recent state, by a soft porous cellular flesh or bark; and the mouths beset with oviporous polypes. The species of this family are entirely of the marine kind, and molly inhabitants of the Indian seas.

Species.

This species is somewhat flexible, about six inches in height, with flesh-coloured joints, and flesh of a cinnamon colour, beset with convex papillae. It inhabits the seas of India and China.

Inhabits the seas of the East Indies; the colour deep-red, or sometimes white, with the junctures brownish-yellow; the stem irregularly grooved, the branches numerous, dichotomous and spread, the joints connected by yellow spongy knobs; flesh yellow, with numerous fleshy lobes, the habits of polypes, each of which is furnished with eight claws.

Entrocha. Stem teflateous, round, with orbicular perforated joints and verticillated dichotomous branches. \textit{Gmel.}

Stem about three quarters of an inch in thickness, with crowded flat orbicular joints, perforated in the centre, the perforations pentangular, with the dish somewhat fluted from the centre, the outer bark unequal and surrounded with a row of tuberces; branches thin, dichotomous, continued and not jointed. Inhabit the ocean.

Found in the seas about the islands of Barbadoes. Neither this nor the species preceding, though retained under the genus \textit{H.}, upon the authority of \textit{Gmelin}, can with propriety be considered as appertaining to that genus, or perhaps to any other, at present established among naturalists. They unquestionably belong to a race of creatures whose manners, and even structure, are not at this time very clearly understood.

Coccinea. Stem jointed, slender, very red, and somewhat fluted; joints united by short yellowish spongy junctures; flesh on the outside covered with small fleshy prominences, each furnished with a mouth. Solander.

A diminutive kind of coral, with irregularly spreading branches, and which rarely exceeds the height of two or three inches. It is a native of the Indian ocean, and is sometimes found entirely white.

ISTI, in Geography, a town of Ruffia, in the government of Irakch, on the Leon. N. lat. 61° E. long. 123° 15'.

ISKASAMAGTI, a name given by the ancients to a light kind of agate, growing to the old stumps of the oak, hazel, and other trees. This being a very light kind of fuel, was used by the ancients in the manner of a cautery, as we have learned from the Indians to use mossa, or the down of mugwort leaves.

ISKARSKOIGOROD, in Geography, a town of Ruffia, in the government of Tobolsk. N. lat. 60° 5'. E. long. 59° 14'.

ISKAM, a name given by the ancients to a light kind of agate, growing to the old stumps of the oak, hazel, and other trees. This being a very light kind of fuel, was used by the ancients in the manner of a cautery, as we have learned from the Indians to use mossa, or the down of mugwort leaves.

ISKOLDZ, a town of Lithuania, in the palatinate of Novgorodek; 30 miles S. E. of Novgorodek.

ISKOROSE, a town of Poland, in Volhynia; 48 miles N. of Zytomiers.

ISLA, Joseph Francis de, in Biography, a Spanish Jefuit of Madrid, who, after the deftruction of his order, retired to Italy, and died at Bologna in 1751. He was author of a fatue on the ignorance and vices of the monks, entitled "Hitoria del Fra. Geranido de Compazas alias Zotes," which the supreme council of Parliament was obliged to suppress. It has been translated into English and German, and it is said that since the time of Cervantes, no Spanish writer has displayed so much wit and humour. Gen. Bog.

ISLA, in Geography, a river of Scotland, which rises in the shire of Angus, and runs into the Tay, 10 miles N. of Perth.

ISLA. See ISLA.

ISLAM. See MAHIOMETANS.

ISLAMABAD, a town of Bengal, and capital of the province of Chittigong, situated on the river Chittigong, or Currumpelly, about 12 miles from the bay of Bengal. N. lat. 22° 20'. E. long. 91° 35'.—Also, a small province of Bengal, between Gorogot and Patolah.

ISLAMNAGUR, a town of Hindoostan, in the circuit of Bopal; 10 miles N.E. of Bopalo.

ISLAMPOUR, a town of Hindoostan, in the circuit of Nagore; 36 miles N.E. of Didwana.—Also, a town of Hindoostan, in Dabhar; 28 miles S. of Patna. N. lat. 25° 8'. E. long. 85° 43'.—Also, a town of Hindoostan, in Vai-pour; 15 miles S.W. of Curter.—Also, a town of Hindoostan, in the circuit of Jeynagur; 70 miles N.N.W. of Jeynagur.

ISLAMTI, a town of Asiatic Turkey, in Caramania; 30 miles S.S.E. of Kafarache.

ISLAND, or Isle, a tract of dry land encompassed with water; either with the sea, a river, or lake. In which sense islands are distinguished from continent, or terra firma.

Some conclude that islands are as ancient as the world, and it is by no means probable, that the large islands far remote from the continent are new, or that they either arose out of the sea. Some, however, are of opinion, that islands are the fragments of sunken continents, or mountains which have been submerged by the sea; and that many of them are in their original state a part of the world, and have been cut out.
out of the sea, or were torn from the main land. Nor is it lefts certain, that there have been new islands formed by the
\textit{falling up} of vast heaps of clay, mud, sand, &c. as that, for
instance, of Thongning, in the province of Nan-kuin, in China: or by the violence of the sea, which has torn off
large promontorcks from the continent, as the ancients imag-
inoned Sicily, and even Great Britain, to have been formed.
It is also certain, that some have emerged above the waves, as
Santorini formerly, and three other islands near it in later
times; the last in 1767, which rose from the bottom of the
sea, after an earthquake, that was supposed to have loosed it
from its hold.

Several naturalists are of opinion, that islands were formed
at the deluge: others think they have been rent and sepa-
rated from the continent by violent storms, inundations, and
earthquakes. These last have observed that the East
Indies, which abound in islands more than any other part of
the world, are likewise more annoyed with earthquakes, tem-
pelts, lightnings, volcanos, &c. than any other part.

Varenius thinks most of these opinions true in some in-
stances, and believes that there have been islands produced
each of these ways. St. Helena, Ascension, and other

(Continued)
part of Vaucluse, and chief place of a canton, in the
district of Avignon. The place contains 5,155, and the can-
ton 11,099 inhabitants, on a territory of 1734.4 kilometres,
in 10 communes.

**ISL-Adam**, L', a town of France, in the depart-
ment of the Seine and Oise, and chief place of a canton, in
the district of Pontoise, 6 miles N.N.E. of Pontoise. The
place contains 1331, and the canton 11,995 inhabitants, on a
territory of 1,475.1 kilometres, in 23 communes.

**ISL-Boucicaut**, L', a town of France, in the depart-
ment of Indre and Loire, and chief place of a canton, in
the district of Chinon, surrounded by the Vienne; 9 miles
E.S.E. of Chinon. The place contains 1089, and the can-
ton 10,437 inhabitants, on a territory of 249 kilometres,
in 20 communes.

**ISL-Boulogne, L', or Isle-Bouen**, a town of France, in
the department of the Vendee, situated on an island of the
same name, about 5 miles long, on the coast; 9 miles N.W.
of Challons.

**ISL-Cerc**, a small island in the English channel, near
the coast of France. N. lat. 48° 53'. W. long. 3° 25'.

**ISL-Dieu**, L', a town of France, in the depart-
ment of the Vendee, and chief place of a canton, in the district of
Les Sables d'Olonne. The place contains 1040, and the can-
ton 2253 inhabitants, on a territory of 65 kilometres, in 2
communes.

**ISL-d'Queffant**, L', a town of France, in the depart-
ment of Finisterre, and chief place of a canton, in the district
of Brest. The place contains 1645 inhabitants, on a territo-
ry of 22 kilometres, in 1 commune.

**ISL-en-Deln**, L', a town of France, in the depart-
ment of the Upper Garonne, and chief place of a canton, in
the district of St. Gaudens; 18 miles N.N.E. of St. Gaudens.
The place contains 1106, and the canton 10,932 inhabitants,
on a territory of 232.4 kilometres, in 24 communes.

**ISL-Fourdin**, L', a town of France, in the depart-
ment of the Gers, and chief place of a canton, in the district
of Lombez, situated on the Save; 7 miles E. of Auch. The
place contains 4688, and the canton 11,034 inhabitants, on a
territory of 43.14 kilometres, in 23 communes. N. lat. 43°
37'. E. long. 1° 10'.-Allo, a town of France, in the depart-
ment of the Vienne, and chief place of a canton, in the
district of Montmorillon, 24 miles S.E. of Poitiers. The
place contains 448, and the canton 7553 inhabitants, on a
territory of 375 kilometres, in 11 communes. N. lat. 46°
15'. E. long. 0° 25'.

**ISL-Jerle-Doubs**, L', a town of France, in the depart-
ment of the Doubs, and chief place of a canton, in the dis-
trict of Baume; 11 miles N.E. of Baume. The place con-
tains 685, and the canton 7048 inhabitants, on a territory of
167.7 kilometres, in 24 communes.

**ISL-Jerle-Serrein**, L', a town of France, in the depart-
ment of the Yonne, and chief place of a canton, in the dis-
trict of Avallon. The place contains 478, and the canton
8766 inhabitants, on a territory of 250 kilometres, in 23
communes.

**ISL-des-Moing**, an island of France, in lake Morbihan,
with a tower; 5 miles S.S.W. of Vannes.

**ISL-Grande, or La Roche**, an island in the South Pacific
ocean, seen by Anthony de la Roche, in 1675. S. lat.
45°.

**ISL-Royal**, an island on the N.W. side of lake Super-
ior, within the territory of the United States, N.W. of the
Ohio; about 100 miles long, and, in many places, about 45
broad. The natives suppose that this and the other islands
on the lake are the residence of the Great Spirit.

**ISL Plate**, a small island in the English channel, near
the coast of France. N. lat. 43° 23'. W. long. 3° 24'.

**ISL of Dogs Canal**, is the name of a very wide and
deep canal for the passage of ships across the islands called
the Isle of Dogs, in the river Thames, below London, of
which an account has been given under the head of that
river, in our article Canal, and a plan of the same will be
found in our plate of Docks.

**ISL of Height**, an inhabited tract of land, situated in
the English channel, near the coast of Hampshire, from which
it is not more than three miles distant at the nearest point,
and to which county it belongs in all political and civil mat-
ters. The form of the island is that of an irregular lozenge;
measuring from the eastern to the western angle nearly
twenty-three miles; and about thirteen from the northern to
the southern point: its superficies is computed at 105,000
acres. Through the middle, in the longest direction, ex-
tends a range of hills, affording excellent pasture for sheep,
and commanding views over every part of the island, with
the ocean on the south side, and the coasts of Hampshire on
the north. The face of the country is much diversified; hill
and dale, the swelling promontory and the lowly glen, ap-
ppear in quick succession to animate, and give interest to
the prospects. The land round the coast is, in some parts,
very high, particularly on the south, or back of the island, as
it is commonly termed; here the cliffs are very steep, and
vaft fragments of rock, undermined by the waves, lie scattered
along the shore: on the northern side, the ground slopes to
the water in easy declivities, excepting towards the Needles,
or western point, where the rocks are bare, broken, and
precipitous. The height of the cliffs, of which the Needles
form the extreme point, is, in some places, six hundred feet
above the level of the sea, and when viewed from the distance
of about a quarter of a mile, have a grand and sublimul
and stupendous effect. These cliffs are frequented by immense
numbers of marine birds; as puffins, razor-bills, willow-
gulls, cormorants, cornisingshoughs, daws, starlings, and
wild pigeons; some of which come, at rated times, to lay
their eggs and breed; while others remain there all the year.
The cliffs are in some places perpendicular; in others, they
project and hang over, in a tremendous manner; the several
parts form many shelves; which serve as lodgements for the
birds, where they sit in thick rows, and discover themselves
by their motions and flight, though not individually visible.
Here are many caverns and deep chasms, which seem
to enter far into the rocks; and in some places, the issuing
of springs forms small cascades of rippling water down to
the sea. The country people take the birds that harbour in
these rocks, by the perilous experiment of defending by
ropes, which are fixed to iron crows, driven into the ground;
thus uplifted, they with flocks beat down the birds as they
fly out of their holes. A dozen birds generally yield one
pound weight of soft feathers, for which the merchants give
eight pence; the carcasses are bought by the fishermen at
sixpence per dozen, for the purpose of baiting their crab-
pots. The rocks, called the Needles, derived their name
from a lofty pointed one, resembling a needle in shape,
which had been disjointed, with others, from the main land,
by the force of the waves; this was 120 feet above the low
water mark; but about forty years ago, its base having been
excavated by the sea, it fell, and totally disappeared.
All the higher parts of the island are composed of an in-
mense mass of calcareous matter, of a chalky nature, in-
cumbent on schistus, which runs under the whole life, and
appears, at low water mark, on the coast near Mottifon:
this becomes so indurated by exposure to the air, as to make
very good whitewashes. The lime-dust is burnt for manure;
and in the pits where it is dug for that purpose, are found numerous echinus, thorns' teeth, and ammonites. These fossils are particularly abundant in the range of cliffs which forms the southern shore; together with bivalve and turbatid shells of various descriptions; the corona ammonities are of all sorts, from one inch to eighteen inches in diameter. A stratum of chalk is discovered itself at the foot of Brimbridge cliff, and runs through the southern part of the island, appearing again at Warden Ledge, in Freshwater parish. On the north side of this stratum lies a vein of white sand, and another of fuller's-earth; and on the south side is a vein of red ochre.

The soils of the island are of various kinds; but the most prevailing is a strong loamy earth, well adapted for agricultural purposes, and extremely fertile. The quantity of grain annually raised here, is computed to amount to seven or eight times as much as sufficient for all the inhabitants. The medium produce of wheat, throughout the island, is about twenty-one bushels per acre; of barley and oats about thirty bushels; and of beans and peas about twenty-eight bushels: potatoes are very productive, though not generally in esteem, and turnips also yield a rich increase. The meadow lands are extremely fine, and produce from one to three tons of hay per acre. The elevated tracts are most appropriately adapted for pasturing sheep; the number annually shorn is about 40,000; the wool is of the finest quality, and in much repute; the breed in general use is the Dorset: about 50,000 lambs are sold annually.

The climate is extremely balmy, and highly favourable to vegetation: its general qualities, and near approximation, in mildness, to more southern regions, may be influenced by the position of its myrtles, and by the flourishing state of a vine-plantation at Appuldurcombe. The central parts of the island are subject to frequent rains; the high range of hills provoking a constant source of attraction to the vapours, and, in the winter months, involving all beneath them in gloom and humidity. The general fertility, however, is so little affected, and the vegetation is so abundant, that this island has often been styled the "Garden of England," an appellation, perhaps, that is partly figmented to the mind by the innumerable plants and flowers which grow every where in wild luxuriance; among them are the ophrys apifera, or bee-orchis; the digitata, or fox-glove; and the crinum maritimum, or rock-famphire.

The contiguity of the Portsmouth, and other dock-yards for ship-building, has operated to deprive the Isle of Wight of much of its timber; and even Parkhurst, or Carisbrooke forest, which includes about 3000 acres of good land, is almost destitute of trees of any value. The woods of Swanston are of considerable extent; and those of Wooten and Quarr cover a superfluities of nearly 1200 acres: the oak and the elm are the most flourishing trees.

Great variety of fish is found on the coast, and in considerable abundance: those of the crustaceous kinds are particularly numerous on the southern shores. The lobster and crab are of uncommon size, and peculiar quality; some of the former are often taken upwards of fix pounds weight; the latter so abundant on a particular part of the coast, that a neighbouring village has obtained the name of Crab-Niton from this circumstance. Cockles are in high estimation; the sand-eel is also very plentiful.

The trade of the Isle of Wight is flourishing: the harbour of Cowes is particularly convenient for shipping and unshipping merchandise. The chief imports are coal, timber, deals, iron, wine, hemp, and fruits; the principal exports are wheat, flour, barley, malt, and salt. The chief manufactures are those of flax, hair-powder, and salt; and latterly the making of woolens, flaxing, &c. has been carried to some extent in the House of Industry near Newport.

Several chalybeate springs have been discovered in different parts of the island; one of them, at Black Gang, under Chale cliff, is very strong; about half a mile from this, at Pitland, is a spring, impregnated with sulphur; and at Shanklin is a spring, the waters of which are slightly tinctured with alum. Springs of clear water are very numerous, and in general extremely pure and transparent, from the natural purification which they undergo through the thin-flame strata.

The principal rivers are the Medina, the Yar, and the Wooten. The Medina, annually called the Mede, rises near the bottom of St. Catherines Down, and flowing directly northward, divides the island into two nearly equal parts; gradually widening in its course, it passes to the east of Newport, and in Cowes harbour unites its waters with the ocean. Numerous smaller streams also exist, and various creeks and bays run up from the sea. The two divisions of the island are called the hundreds, or liberties, of East and West Medina, from their relative situations to that river. They contain thirty parishes, in which are comprehended the following boroughs and towns: Brading, Newport, Newtown, and Yarmouth; the three latter of which return five members to parliament.

The ancient history of this island has been a subject of much controversy with topographical writers. Whatkin, in his History of Manchester, contends that it was formerly connected with the main land; and that it is the Icins of Diocorus Siculus. At this port, according to the latter writer, the Britons shipped their tin for Gaul; but the original tin staple of Britain was certainly the Caetherides, or Scilly islands. (See Borlase and Heath's Accounts of the isles.) During the Anglo-Roman dynasty this island was called Vituli; but it does not appear that the Romans had any station or settlement here; though they had two or three considerable stations on the opposite coast; one at Clauentum, near Southampton, and another at Port-cleather. Suetonius, the sirl of the Roman authors, who notices the island under consideration, states, that it was subdued in A.D. 43 by Vespasian. Cerdic, a Saxon chief, and founder of the kingdom of Wiltshire, made a second conquest of the Isle, and appointed his nephews Sterf and Whilunger to govern the inhabitants. In the year 661 it was again subdued by Sulphur, king of Mercia, but this monarch was dispossessed of this tract of land within the space of 15 years. The Danish marauders afterwards visited, and took possession of this island; and preferring a port here, they made frequent descents on the coasts of Hampshire, Dorsetshire, and Suffolk. After the Norman conquest, the island was annexed to the crown, and was frequently granted, in trust, to the favourites of different monarchs.

A list of the different noblemen who were governors, or lords of the island, with the conditions on which it was held, are fully narrated in Sir Richard Worsley's History of the Isle of Wight. The situation of this island has rendered it liable to invasions in the time of warfare, and particularly when France has been at war with England, and many insurrections have been recorded of descents on this coast. To protect the island, a large and strong fortress, called Carisbrooke castle, was constructed at an early period, and has been preserved as a place of refuge and strength even to the present time. Here a military governor occasionally resides. Other forts were constructed on different parts of the coast; but the great fortifications at Portsmouth, and at other places on the Hampshire coast, serve to guard the island. The southern shore is also naturally protected by rocks. The island

Isle of Wight, a county of Virginia, on the S. side of James’s river, W. of Norfolk county, about 40 miles long and 15 broad, containing 5313 free inhabitants, and 4229 slaves. In this county is a mineral spring, to which many persons resort. It is situated about 10 miles from Smithfield, and 12 from Suffolk.

ISLEBEIUS, in Natural History, a name given by authors to a kind of blackish flate, very heavy, not very hard, and easily splitting into thin flakes. It is dug near Isleb, in Thuringia, where it has its name, and is much of the nature of that sort of black flate which we have common in England, lying over the coal strata. As our plate of this kind contains usually leaves of fern and other plants, this foreign kind contains the impressions of several kinds of flate, so exactly delineated in shape, and with the ferns, fiddle, and all other parts so perfect, that the species are easily known. All these impressions and delineations are, however, to flat and thin, and have taken up so little room in the flate, that they seem rather to have been the skins and exuvia of flates than the whole bodies of them; but this is not wonderful when we consider how easily the bodies, and even the bones of flates may be dissolvd; and that these exuvia are lodged in a sub stance which contains a vitriolic salt, very capable of effecting such a dissolvtion. It is easy to conceive, that this and other such salts, while in a state of dissolvtion in water, before the concr etation of the matter of this flate into hard mafs, might make that water a fen trumum capable of thus dissolving the bodies and bones of flates, while the outer skin and scales being much tougher, and of a different nature, might escape the effects of them. It is well known that the fins and scales, and other external parts of flates, are much more capable of bearing maceration in water than the internal sub stances of them; and it is easy to conceive that these, after having with stood that power in the water, would at length dissolve among the muddy matter that was to form some of this crata of the flate; the motion of the water would not fail to expand their skins, though ever so thin, into the true and exact shape of the whole flate; and when thus laid along upon the surface of the new-formed cratum, the next quantity of the same matter that subsided would form another cratum, which falling evenly upon the former, would cover it, and on the following concr etation of both, the figure of the flate would be beautifully preserved between two plates or flakes of a flinty flate.

It is very remarkable, that as in these flates of Isleb preserving fishes, the external parts only are preserved, the bones and flish being wanting: so, on the other hand, in those flitible flates brought from Syria, the skins and scales are wanting, and the skeletons are principally the part preserved. In some of these the bones are not clear, small parcels of the flish being found petrified among them; but this flish is stripped of the skin. The flate in which these Syrian fishes are preserved is also very different from the Isleb flate, being whitish or greyish, and very hard. The flates of this kind found on mount Libanus, where they are very common, have very fine delineations of the sub-fish complete.

ISL

ISLEDIANS, in Ecclesiastical History, a name given to those who adopted the sentiments of a Lutheran divine of Saxony, called John Agricola, a disciple and companion of Luther, a native of Isleb, whence the name; who, inter- preting literally some of the precepts of St. Paul with regard to the Jewish law, declaimed against the law, and the necessity of good works. See ANTISMIANS.

ISLEBOURGH, in Geography, a township of America, in Hancock county, Maine, formed by Long island, in the centre of Penobscot-bay; 15 miles long, and from two to three broad; it was incorporated in 1789, contains 483 inhabitants, and is distant 200 miles N.E. by N. from Boston.

ISLES de Madame, islands that lie at the S. end of Sydney, or Cape Breton island, on which they are dependent. The largest of these, with Cape Canfo, the P. point of Nova Scotia, forms the entrance of the gut of Canfo from the Atlantic ocean.

ISLESMEN, in Natural History, a large cluster of islands in the South sea, populous, and affording plenty of potatoes, cocoa, bananas, and other fruits. S. lat. 19° 39'. E. long. 179° 38' from Paris.

ISLES, in Architecture, the sides or wings of a building.

ISLEWORTH, in Geography, a parish in the hundred of the same name, and county of Middlesex, England, is delightfully seated on the banks of the Thames, and has long been the residence of many persons of rank and fortune. The parish consists of about 2370 acres, chiefly appropriated to arable and pasture; but nearly 550 acres are used as gardens and nursery-grounds. At Baderbridge, in this parish, are some large copper and brass mills, rented by the society of the mines-royal. A considerable china manufactory, some extensive culco-grounds, and two large flour-mills are also within this parish. The chief business, or trade of the place, is derived from the gardens, which furnish a vast variety of fruit and vegetables for Covent-garden market. In the year 1794, Sir Joseph Banks obtained a correct statement of the population of this parish: and it appeared that the number of houses was 712; of which 43 belonged to gentlemen, 6 to farmers, 26 to publicans; the remainder consisted of shops and cottages. The inhabitants at the same time amounted to 4140. In the year 1800, the houses amounted to 768, and inhabitants to 4346. The principal building in this parish is Sion-house, a spacious seat of the duke of Northumberland. The house occupies the site of a convent of Bridge-tines, founded by king Henry V. The present manor was enlarged and fitted up by the late duke, who embellished it with several pieces of ancient sculpture, also with twelve Ionic columns, and sixteen pilasters of fine marble. The improvements made in the house, and the elegant finish, adjoining the public road near Brentford, are of designs by the late Mr. Adams. The gardens and pleasure-grounds, contiguous to the Thames, were laid out by the late Mr. Brown. The house of Marlborough and the earl of Shrewbury have seats in this parish. Isleworth Park was occupied by the barons’ army, headed by Simon de Montfort, in the year 1263. On the 4th of August, 1647, general Fairfax appointed his head-quarters at Isleworth, and received the parliament commissioners here. Lyfons’s Environs of London and Middlesex Parishes.

ISLINGTON, a village in Offisoloh hundred, Middlesex, England, though formerly a small place, and separated from London by several intervening fields, is now connected to the northern suburbs of the metropolis, and indeed appears to form a part of this vast city. “When it is considered, that Islington is scarcely two miles from the centre of the original London; that it is seated upon the Ermin-street of the Romans, and the spot where they had a military post; also, that it has, from the earliest period of our history, been celebrated for the richness of its pastures, and the excel-
of the produce of its dairies, there can remain little doubt
that those circumstances must have rendered it of con-
siderable importance to the Londoners, as well as the garrison
there". This village has been variously spelt in old records
and publications; as Hundle, Hendon, Hendol, Yeldon,
and Eyfeldon: but it appears that the present name has
prevailed from the close of the 16th century. The parish
of Iffington is three miles two furlongs in length, from
N.W. to S.E., and two miles one furlong in breadth. It
consists of 3022 acres three roods, of which the chief part
is appropriated to pasture. Besides the village of Iffington,
the parish contains the following hamlets: Holloway, Bull-
pond, Battle-bridge, the City-gardens, kingsland-green, and
great part of Newton-green. The population of this
parish, in 1800, was returned at 10,212, occupying 1663
houses; in 1792, the latter was only 1200, and the former
1620; whereas, in 1790, the population has increased to
15,000. Previous to the year 1714, the roads and high-
ways were in so bad a state, that in an act of parliament then
passed, they are described to be "very ruinous and almost
impossible for the space of five months in the year." This
furnishes a curious illustration of the amazing improve-
ments made for public accommodation within 100 years: for now
foot-passengers are provided with good pavements, or gravel
paths, and the public roads are firm, even, and generally
clean. They are also furnished with lamps for winter, and
watchmen and patroles are employed to protect houses and
pavements. From an early period, even before the time of
Henry II., Iffington has been noted as a place of recrea-
tion for the citizens of London; where wrestling-matches, foot-
ring, archery, calling the flute, and other athletic pastimes
were pursued. Now the mechanics and lower classes fre-
quent public-houses, which are provided with grounds for
skittles and Dutch-pins; places for playing at fives, cricket,
and bowls. In this parish, to the north of White Conduit-
house, are the traces of an encampment, which several
writers have attributed to the Romans, but neither its pre-
fent state, nor any discoveries that have been made, justify
this opinion. Iffington contains several commodious, and
some handsome houses belonging to London merchants and
tradesmen.

For a full and circumstantial history and description of
this parish, the reader is referred to "The History, Topo-
graphy, and Antiquities of Iffington," by John Nelfon,
4to. 1811.

ISLIP, a post-town of New York, in Suffolk county,
Long island, E. of Huntington, containing 958 inhabi-
tants.

ISMADABS, a town of Japan, in the ifland of Niphon;
126 miles N.W. of Jedo.

ISMAELPOUR, a town of Hindoolan, in Bahar; 38
miles S.W. of Patna. Also, a town of Bengal; six miles E.
of Boghjipour.

ISMAIL, or ISMAIL, a town of European Turkey,
in the province of Bessarabia, situated on the N. side of
the Danube, about 33 miles from the Black sea. The town
measures about a mile toward the land, and half a mile by
the side of the Danube, and was fortified by eight bastions.
The ramparts are in general 18 feet high, and in some places
95. The moat is from 30 to 40 feet deep, and at an inter-
mediate distance between the pylons named Bender and
Brock was a false trench. Near the town was a cavalier of
flone-work, capable of holding three thousand men. The
side next the water was defended by ramparts and horizontal
batteries. This place was taken by force, December 22,
1796, by the Russians, under general Suwarrow. It is said,
that after the Turks had surrendered, the garrison was put
to death, and 30,000 men massacred in cold blood; the town
was given up to the unrestrained brutality of the victorious
army. The booty found in the place was immense: 144
miles S. W. of Ochakov. N. lat. 43° 23'. E. long.
29° 45'.

ISMANNING, a town of Bavaria, which gives name to
a county, situated on the Iser; eight miles N. N.E. of
Munich.

ISMENIAS, in Geography, one of the most celebrated
performers on the flute in antiquity, was a native of Thesee,
and not less renowned for splendour, extravagance, and cap-
price, than for his skill in music. Having been taken pri-
toner by Athens, king of the Scythians, he performed on
the flute before this rude monarch; but though his attend-
ants were charmed so much that they applauded him with
rapture, the king laughed at their folly, and said that he
preferred the neighing of his horse to the flute of this fine
musician.

Aelian tells us, that he was sent ambassador into Persia.
Lucian, that he gave three talents, or 4814 £s. for a flute
at Corinth. Antiphenes, not very partial to music, said he
was sure that Ismenias was a worthless fellow, by his play-
ing so well on the flute. Plutarch relates the following
story of Ismenias: being sent for to accompany a sacrifice,
and having played some time without the appearance of any
good omen in the victim, his employer became impatient,
and, taunting the flute out of his hand, began playing in
a very ridiculous manner himself, for which he was repre-
ned by the company; but the happy omen soon appear-
ing, said he, to play acceptably to the gods, is their
own gift! Ismenias answered with a smile, "While I
played, the gods were so delighted, that they deferred the
omen, in order to hear me the longer; but they were glad
to get rid of your noise upon any terms." Thus we see
that neither vanity nor impiety is peculiar to modern mu-
cicians.

The same author, in his life of Demetrius, informs us,
that Ismenias used to instruct his pupils by examples of
excellent and execrable performance; letting them hear, imme-
diately after each other, a good and a bad player on the
flute; saying of the first, "This is the way you should
play!" and of the second, "This is the way you should not
play." He is recorded by Pliny as a prodigal purchaser of
jewels, which he displayed with great ostentation. Being
at Cyprus, he found at a jeweller's an engraved emerald of
the most exquisite kind, representing the princess Amyona,
one of the daughters of Danaus, for which the jeweller
asked him five talents, with which demand Ismenias imme-
diately complied. But the jeweller, astonished at his facility,
and expecting that an abatement would have been required,
offered, confident only, to return two of the five talents;
but the magnificent musician refused to take them; saying,
that it was that for ever diminish the value of the gem. Upon
this principle it seems as if the purchasers of scarce books
were fearful of acquiring them cheap; as their value is
often more heightened by their price and margin than con-
ten. And we are convinced that the innumerable crowds
who flocked to the Pantheon in 1775, when the Aga-
jariff sang there, were not for occasions of her merit or cel-
brity as a singer, but by her having recd. a night for her
performance; and who knows but that Mrs. Billington's
high salaries may have contributed to her attractions, as
well as her extraordinary talents?

ISMID, or IS NICKMID, in Geography, a town of Asiatic
Turkey, situated on a bay of the sea of Marmora; where
the Greeks and Armenians have each a church and an arch-
bishop. This is supposed to have been the ancient Nico-
media,
media, the capital of Bithynia; 45 miles E.S.E. of Constantinople. N. lat. 40'. E. long. 29'.
Isbain, a town of Asia, Turkey, in Caramania; 24 miles E.S.E. of Cogni.
ISMIIL, a town of Asiatic Turkey, in Caramania; 30 miles E. of Cogni.
ISMOKIL, a small island on the E. side of the gulf of Constantia. N. lat. 63'. E. long. 20' 34'.
ISNAGAR, or ISNAR, a town of Spain, in the province of Cordova; 10 miles S. of Lucena.
ISNARDI, in Biography, according to M. Laborde, "after lingering, in his youth, on the stage with success, quitted the theatre, and studied composition and poetry. After which he published sonnets, madrigals, and even short dramas, set to music by himself. His works have been often reprinted." Now if Walther's dates are correct, and he gives authorities for them,Isnardi must have sung with success on the stage before the lyric stage or operas had existence; but we are unable to find a musician of this name.
ISNARDIA, in Botany, was so named by Linnaeus, in honour of M. Antoine Dautii d'Isnard, member of the Academy of Sciences, in the Memoires of which academy may be found several of his tracts on botany, published between the years 1716 and 1726. — Linna. Gen. 61. Schreb. 84.
Gen. Ch. Cal. Perianth superior, bell-shaped, permanent, divided into four, slightly spreading segments. Cor. gone. Stam. Filaments four, shorter than the calyx, one placed within each segment of it; anthers simple. Pist. Germen inferior; style cylindrical, longer than the stamens; stigma capitate. Peris. Capsule square, of four cells, crowned by the calyx. Seeds numerous, oblong.
Obs. Linnaeus has observed, in a MS. note to his own copy of the Genera Plantarum, that the bale of the calyx is furnished with two awl-shaped bracteas adhering closely together.
I. 1. papufris. Linn. Sp. Pl. 175. (Glaux major papufris, here herbaceous; Bocc. Muf. 165. t. 84. f. 2.) A native of rivers in France, Ruffia, Jamaica, North America, &c. It flowers in July, and was first introduced at Kew by Dr. Fothergill, in 1776. — "In general appearance this plant greatly resembles Ptilis Portulaca. It is creeping and floating. Flowers axillary, opposite, sessile, green." — Linn. obovate, wedge-shaped at the base, veined and smooth. Seeds brown. — Swartz has described a plant in his Fl. Ind. Oer. v. 1. 273, under the name of Ludwigia ripiens, which he says differs only from Isnardi papufris in being furnished with petals.
ISNARI, Paolo, of Ferrara, in Biography, a disciple of the celebrated musician Manara, maestro di cappella of the Duomo in that city, and a voluminous composer of church music, flourished in the latter end of the sixteenth century. In 1565, he published his "Canzoni Hebbomadase Sanzè," or Music for Passion Week; in 1568, six-part masses; in 1578, the Vesper psalms in three parts, and three Magnificats in four parts. This last work was reprinted at Milan, 1590.
ISNELLO, in Geography, a town of Sicily, in the valley of Demona; 13 miles S. of Cefalu.
ISNIK, a town of Asiatic Turkey, in Natalia, situated on a lake of the same name, called by the ancients Acanthus, that abounds with fish, and that communicates with the sea of Marmora. The chief article of its trade is fish. It is the place of a Greek archbishop, though it contains scarcely 300 houses. It was anciently called "Nice," and famous for its council; 60 miles E. of Constantinople. N. lat. 45'. E. long. 29'.
ISNY, or YNI, a town of Germany, lately imperial, situated in the Algov, between the counties of Holeneck and Traubach, and the lordship of Eglof. The magistrates and great number of the citizens are Lutherans. It has often suffered by fire; 40 miles S. of Ulm. N. lat. 47'. E. long. 9'.
ISOCHRONAL, or isochronous, is applied to such vibrations of a pendulum, as are performed in equal times. Of which kind are all the vibrations or swings of the same pendulum, whether the arcs it describes be longer or shorter; for when it describes a shorter arc, it moves much the slower; and when a long one, proportionately faster. See Pendulum.
ISOCHRONAL Line, is that wherein a heavy body is supposed to descend without any acceleration.
Leibnitz, in the Act. Erud. Lipf. for April 1689, has discussed the line isochrona, in which he shews, that a heavy body, with a degree of velocity acquired by its descent from any height, may descend from the same point by an infinite number of isochronous curves, which are all of the same species, differing from one another only in the magnitude of their parameters; such as are all the quadratical paraboloids, and consequently similar to one another.
He shews also how to find a line, in which a heavy body descending, shall recede uniformly from a given point, or approach uniformly to it. See Cycloid.
ISOCHRONOUS PARCELS, in Music. Mr. John Holden labours in his "Essay towards a rational System of Music," to establish it as a principle, that "there is a certain propensity in our mind to be subdividing the large numbers (of equal and equidistant objects) into smaller equal parcels; or, as it may be justly called, compounding the large numbers of several small numbers, and conceiving the whole by means of its parts," p. 288. "Seven, we conceive, as three twos joined, and one in the middle; five becomes two threes joined, and one in the middle," p. 289; and again, p. 355, "we readily conceive five by its affinity to four, and seven by its affinity to six," p. 292. "Among the isochronous single vibrations of musical sounds, the mind naturally seeks to conludue isochronous compound parcels;" p. 327. "The five or magnitude of a musical interval is estimated by the inequality of the isochronous parcels of vibrations of its two terms; and in proportion as their isochronous parcels differ more from equality, the included interval becomes greater," p. 327. The above extracts shew the nature and uses to which this author attempts to apply his isochronous parcels of vibrations; in which we can scarcely admit him to have been more successful, than in the application of the grave Harmonics (see that article), or Tartini founds, to accounting for the constitution of the musical scale; the incongruous system of intervals to which these fancies lead, will be seen in our article Holden's System of Musical Intervals.
ISOCRATES, in Biography, a celebrated Greek rhetorician, was born at Athens about the year 436 B. C. He received a good education, but his father, being ruined by the Peloponnesian war, left him no other inheritance. He had studied under Gorgias, Prodicas, and other great masters of eloquence, but the weaknesses of his voice, and his want of a proper degree of confidence, prevented him from exercising the talent of speaking in public. He employed himself, therefore, in compounding discourses in his closet, and
ISO

in teaching the art of rhetoric. He was the instructor of Timotheus, son of Conon, whom he afterwards accompanied to several parts of Greece as his secretary. He had numerous scholars at Athens, and was amply remunerated for some of his writings, particularly for a discourse which he addressed to Nicocles, king of Cyprus, for which he received a sum equal to between four and five thousand pounds of our money. Though courted by the great, he had an ardent mind in defence of what was just and right. When Thra-

menes, profricted by the thirty tyrants, took refuge at the altar, he pleaded in his defence, at the hazard of infaring his fate; and after the death of Socrates, when all his dis-
ciples took flight, he dared appear in mourning in the public streets of Athens. He passed a long life in peace and ho-
nor, and had reached his ninety-eighth year at the fatal battle of Cheronza, when, unable to bear the calamity which had befallen his country, he abdicated from all sufficiency for four days, and expired. It was mentioned, to his praise, that he never, by writing or accusation, injured a single individual. A statue of bronze was raised to his memory by Timotheus, and another by his adopted son Ephorus. The style of Icerates is pure, sweet, and flowing: he was extremely attentive to the harmony of his periods, and he is reckoned by Cicero as the first who introduced into Greek prose that melody of which it is susceptible. He spent a deal of time in polishing his compositions; his pane-

gyrics on Athens is said to have cost him ten years labour. Twenty-one of his discourses remain, which have been distri-

buted into the moral, the deliberative, the panegyric, and the ethical. Moreri.

Eff. Ch. Mile within the bafe of the inner leaves. Anthers foitary, standing on the heart-shaped calyx. Fe-

male within the bafe of the outer leaves. Germin standing on the heart-shaped calyx. Capsule membraneous. Seeds many, angular, rough.

moreland, it is abundant, making a sort of coarse evergreen turf, much below the surface. The root is perennial, fubterranean, throwing out many long fimple fibres. Leaves or fronds numerous, tufted, fimple, awl-shaped, from three to twelve inches high, rather spreading upwards, and often recurved, femicylinfudal, smooth, divided internally into four longi-

dudal cells or tubes, with numerous tranfverfe partitions.

The bafe of each leaf is somewhat dilated, and bordered with a membrane; the frutification being situated on the inner fide, under the cuticle, that of the inner leaves being male, the outer female. What supports the anther in one flower, the germin in another, may be termed either a calyx or receptacle. The ripe capitule is nearly as large as a split pea, brownish, thin, and membraneous; we find it divided into two cells by a tranfverfe fiftriform or partition, notwithstanding what Schreber has mentioned to the contrary, apparently from Osder. The seeds are numerous, fmall, white, rough all over with minute granulations.

2. J. jefaceae. Slender Quillwort. Lamarch. Diet. v. 3. 314.—Fronds brifl-shaped, nearly round, erect.—La-

marck mentions this as very different from the former in the flendernefs and ftraightnefs of its leaves, which are only about 2½ inches high. The root alfo is entirely ftrious, not tufe-

bious. It was found by the abbe Bonnatere, growing three or four feet under water, in the lake of St. Andrinol, on the mountains of Aubane, in Gveaudan. We have had no other tidings of this species, but fhould expect to find it in Britain.

3. J. unicollus. Indian Quillwort.—Roxb. MSS.—Fronds somewhat triangular, erect. Capsules elliptical, of one cell. Seeds granulated on one fide, triangular on the other.—Sent from the coast of Coromandel by Dr. Rox-

burgh. Koennig fent what appears certainly to be the fame, in a younger feate, to Linneus by the name of J. indica, as found in ponds on a fandy foil, in December. In thefe latter fpecimens the root of each is a globose ftripe. Fronds about fix, erect, ftrait, flenfer, obfolutely triangular, with a broad membraneous bafe. Frutification too young to be difcernible. Dr. Roxburgh's fpecimens conflit of feparate fronds, larger than the former, as being more advanced, but otherwife exactly同类, the bafe of each winged with a broad membrane, and lodging an elliptical, lightly comprefed, membraneous, brownish capitule, from above half an inch near to an inch long, of one cell, whole inner is lined with innumerable comprefed membraneous ftalks, each bearing a beautiful white fede, convex and granulated below, triangular and smooth above. A feomy body, above the capitule, but, in our fpecimens, disjohted from it, is lodged in the fubfiance of the leaf, and the fame is indicated by the figure of the firft fpecies in Engl. Bot. in both male and female flowers, as well as by Linneus in his Iter Sculturum. Having never had an opportunity of tracing the progress of the frutification, we are not certain whether this be the part called fometimes calyx, fometimes receptacle, but if fo, the capitule is reverfed. S.

ISOLA, in Geography, a town of Naples, in Calabria Ultra, the fee of a bishop, suffragan of St. Severina, from which it is distant S.E. 15 miles. 'N. lat. 39° 4'. E. long. 17° 24'.—Also, a town of Ifquia, feated on an ifinium which extends far into the sea, the environs of which are celebrated for wine; 7 miles S. of Capo d'Illria. 'N. lat. 45° 37'. E. long. 13° 40'.

1. ISOLA Alta, a town of Italy, in the department of the Mincio; 11 miles N.E. of Mantua.

2. ISOLA di Desenzano, a town of Italy, in the department of the Upper Po, on the Oglio; 12 miles N.E. of Cremona.

3. ISOLA Poccavizza, a town of Italy, in the department of the Mincio; 18 miles N.E. of Mantua.

4. ISOLA Grofita. See GROSSA.

5. ISOLA delle Femic, a small ifland near the W. coast of Sicily, which was formerly a place of banishment for women.

6. ISOLA Sacra, a small ifland at the mouth of the Tiber, near Orfia.

7. ISOLA delle Scala, a town of the Veronese; 13 miles S. of Verona.

ISOLACCIO,
ISOLACCO, a town of the island of Corsica; 38 miles N. of Porto Vecchio.

ISOLEPS, in Botany, from \( \omega \sigma \), equal or uniform, and \( \nu \nu \nu \), a scale; a genus separated from Scirpus by Mr. Brown, in his Prod. Nov. Hall. v. 1. 221, on account of the want of bristles at the base of the germs or seed, by which alone it is distinguished; a mark, if constant, certainly sufficient in so difficult a tribe. Twelve New Holland species are defined by this author, amongst which are Scirpus fluitans, supinus, petaceus, and capillaris of Linnæus; nodosus and proliher of Rothboll; with six never before described.

ISOLETTA, in Geography, a town of Italy, in the department of the Mela; 15 miles S. of Brescia.

ISONA, in Geography, a town of Spain, in Catalonia; 24 miles N. of Balaguer.

ISONEMA, in Botany, from \( \omega \sigma \), equal, and \( \nu \nu \nu \), a thread or filament. Brown, Mem. of the Wernerian Society, v. 1. 62.—Cliffs and order, Pentandria Monogynia. Nat. Ord. Contorta, Linn. Apocine, Brown.

Elli Ch. Corolla silvered-flaped; its mouth and tube without stigmas; limb in five deep segments. Stamens prominent; filaments inserted into the mouth, simple at the top; anthers arrow-shaped, adorning to the stigma by their middle part. Gernons two; style one, thread-flaped; stigma thick, obtuse. No scales beneath the germs. Pouces .

The above characters are taken from a shrub gathered on the African coast, near Sierra Leone, by Smeathman, and preserved in the Bankian herbarium. It is hairy, apparently erect, with opposite leaves. Punice terminal, oppositely divided, corymbose. Leaves of the cayer with a double scale at their base on the inside. Tube of the corolla half an inch long, cylindrical, bored in the middle within Brown.

ISOPERIMETRY, in Mathematics, is a branch of the higher geometry, which treats of the properties of isoperimetrical figures, \( \omega \nu \nu \nu \), of surfaces contained under equal perimeters; of solids under equal surfaces; curves of equal lengths, &c. Of the foregoing heads, the first may be considered as containing the elements of the science, which relate principally to the maximum et minima of different surfaces and solids, when bounded by figures of equal perimeters, but of a greater or less number of sides, and related in a different order. The other part, which relates to the maximum et minima of curves, treats of problems of another kind, and of the most difficult nature which have engaged the attention, and exercised the talents, of many of the greatest mathematicians of modern times; as Newton, Leibnitz, the Bernoullis, Euler, Lagrange, &c. and gave rise to many warm and even rancorous disputes, particularly between the brothers John and James Bernoulli, which we shall mention more particularly in the subsequent part of this article, after having given a flight historical sketch and view of the more elementary parts of this interesting branch of mathematical inquiry.

The problems in which it is required to find, among figures of the same or different kind, those which, within equal perimeters, shall comprehend the greatest surfaces, and those solids which, under equal surfaces, shall contain the greatest volume, had long engaged the attention of mathematicians before the invention of fluxions, and different methods had been devised for the solution of them by Des Cartes, Fermat, Sluze, Hudde, and others; but these were all supplanted by the simplicity and generality of the new analysis; after which time the elements of the science seem to have been lost sight of by mathematicians, who were all engaged in the solution of the higher order of isoperimetrical problems.

Simpson was the first who condescended to treat of the more elementary parts of this science, by giving, in his Geometry, a very interesting chapter on the maxima and minima of geometrical quantities, and some of the simplest problems concerning isoperimeters. The next who treated the subject in an elementary manner was Simon L'Hôpiller of Geneva, who, in 1785, published his treatise "De Relations mutua Capacitatis et Terminorum Figurarum," &c. His principal object in the composition of that work was to supply the deficiency in this respect, which he found in most of the elementary courses, and to determine, with regard to both the most usual surfaces and solids, those which possess the minimum of contour with the same capacity; and reciprocally, the maximum of capacity with the same boundary. Legendre has also considered the same subject, in his "Eléments de Géométrie," Dr. Hutton, in his "Course of Mathematics," and Dr. Horstey, in the Philosophical Transactions, vol. lxxv. for 1775.

Elements of Isoperimetry.

Proposition I.—Of all triangles that can be contained under any two given right lines, and any other line joining their extremities, that will be the greatest that has the two given lines perpendicular to each other. Fig. 1.

Isoperimetry. Plate IX. Geometry.

Let \( AB \) and \( BD \) be the given lines, then will the triangle \( ABD \), in which they are perpendicular to each other, be the greatest; for let \( BC = BD \), and the angle \( ABC \) either greater or less than the right angle \( ABD \); and let also \( CF \) be drawn parallel to \( AB \), and meeting \( BD \) in \( F \); and join \( AF \), \( AC \), \( AC' \).

Then the \( CDF \) being a right angle, it is evident that \( BC \), or \( BD \), is greater than \( BF \), and therefore the triangle \( ABD \), being greater than the triangle \( ABC \), is also greater than its equal \( ABC \). Q. E. D.

The same may be otherwise demonstrated, thus:—Assume either of the two given sides for the base of the triangle; then the area being directly as the perpendicular let fall upon that side from the opposite extremity of the other given side, the surface will be the greatest when that perpendicular is the greatest, that is, when the other side is not inclined to that perpendicular, but coincides with it; hence the area is a maximum when the two given sides are perpendicular to each other. Q. E. D.

Prop. II.

Of all triangles of the same base, and whose vertices fall in a right line given in position, the one whose perimeter is a minimum, is that whose sides make equal angles with the given line. Fig. 2.

Let \( ABC \) be the common base of a series of triangles \( ABC, A'B'C' \), whose vertices \( C, C' \) fall in the right line \( LM \), given in position; then is the triangle of least perimeter, that whose sides \( AC, BC, \) make equal angles with the line \( LM \).

For, let \( BL \) be drawn from \( B \) perpendicular to \( LM \), and produce it to \( D \), till \( DM = BM \), and join \( DA \); and from the point \( C \), where this line meets \( BL \),
draw \( C B \); and all from any other points \( C', C'' \), assumed in \( LM \), draw \( C'A, C'B, C'D \); then it is obvious, that \( C'D, CD, C'D \), are respectively equal to \( C'B, C'B, C'B \), and therefore \( AC + CB = AC' + CD \), and \( AC + CB = AC + CD = AD \); and consequently, three sides of a triangle are greater than the third side, we have \( AC' + CD > AD \), or \( (AC + CB) > (AC + CB) \); and the same is true of any other point \( C' \) in the line \( LM \); therefore \( AC + CB \) is less than any other two lines that can be drawn from \( A, B \), to meet in the line \( LM \), and consequently \( AB + AC + C'B \) is the triangle, having the minimum perimeter, and it has its sides meeting \( LM \) at equal angles, as is evident, \( Q.\ E. D. \)

Cor.—Of all lines drawn from two given points, to meet in a line given in position, the sum of those two shall be the half, that make equal angles with the given line.

**Prop. III.**

Of all triangles having the same base, and the sum of the other two sides the same, the isosceles is the greatest.

Fig. 3.

Let \( ABC \) be an isosceles triangle on the base \( AB \), and \( ADB \) a triangle on the same base, having its two sides \( AD + DB = AC + CB \); then will \( ABC \) be the greatest triangle.

First draw \( CH \) perpendicular to \( AB \), and \( DEF \) parallel to \( AB \), intersecting \( CH \) (produced if necessary) in the point \( E \); likewise let \( AE \) and \( BE \) be drawn.

Now it is evident, that the angles \( AEF \) and \( BED \) are equal, and consequently by Prop. II. \( AE + EB \) is less than \( AD + DB \), or less than the equal sum \( AC + CB \); therefore the point \( E \), and consequently the whole triangle \( AEB \), must fall within the triangle \( ABC \), and therefore the triangle \( AEB \), or its equal \( ADB \), is less than \( ABC \). \( Q.\ E. D.\)

**Prop. IV.**

Of all triangles standing on the same base, and having the same vertical angle, the isosceles one is the greatest.

Fig. 4.

For since all triangles whose bases and vertical angles are equal have their vertices in the same circumferential segment, it is obvious, that the isosceles triangle \( ABC \) is that which has the greatest perpendicular; and since triangles whose bases are given, are as their perpendiculars, it follows that the isosceles triangle, which has the greatest perpendicular, will also have the greatest surface. \( Q.\ E. D.\)

**Prop. V.**

Of all right lines that can be drawn through a given point, between two right lines given in position, but not parallel, that which is bisected by the given point forms, with the other two lines, the least triangle. \( Q.\ E. D.\)

Let \( A, B, C \) be any two lines given in position, and \( D \) the given point; then I say that the line \( EDF \), which is bisected in the point \( D \), makes with the two given lines \( AB, BC \) the least triangle. For if \( E \) be drawn parallel to \( BC \), meeting \( GH \) in \( I \), the equal angular triangles \( DFE, DFI \), will be equal, because \( EDF = FID \); and \( DFI \) will therefore be greater, or less than \( DFG \), according as \( BGI \) is less, or greater, than \( BGE \); in the latter case, let the space \( DFB \) be added to both, so that \( EFB \) be less than \( GHB \); and if in the former case, \( DGBF \) be added, then will \( HGB \) be greater than \( EFB \); and consequently \( EFB \), in this case also, is less than \( HGB \). \( Q.\ E. D.\)

**Cor.**—If \( DM \) and \( DN \) be drawn parallel to \( BC \) and \( BA \), the two equal triangles \( DEM \) and \( DFN \), taken together (since \( E = D = N = M \)), will be equal to the parallelogram \( DMNB \); and therefore this parallelogram is equal to half the triangle \( FEB \), but less than half the triangle \( DGH \); whence it follows, that a parallelogram is always less than half the triangle in which it is inscribed, except when the base of the one is half the base of the other, in which case the parallelogram is exactly equal to half the triangle, which is the maximum parallelogram that can be inscribed in any triangle.

**Prop. VI.**

Of all right-lined figures, contained under the same number of sides, and inscribed in the same circle, that is the greatest whose sides are all equal. \( Q.\ E. D.\)

For, if possible, let some polygon, \( ABCDE \), whose sides \( CE, EF \), are unequal, be the greatest; and let \( CDF \) be an isosceles triangle, described in the same segment with \( CEF \) which, being greater than \( CEF \) by Prop. IV., the whole polygon \( ABCDE \) is greater than the polygon \( ABCDF \), whereas we have supposed the latter to be the greatest, which is absurd; therefore the polygon which has all its sides equal is the greatest. \( Q.\ E. D.\)

Cor. 1.—It follows, with reference to the same figure, that of all right-lined figures, contained under the same perimeter, and of the same number of sides, the greatest is that which has all its sides equal.

For if \( ABCDE \) be supposed the greatest, in which the sides \( CE \) and \( EF \) are unequal, then the triangle \( CEF \) would be greater than the triangle \( CDF \), the sum of the sides in both cases being equal; but, since \( CDF \) is an isosceles triangle, it is greater than any other on the same base, and of equal perimeter, \( Prop. \ III. \); therefore \( DCF \) and \( DEF \) must be equal, and the figure may be demonstrated of any other two unequal sides.

Cor. 2.—Hence again it follows, that of all right-lined figures, contained under the same number of sides, and of equal perimeters, the greatest is that which may be inscribed in a circle: the figure being a regular polygon by the foregoing corollary.

**Prop. VII.**

Of all rectilinear figures, in which all the sides except one are given, the greatest is that which may be inscribed in a semicircle, whose diameter is that unknown side. \( Q.\ E. D.\)

For conceive \( ABCDE \) to be a rectilinear figure, that is not inscribable in a semicircle, and draw any two lines \( AD, DF \), from the extremities of the side \( AF \), to any angle of the figure; then it is obvious, that the whole figure will be the greatest when the triangle \( ADF \) is the greatest, but this will be Prop. I. when \( ADF \) is a right angle, and in the same manner we find that \( ACF \) is a right angle, and so on; and consequently when the figure is inscribed in a semicircle, of which the unknown side is the diameter, its surface will be the greatest. \( Q.\ E. D.\)

**Prop. VIII.**

Of all figures, made with sides given in number and magnitude,
that which may be inscribed in a circle is the greatest.

Prop. IX.

Of all polygons circumscribed about the same or equal circles, that has the greatest surface which has the greatest perimeter. For conceive radii to be drawn from the centre of the circle to each of the points of contact, then it is obvious that the area of the polygon will be equal to the rectangle of the radius into half the perimeter of the figure; therefore the area being as the perimeter, it follows that the polygon, having the greatest perimeter, will have the greatest area.

Cor. 1.—Hence the area of any polygon circumscribed about a circle, is to the area of the circle, as the perimeter of the former is to the circumference of the latter. Also, the area of different polygons circumscribed about the same, or equal circles, are to each other as their perimeters.

Cor. 2.—If a circle and a polygon, circumscribed about another circle, are isoperimeters, they will be to each other as the radii of the circles.

Prop. X.

The circle is greater than any rectilinear figure of the same perimeter, and it has a perimeter less than any rectilinear figure of equal surface. Figs. 10. and 11.

Let the circle PQ, and the polygon ABCDEF, be isoperimeters; then I say that the circle is greater than the polygon.

For first, whatever may be the number of sides of the polygon, it will be the greatest under the same perimeter when the polygon is regular, Cor. 1. Prop. VI.; and consequently there may be a circle inscribed within it, the area of which circle will be evidently less than the area of the polygon, and therefore by Cor. 1. of the preceding proposition, the circumference of this circle will be less than the perimeter of the polygon, or less than that of the circle PQ; and consequently, also, the radius of the former will be less than the radius of the latter. But by Cor. 2. Prop. IX. the area of the circle PQ is to the area of the polygon, as the radius of the circle PQ is to the radius of the circle ab; and therefore the area of the former is greater than the area of the latter; that is, a circle is greater than any right-lined figure of equal perimeter.

Again, conversely, if the areas are equal, the circumference of the circles is less than the perimeters of the polygon.

For conceive a circle to be made whose circumference is equal to the perimeter of the polygon, then will the circle be greater than the polygon by what is proved above, and consequently greater than that circle which is equal to the polygon; and therefore its circumference will also be greater, that is, the perimeter of the polygon will always be greater than the circumference of a circle of equal surface.

Q. E. D.

Prop. XI.

The greatest rectangle, that can be contained under the two parts of a line, any how divided, will be when the line is bisected.

Let AB be a line that is bisected in C, then will AC × CB be greater than AD × DB, DB being any other point in the line AB.

For AC × CB = AC², but AD × DB = (AC - EC) × (AC + CB) = AC² - CB²; consequently the first rectangle is the greatest.

Q. E. D.

Prop. XII.

The greatest solid that can be contained, under the three parts of a given line, any way taken, will be that in which the three parts are equal to each other.

For supposing the point C fixed, then the rectangle of the two parts AD × DC, will be the greatest when AD = DC (by Prop. XI). In the same way, if any other point be supposed fixed, as D, then will the rectangle DC × CB be the greatest when DC = CB, and consequently the solid AD × DC × CB will be the greatest when these parts are all equal.

Q. E. D.

Cor.—Hence of all parallelopipeds having the same of their dimensions the same, the cube is that which has the greatest capacity.

Prop. XIII.

A line being divided into two parts, the solid that is contained under one of these parts, and the square of the other, will be the greatest when the latter part is double the former.

Let AB be divided into two parts, the point C being a point taken in AB, and AC × CB be greater than when C is taken in any other part of the line AB.

For in whatever part of the line AB the point C be taken, the point AC may be bisected in D, and then we shall have AC × CB = four times AD × DC × CB, but this last is the greatest when AD = DC = CB (Prop. XI.,) therefore the former is the greatest when AC = 2 CB.

Q. E. D.

Prop. XIV.

Of all prisms of equal altitudes, and whose bases are also equal, and like, the right prism has the smallest surface.

For the area of each face of the prism is proportional to its height; and therefore the area of each face is the smallest when its height is the smallest, that is, when it is equal to the altitude of the prism, which is evidently when the prism is a right one.

Q. E. D.

Cor.—And hence, conversely, of all prisms whose bases are equal and like, and whose lateral surface is the same, the right prism has the greatest altitude and capacity.
Prop. XV.

A cylinder has less surface than any prism of equal base and altitude.

For since the bases and altitudes are equal by hypothesis, the surfaces will be greater or less, as the lateral surfaces are greater or less; but these will be as the perimeters of the solid bases, of which that of the cylinder will be the least, being a circle (by Prop. X.), and consequently the cylinder is that which has the least surface.

Cor. 1.—And again conversely, of all solids on equal bases, and whose surfaces are also equal, the cylinder is that which has the greatest capacity.

Cor. 2.—In the same manner (by Prop. VI. Cor. 1.) it may be demonstrated, that of all right prisms of the same altitude, and whose bases are equal, and of the same number of sides; that has the least surface whose base is a regular figure, and therefore when the prism is a parallelopiped the base is a square.

Cor. 3.—And again, of all right prisms, whose altitudes and surfaces are equal, and whose bases have a given number of sides, that which has a regular figure for its base is the greatest; and therefore when the prism is a parallelopiped the base is a square.

Prop. XVI.

Of all right parallelopipeds, given in magnitude, that which has the smallest surface has all its faces equal, or is a cube: and reciprocally of all parallelopipeds of equal surface, the greatest is a cube.

For by the foregoing corollaries, the right parallelopiped, having the smallest surface, with the same capacity, or the greatest capacity with the same surface has a square for its base; but any face whatever may be taken for the base: therefore in the parallelopiped, whose surface is the smallest with the same capacity, or whose capacity is the greatest with the same surface, has necessarily every one of its opposite faces squares, and consequently it is a cube.

Q. E. D.

Prop. XVII.

Of all cylinders of the same capacity, that has the least surface whose altitude is equal to the diameter of its base.

Fig. 12. and 13.

Let ABCD, and abcd, be two cylinders of equal capacity, and of which the first, ABCD, has its altitude equal to the diameter of its base, and the other any cylinder whose dimensions are not the same with the first, then I say the cylinder ABCD has the least surface.

For conceive each of these cylinders to be circumscribed by a square prism, then will the capacities of these prisms be also equal; and their surfaces will be to each other as the surfaces of the cylinders that they circumscribe, as is evident from (Cor. 1. Prop. IX.) and therefore reciprocally, the surfaces of the cylinders will be to each other as the surfaces of the prisms: but since these prisms have equal capacities, that which circumscribes the cylinder ABCD has the least surface, because it is a cube (Prop. XVI.); and consequently, the surface of that cylinder is the least also.

Q. E. D.

Cor.—In a similar manner it is demonstrated, that of all cylinders of the same surface, that has the greatest solidity whose altitude is equal to the diameter of its base.

Isoperimetrical Problems.—We have before observed, that the theorems relating to the surfaces and solidities of bodies, of equal perimeters, might be considered as forming the elements of isoperimetrical geometry, and which, as we have seen, are demonstrable from the simple elements of geometry; while those relating to the maxima et minima of curves are of the highest order of problems; which have called into action the talents, and excited the passions, of some of the ablest geometers of modern times, having led to a dispute, which, for want of impartial and competent judges, remained undecided for many years, and which has since been termed "the war of problems," on account of the great interest it excited, and the determined and able manner in which each party supported its opinion, and contended that of its opponent; and as this dispute cannot but be considered as one of the most memorable events in the history of the modern analysis, we shall present the reader with an abstract of it, so far as it relates to isoperimetry, referring him for further information to the "Histoire des Mathematiques," by Montucla, vol. iii. p. 323, and to Boyllus' "History of Mathematics," p. 331; and also to an interesting little treatise on this subject, lately published by Mr. Woodhouse of Caus college, Cambridge.

The first problem which can be said to relate to this class, was proposed by Newton in his "Principia," which was that of the solid of least resistance. But the subject and doctrine did not become a matter of diffusion and controversy, till John Bernoulli required of mathematicians the determination of the curve of quickest descent, in a paper published in the Leipsic acts for June 1695, under the following form:

Problema Novum.

Ad curiam solutionem mathematici invitantur.

"Dat is plano verticali duobus punctis A et B, assignare mobilii M, quam gravitavit sua defendens, et moveri incipiens in puncto A, brevissimo tempore perveniat ad alium punctum B." Fig. 14.

At the first view of this problem, it would be imagined, that a right line, as it is the shortest path from one point to another, must likewise be the line of swiftest descent; but the attentive geomter will not hastily affer this, when he considers that in a concave curve described from one point to another, the moving body descends at first in a direction more approaching to a perpendicular, and consequently acquires a greater velocity than down an inclined plane: which greater velocity is to be fetched against the length of the path, which may cause the body to arrive at the point B sooner through the curve than down the plane. Mathematics alone, therefore, cannot solve the question: in fact it requires the utmost accuracy of mathematical investigation and calculation, the result of which shews that the path required is a cycloid, as we shall see in what follows, being at that time a new and remarkable property of this curve, which the researches of Huygens and Pascal had previously rendered fo celebrated. See Cycloid.

According to Leibnitz, Leibnitz resolved this problem the same day on which he received it, but that he and John Bernoulli agreed to keep back their solutions; but the fact of Leibnitz having obtained a correct solution seems to be very doubtful: at all events, at the expiration of six months, the time allowed, no solution was published, and the time was accordingly enlarged to one year, during which period the solutions of James Bernoulli, Newton, and the marquis de l'Hopital appeared; Bernoulli's and Newton's were both given in the Acta. Erud. Lipp. for May 1697, but the latter without a name, the real author of which, however, mathematicians had little trouble in divining, for as John Bernoulli observed on this occasion, "ex ungue leonem." James Bernoulli, in the course of his investigations, had ascended to problems on isoperimetrical figures requiring still more profound speculations, and, after having resolved
them, he proposed to mathematicians in general, at the conclusion of his solution of his brother's problem.

The rivalry in glory that had long divided the Bernoullis, was fully displayed on this occasion. At first it was a little moderated by their habits of facing each other, at least occasionally, and by the intervention of their common friends; but John having been appointed professor of mathematics at Groningen in 1695, all private intercourse between them soon ceased, and they no longer corresponded except through the medium of periodical publications, for the purpose of proposing to each other the most difficult problems; and here it was that James Bernoulli, desirous of avenging himself of the ingratitude of his brother, to whom he had been preceptor, challenged him by name to answer the following problem.

Of all isoperimetrical curves described on the same common base BN, to find BN, such that another curve, B Z N, shall contain the greatest space; the ordinate of which, P Z, is in any multiplicate or submultiplicate ratio of the ordinate P F, or of the arc B F. This he added another more analogous to that of the line of swiftest descent, which was to find among all the cycloids, which a heavy body may descend from a point to a line given in position, that cycloid which is described in the least possible time, which propositions he concluded in nearly the following words. "A problem which I pledge myself (Proprius Non Nemo, pro qui careo) engages to give my brother, independently of the praise he will deserve, a prize of 50 florins, on condition that within three months, he engages to solve these problems, and within a year publishes legitimate solutions of them." Adding, if at the expiration of this time, no one shall have resolved them, I will make public my solutions.

These propositions, as we have before observed, were sent with the solution of the brachytochron (a term by which John Bernoulli's problem was designated); and as soon as he had noticed the solutions to this, in doing which he bestowed great praise on that of Newton and de l'Hôpital, and some slight cen sure on his brother's, he undertook the solution of James's problems above-mentioned, and imagining that his theory of the line of swiftest descent was alone sufficient to solve them, the following expressions of ingenious vanity escaped him. "Difficult," says he, "as these problems appear, I did not fail to apply to them the initant they came to my hands, and hear with what success; instead of three months allowed me to found their depth, and the remainder of the year to find their solutions, I have employed only three minutes to examine, enter upon, and devote to the bottom of this mystery." These high sounding phrases were accompanied with the construction he gave of the problems, and the consequent demand of the prize, which he said he should give to the poor, as it cost him too little trouble to gain it. But the business was so far further advanced as he supposed, as his solution only answered for particular cases, in consequence of his having made only two elements of the curve enter therein, while the general solution required three; and he therefore laid himself open to the keen reproaches of his brother, who soon perceived in what respect the solution was defective, and being at the same time perfectly sure of his own, he published an advertisement in 1698, in which he asserted that his brother's method was defective. He still allowed geometrical time to find the solution, and if no one gave it, he pledged himself for three things: 1. To divine with precision the analysis of his brother; 2. To try whatever it might be, to point out fallacies in it; and, 3. To give the true solution of the problem in all its parts. Adding, at the same time, that if any person was sufficiently interested in the progress of science to venture a wager upon these articles, that he would engage to forswear an equal sum if he failed in the first; double the sum if he did not succeed in the second; and triple the sum if he did not accomplish the third.

The singularity of this advertisement, and the reputation of the writer as a mathematician, a little staggered John Bernoulli's confidence in his method. He revised his solution, allowed that he had made a trifling mistake, which he ascribed to too great precipitancy, and sent a new refutation, but without assuming a more modest tone, and again demanded the prize.

To these pretensions, James Bernoulli laconically answered, "I beg my brother to revise his last solution anew, to examine it carefully in every point, and then to let us know whether it be all right; as he must be aware, that no attention can be paid to his excuses of precipitancy after I have published my solution. But John Bernoulli, who was not aware of the radical defect of the method that he employed, felt an entire confidence in his last refutation, and laid in reply there was no necessity to revile what he had done, and that his time would be much better spent in making new discoveries. To this confident assertion James ironically answered, "I never believed that my brother was master of the true solution of the isoperimetrical problem, and I doubt it now more than ever, from the difficulty he makes of the revision of his solution; if it cost him but three minutes, as he affirms, "to examine, enter upon, and devote to the bottom of the whole mystery," surely the revile could not require more: but suppose he spent double that time, how many new discoveries would he be robbed of by the six minutes thus employed."

To this John again replied, and the matter still remained undecided; till, in 1700, James Bernoulli printed at Bas! a letter addressed to his brother, in which he invited him with great moderation to publish his method, and concluded by giving the form of the problem, but without their denominations. John soon perceived how far he differed from his brother, but not discovering the principle of the true solution, nor the defect of his own method, he at length gave it in a paper which was sent under a seal to the Academy of Sciences at Paris, in the month of February 1701, on condition that it should not be opened without his consent, and after his brother had published his analysis.

As soon as James Bernoulli was informed of this, he had no longer any reason to keep his solution a secret: he accordingly made it public, and maintained it by way of a thesis at Bas!, in March 1701, with a dedication to the four illustrious mathematicians of l'Hôpital, Leibnitz, Newton, and Patric de Duillier. He likewise printed it separately under the following title: "Analyse magnum problematicis isoperimetriae." This was considered as a proof of sagacity and invention; and indeed, if the time be considered, it will not be too much to effect a that a more difficult problem was never resolved. The marquis de l'Hôpital wrote to Leibnitz, that he had read it with avidity, and that he had found it very direct and accurate, which testimony Leibnitz transmitted to John Bernoulli himself, though he was much prejudiced in his favour, having himself before examined and approved of John Bernoulli's solution; the latter having submitted it to him for his opinion.

After this publication John Bernoulli maintained a perfect silence,
silence, neither publishing his own solution, nor criticising that of his brother's. At length, in 1725, James Bernoulli died, and a short time after John Bernoulli published his solution in the Memoires of the academy for 1766. This, however, possessed the same radical defect that has been before stated, namely, that the author had considered only two elements of the curve, instead of which it is requisite to have three enter, or to employ an equivalent condition. In problems of the same kind as that of the line of swiftest descent, where it is simply required to fulfil the conditions of the maximum or minimum, the applying of this condition to two elements is sufficient to find the flexional equation of the curve; but when, beside the maximum or minimum of the curve must possess a further property of being isoperimetrical to another, this new condition requires that a third element of the curve shall have a certain inclination with respect to the other two, and every determination, founded simply on the first consideration, will give false results; except in those cases where a curve cannot satisfy one of the two conditions, without at the same time fulfilling the other; and of this John Bernoulli was at length so convinced, that he made it the basis of a new solution, more than 13 years after his brother's death, confessing himself deceived in his first. "Pau! domne ici," says he, "pour reparier cette inadvertence une nouvelle maniere de refoudre," &c. This was a tardy avowal, but it would still have done him honour, had he at the same time acknowledged that his new solution was in substance the same as his brother's; but given in a form which considerably abridged the calculation; instead of which, he even in this feeks every occasion to alpéce his brother's method, and this after a lapse of so many years, when, as Mr. Woodhoufe observes, "the recollection of his brother's kind-ness, or zeal for a brother's fame, ought to have aflinaged and laid to sleep all angry passions!" but with regard to the solution itself, it must be acknowledged, considering the state of analytical science at that time, to possess very distinguishing marks of a great master, and fairly merits the eulogism which the author himself has bestowed upon it; that of being equally exempt from the tediousness of his brother's, and the obscurity of Taylor's calculation, alluding here to the solution of the celebrated Dr. Brook Taylor, which appeared, in 1715, in his "Methodus Incrementorum." At the period at which we have now arrived, James Bernoulli had been dead several years, and the above paper was the last that John Bernoulli wrote on the subject of isoperimetry, but the theory was pursued by many other eminent mathematicians, and introduced into several of their works. Simpson, in his Tracts, has a chapter, entitled "An Inquisition of a General Rule for the Resolution of isoperimetrical Problems of all Orders." He has also given the solution of several isoperimetrical problems, in his "Dissertation of Fluxions." Maclaurin has likewise a chapter on the same subject in his "Treatise of Fluxions." To these may also be added Meramon, Le Seur, Boffut, and Lacroix; each of which authors has introduced this doctrine into their respective works; but the two writers who have most contributed in bringing to perfection the theory of isoperimetry, are Euler and Lagrange, the former having, before several memoirs in the Acta Petrorum, a tract on this subject, entitled "Methodus inveniendi Lineas Curvas Proprietate Maximi Minimo gaudentes," which, with a very few exceptions, is what it was intended to be, a complete treatise, containing essentially all the requisite methods of solutions, with great variety and abundance of examples and illustrations: there were few, however, some defects in this work, for want of a better algorithm, or more copious process of establishing the theorems; and certain supplemental formulae; which defects have been finally removed by Lagrange, in his admirable and refined "Calculus of Variations," and a very interesting treatise on the same subject has lately been published by Mr. Woodhoufe, in which are combined the history and progress of the science, with such observations and remarks, as form most calculated to render it instructive and familiar to the English student.

Having thus given a brief sketch of the successive improvements that have been made in the theory of isoperimetry, from the time of its first introduction by John Bernoulli, to its completion by Lagrange we shall conclude this article with the solution of a few problems which will illustrate many of the remarks that have been made in the foregoing pages, referring the reader who wishes for farther information to the works above quoted.

The refarches of Euler and Lagrange have rendered the solution of isoperimetrical problems extremely simple, but the investigations by which they arrived at their formulæ of solution are very profound, long, and embarrassing, which nothing less than the genius of these celebrated men would have been able to have reduced to that simple form at which they at length arrived, an investigation of which, at least of Lagrange's, will be given under the article Variation. In this place we shall barely state the results, and shew their application to the solution of a few problems of this kind.

Let \( V \) represent any function of the variable quantities \( x \) and \( y \); and let there be affined

\[
\dot{V} = M \dot{x} + N \dot{y} + P \dot{p} + Q \dot{q} + \text{c.c.} \quad [A]
\]

where \( p = \frac{\dot{x}}{\dot{y}} \), \( q = \frac{\dot{y}}{\dot{x}} \), \( r = \frac{\dot{y}}{\dot{x}} \), &c.

Then the solution of all isoperimetrical problems, into which no integral quantity enters, is soluble by the following general formula,

\[
N - \frac{\dot{p}}{\dot{x}} = \frac{\dot{q}}{\dot{x}} - \frac{\dot{r}}{\dot{x}} + \text{c.c.} = 0 \quad [B]
\]

which however, for the sake of a more ready application, may be divided into the following cases.

Case 1. - If \( M, Q \), and all the co-efficients except \( N \) and \( P \), in the above value of \( \dot{V} \), be equal to zero, then we have

\[
\dot{V} = N \dot{y} + P \dot{p} \quad \text{and since generally } N = \frac{\dot{p}}{\dot{x}} + \frac{\dot{q}}{\dot{x}} + \text{c.c.}
\]

which becomes, in this case

\[
\dot{V} = N \dot{y} + P \dot{p} \quad \text{and hence } N = \frac{\dot{p}}{\dot{x}} + \frac{\dot{q}}{\dot{x}} + \text{c.c.}
\]

with the exception of the constant values of \( p, q, r \), which are given by

\[
\dot{y} \dot{x} - \dot{x} \dot{y} = \text{c.c.}
\]

in the same manner as

\[
\dot{y} \dot{x} - \dot{x} \dot{y} = \text{c.c.}
\]

and the foregoing problems will be solved.

Case 2. - Let \( M = 0 \), \( N = 0 \), and all the co-efficients after \( Q \), then

\[
\dot{V} = P \dot{p} + Q \dot{q} \quad \text{and the general formula in this case becomes}
\]

\[
- \frac{\dot{p}}{\dot{x}} + \frac{\dot{q}}{\dot{x}} = 0
\]

whence

\[
\dot{p} = \frac{\dot{q}}{\dot{x}}
\]

and the co-efficients have the values

\[
P = \frac{\dot{q}}{\dot{x}} + \epsilon
\]
multiply this by $\dot{x}$, and since $\frac{\dot{y}}{y} = \theta$, we thus obtain

$$P \dot{y} = \theta \dot{Q} + \epsilon \dot{p};$$

and now substituting this value of $\dot{P} \dot{y}$ in the general expression for $V$, it becomes

$$V = \theta \dot{Q} + \epsilon \dot{p} + \epsilon \dot{p};$$

and by taking the fluents on both sides

$$V = \epsilon \dot{p} + \epsilon \dot{p} + \epsilon '\;$$

c and $\epsilon'$ being the corrections.

If $M$ be not equal to $o$, we must add the fluent of $M \dot{x}$; in which case

$$V = \int \dot{M} \dot{x} + Q q + \epsilon \dot{p} + \epsilon '\;$$

Cafe 3.—If $M = o$, but $N$ is not $= o$; that is if the form be

$$V = N \dot{y} + \dot{P} \dot{p} + \dot{Q} q;$$

then since $N - \frac{\dot{p}}{x} \dot{Q} = \theta$, we have by multiplying by $\dot{x} = \dot{p} \dot{x}$, (because $p = \frac{\dot{x}}{x}$)

$$N \dot{y} - \dot{P} \dot{p} + \dot{p} \frac{\dot{Q}}{x} \dot{x} = \theta;$$

But $\dot{P} \frac{\dot{Q}}{x} \dot{x} = \left(\dot{P} \frac{\dot{Q}}{x}\right) \dot{x} - \dot{P} \dot{p} = \left(\dot{P} \frac{\dot{Q}}{x}\right) - q \frac{\dot{Q}}{x} \dot{x}$, which last expression being substituted for $\dot{P} \frac{\dot{Q}}{x} \dot{x}$, gives

$$N \dot{y} = \epsilon \dot{p} - \left(\dot{P} \frac{\dot{Q}}{x}\right) \dot{x} + q \frac{\dot{Q}}{x} \dot{x},$$

giving

$$V = \epsilon \dot{P} + \epsilon \dot{p} - \left(\dot{P} \frac{\dot{Q}}{x}\right) + q \frac{\dot{Q}}{x} \dot{x};$$

and taking the fluents

$$V = \frac{\dot{P} \dot{p} + \epsilon \dot{p} + \epsilon \dot{Q}}{x} + \epsilon \;$$

c being the correction, as before.

We might continue thus to deduce from the general formula other particular ones, but the foregoing are sufficient for the solution of such problems as the limit of our article will admit of in this place, which, for the sake of a more ready reference, we will again repeat.

1. If the general form

$$V = M \dot{x} + N \dot{y} + P \dot{p} + Q \dot{q} \;$$

becomes

$$V = N \dot{y} + P \dot{p} + \epsilon \dot{p} \;$$

then we have

$$V = \int \dot{M} \dot{x} + P \dot{p} + \epsilon \;$$

when $M$ is not equal to $o$.

2. If the formula be

$$V = P \dot{p} + Q \dot{q},$$

then will

$$V = \int \dot{M} \dot{x} + P \dot{p} + \epsilon \;$$

when $M$ is not equal to $o$.

3. If the formula be

$$V = N \dot{y} + P \dot{p} + Q \dot{q},$$

then will

$$V = \int \dot{M} \dot{x} + P \dot{p} + Q \dot{q} \;$$

To which we may also add the following,

4. If the formula be

$$V = P \dot{p} + R \;$$

then will

$$V = \epsilon \dot{p} - \frac{\dot{R}}{x} + \epsilon \;$$

By means of which formula the following problems are readily solved.

**Problem I.**

Required the relation of $x$ and $y$, such that the fluence of $(a x - y) \dot{x}$, or $(a x - y) \dot{y}$, shall be a maximum, or a minimum.

Comparing this expression with $\int V \dot{x}$, (the analytical expression for the maximum or minimum property), we see that

$$V = a x \dot{y} - y \;$$

correspondingly $V = a y \dot{x} + (a x - 3 y) \dot{x}$, which compared with the general formula,

$$V = M \dot{x} + N \dot{y} + \epsilon \;$$

gives $M = a y$, and $N = a x - 3 y$, $P = o$, $Q = o$, &c.

But since $N - \frac{\dot{p}}{x} + \epsilon \;\epsilon = o$, this becomes

$$a x - 3 y = o;$$

whence the relation of $x$ and $y$ required.

**Problem II.**

Required the shortest curve that can be drawn between two points, or between two curves.

Here, if we take $x$ to represent the curve, $x$ the abscissa, and $y$ the ordinate, it will be necessary to fulfill the following condition, namely, that $\int \dot{x}$ be a minimum.

Now by the doctrine of fluxions, $\dot{x} \dot{y} = \dot{x} \sqrt{1 + \dot{y}^2} = \dot{x} \sqrt{1 + \dot{p}^2}$; which being compared with $\int V \dot{x}$, gives $V = \sqrt{1 + \dot{p}^2}$, whence by taking the fluxions on both sides, it becomes $V = \frac{\dot{p} \dot{p}}{\sqrt{(1 + \dot{p}^2)}}$, and $M$, $N$, &c. all equal to $o$.

Therefore comparing this with the general value of $V$, we have $P = \frac{\dot{p}}{\sqrt{(1 + \dot{p}^2)}}$, and consequently from the formula [B] we have, $- \frac{\dot{p}}{\sqrt{(1 + \dot{p}^2)}} = o$; therefore $\dot{p} = a \sqrt{(1 + \dot{p}^2)}$; and by squaring $\dot{p}^2 = a^2 + \dot{p}^2$; or $(a^2 - 1) \dot{p}^2 = a^2$, whence

$$\dot{p} = \frac{a}{\sqrt{(1 - a^2)}} \;$$

and $\sqrt{(1 - a^2)} = a \dot{x}$, taking the fluents $y \sqrt{(1 - a^2)} = a x + \epsilon$, which is an equation to a right line, as it ought to be.

**Problem III.**

Required the curve of quickest descent between two given points.

**Fig. 16. Plate Isoperimetry.**

Let $A$ and $B$ be the two given points, and $A M B$ the required curve; draw $P M$ perpendicular to $A C$; and put $A P = x, P M = y$, $A M = \epsilon x$; then since the time will be reciprocally as the square root of the height, it will be required to find $\int \frac{\dot{x}}{\sqrt{y}}$, a minimum, but $\dot{x} = \sqrt{(x^2 + y^2)}$, whence

$$\int \frac{\sqrt{x^2 + y^2}}{\sqrt{y}} = \int \frac{\sqrt{(1 + \frac{y}{x})^2}}{\sqrt{y}} \dot{x} = \int \sqrt{(1 + \frac{y}{x})^2} \dot{x} = \frac{\sqrt{(x^2 + y^2)} - x}{\sqrt{y}} \dot{x} = \int \sqrt{(1 + \frac{y}{x})^2} \dot{x}.$$
\[ \int \frac{\sqrt{(1 + \rho^2)}}{\sqrt{y}} \, \dot{x}, \text{ a minimum, which compared with the} \]
\[ \text{minimum expression } \int V \, \dot{x}, \text{ gives } V = \frac{\sqrt{(1 + \rho^2)}}{\sqrt{y}}; \text{ whence} \]
\[ V = -\frac{\sqrt{(1 + \rho^2)}}{2y} \, \dot{y} + \frac{\rho \dot{\rho}}{\sqrt{y} \sqrt{(1 + \rho^2)}}, \text{ which compared with formula } [\Lambda], \text{ gives } M = \sigma; \text{ } N = -\frac{\sqrt{(1 + \rho^2)}}{2y}. \]
\[ \text{Therefore, since by formula } [a] \text{ } V = \rho \dot{\rho} + \epsilon; \text{ therefore in this case } \frac{\sqrt{(1 + \rho^2)}}{\sqrt{y}} = \frac{\rho^2}{\sqrt{y} \sqrt{(1 + \rho^2)}}, \text{ whence} \]
\[ \frac{x}{\sqrt{(1 + \epsilon^2)}} = \epsilon; \text{ or multiplying both numerator and denominator of this fraction by } \dot{x}, \text{ it becomes} \]
\[ \frac{x}{\sqrt{\rho^2 + \epsilon^2}} = \epsilon, \text{ which is reducible to } \dot{x} = \frac{\sqrt{\rho^2 + \epsilon^2}}{1 + \rho^2} \, \dot{y}, \text{ an equation to a cycloid; which, therefore, is the curve required.} \]

**Prop. IV.**

Required the curve which, by its revolution round its axis, generates the fold of leaf resistance. *Fig. 17.*

Let \( A B C \) be the required curve, which by its rotation generates the fold, \( D A C \), of leaf resistance: draw \( P M \) perpendicular to \( A B \); put \( AP = x, \text{ } PM = y, \text{ } \text{and the arc } AM = z; \text{ then we know from the principles of mechanics, that the resistence} \]
\[ = \int \frac{y \, \dot{y}^2}{x^2 + y^2}, \text{ which must therefore be a minimum. Now this being put under the form,} \]
\[ \int \frac{y \, \dot{y}^2}{x^2 + y^2} \, \dot{x} = \int \frac{y \, \dot{x}}{1 + \rho^2} \, \dot{x}, \text{ (because } \rho = \frac{y}{x}) \]
\[ \text{which being compared with the expression } \int V \, \dot{x}, \text{ gives} \]
\[ V = \frac{\rho^2}{1 + \rho^2}; \text{ the fluxion of which expression being taken, gives} \]
\[ \dot{V} = \frac{\rho \dot{\rho}}{1 + \rho^2} + \frac{3y \rho^3 + y \rho^3}{(1 + \rho^2)^2}; \]
\[ \text{whence } M = \sigma; \text{ } N = \frac{\rho^3}{1 + \rho^2}; \text{ } P = \frac{3y \rho^3 + y \rho^3}{(1 + \rho^2)^2}. \]

Hence by the foregoine form \([a]\), and using \(- \epsilon \) for a correction, we have
\[ \frac{\rho^3}{1 + \rho^2} = \frac{3y \rho^3 + y \rho^3}{(1 + \rho^2)^2} - \epsilon, \]
which by reduction gives,
\[ (1 + \rho^2)^2 = 2y \rho^3, \text{ and } y = \frac{\epsilon}{2 \epsilon \rho} + \frac{\epsilon \rho}{2}. \]

but since \( \rho = \frac{y}{x}, \text{ or } \rho \dot{x} = \dot{y}, \text{ we obtain} \]
\[ \dot{x} = -\frac{3\epsilon \rho^2}{2 \epsilon \rho} - \rho \dot{\rho} + \frac{\epsilon \rho}{2 \rho} \]
whence, \( x = \frac{3\epsilon}{8 \rho^2} + \frac{\epsilon}{2 \rho^2} + \frac{\epsilon}{2} \text{ hyp. log. } \rho + \epsilon \]
by means of which equation, and that above, \( \text{viz. } (1 + \rho^2)^2 = 2y \rho^3 \), the relative values of \( \epsilon \) and \( \rho \) are determined.

**Prop. V.**

Required the brachytochrone, or curve of quickest descent, when the length of the curve is given.

This is an isoperimetrical problem of the second order; those which we have been considering have only one condition enters, namely the minimum; but in the present problem, besides the minimum property, the isoperimetrical also enters; and we have, therefore, to find the variation of \( (V - a \rho) \), instead of \( V \). See Woodhouse's Tract on Isoperimetry, p. 122.

Here by means of the comparison of \( f(V - a \rho) \), with the minimum condition of the problem, we obtain
\[ V = \frac{\sqrt{(1 + \rho^2)}}{\sqrt{y}}, \text{ and } u = \frac{\sqrt{(1 + \rho^2)}}{\sqrt{y}}; \]
therefore \( V - a \rho, \text{ or } \dot{V}' = \frac{\beta - (1 + \rho^2)}{\sqrt{y}} \)
and consequently,
\[ \dot{V}' = -\frac{1}{2y} \, \sqrt{(1 + \rho^2)} \, y \, \dot{y} + \frac{1}{\sqrt{y} - a} \times \frac{\rho \dot{\rho}}{\sqrt{(1 + \rho^2)}}, \]

Hence we deduce, by comparing this with the general formula \([\Lambda]\),
\[ \left\{ \begin{array}{l}
N = -\frac{1}{2y} \, \sqrt{(1 + \rho^2)} \\
\rho = \frac{1}{\sqrt{y} - a} \times \frac{\rho \dot{\rho}}{\sqrt{(1 + \rho^2)}},
\end{array} \right. \]
Hence again by formula \([a]\),
\[ \sqrt{(1 + \rho^2)} \left( \frac{1}{\sqrt{y} - a} \right) = -\frac{\rho^3}{\sqrt{(1 + \rho^2)} \left( \frac{1}{\sqrt{y} - a} \right) + \epsilon} \]
or,
\[ \left( \frac{1}{\sqrt{y} - a} \right) = \frac{\epsilon \sqrt{(1 + \rho^2)}}{\sqrt{y}} \times \frac{\rho \dot{\rho}}{\sqrt{(1 + \rho^2)}}, \]
whence again by reduction,
\[ \dot{x} = \frac{\epsilon \sqrt{y}}{1 - 2a \sqrt{y} + (a - \epsilon) \sqrt{y}} \]
where, by taking the fluents, we have the relation between \( x \) and \( y \), the abscis and ordinate of the curve.

If, instead of the length of the curve, the area had been given, then \( \int u \, x = \int y \, \dot{x}, \text{ and consequently we should have} \]
\[ \dot{V}' = V - a \rho = \frac{\sqrt{(1 + \rho^2)}}{\sqrt{y}} - ay; \]
in which case,
\[ \rho = \frac{\sqrt{y} \sqrt{(1 + \rho^2)}}{\sqrt{(1 + \rho^2)} \sqrt{y} \sqrt{(1 + \rho^2)}}, \]
and
\[ \frac{(1 + \rho^2)}{\sqrt{y} \sqrt{(1 + \rho^2)}} - ay = \frac{\rho^3}{\sqrt{(1 + \rho^2)} + \epsilon}; \]
whence, again,
\[ \frac{1}{\sqrt{y} \sqrt{(1 + \rho^2)}} = \epsilon + ay; \]
which by reduction becomes,
\[ \dot{x} = \frac{\sqrt{y} \sqrt{(1 + \rho^2)}}{\sqrt{(1 + \rho^2)} \sqrt{y} \sqrt{(1 + \rho^2)}}, \]
and
\[ \sqrt{(1 + \rho^2)} \left( \frac{1}{\sqrt{y} - a} \right) = -\frac{\rho^3}{\sqrt{(1 + \rho^2)} \left( \frac{1}{\sqrt{y} - a} \right) + \epsilon} \]

or,
\[ \left( \frac{1}{\sqrt{y} - a} \right) = \frac{\epsilon \sqrt{(1 + \rho^2)}}{\sqrt{y}} \times \frac{\rho \dot{\rho}}{\sqrt{(1 + \rho^2)}}, \]
whence again by reduction,
\[ \dot{x} = \frac{\epsilon \sqrt{y}}{1 - 2a \sqrt{y} + (a - \epsilon) \sqrt{y}} \]
where, by taking the fluents, we have the relation between \( x \) and \( y \), the abscis and ordinate of the curve.

If, instead of the length of the curve, the area had been given, then \( \int u \, x = \int y \, \dot{x}, \text{ and consequently we should have} \]
\[ \dot{V}' = V - a \rho = \frac{\sqrt{(1 + \rho^2)}}{\sqrt{y}} - ay; \]
in which case,
\[ \rho = \frac{\sqrt{y} \sqrt{(1 + \rho^2)}}{\sqrt{(1 + \rho^2)} \sqrt{y} \sqrt{(1 + \rho^2)}}, \]
and
\[ \frac{(1 + \rho^2)}{\sqrt{y} \sqrt{(1 + \rho^2)}} - ay = \frac{\rho^3}{\sqrt{(1 + \rho^2)} + \epsilon}; \]
whence, again,
\[ \frac{1}{\sqrt{y} \sqrt{(1 + \rho^2)}} = \epsilon + ay; \]
which by reduction becomes,
\[
\dot{x} = \frac{(\alpha + ay)^2}{\sqrt{1 - y^2 (\alpha + ay)^2}}; \\
\dot{y} = -\frac{\alpha y}{\sqrt{1 - y^2 (\alpha + ay)^2}}; \\
\]

which expression, when \( c = c \), becomes

\[
\dot{x} = \frac{ay}{\sqrt{(1 - ay^2)}}, \\
\dot{y} = \frac{ay}{\sqrt{(1 - ay^2)}}, \\
\]

whence the relative values of \( x \) and \( y \) are determined in both cases.

**PROB. VI.**

Required the solid of least resistance, amongst all the solids of equal capacity.

Here, the same as in Prob. IV. we have

\[
V = \frac{y^p}{1 + p^2}, \\
\]

and \( f \mu \dot{x} = f \tau y \dot{x} \), \( (\tau \) being equal 3.14159. &c.) (see Woodhouse's *Isoperimetry*, p. 123); therefore \( V = au \)

\[
V = \frac{y^p}{1 + p^2} - ay^p \left( \text{including } \pi \text{ in the quantity } a \right). \\
\]

Hence \( P = 3y^p + y^p \), and by formula \[a\]

\[
\frac{y^p}{1 + p^2} - ay^p = 3y^p + y^p \left( 1 + p^2 \right) \]

whence, by reduction, we obtain

\[
\left\{ \begin{array}{l}
\{c - ay^p \} \left( 1 + p^2 \right) = 2y^p, \text{ or } \\
\{c - ay^p \} d\tau = 2y^p \dot{x}
\end{array} \right\}
\]

which expressions will furnish the relative values of \( x \) and \( y \).

Having the condition of equal capacity, that of equal superficialises being substituted, we have

\[
V = au = V' = \frac{y^p}{1 + p^2} - ay^p \sqrt{(1 + p^2)}, \text{ and } \\
P = 3y^p + y^p \left( 1 + p^2 \right) - \frac{ay^p}{\sqrt{1 + p^2}}; \\
\]

whence we deduce from formula \[a\]

\[
\frac{y^p}{1 + p^2} - ay^p \sqrt{(1 + p^2)} = \\
\frac{3y^p + y^p \left( 1 + p^2 \right) - \frac{ay^p}{\sqrt{1 + p^2}}}{2y^p + ay \left( 1 + p^2 \right)}, \\
\]

which, by reduction, becomes

\[
\frac{1}{y} - 1 = 2y^p + ay \left( 1 + p^2 \right); \\
\]

or, \( y = 2 y^p + ay \left( 1 + p^2 \right). \)

Thus the expressions for \( V \) and \( a \) are reduced.

**PROB. VII.**

Given the length of a curve, to determine its nature, when the solid generated by its rotation is a maximum.

Marking as before \( \tau = \frac{3}{4} \), &c. we shall have

\[
\int \dot{x} = \int \dot{y} \sqrt{(1 + p^2)}, \text{ and } \int \dot{x} = \int \dot{y} \sqrt{(1 + p^2)} \dot{x}. \\
\]

Therefore \( \tau \) or \( V - au = \pi y - ay \sqrt{(1 + p^2)} \); and taking the direction on both sides,

\[
V = 2\pi y - \frac{\alpha y}{\sqrt{(1 + p^2)}}, \\
\]

comparing this expression with the general one \[A\],

we have \( P = -\frac{\alpha y}{\sqrt{(1 + p^2)}} \); and, therefore, by formula \[a\],

\( \tau = \sqrt{(1 + p^2)} \),

and therefore

\[
\sqrt{(1 + p^2)} = \frac{\alpha y}{\sqrt{(1 + p^2)}}, \\
\]

which, by reduction, becomes

\[
\dot{x} = \frac{\alpha y}{\sqrt{(1 + p^2)}}, \text{ or } \\
\]

\[
\frac{\alpha y}{\sqrt{(1 + p^2)}}, \text{ or } \\
\]

This last result agrees with Simpson's, but it is restricted, because \( \alpha \) is not necessarily equal to \( \alpha \).

**PROB. VIII.**

The length of a curve being given, it is required to determine its nature, when the area is a maximum.

Here, by proceeding as in the foregoing examples, we shall have

\[
V' = \sqrt{(1 + p^2) - ay}, \text{ and } \\
P = \frac{p}{\sqrt{(1 + p^2)}}, \\
\]

and hence, by means of the formula \[a\],

\[
\sqrt{(1 + p^2) - ay} = \frac{\alpha y^2}{\sqrt{(1 + p^2)}} + \epsilon, \\
\]

Therefore,

\[
\frac{1}{\sqrt{(1 + p^2)}} = \epsilon + ay, \\
\]

which, being farther reduced, becomes

\[
\dot{x} = \frac{\alpha y}{\sqrt{(1 + p^2)}}, \text{ or } \\
\]

\[
\frac{\alpha y}{\sqrt{(1 + p^2)}}, \text{ or } \\
\]

the flutes of which being taken, we have

\( x = \epsilon - \sqrt{(1 + ay)^2} \),

which is an equation to a circle.

**PROB. IX.**

Required the curve that generates the solid of the least resistance, the area being given.

Here \( V = 2\pi y \sqrt{(1 + p^2)} \), and \( u = y \); therefore \( V' \), or \( V - au = 2\pi y \sqrt{(1 + p^2)} - ay \), and

\[
V = \frac{2\pi y \sqrt{(1 + p^2)} - ay}{\sqrt{(1 + p^2)}}, \\
\]

whence, by comparison with formula \[a\],

\[
P = \frac{-2\pi y^2 p}{\sqrt{(1 + p^2)}}, \text{ or } \\
\]

\[
\text{then, again, by formula } [a], \text{ we have } \\
2\pi y \sqrt{(1 + p^2)} - ay = \frac{2\pi y^2 p}{\sqrt{(1 + p^2)}}, + \epsilon, \\
\]

which, by reduction, becomes

\[
\dot{x} = \frac{\alpha y}{\sqrt{(1 + p^2)}}, \text{ or } \\
\]

\[
\frac{\alpha y}{\sqrt{(1 + p^2)}}, \text{ or } \\
\]

or,

\[
\frac{\alpha y}{\sqrt{(1 + p^2)}}, \text{ or } \\
\]

\[
\frac{\alpha y}{\sqrt{(1 + p^2)}}, \text{ or } \\
\]

\[
\frac{\alpha y}{\sqrt{(1 + p^2)}}, \text{ or } \\
\]
\[ x = \frac{(c + ay) \sqrt{1 + \phi}}{\sqrt{4 + ay^2 - (c + ay)^2}} \]

If, instead of the area, the length of the curve had been given, then we should have had

\[ f u \cdot f z = f x \sqrt{(1 + \phi^2)} \quad \text{and} \quad u = \sqrt{(1 + \phi^2)} \]

Therefore \( V = 2, \sqrt{y} \sqrt{(1 + \phi^2)} - a \sqrt{(1 + \phi^2)} \), and consequently, by formula \( [A] \),

\[ P = \frac{2, \sqrt{y} \sqrt{(1 + \phi^2)} - a \sqrt{(1 + \phi^2)}}{\sqrt{(1 + \phi^2)}} \]

whence, again, by formula \( [y] \), we have

\[ (2, \sqrt{y} - a) \sqrt{(1 + \phi^2)} = \frac{(2, \sqrt{y} - a) \sqrt{(1 + \phi^2)} + c + \sqrt{(1 + \phi^2)}}{\sqrt{(1 + \phi^2)}} \]

whence, by reduction,

\[ \hat{x} = \frac{c + \sqrt{(2, \sqrt{y} - a) \sqrt{(1 + \phi^2)} + c + \sqrt{(1 + \phi^2)}}}{\sqrt{(1 + \phi^2)}} \]

the fluents of which expression being taken, gives

\[ \hat{x} = \frac{c}{\sqrt{2}} \ \text{hyp.} \ \text{log.} \]

\[ [(2, \sqrt{y} - a) + \sqrt{(2, \sqrt{y} - a)^2 + c^2} + c', \sqrt{(1 + \phi^2)}] \]

and therefore the required curve is the catenary.

**Prob. X.**

Of all isoperimetrical curves, drawn between \( B \) and \( N \), (fig. 15.) to find \( B' \) \( F' \) \( N' \) such that, \( B' \) \( Z' \) \( N' \) shall contain the greatest area, \( P' \) \( Z' \) being a function of \( P' \) \( F' \). See the foregoing historical sketch.

Let \( P' F' = y \), and \( P' Z' \) a function of \( y = Y \); then \( f' \hat{x} \) corresponds to \( f \hat{y} \hat{x} \); and \( f' \hat{x} \hat{y} \) to \( f' \hat{y} \hat{x} \). Hence \( V + a \ u_1 = V = \sqrt{(1 + \phi^2)} \)

and

\[ \hat{y} = \frac{y}{\sqrt{(1 + \phi^2)}} + \frac{a \phi \sqrt{(1 + \phi^2)}}{\sqrt{(1 + \phi^2)}} \]

whence we have, by comparision of formula \( [A] \),

\[ P = \frac{a \phi \sqrt{(1 + \phi^2)}}{\sqrt{(1 + \phi^2)}} \]

and hence, again, by form \( [y] \) is deduced

\[ Y + \alpha \sqrt{(1 + \phi^2)} = \frac{a \phi \sqrt{(1 + \phi^2)}}{\sqrt{(1 + \phi^2)}} + c \]

or

\[ Y' = \frac{\alpha \phi \sqrt{(1 + \phi^2)}}{\sqrt{(1 + \phi^2)}} = c - Y, \] and by reduction

\[ a = \frac{\beta \phi \sqrt{(1 + \phi^2)}}{\sqrt{(1 + \phi^2)}}, \] and consequently,

\[ \hat{x} = \frac{(c - Y) \beta \phi \sqrt{(1 + \phi^2)}}{\sqrt{(1 + \phi^2)}} \]

the equation of the curve.

In the equation, as it stands, there are two arbitrary undetermined quantities \( a \) and \( c \). The integration of the equation would introduce a third, and to determine the three, we have given the two points \( B \) and \( N \), and the length of the curve.

**ISOPOGON**, in Botany, from \( \sigma \) \( \varphi \), equal, and \( \pi \) \( \gamma \), a beard, because the fronds are every where equally bearded.
simple. *Pisum.* Germ. several, ovate or oblong, superior, feellie, styles simple, scarcely so long as the germen; frig, oblong. **Peris.** Capsules several, feellie, leguminous, of one cell and one valve, keeled at the outside, burrving at the inner edge. **Secs.** Numerous, attached in two rows to the edge of the capsule.

**Eul.** Calyx 5-n. Petals five, deciduous. Nectaries stellate, three-cleft. Capsules feellie, of one cell and one valve. **Secs.** Numerous, marginal.

1. *Lunaria.* Linn. Sp. Pl. 738. (Helleborus firmans DC.; Ammann, Ruth. 74. t. 13.)—Stipulas awl-shaped. Leaves pinnatifid. Native of moist shady places, near rivers, in Siberia, flowering in June and Summer. It is sometimes cultivated in gardens, as being not only curious, but an elegant little annual plant, with the habit and graceful hue of a *Fumaria.* to several of which genus its leaves bear a great resemblance, in their pinnatied obovate leaves. *The flowers, however, are totally different, resembling a Thalictrum, small, white, short-lived, on long simple stalks. Capsules about ten, spreading, pale green, about half an inch long, pointed with the permanent stigmas.*

2. *Thalictrum.* Linn. Sp. Pl. 733. Jacq. Amur. t. 105.—Stipulas ovate. Leaves three-cleft, dilated. Capsules ovate. Native of shady rather moist places, in the mountains of Italy, Carniola, Austria, &c. flowering in April and May, and soon ripening its seed. *Reeds creep, perennial. Stem a spind high or more, naked below, smooth. Leaves ternate, leaves more or less three-cleft, broadish, smooth, resembling those of an *Aquilegia* or *Thalictrum.* Flowers white, with yellow stamens, not unlike some small *Anemone.* Capsules only two or three, ovate, on a globose receptacle.

Such are the only certain species. *L. pinnatifida* of Linnæus appears to be a nonentity, its synonyms, as far as they can be made out, belonging to *Aquilegia sibirica,* which is Haller's *Pisum,* p. 1192.

Mr. Salisbury, in *Tr. of Linn. Soc.* v. 8. 105, has established, by the name of *Copis,* a very natural genus, though differing from *Ipomoea* chiefly by having stalked germinous and capsules. Of this one species is *Helleborus trifidus* of Linnæus, Fl. Dan. t. 556; the other is C. *afzelii,* of Salisbury, of which we have specimens and a drawing from Mr. Menzies, who gathered the plant on the west coast of North America. This leaf, strange to tell! appears, by specimens from Thumberg, to be *Thalictrum japonicum,* Tr. of Linn. Soc. v. 2. 337, called in Fl. Jap. 364. *Dieldfaiou Salisie fimilius,* though nothing can be less favorable than the latter description. He informs us he had never seen the flower, only the fruit.

**ISO.** A Malabar name for some species of the *Ehern.* of Linnæus, and adopted by Pluhier to designate that genus. See HELIETRÆS.

**ISOCLES TRINÆCULÆ,** of 3, 6, and 12, *is* a triangle which has two equal sides. In an isocles triangle, FDE Plat. VIII. Common, fig. 153.) the angles y and y, opposite to the equal sides, are equal; and a line drawn from the top or vertex V, cutting the base into two equal parts, is perpendicular to the base. The same line also bisects the vertical angle of the triangle. It appears likewise that if the equal sides be produced, the angles under the base will be equal, the sum of those above and below respectively being equal to two right angles. And if the vertical angles of two isocles triangles be equal, the two triangles will be equiangular. Moreover, every equilateral triangle must be equiangular.

**ISP.**

**ISOTONIC Scale of Muses, or the Equal Temperament Scale,** is that in which the octave is divided into twelve equal parts; of coure, each half note is equal $1 = \frac{1}{12} = 5 \lambda + \frac{1}{12} + \frac{1}{2} + \frac{1}{4} = \mu$. This is sometimes called a mean femitone, and this, a syllab of mean femitones. The following table shews some of the most useful particulars of this syllab, $\mu$.

The last column of this table was published in the Philosophical Magazine, vol. xxxix. p. 347; in the xxxvith vol. p. 47, ch. 7, the temperatures of the concerts in this syllab will be found, and in vol. xxxix. p. 472, he beats of all the congresses. Broadwood and some other tuners of pianofortes pretend, it is said, that they tune them to an equal temperament, but which is very much to be doubted. On the organ, it appears, as Mr. Smyth observes in the Phil. Mag. xxxvi. p. 435, that an equal temperament never has been, and we may perhaps say, never will be practiced: however many advocates this syllab may have had among speculative writers, among whom have been mentioned D'Alembert, Cavallio, Chladis, Coppenin, Davis, Des Cartes, Emerson, Marquart, Merrick, Merlenus, Rameau, and Ricci, &c. Mr. Farey, in preparing what he calls his equal temperament, in the Phil. Mag. vol. xxviii. p. 53, expressly stated his object to be, to enable those to tune it who might wish to try it, and not as recommending its adoption. See Equal Temperament.

**ISPANIAN, in Geography,** the capital city of modern Peræa, situated in the province of Iraq, on the small river Zenderud, which rises in the mountains of Galatæ, three days' journey towards the north; but Abas the Great, at a prodigious expense, pierced some mountains about 50 leagues from Ipahan, and introduced another stream to the Zenderud, which rises in the mountains of Peræa in the winter; for, in that season, the fountains on the high range of mountains melted, and very much swelled the river. The city is surrounded by walls of earth, which are suffered to remain in bad repair, and which are concealed by the adjoining houfes and gardens. It has eight gates, which, according to Chardin, could not be shut; and its streets are narrow, devious, and badly paved. This writer computes its circuit, the suburbs included, at about 24 miles, and its inhabitants, by the lowest estimate, at 605,000. But the royal square, or Moidan Shah, and its grand market, the palace of the Sei, and those of the grandees, the mosques, the public bath, and other edifices, are magnificent and splendid. To carry the plantations of lofty plane trees on 5 R. |
both sides of the streets, and the frequent waterings of them, contribute not only to its beauty, but its salubrity. The royal square is 440 paces long, and 160 broad, and is surrounded with a canal built with bricks, cemented with black mortar, which in time becomes harder than freestone. The royal mosque is situated at the S. end of this square, and its portico is richly ornamented with a thousand figures of a rich profusion of gold and azure; the whole being also inlaid with enamelled squares, and a frieze encompassing it of the same materials. The royal palace, and the "hammam," or women's apartment, are very splendid buildings. The former is nearly five miles in compass; its great portico stands in the royal square, and is built to a great height with porphyry. By the Persians it is regarded as sacred. The suburb of Julfa, or Yulfa, was very large, and populated by the Armenians, whose cemetery was near the mountains of Iphahan, called Kou Soua, or a mountain in the form of a terrace, and also Tag Rulfan, the hill or throne of Rulfan. This city is laid to be encompassed by 1400 villages, the inhabitants of which fabricate chiefly by their manufactures of silk and wool. Its environs are pleasant, and much diversified by the vicinities of mountains. Iphahan was taken by Timur in the year 1287; when the inhabitants ran for their lives by the payment of a large sum, but an insurrection happening in the night, Timur ordered all the inhabitants to be put to the sword; and in this massacre it is computed that 70,000 persons were killed by the soldiery, and their heads piled in heaps on the walls of the city. In 1723, it was taken by the Afghans, under Nadir Shah. By these repeated attacks, Iphahan was greatly reduced, so that a Persian merchant inferred Mr. Hasway that not above 5000 houses were inhabited. N. lat. 22° 24' 54". E. long. 51° 50'.

ISSIPA, or King-Fisher, in Ornithology. See Alcedo.

ISPIRA, in Geography, a town of Turkish Armenia; 74 miles N.E. of Erzerum.

ISQUINTA, a town of Mexico, in the province of Guatimala; 30 miles W.N.W. of Guatimala. N. lat. 14° 32'. W long. 95'.

ISQUITENANGO, a town of Mexico, in the province of Yucatan; 50 miles S. of Chiapa dos Espagnols.

ISQUETEPIC, a town of Mexico, in the province of Guaxaca; 40 miles W.N.W. of Guaxaca.

ISRAEL, in Scripture History, Heb. סְמַּס, who prevails with God, formed of מָלַץ, to govern, and יָס, to, a name given to the patriarch Jacob by the angel who wrestled with him at Mahanaim, or Penuel, Gen. xxxii. 1. 2. 28. 30. 32. This name was afterwards applied to the descendants of Jacob in general, hence called Israelites, as well as to Jacob himself, and also to the ten tribes who formed a kingdom distinct from that of Judah. These tribes revolted during the reign of Rehoboam, under the conduct of Jeroboam, who became head of this new monarchy, riyled the "kingdom of Israel" in opposition to that of Judah. See Jews.

ISSA, in Ancient Geography, a town of the island of Lefbos; more anciently called Himera. Also, an island of Illyris, in the Adriatic gulf, upon the coast of Dalmatia, with a town of the same name. Strabo mentions it as a very celebrated island.

ISSACHAR, one of the twelve tribes of Israel, derived from the fifth son of Jacob, whose lot was assigned to him in one of the left parts of the land of Canaan. It was situated in Lower Galilee, and bounded by the Mediterranean on the W., by Zebrun on the N., by the Jordan on the E., which parted it from that of Gad, and on the S. by the half tribe of Manasseh. Its most remarkable places were mounts Carmel and Gilboa, the valley of Jezreel, and the great plain of Megiddo, called also the plain of Galilee, and now Saba, from a castle built upon it, and famed, like that of Jezreel, for the many battles fought upon it, and also for the abundance of corn, wine, oil, &c. which it produced.

ISSAGUNGE, in Geography, a town of Hindooftan, in Oude; 35 miles N.E. of Kirabad.

ISSAPOUR, a town of Hindooftan, in Oude; 25 miles N.E. of Lucknow.

ISSAWARRA, a town of Hindooftan, in Oude; 15 miles S.E. of Kirabad.

ISSE HEAD, a cape of Denmark, on the northern extremity of the island of Samoë. N. lat. 36° 3'. E. long. 10° 25'.

ISSEDON, or ESSEDON, in Ancient Geography, a town of Scythia, on the other side of the Imaus. Also, a town of Serica, situated E.N.E. of the former.

ISSEDONES, or ESSEDONES, a people of Serica according to Ptolemy, but Pomponius Mela places them in the vicinity of the Palaclusianides; Pliny joins them to the Sraurumites, and assigns them an habitation near the Colchide. Herodotus speaks of Istdones as neighbours to the Massagetae, as a numerous people, and living to the W. of the Caspian sea. Herodotus, who speaks of the customs and religion of the Istdones (I. iv.), says, that when any one of them has lost his father, all his relations bring him a number of cattle, whose carcasses they cut in pieces, and in the same manner cutting the body of the deceased father, they mix all the pieces of flesh together, and serve them up at an entertainment, referring only the head of the deceased parent, which they set in gold, and use as an idol, to which they every year offer solemn sacrifices.

ISSELBURG, in Geography, a town of the duchy of Cleves, on the Ijssel, containing a Lutheran and Calvinist church; 14 miles E.N.E. of Cleves. N. lat. 51° 53'. E. long. 6° 35'.

ISSELMOND, an island in the river Meuse, opposite to Rotterdam, with a town in it of the same name.

ISSELORT, a town of Holland, in Gelderland, situated at the separation of the Rhine and Ijssel near Arnheim.

ISSELSTEIN, a town of Holland, belonging to the state of Utrecht, and seated on the river Ijssel; it is the capital of a small territory formerly belonging to William III., king of England; five miles S. of Utrecht.

ISSENBRON, a town of Bavaria, in the principality of Aichlau; six miles E.N.E. of Aichlau.

ISSER, a river of Algiers, which joins the Tafna, near its mouth; anciently called "Allanus."

ISSESUCAR, a town on the S. coast of the island of Java; 70 miles S.W. of Batavia.

ISSICUS SINS, in Ancient Geography, a gulf of the Mediterranean sea, between Syria and Cilicia.

ISSIGEAC, in Geography, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Bergerac; nine miles S.S.E. of Bergerac. The place contains 870, and the canton 5316 inhabitants, on a territory of 210 kilometres, in 21 communes.

ISSIN, a town of Peru, in the province of Kerman, whither many of the inhabitants of Guomor retreat during the unhealthy season; six miles N. of Guomor.

ISSINI, a kingdom of Africa, on the Ivory Coast, containing of 12 or 13 villages. From the Rio de Sueru da Colla.
Coila to Cape Apollo. The coast is low and even, extending itself for a course of 12 miles eastward, bordered with large trees, and covered with villages, the chief of which are Boquin, Illimi Pequena, Great Illimi, Albam, Tabo, and Akunimba. The first lands at a small distance from the shore, near the mouth of the river Da Coila, surrounded by woods and pleasantly situated. Illimi Pequena, and Great Illimi, are both situated on the 44°-coast, at the distance of three or four miles, and between them is a number of villages. Three of them are considerable. Great Illimi is built at the entrance of a small river, which, during the dry season, is lost in the sands, but discharges itself into the sea during the rainy months. This town was pillaged and burnt by the inland Negroes in 1858, but it has since regained its importance by the addition of a great number of huts and inhabitants. Where the river empties itself into the sea, it forms a small island, very commodious for building a fort; but no such defence has been attempted by the Europeans. Great Illimi is celebrated for the purity of its gold, which probably comes from the kingdom of Allanto, at the source of the Rio de Sueco da Coila, a country rich in gold, but little known to the Europeans. East of Illimi are the little districts and towns of Albamia and Tabo, the former six miles and the latter ten from it, both surrounded by high groves of palms, seen at a great distance at sea, and much frequented by European shipping. A mile further east, and half a mile west of Cape Apollo, stands the village AKU- NIMBA, on a rising ground, commanding an extensive sea and land prospect. The interior country between Boquin and this village, is high, rugged, and mountainous, but affording some fine gold, ivory, and formerly a few slaves. The gold dust of these two places is commonly found at the depth of six fathoms, for two miles along the coast; and the Negroes mix it with pulverised copper to expertly, that it requires touching to discover the fraud.

ISSOIRE, a town of France, and principal place of a district, in the department of the Pay de Dôme, seated on the Canoe, near the Allier; 15 miles S.W. of Clermont. The place contains 5997, and the canton 14,096 inhabitants, on a territory of 155 kilometres, in 15 communes. N. lat. 45° 32'. E. long. 3° 19'.

ISSONG, in Zoggy, a name given by the people of Guinea to a species of plant, which they infuse in water, and afterwards boil, and then wash the head with it, as a cure for all kinds of the head-ache. It is a plant described by the botanical writers under the name of Plume velignum fructu nigro, ziba macula notato, the bladder pea, with a black fruit marked with a white spot; and called by the people of Malabar, where it also grows very plentifully, adjarga. It is also found in Barbadoes and Jamaica, and is there called faraher. Phil. Trans. N. 232.

ISSOUDUN, in Geography, a town of France, and principal place of a district, in the department of the Indro, on the Theols; 18 miles N.E. of Chateauroux. The place contains 10,156, and the two cantons into which it is divided 23,097 inhabitants, on a territory of 663² kilometres, in 27 communes. This place has considerable manufactories. N. lat. 46° 56'. E. long. 1° 56'.

ISSUABLE TERMS, in Law, a name applied to Hilary or Trinity terms, from the making up of the iuisses in those terms.

ISSUANT, Issuing, in Heraldry, is understood of a lion, or other animal, in a coat of arms, that seems just coming out from under a chief, fesse, a house, a wood, or the like; and only shews half his body.

It is not very easy to distingnish the lion issuant from the lion issuant: some say the issuant is that which come out from the bottom of the chief, shewing his head, neck, the tip of his fore-legs and his tail, against the chief of the coat; whereas the issuant has its rife about the middle of the field, and shews all his fore-part, with the tip of his tail, as if he were rising out of the earth.

ISSUER, in Common Law, has diverse applications, being sometimes taken for the children begotten between a man and his wife—four times for profits growing from agreements or fines—sometimes for profits of lands and tenements—but more frequently for the point of matter depending in fact, whereupon the parties join, and put their cause to the trial of a jury.

On all these occasions, issue has but one signification, which, is, an effect of a cause proceeding: as the children are the effect of the marriage between the parents; the profits growing to the king or lord, from the punishment of any man's offence, are the effect of his transgression; the point referred to the trial of twelve men, is the effect of pleading or process.

Iuisses concerning causes are of two kinds; that upon matter of fact, and that upon matter of law. An issue in fact is when the plaintiff and defendant have agreed upon a point to be tried by a jury; and issue in law is when there is a demurrer to a declaration, plea, &c. and a joinder in demurrer, which is an issue at law to be determined by the judge. (See Demurrer.) Issues in fact are either general or special. General, seems to be that whereby it is referred to the jury to bring in their verdict, whether or no the defendant hath done any such thing as the plaintiff lays to his charge.

For example, if it be an offence against any statute, and the defendant plead not guilty; this being put to the jury, it is called the general issue. So, if a man complains of a private wrong, which the defendant denies, and pleads to wrong, nor differ, is to be referred to the jury, it is likewise the general issue. Special, is that, wherein special matters being alleged by the defendant in his offence, both parties join, and to go to a demurrer, in the quasifio juris; or else to a trial by the jury, if it be special fact: as in assault and battery, where the defendant pleads that the plaintiff struck first.

Issue, Collateral. See Reprieve.

Issue, Feigned, in Easement, is used when a matter of fact is strongly controverted, and the court directs the matter to be tried by a jury: but as no jury can be summoned to attend this court, the fact is usually directed to be tried at the bar of the court of king's bench, or at the assizes upon a feigned issue. For, in order to bring it there, and law the point in dispute, and thereby, put in place, an action is brought, wherein the plaintiff, by a fiction, declares that he laid a wager of 5l. with the defendant, that A was less at law to B, and then aver there he is so, and therefore demand the 5l. The defendant allows the feigned wager, but avers that A is not the heir to B: and thereupon that issue is joined, which is directed out of chancery to be tried, and thus the verdict of the jurors at law determines the fact in the court of equity. These feigned issues seem to be borrowed from the from judicallis of the Romans; and are also frequently used in the courts of law, by consent of the parties, to determine some disputed right without the formality of pleading, and thereby to save much time and expense in the decision of a cause. Blackitt. Com. book iii. p. 452.

Issues in Sheriff are for neglects and defaults, by an agreement and fine to the king, levied out of the iuisses and profits of their lands; and double or treble iuisses may be laid on among
though, but and one, proved z practitioner, ill the complaints, diseases.

murdered, mankind, for the cure or prevention of a variety of diseases. The physician in his practice, has frequent occasion to recommend the making of an incision, and the surgeon finds it a principal means of relief in several important cases; as, for instance, the white-swelling, the disease of the hip-joint, caries of the vertebrae, &c. Many persons are never in health, or at least fancy themselves always ill, unless they have an incision in some part of their body or another.

Making an incision, indeed, is not unfrequently considered as an imitation of nature, who, of her own accord, often forms ulcers in various parts of the body (as is not uncommonly conjectured) for the purpose of discharging pernicious humours, whereby people are supposed to be freed from grievous disorders, and have their health preserved. The humoral pathologists were excessively partial to these notions, which, at the present time, will be found by every experienced practitioner to influence the mafs of mankind, and render the formation of incisions more common than is perhaps is consistent with the better established principles of medical science. Few old subjects will allow a fore of long standing to be dried up, (as the expression is,) without requiring the surgeon immediately afterwards to make an incision for them. When an ulcer has existed a great length of time, the constitution may possibly become so habituated to it, that the health may really suffer from its being healed. We have often seen affirmative complaints, and severe head-aches follow the cicatrization of an old ulcer; but whether they would have happened, if an incision had been made in time, we cannot undertake to determine positively, though the plan is commendable both as rational and exempt from danger. Whatever may be the fidelity of the theories which have been offered by medical writers in regard to incision, the practitioner, who has his eyes open, cannot fail to see the benefit often derived from such means; and if there be any unquestionable facts in medicine and surgery, we may confidently set down amongst them the frequent possibility of relieving one disease by exciting another of a less grievous and more curable nature.

Surgeons of the present day have only two ways of making an incision; one is with a lancet, or scalpel; the other with cautery.

The place for the incision being fixed upon, the surgeon and his assistant are to pinch up a fold of the integuments, and with a lancet, or knife, make in them an incision of sufficient size to hold a pea, or as many peas as may be thought proper. The pea or peas are then to be placed in the cut, and covered with a piece of adhesive plasters, a compres and bandage. The peas first inserted need not be removed for three or four days, when suppuration will have begun; but the incision is afterwards to be cleaned and dried every day, and have fresh peas put into it. The preceding is the ordinary mode of making such incisions as are intended to contain only one or two peas.

When the incision is to be larger, which is generally proper in cases of deformed vertebrae, white-swellings, &c; the best plan is to destroy a portion of the integuments with cautery. The whole process, blended with quicklime, is mostly preferred for this purpose. The situation and size of the incision having been determined, the surgeon is to take care that the cautery does not extend its action to the surrounding parts.

With this view he is to take a piece of adhesive plaster, and having cut a hole in it of the exact shape and size of the incision intended to be made, he is to apply it to the part. Thus the plasters will cover the adjacent skin from the effects of the cautery, while the uncovered portion of incisions, corresponding to the hole in the plasters, is that which is to be destroyed. The cautery is to be taken hold of with a bit of lint or tow, and its end, having been a little moistened with water, is to be steadily rubbed upon the part of the skin where the incision is to be formed. The friction are to be continued, till the whole surface intended to be destroyed assumes a darkish corroded appearance. The cautery matter may now be carefully washed off with some cold water. The plasters is to be removed, and a linted poultice applied. As soon as the eschar is detached, or any part of it is loose enough to be cut away without pain or bleeding, the peas are to be inserted and covered in their proper place with a piece of adhesive plaster. Some use beans for the purpose; others beans, which answer very well, and have the advantage of serving for any length of time, when washed and cleaned every day. If the incision is at all of a longitudinal shape, the pea, beans, or beads may be more easily kept in their places when frang upon a thread.

Incisions ought always to be made, if possible, in a situation where the peas will not be much disturbed in the ordinary motions of the body, or interfere with the actions of the muscles. The intercostal muscles are often made just at the interior angle of the deltoid muscles, by the side of the external edge of the biceps. In the lower extremities incisions are often made at the inner side of the thigh, immediately above the knee, in a cavity readily left there with the fingers. Sometimes incisions are made upon the inside of the leg, just below the knee. The nape of the neck is a common place for them. In cases of the vertebrae they are made on each side of the spine, procuring. In diseased hips they are formed in a depression just behind and below the trochanter major. When the nature of the case does not fix the situation of an incision particularly, the arm should be preferred to the leg, as incisions upon the upper extremity, especially the left arm, are much less annoying than upon either of the lower limbs.

The great art of keeping an incision open for a long while, is always to maintain an equal and effectual pressure upon the peas, by which means they will be confined in their places, and the granulations hindered from rising. Compresses of paper-board and sheet lead will often be found highly serviceable.

IS-SUR-TILLE, in Geography, a town of France, in the department of the Côte d'Or, and chief place of a canton, in the district of Dijon; 4 miles N. of Dijon. The place contains 1598, and the canton 16,170 inhabitants, on a territory of 355 kilometres, in 23 communes. N. lat. 47 3', E. long. 5'.

ISSUS, in Ancient Geography, a town of Asia, in Cilicia, situated on the S. coast. This town was large, rich, and populous. It is famous for the battle fought by Alexander in the year 333 B.C. in which he defeated the Persians, and took as prisoners the wife, mother, and daughters of Darius.

ISSY L'EVÊQUE, in Geography, a town of France, in the department of the Saône et Loire, and chief place of a canton,
a canton, in the district of Autun, 19 miles S.S.W. of Autun. The place contains 7953, and the canton 53,429 inhabitants, on a territory of 220 kilometers, in 7 communes.  

ISTAD, St., a small island in the Grecian Archipelago, near the S. E. coast of Argentina.  

ISTAKAR, a town of Peria, in the province of Farischa (which lie), at a small distance N. of Shiraz.  

ISTAN, a town of Spain, in the province of Grenada; 6 miles S.E. of Monda.  

ISTANNA, a country of Africa, E. of Benin.  

ISTAPA, a town of Mexico, in the province of Guadalajara; 15 miles N.E. of St. Miguel.  

ISTECHIA, a town of the Morea, in the gulf of Corinth; 7 miles S. of Scaramunda.  

ISTEFAN, a town of Asiatic Turkey, in the province of Natolia; 20 miles N. of Sinop.  

ISTENAZ, a town of Asiatic Turkey, in the province of Caramania; 18 miles W. of Satalia.  

ISTEPEC, a town of Mexico, in the province of Guatimala; 12 miles N. of St. Salvador.  

ISTER, in Ancient Geography, the name which the Greeks gave to the river which we call the Danube; which is  

ISTESSO, L'ISTESSO, Lily, in Music, the fame found, air, or interval. Domenico Scarlatti, in Rodeigrave's edition of his first book of Leflons, has l'istesso differente for the fame air, varied; and Padre Martini, for exactly the fame thing, has l'istesso, |as differente.  

ISTEVONES, or ISTEVONES, in Ancient Geography, a people of Germany, who, according to Pliny (I. iv. c. 14), were situated near the Rhine, and of whom the Cimbri, in the interior of the country, formed a part.  

ISTHIMA, Isthmus, or Isthmian Games, Ludi Isthmi, were solemn sports, being one of the four sacred games celebrated in ancient Greece.  

They were called Isthmian, because they were celebrated in the Corinthian Isthmus, a neck of land by which Peloponnesus is joined to the continent.  

Plutarus, in the life of Theseus, tells us they were instituted by that hero to the honour of Neptune, in imitation of Hercules, who had before instituted the Olympic games to the honour of Jupiter; but Archias refers their institution to the honour of Melicertes, or Palemon, son of Athamas, king of Thebes, whom the Latins call Portunus. Others say they were instituted by Nile, son of Neptune; and others, by Silvius, brother of Athamas, king of Corinth, about 1326 years B.C. Others are of opinion that there were two distinct solemnities observed in the Isthmus, one in honour of Melicertes, and another in honour of Neptune.  

The most probable account of the origin and subsequent renewal of these games, allowing, as it may perhaps be necessary, for some mixture of fable, is as follows: Athamas, king of the Orchomenians, a people of Boeotia, having divorced his former wife, named Nephele, by whom he had two sons, Phryxus and Helio, and having married Iaso, by whom he had also two sons, Leucæus and Melicertes, or Melicertes; the latter perjured the children of the former marriage, so far as to make her husband believe that the oracle of Delos demanded the blood of Phryxus, as the means of putting a stop to the famine of which it. ther-
IST

ISTIMNAS is also applied, by the anatomists, to several parts of the human body, particularly that narrow part of the throat situated between the two tonsils.

Also to the ridge that separates the two nostrils; and to the palatine in that part of the medulla oblongata of the brain which lies between the cerebrum and cerebellum, and which reaches from the place called obex to the fourth ventricle. The upper part or cover of this conduit or passage, which is between the septum and the foremost vertical process of the cerebellum; and to which the tongue is applied, is called the vela nigra; it is of a medullary substance, and its use is to keep the lympha from falling out above the nerves in the back of the skull.

ISTIATZKA, in Geography, a town of Russia, in the government of Tobolsk, on the Vaga; 68 miles S. of Tobolsk.

ISTIL, in Ancient Geography, a town of the island of Euboea; situated in the northern part of the island upon a mountain, nearly opposite to the Pelopisic gulf, which belonged to Thessaly. It was anciently called Oros, from its situation, on top of a mountain. Its original inhabitants were driven from it by Pindus, and retired to the Eutopia, an interior country of Thessaly; and their place was occupied by a colony of Athenians, of the tribe Idaetians. It is now called Oris, or Oree.

ISTIB, in Geography, a town of European Turkey, in Macedonia; 72 miles N. of Saloniki. N. lat. 41° 35', E. long. 22° 48'.

ISTILLAR, a town of European Turkey, in Macedonia; 56 miles S.E. of Saloniki.

ISTIZER, a town of Russia, in the government of Tobolsk; 24 miles E.S.E. of Tobolsk.

ISTIGAN, a town of Mexico; 60 miles N.W. of Mexico.

ISTIGR, a town of France, in the department of the Ais; and chief place of a canton, in the district of Aix; 18 miles S.E. of Arles. The place contains 2,111, and the canton 5,922 inhabitants, on a territory of 517 square kilometres, in 4 communes.

ISTIATA, a peninsula of Europe, bounded every where by the sea, except on the north, where it is joined to Carmania. This peninsula was anciently a part of Illyrium; but being conquered by the Romans, between the first and second Punic wars, it was annexed to Italy. In the middle ages it belonged to the patriarch of Aquileia, who was invested with it, as a marquisate, by the emperor Henry IV.

In the year 1165 the maritime part was for the most part conquered by the republic of Venice, abating some interruptions on the part of the Avars. Venetian Illyria was divided into 4 bishoprics and 28 districts; it contained 6 large, and 12 small towns, or boroughs, 200 villages, and 15,000 inhabitants, who were chiefly employed in agriculture, the production of wine and oil, the rearing of bees, the manufacture of silk, leather, tallow, and salt, and fishing. The grain, wine, oil, and salt, have been reckoned excellent, and have afforded, together with the tunny fish and anchovy fishery, profitable articles of commerce. The marble and stone have likewise supplied important branches of trade. But the chief wealth of Illyria has consisted in its forests, which overspread a great part of the country, and yield abundance, not only of fire-wood and timber for ship-building, but also of game. By the treaty of Campo Formio, in 1797, and that of Luneville, in 1801, the Venetian part of Illyria was ceded to Austria. But by the treaty of Presburg, in 1805, that part of the estates of the republic of Venice, which had been ceded to the emperor of Germany and Austria by the treaties of Campo Formio and Luneville, were united in perpetuity to the king of Italy.

ISTRUP, or ISTUP, a town of the bishopric of Paderborn; 12 miles E. of Paderborn.

ISTUNALA, a town of South America, in the government of Tacaram; 150 miles E. of St. Miguel de Tucuman.

ISUNGO, a town near the centre of the island of Gibao.

ISTSTORA, a town of Walachia; 12 miles E.S.E. of Brancoveni.

ISURUM, in Ancient Geography, a town of the island of Albion, or Britain, in the country of the Britons. It is now Alderrow, near Brougham, and probably derived its name from its situation on the river Ure. Although it is now a small village, it seems to have been once the capital of the Britons; being called, both in the Itinerary of Antoninus and in Ravenna's, "flarium Brigantium." The foundations of the ramparts may still be traced.

ISWARA, in Hindu Mythology, one of the many names of Siva; but it is sometimes applied, rather carelessly, to other deities, being nearly equivalent to our lord, and susceptible of equivocal application. Generally, however, it is understood of Siva, and sometimes has the epithet Male prefixed, giving Maheswara, or the great Isvara. Under this form the name of his faktu, or form, is Maheswari.

ISWETOSTA, in Geography, a town of Sweden, in the province of Skonen; 8 miles N. E. of Christianstatt.

ITABIER, a town of the island of Bornoe; 30 miles N. of Negara.

ITABOCA, a town of Brazil, in the government of Para, on the Tocantin; 90 miles S. of Cananéia.

ITACAMBIM, a town of Brazil; 60 miles N. of Villa Nova del Principe.

ITACORUSSA, a town of Brazil, situated on the Xingis; 60 miles S.W. of Curupá.

ITALIAR, in Ichthyology, a name by which some have called a Brazilian fish, of the turdus kind, of great beauty, and a very delicate taste, more usually known by the name juruca.érhu.

ITAKA, in Geography, a town of Japan, in the island of Niphon; 35 miles S. of Ixo.

ITALA, a town of Sicily, in the valley of Demona; 13 miles S.W. of Messina.

ITALAH, a town of Asiatic Turkey, in Nataia. N. lat. 35° 45', E. long. 28° 29'.

ITALIA, in Ancient Geography. See Italy.

ITALIAN, the language spoken in Italy. This tongue is derived principally from the Latin, and, of all the languages formed from the Latin, there is none which carries with it more visible marks of its original than the Italian.

It is accounted one of the most perfect among the modern tongues. It is composed, indeed, that it has too many diminutives and superlatives, or rather augmentatives; but without any great reason; for if those words convey nothing farther to the mind than the just ideas of things, they are no more faulty than our pleonasm and hyperboles.

The language corresponds to the genius of the people; they are slow and thoughtful; and, accordingly, their language runs heavily, though smoothly; and many of their
words are lengthened out to a great degree. They have a
great taste for music; and to gratify their passion this way,
have altered abundance of their primitive words; leaving
out consonants, taking in vowels, softening and lengthening
out their terminations for the sake of the cadence.

Hence the language is rendered extremely musical, and
succeeds better than any other in operas, and some parts
of poetry; but it fails in strength and nervousness: hence
also a great part of its words, borrowed from the Lat).
tin, become so far dignified, that they are not easily known
again.

The multitude of sovereign flaes into which Italy is
divided, has given rise to a great number of different dialects
in that language; which, however, are all good in the place
where they are used. The Tuscan is usually preferred
by the other dialects, and the Roman pronunciation to that
of the other cities; whence the Italian proverb, "Lingua
Toscana in beca* Romana."

The Italian is generally pretty well understood throughout
Europe, and is frequently spoken in Germany, Poland, and
Hungary. At Constantinople, in Greece, and in the ports
of the Levant, the Italian is used as commonly as the
language of the country; indeed in those places it is not
spoken so pure as in Tuscany, but is corrupted with many
of the proper words and idioms of the place; whence it
takes a new name and is called Franto Italian. See Lan-
guage.

ITALIAN Coins, Meafures, Marks, Silks. See the sub-
ficials.

ITALIAN School of Engraving. Engraving, with the work
of the fonder occasionally mingled with that of the
grover, had been raised in Italy, from time immemorial,
laforetting the golden and finer vases, fiblers, chalices,
and other vessels of like, which adorned the common-
tables of the Catholic church, and the side-boards of the
noble and opulent, when, about the middle of the fift
century, Mafo, or Thomato, Finiguerra, a goldsmith
of Florence, accidentally discovered the means of printing
from the incisions thus sculptured on the metal: so that
engraving on copper-plates, as it is now practiced, with the view
of rendering impressions on paper, is a fecon from the decora-
tive part of the art or trade of the goldsmith; but which
has gradually far out-grown the parent tree.

Vafari, in his biography of Marc Antonio, has, with
great propriety, connected his account of that distinguished
engraver, with an history of the discovery which rendered
his art fo famous and fo extensively beneficial. He says
that Finiguerra, having performed an engraving on a piece
of plate, and intending to fill up the hollows with enamel;
in order to try the effect of it previously to putting on the
enamal, cast some melted sulfur upon it, and, on taking it
off, perceived that the dirt (or charcoal with which he first
stirred his work) collected at the bottom of the hollows, by
adhering to the sulfur, gave an impression of what he had
engraved. Struck with the discovery, he repeated the experiment,
by applying moistened paper to his engraving instead of sulfur, rolling it gently with a roller, and this
experiment being attended with success, he imparted his
discovery to Baccio Baldini, who was also of Florence,
by whom it was communicated to Sandro Boticelli, and
perhaps also Antonio Polajuolo, and Andrea Mantegna.

The baron Heinemcin, however, believes that rol-
ing-press printing had previous existence in Germany, and
frequent writers (among whom is our countryman Strutt),
strongly credit to the opinion of an author, who is in general
worthy of it as Heinemcin, have copied this belief, or re-
peted this assertion of the baron, perhaps, with good re-
flexion.

An accidental discovery of this kind, which may have
been taken place in any country where paper was known
and used, reflects so little honour upon its birth-places, as
to be unworthy of half the importance which has been
unjustly attributed to it; yet for the sake of the meri-
tified or fancied honour, the connoisseurs and literati of Italy
and Germany have contended, and we must allow, that
the mind of Heinemcin appears, in this instance, to have been
influenced by an evident bias in favour of the pretensions of
his country.

He ceases, however, only to conjecture to the plain and
simple fact of Vafari, which we have quoted above; and
though he, as well as others, have faithfully sought for
evidence in the dates of the earliest German engravings, no
such evidence has been found. No German print imprinted
from an engraved plate, of which the date has not been sub-
fsequently altered to impose on the credulous, has been,
can be produced, as the present writer believes, bearing an
earlier date than 1460, the year in which, according to Vafari,
the accident happened in the workshop of Finiguerra, which
gave to Europe the means of printing from the incision of the
grover.

Finiguerra was born at Florence some time about the
year 1424, and died in the same city at an advanced age.
He is reported to have flamed under Massaccio. Probably
he learned drawing in the school of that master; and Baldini
Bandinelli, in one of his letters says, that Mafo worked
with Pollajuolo and other contemporary artists, on the far
famed metal doors of the church of St. John at Florence.
About the year 1450, he engraved also for the church of
St. John, the Passion of Christ on a sacred vase of gold,
in a very artist-like manner, though the figures were small.
This fact is reported in a letter from M. Gabucci to
Maricte; but of his other engravings we are compellcd to speak
with doubt.

Whether any impressions from the works of this artifl
remain to attest his discovery of printing, and corroborate the
statement of Vafari, is at the best uncertain. Strutt has
mentioned dubiously, "The Seven Planets," which are
really from the graver of Boticelli, and with better show of
reason, a small plate of an artist engaged in his profession,
which is marked with the letter F on a stone, and is certainly
in the very earliest style (for Baldini and Boticelli can scarcely be
said to have attained a style) of Italian engraving; to which
the foreign writers on art have added the twenty-four fol-
lowing small engravings, which are, for the most part, of the
 circular form. According to Huber and Roff they were
recognized as the work of Finiguerra by M. Otto, a well-
known amateur of Lepic, by M. P. Abbe Zan of Parma,
and by the more celebrated baron de Stolich, the latter of
whom relied a long time at Florence, whilst he was forming
his immense collection of works of art. All of these con-
nosdlors have admitted them into their collections as the
work of Finiguerra; and Heinemcin, after attentive examin
ation, has adjudged them to be his engraving and printing.

On a frameer fuming out the couch, is inscribed "Amor
van't loöv der neemt." 2. The male and female suppor-
ters (a young man and woman) of the arms of the
Medici, with a vase of flowers, &c. The female is dressed
in the Grecian tait, and holds two giblets. N. B. This
seems to have been printed from the cover of a round box.
3. A half-length figure of a young man with a paraproch
on his shoulder, playing the guitar, enriched by a border of
fruit. 4. An adolescent rudisch at a tree, his eyes

Vol. XIX.
ITALIAN SCHOOL OF ENGRAVING.

5. The same subject, differently treated. 6. Eight small ovals enclosed in a circular border of foliage. In the middle are two prominent characters, and in each of the rest a little cupid holding a musical instrument. 7. A similar subject, with a lady in the middle, a cavalier and lady on the right, and another in the center. 8. Another circular bordered with fruit. In the middle part, a bear in a landscape is attacked by five wolves, and at the top are two cartouches, on the fronts of which the arms of the Medici are traced with great skill. 9. Another cartouche with foliage. The figure in the upper part, resembling a cavalier and two horses is bordered by two lines in a circular border.

10. A subject in profile on medallion bordered with laurel, and is surrounded by three hunting subjects, in one of which a dog is running a course, which a hare is escaping.

11. A lady is known. A dog is at her feet, and her hand is holding flowers. 12. Judith and Holophene, with several in the antique taste. 13. The heads of Judith and of David are much improved.

14. The subject is the death of Judith, and David crowned. 15. A cavalier and lady walking at the time of day, whilst a youth plays the lute. 16. Judith and Medusa, who appear as supporters on an important border. 17. Two supporters to a sphere: one, carrying a laurel leaf and an amethyst, on which is written "Antonio Batelli," the other is a female dressed as an antique, and holding the motto "Amor fidelis." 18. Another birdlike subject, in the middle of which is a little block for an armorial bearing. The cushion is a young girl, and on the right hand it holds a flower, a wreath of laurel, a golden cup, a scroll above, and beneath, a dog is asleep. 19. An armorial border, with a male and a female supporter. 20. A guardian angel, with expanded wings and a vertical globe. 21. Cupids holding wreaths of flowers and fruit, one with his bow unbound. 22. Bacchanales: in the left of which is a car drawn by cupids, surmounted by a bunch of goblins throwing out fire. Some of the cupids holding instruments of music, others bearing flambeaux.

The execution is led by one carrying a flag, on which is written "Purita," and followed by another, whose motto is "Allegro benediti." 23. Two women elegantly attired, fitting in a landscape, supporting a border of cornucopias. 24. Two women, with each a knee on the ground, supporting diagonally a cartouch, on which is a female with her hands raised towards heaven. N.B. The four latter are well.

An edition of the "Inferno of Dante," printed at Florence in the year 1481, has long been supposed to contain the earliest Italian engraving, excepting the maps to an edition of Ptolemy printed at Rome in 1474, of which the date is not retained, and to have been the first book ever embellished with copper-plate prints, in which human figures or other natural objects were attempted to be represented. This is, however, a mistake. The extensive and wide-ranging graphical collection of Earl Spencer contains a number of plates printed at Florence, by Niccolo della Magna, but in the year 1477, which is four years earlier than the "Dante." It is entitled "Monza Santa Maria Maggiore, and to the author Anno Buitoni, Bishop of Foligno; in which the subject of Dante; one is much larger than the other of the houses of Dante.

It is generally supposed that the two books are the joint production of Boccaccio and Alessandro Boccaccio, or at least that the smaller was only a part of the execution. The fame artists have also engraved a great number of the Prophets, single figures; and a much larger plate than had yet appeared in Italy, of which the subject is "The Last Judgment," and where the damned are represented in separate places of torment, which resemble ovens, each inscribed with a particular vice or mortal sin. But it must be added, that all the engravings which these artists performed in conjunction, are Gothic, vulgar, and inferior to those of their German contemporaries.

Baldini was a Florentine by birth, and was brought up to the business of a goldsmith. Judging from his engraving, and his obliquity to every other respect, he seems to have been one of those men of flatter talent, who are pretty numerous in all times and places; whose mere want of employment affords them leisure to catch at, andavail themselves of the advantages of the inventions and discoveries of others. From Finghiera he obtained his method of printing, and Bottecelli furnishing him with designs, he engraved, with the help of the latter, nineteen plates for the abovementioned edition of the "Inferno of Dante." The whole of his other engravings, with which we are acquainted, have been already mentioned.

Sandro Bottecelli, named Filippino, goldsmith, painter, engraver, was born at Florence in the year 1476, and died in the same city in 1515. Though apprenticed to a goldsmith, he studied the art under Filippo Lippi the painter, and acquired some reputation by his pictures, but more by his drawings. His biographers say, that he learned engraving (probably printing by means of the roller) of Finghiera; and besides the design for Dante's poem, and those which follow, Valari mentions with distinction, as his very best performance with the graver, a print, entitled "Triumph of the Fio di Fra Girolamo Savaranola." "St. Jerome on his knees, extending his right Hand toward a Crucifix," "St. Sebastian with the Virgin Mary," inscribed "O Mater Dei, memento mei, -O beate Zebattiano;" a fort of twelve of "The Sybils," with each a scroll, and eight Italian verses beneath; "The Seven Planets." (N.B. It is one of them, namely, the planet Venus, which Strutt has copied, and ascribed to Finghiera.) The Triumph of Paulus Emilius, inscribed on a medallion, "Paulus Emilius Aug., a fort of the "Viccis" and "Passions," with "Innocence" and "Truth;" "The glorified Saul," Engraving in Judgment, attended by the Prophets and Saints. The three latter are of small folio dimensions; and of the half of all we have already particularly spoken under the title of "The Last Judgment," the joint production of Bottecelli and Baldini.

Antonio Pollajuolo, or Pollajach, who was also of Florence, and born some time before the year 1426, may with more propriety be called an artist. From the antique sculpture, which was now beginning to reappear, he seems to have learned attention to the anatomy of his figures: to which most important requisite of historical art, Pollajuolo has the distinguished honour of having been the first to attract critical attention. He has shown his predilection for this study, by representing the conspirators naked in the medal which he cut to commemorate the assassination of Juliano, and the attack on Lorenzo de Medici; and also in a much larger engraving than had hitherto been executed, of which the subject is a battle, and wherein he has represented all the combatants naked. There is an impression of this very scarce print in the Churchean collection, printed on red-rot paper; each figure is nearly even such a size; the heads have some faint traces of expression; and the shadows are produced without cross-edges, by diagonal lines, apparently done to imitate the hatching of a pen, and in the same direction in which it is customary to
ITILIAN SCHOOL OF ENGRAVING.

write: but the outlines and shadows are dry and hard, and the forms vulgar and heavy. It is only by comparing Pol- 
lajo with his contemporaries and predecessors, that we learn
to respect his performance; and it has even been said of his most celebrated work, ("The Martyrdom of St. Sa-
Balbain," that it "exhibits only a group of half-naked and
guarding wretches discharging their arrows at a miserable
fell-wretch, who, by changing places with one of his
murders, might, with equal propriety become a murderer
himself." So little attention was paid even in Italy, at this
early period, to character and expression." Landor's
Lecture.

Like most of the contemporary artists of his country,
Polliajo practiced occasionally the several branches of ini-
mitative art, which have since become distinct professions, and
was at once goldsmith, medalist, sculptor in relief, painter,
and engraver with the burin. Bartolucci was his principal,
or at least his first instructor; but he worked with consider-
able credit, under Chiari, and in the guild celebrating metal
doors of the church of St. John at Floine. He also ex-
cluded the monument of pope Sixtus IV., which originally
stood in the chapel of that name, and has since been removed
by the order of Urban VIII. to the church of St. Peter;
and that of Innocent VIII.; which are both in bronze, and
are works of great merit. The plan of the Belvidere palace
has been likewise attributed to him.

Of the prints now extant from the graver of Pdllajo,
we know only of the following:

The above-mentioned large folio, wherein six men are
represented fighting with swords in a forest, an "Ho* 
Family," also in folio; and two smaller prints of "The La-
burcs of Hercules," in one of which he is engaged with
Artaxerxes, and in the other removing a column.

An obscure village near Mantua gave birth to the che-
vile Andre Mantegna, in the year 1451. Born in indi-
gence, he was obliged in his early youth to tend sheep for
a subsistence; but being gifted by nature with a happy
genius for the imitative arts, he employed all his leisure
in endeavouring to draw the objects around him. F. Squa-
cione, that observant protector of the fine arts, who was
thence famend the Father of Painters, discovering the dis-
opposition of our young shepherd for painting, took charge
of his education; and conceiving for him an ardent affection,
which increased with the increasing merit of Mantegna,
finally created him heir to his fortune.

Mantegna married the daughter of John Bellini of Vi-
nice. Correggio became his disciple, and the duke of Mantua
his warm admirer and patron: from his hands our artist re-
ceived the honour of knighthood; and for him he printed
that celebrated picture, which he afterwards engraved, and
which is now in the royal palace at Hampton-Court, of the
"Triumph of Julius Caesar."

He executed several great works for pope Innocent VIII.,
who invited him for that purpose to Rome. He painted an
altar-piece for the church of St. Sophia of Padua; and relief pictures for that of St. Julian, particularly one which
has been much admired for its colouring so well as design, in
a chapel belonging to that church; finally, he died in the
fame city (of Padua), highly honoured and admired, in the
year 1512; and a tomb, furnished by his bust, was raised
to his memory in the church of St. Andrew.

Mantegna contributed much to the advancement of Italian
engraving. "By his more intimate knowledge of the antique,
and his superior taste for that knowledge, he improved the
drawing, without materially altering the style of engraving
of Polliajo, by whom he is presumed to have been in-
structed in the new art. Indeed, as the local energies and
practical perfections of painting were still to be per-
fectly developed, it was not until the artist was a degree more
witty, for engraving, than when he had only that faculty to
imitate pictures. The engraving of Mantegna's prints derive a peculiar strength from this circumstance. By his means, the whole of the engraving of the pen, or of the shovels he used, and how he worked in the whole he became more appro-
quate; and the great simplicity of the noble simplicity of the
heavily, and the very manner of altering engraving to his own mode of showing the objects that to imitate pen and ink drawing was the property of his
art."

"A very curious pen and ink design, from the hand of
Mantegna, of which the following description is intended:
the allegorical picture which Apuleius has deduced from
his own life, is now in the possession of the Academy of
the Royal Society. He received, from his own designs,
sometimes on copper, and sometimes on paper, the
mapple upon which the "In his engravings, as in his pictures, the contours are of a grand and decided character, rippled
throughout by much of what has since been termed the
noble simplicity of the Roman school. His prints are few;
but considering the early period at which they were
performed, are much more extraordinary than many
other. The two "Labours of Hercules," in the Crotchoid's
Collection, ought probably to be reckoned among the
earliest of Mantegna's engravings. Like those of Polliajo,
they are printed on red-rose paper, and are designed in the
same heavy style. His "Descripshon of the Prose of
Tracta" has had some considerable remains of Gothic gilding;
but he has here shown his talent in composition, and the fore-shortenings
which occur are far better expressed than they were hitherto
seen. The composition of his "Battle of Sea-Gods and
Tritons" is wildly grand, with such a mixture of the pro-
tique, as may seem not improperly to belong to a subject
which we should esteem out of nature, or beyond the limits
of the material world. The combatants in this battle are
the offspring of his own fertile and vigorous fancy, gene-
rated by the sculpture of antiquity. Beside the trireme and
sea-monsters, are here the general forms of horses and men;
but, like the fawns and sylvan deities of the Greeks, these
natures partake of the element in which they exist—sea.
The spectator is led to conceive that this interview or-
s 312
lified in the mind of the artist, and that (in the words of
Ariel's song) they have undergone "a change, into some
ingh and strange." Instead of hair, sea-weeds decorate
the human heads; and the fins and tails of marine
animals help to constitute the horses and tritons. Their
weapens, too, are congeal with themselves: they fight
with fish and fish-bones, and the skull of some fallen
foe is transformed in the deep ferves as a shield.

The heads of the horses, as well as those of the foos,
are animated by no considerable portion of the ideal con-
da of the antique; the anatomical markings, the facial
object of Mantegna's attention, are almost fully formed,
from the same indubitable source of information; and in the
early impressions, the choracio has more breadth, as well
as depth, than seems to belong to the Italian art of the
carly period, and is conducted through the whole with
mannerly order.

A more flow and sedate magnificence marks the triumph-
phrase prints of Julius Caesar. The wild imagination
which reigned in the scenes of the ocean, and his barbar-
hian procedure, is nearly excluded from hence; it but
serves, in the diming of the candelabra, to gladden
the "floods of nations, and the pomp of war?" or simply

312
discovers itself in other subordinate accessories as the fringed ornament of flately grandeur.

"In his Dance of females, he has shown so much of the graceful simplicity and general air of Greek sculpture, as to give rise to a belief that it has been copied from an antique baso-relieve; but till such a baso-relieve is shown, it would be unfair in us to reject so much of the merit of Andrea Mantegna as this composition may claim. These three engravings abundantly demonstrate the wide range of his technical and inventive powers; and flew with what fancies he would combine, or separately exhibit, elegance, wildness, and grandeur, as occasion admitted or required.

"Some critics have thought that Mantegna's admiration of the antique was too predominant in his works; that it too frequently engrossed his powers; and hurried him too entirely away from that contemplation of nature, which must always be one of the parents of originality in art. Yet, if this enthusiasm be a fault, it is a fault proceeding so necessarily, and so immediately, from the localities of time and place, and the recallance of his merit; that it is as secure of pardon from the candid, as those merits are of praise. Landier's Lectures.

The monogram of this celebrated engraver, resembling that of Marc Antonio, will be found in our Plate I. of those of the Italian School. The following list is believed to contain all his principal works; and it is not certain that he engraved any more than this list contains. They are of tolerable dimensions, and some of them very large:—The Madonna and Infant Christ," (copied by Strutt in his Biographical Dictionary of Engravers); "The Choice of Hercules;" "Hercules overcoming Antaeus," inscribed "Divo Hercule invicto." "The Marriage of Eneas with Laevinia;" "The Scourging of Christ;" "The Entombing of Christ," inscribed "Human genio Redemptori;" "The Defect of the Saviour to Hell;" "The Resurrection of Jesus Christ;" "Judith with the Head of Holofemes;" and two grotesque monsters fighting in the presence of two warriors.

The following are the principal subjects of M. Landier's comments which are quoted above:—"A Bacchalian Procession," in which both fawns and satyrs are introduced; "A Battle between a number of marine Monsters;" "A Dance of Four Females;" "The Triumph of Julius Caesar," engraved on nine plates, which, when joined, form a magnificent frieze: but it is uncommon to find a collection where the nine are complete.

Giovanni Marie da Brescia, or Brixianisis, was a native of Brescia, in the Venetian territory, and was born A.D. 1460. He was an ecclesiastic of the order of Carmelites, and about the beginning of the sixteenth century, painted "The History of Eliaa and Elijah," for the monastery to which he belonged. He also practiced goldsmithery; but it is his engravings, which are somewhat numerous, that are the proper subject of our present notice.

The style of his initial execution is not always alike. In some of his prints it is evidently founded on that of Andrea Mantegna, the lines which form the shadows being laid from one corner of the plate toward the other, without any cross-hatching, somewhat nearer than those of his great example, but very inferior to him in every other respect. On other occasions he employed second copies of lines, but his drawing is heavy, and his extremities not well marked: yet his prints, of which the principal are entitled as follows, are much sought after by the curious:—

"The Virgin Mary seated on a Bench with a Book in her right Hand, holding the Infant Christ;" "The Virgin seated upon Clouds with the Infant Christ;" St. John Baptist, St. Jerome, and three Carmelite Friars below," dated 1501; "The Miracle of St. Gregory restoring a Boy to Life." It is a large folio of thirteen inches by nine, and is inscribed "Opus Iris a Maria Brixianisis, o Carmelitaram MCCXXCI." The manual part of the engraving of this plate is in a mixed style between those of Mantegna and Marc Antonio. "The History of the Emperor Trajan," wherein the artist has complimented the reigning pope, by introducing him at a balcony above.

Giovanni Antonio da Brescia, the brother of the preceding artist, was born at Brescia some time about the year 1461, and also became a Carmelite friar. He applied more closely to engraving than Giovanni Marie, and studied the works of Mantegna with somewhat better success. Yet his outline is poor, though his manual execution is sufficiently clear and neat. He have subjoined a list of his most esteemed works, of which the list appear to be copies from Andrea Mantegna:—"Hercules vanquishing the Nemean Lion," after Andrea Mantegna, inscribed "D. Here in vieto;" two plates of "Hercules" and "Antaeus," after the same master, one of them an upright ato; "A White Horse," referring that by Albert Durer, except in the back ground, a small upright; "The Scouring of Christ," a large upright. Of these the earliest and best impressions are dated 1509, and a second edition was printed in 1529. "The Virgin and Child;" "The Holy Family, with St. Joseph asleep;" two plates of a "Satyr and Female," inscribed "Victoria Augusta," on a tablet; "A Naked Female reproving with an Infant, while a Satyr is playing on a Pipe."

Hieronymus Mocetus, or Jerome Mocetto, engraved both on metal and on wood, and was born at Verona in the year 1454. Strutt's account of him is as follows:—The prints by this ancient master are by no means common. He worked with the graver only; but did not excel in the management of that instrument. His style of engraving bears some resemblance to that of Robella. Though it is considerably neater and clearer, he did not draw the naked parts of the human figure correctly. The extremities especially are very defective. The study of the chiaroscuro was at this time very little attended to. We must not wonder, therefore, at finding the works of this artist totally deficient of effect. However, they are not without merit; though, it must be confessed, that their scarcity is an advantage of the value on them. We have by him, "The Resurrection of Christ, with Four Soldiers at the Foot of the Tomb," apparently from his own design; "A Sacrifice," with many figures, from an antique bas-relief; a middle-sized plate, lengthways. Alto several battles, with other subjects; which are variously marked, as may be seen in our Plate I. of the monograms, &c. of the Italian School of Engravers.

Nicoletta, or Nicolo da Modena, was a native of Modena, and seems to have studied architecture and perspective with more ability than success. He is ranked as one of the earliest engravers of the school of Lombardy; and, when he executed his work, it seems as if engraving only had reached him; and that he had been obliged to work out his own system. It is all nothing, at a time when so many engravers of consequence were living, and had produced such a variety of excellent prints, especially Marc Antonio and his followers, that this man, who was himself a painter, should have been so much at a loss, not only in the mechanical part of the execution of his plates, but with respect to the compositions and drawing of them also. If their rude productions have any merit to recommend them, it must consist in the buildings and architectural ornaments, which he introduced into his designs, and with which he has frequently crowded them in a very absurd manner: he worked with the graver only; and his
ITALIAN SCHOOL OF ENGRAVING.

Large plates seldom exceeded the common folio size. He usually signed his name at length; but in some few instances, he used the two monograms which we have copied in our Plate I. of those of the Italian School. We have engraved by him, "The Adoration of the Shepherds," a middling-sized upright plate, marked with his name at length; "St. Sebastian," a middling-sized upright plate, marked with his baptismal name; "Niccolo," on a tablet; another "St. Sebastian," inscribed with his monogram; "St. Jerome," "St. George," "St. Martin," "A Triton embracing a Siren;" besides other works of less repute.

Benedetto Montagna, was born at Venice some time about the year 1458, and died at Verona in 1530. He engraved on copper, and the graver was the sole instrument of his art. His engravings are dated from a very early period of the art in Italy, and it is more than possible that the prints of Albert Durer, which were brought to Venice as an article both of trade and commerce, and those of Marc Antonio, who had now been following the profession of engraving for some time in that city, might induce him to take up the novel art either as a matter of profit or of curiosity. The efforts of Montagna, however, are but feeble; his outline is exceedingly defective, and his manual execution harsh and rude, though in some few instances he attempted to fill up the blinding of his lights and half-tints by means of stippling.

Benedetto engraved from his own compositions; and the resemblance which some of his prints bear to the original and rude productions of Marc Antonio, of which we shall presently speak, may well be thought to strengthen our supposition, that from them he learned the rudiments of the art. His engravings, of which the following will probably be found the best, are very rare, and are generally, if not in every instance, marked with his name at length:—

"An Holy Family," in which the Virgin Mary appears seated, holding the Infant Christ; St. John is standing beside her naked, and St. Joseph appears below. A view of a town, with a river and bridge over it, constitutes the groundwork: at the top is the artist's name, "The Judgment of Midas," a small upright. A naked figure standing by a tree, somewhat larger. An elderly man and a youth; the former playing on the bag-pipes, the latter upon the vihio. A landscape, with a hamlet in view, and an old man seated on a bank, both small uprights. Another landscape, with three women on the foreground. A young man sitting on a rock, pulling a cord round a palm tree. "The Rape of Europa." "Venus chastising Cupid."

Strutt says, that Rubetta, or H. Robert, flourished in 1610. This is evidently a mistake. The French writers on art, with much more probability, say that he was born at Florence in the year 1463; but the events of his life are very obscure, and his engravings of no value but from their antiquity and rarity, for they are wretchedly executed. The subjects of most of them are devotional; and he sometimes added his name at length, and at others the initial letters R.B.T.A. on a little tablet.

His most esteemed engravings are, "Adam and Eve," a small upright folio; "The Adoration of the Magi," of a nearly square form; "The Resurrection of Jesus Christ," a small upright folio; and "The Golden Age," a large upright folio.

Titian also etched some plates about this time, probably in the way of recreation, and it is said, performed some engravings on wood. Among the former are several large landscapes from his own compositions, the subject of the most remarkable of which is a pastoral, where a shepherd is playing on a flute, before his flock, by the side of a stream. In another a traveller is sleeping by moonlight. He likewise etched an allegorical print of Death habited in the armour of a knight.

The most remarkable of his wood-cuts, if these are really by the hand of Titian, which appears very doubtful, are, "The Marriage of St. Catherine," a large upright, executed in a flight but manner, and inscribed "Titianus Veronensis Inventor Lincaviti." "The Triumph of Faith," represented by a procession of patriarchs, prophets, evangelists, apostles, saints, martyrs, preceding and following Jesus Christ; it is composed of from eight to ten prints, forming, when palled together, a very long frieze, and dated 1505. "The Destruction of Pharaoh and His Hoof," a very large print lengthways, composed of fix parts. This is very rough and rudely cut, and by no means equal to the "Triumph of Faith," which is a very matterly performance. " Sampson betrayed by Dalilah" "The Deluge," a larger engraving, printed on two sheets, of which Papillon says, that it is very correct and admirable; but Strutt, who had seen the print, very properly obersives, that this bouded precision seems to make against its being from the graver of Titian, who would scarcely have bestowed so much time and labour as must have been required to complicate it in so neat and regular a manner.

The famous fictitious engraving of an old ape and two young monks, in the attitudes of Laccoon and his sons, which was long ascribed to Titian, is now known to be the performance of Nicolò Vicentino. It was done to satirize Baccio Bandinelli, who boasted of having executed a Laccoon, which was superior to the antique.

But Strutt thinks, and with great appearance of probability, that most, if not all of the wood engravings ascribed to Titian, are really the work of his younger brother Cefare Vecellii, who also produced a set of 500 prints, executed in a very spirited and masterly style, from the designs of Titian, of ancient and modern deeds, which was published at Venice in 1505, but perhaps there had been a former edition. The title of the edition of 1505 runs thus, "Dei Hubite Antichi et Moderni di diverse parte del mondo, Libri due fatti da Cefare Vecellii" and in a subsequent edition, published in 1664, it is more fully expressed as follows: "Raccolta di figure delineate dal gran Titiano, e da Cefare Vecelio fuo fratello diligentemente intagiate."

A single print in chiaroeco, serves to mark the talent, in that mode of engraving, of Baldassare Perini, an extraordinary architect, painter, engraver, and antiquary of this period. He is generally supposed to have been a native of Sienna, but Valfaris says, and probably with truth, that he was born at Volterra, in the year 1431. Before building churches and palaces at Sienna, and other parts of Italy, he embellished them with his pictures; and wrote a treatise on the antiquities of Rome. He left behind him a commentary on Vitruvius, which Papillon informs us he intended, but that the hand of death prevented him, to have illustrated with engravings on wood. It is reported, but we cannot say what foundation, that he was poisoned by some artist who envied his superior talents.

The print to which we have alluded is an upright folio, representing Apollo, Minerva, and the Muses, with Hercules expelling Avarice from their presence. It appears to be engraved on three blocks; one for the outlines, another for the half-tints, and a third for the deeper shadows. It is executed in a bold and spirited style, and inscribed "Baldassar Peny," over which letters is a five-pointed star.

Domenico Campagnola, was born at Padua A.D. 1462. He was the son of Jerome Campagnola, the sculptor, and the disciple of Titian. He chiefly excelled in landscape, and has produced a considerable number of prints, some of which are
are etchings and others engravings on wood, executed in a bold style, but very slight, and incorrect in his drawing of the naked. He died at Venice in the year 1550, but lies interred in the church of St. Anthony of Padua, near the tombs of his ancestors.

Of his etchings the following are the principal:—"The Adoration of the Magi and Kings," a grand composition, in folio; "Caesar's Tribute Money;" "Our Saviour healing the Sick;" "The Parable of Dives and Lazarus," in large folio, etched on three plates, and marked "D.C. In Luca Bertelli," &c.; "The Gift of Languages, or Defect of the Holy Ghost," a large circle, inscribed "D. O. Cap. 1515;"

"The Holy Family, with St. Jerome and St. John," after Titian, a large folio, dated 1517. Two circular prints, one of which is "The Decollation of a Female Martyr;" "A Group of Warriors, attended by Fortune, stopping the Progress of the Arts and Sciences." A landscape, with Jupiter and Calisto, after Titian. Another landscape, on the foreground of which is a chariot drawn by two bulls; marked D. C.; a bacchanalian subject; a Venus, inscribed "D. O. Camp. 1517;"

The most esteemed of his letter press engravings are "The Holy Family," in a landscape, with St John and other saints. The Virgin Mother is represented suckling the Infant Christ; a folio print. A grand landscape, in which is introduced St. Jerome. Another large landscape, with a father and his family. Three children near a pedestal, one of whom is contemplating a dog gnawing a bone. "The Maidens of the Innocents," and "The Deoration of Pharoah and his Horse," a large and grand work engraved on twelve blocks after Titian, and marked "Domenico del Grecche 1549;"

According to the testimony of the author of the Abecedario, Julio Campagnola, in a name Antenoreus, was the brother of Domenico; Fonten le Comte says, that he flourished, as an engraver, from 1507 to 1517. He worked entirely with the graver, but in two very different styles, one of which was his own invention.

The only two prints by Julio, with which we are acquainted, exemplify this remarkable variation in his style. The first is a small upright of "The Rape of Ganymede;" the execution of which resembles, in the manner, that of Master Antoine, though the drawing is very inferior. It is inscribed "Julio Campagnola Antenoreus fec.;" the other is somewhat larger, and represents St John standing, holding a cup and looking upwards. In this plate he has closely departed from his former manner. The back ground is executed with round dots, made apparently with a dip pen. The figure is out-lined with a fine, deeply engraved, and finished with dots, in a manner somewhat resembling those prints which D. Marteau engraved at Paris, in imitation of red chalk. The hair and beard are expressed by lines. It is a very extraordinary print, and proves the possibility of that mode of engraving, which has been erroneously considered a modern invention; but its merit consists rather in its purity; for the drawing of the figure and features, and there is nothing in the general effect to correspond with it.

But the time now under our consideration, there also arose in Europe another mode of engraving, which successfully imitated drawing worked with biftre, or thosc ancient Greek pictures which were called monochromes by the ancients. Mr. Landor lays that "the title of engraving in chiaroscuro, was at that time exclusively, and therefore improperly applied to this new mode of art," since chiaroscuro, or effect of light and shade, is a necessary and elementary part of every mode of engraving that goes beyond a mere outline.

The invention of prints in chiaroscuro is claimed both by the Germans and Italians. The latter assert that soon after the commencement of the sixteenth century, Ugo da Carpi, a man of great ingenuity, discovered a mode of imitating flight drawing, by the means of different blocks of wood. The Germans on the other hand, produce several engravings by Mai, which are dated 1499, and one by Lucas Cranach, dated 1520, which are prior to the time affixed by the Italians for the invention by Da Carpi. This circumstance, even if we should suppose that the prints by Mai are the first attempts in this style of engraving, is sufficient to prove the priority of the exercise of it in Germany. Baron Heinckel is of opinion that the chiaroscuros of John Ulric are still more ancient than those of Mai.

There is, however, a material difference between the chiaroscuros of the old German masters, and those of the Italians. Mai and Cranach engraved the outlines and deep shadows upon the copper. The impression taken in this plate was tinted over by the means of a single block of wood, with those parts hollowed out which were designed to be left quite white upon the print. On the contrary, the mode of engraving adopted by Ugo da Carpi, was to cut the outlines on one block of wood; the dark shadows upon a second; and the light shadows, or half-tint, upon a third. The first being impressed upon the paper, the outlines only appeared; this block being taken away, the second was put in its place, their coincidence being secured by a mechanical contrivance, and being also impressed upon the paper, the dark shadows were added to the outlines, and the third block being put in the fame place, upon the removal of the second, and also impressed upon the same paper, made the demi-tints, and the print was completed. In some few instances, the number of blocks were increased, but the operation was still the same, the print received an impression from every block.

Da Carpi, who first practised this mode of art in Italy, was born at Rome in the year 1486. He studied painting with his great contemporary Raphael, but appears to have possessed one of those minds which, in all ages, bear hard upon rectitude, by preferring novelty to established principle. He painted an altar piece for the church of St. Regard, in the execution of which he used no pencil, but laid on the colour with his fingers; Michaelangelo being importuned for his opinion of this work, firmly maintained that it would have been better had he used his pencils.

It is probable that his passion for novelty led him to practise that new mode of engraving on wood, which is now under our notice, which also calling into action his acquired talents as an artist, enabled him to produce those masterly and spirited imitations of the sketches of the great painters, from whose works they are taken, which he sometimes printed in green, sometimes in brown, and sometimes in other colours, as his love of novelty and experiment directed.

Of these works, those which are most sought after by the curious, are as follow:—"A Sybil with Tablets and a Stylus, with an Infant Genius holding a Torch," after Raphael, printed in green; and, according to Vafari, the first work of the kind produced by Da Carpi. "Kneeling before the Cross," an upright folio; "David beheading Goliath;" "The Slaughter of the Innocents;" "Jesus preaching in the Temple;" "Elymas driving out Blindness;" "The Death of Ananias;" "St. John in the Desert;" "A Dead Christ on the Knees of his Mother;" and "Raphael conversing..."
vering with his Mindro's;* are all after the works of this great painter.

After Parmegiano, he has engraved, a philosopher seated, with a book open before him, and in the back ground, to the right, a bird, with its feathers plucked off; probably intended for Diogenes, and the cock which he plucked in ridicule of Plato's definition of man. This is a large and curious folio print, some of the impressions of which are printed in four different colours. "The Holy Virgin, with St. Sebastian, and St. Nicholas." "A Satyr satouthing Water with his flute." All of these prints are of four dimensions.

Dominico Micarino of Siena, furnisher of Beccafumi, was born at Siena, or in some neighboring village in the year 1484, and died in 1539 in the face of a monk, by his various works in sculpture, architecture, painting, and engraving, he greatly contributed to adorn the face of poor parents, and like Andrea Mantegna, made famous works of his life in keeping ship. His family name was Micarino, but he was born Beccafumi, a dweller of Siena, observing him built in tracing forms of life, with his crook, conceived a favourable opinion of his talents and abilities, and ruffled him defenceless.

From this kind parent the face freely played our young artist under Antonio Veronelli, and Pietro Ponzi, he took the name of Beccafumi. He traveled to Rome to complete his studies [sic], from the works of Durer and Michelangelo; after which he turned to Siena, where he was employed in several works both in stained and oil, which acquired him great applause, but nothing contributed more to the establishment of his reputation than the Msafic pavement with which he ornamented the cathedral of Siena.

Micarino appears to have worked occasionally in all the modes of engraving which had then been invented. He was a very good engraver on wood, and particularly excelled in chiaroscuro, sometimes working from his own designs, and at others from those of Titian and other masters. He also etched several plates in a very spirited style, and we have some few prints executed by him with the graver only. In these, the hand of the moulder is very evident; the figures are drawn in a spirited style, and the extremities are finely marked. But, from want of skill in the management of the point and the graver, the mechanical part of the work has a harsh and unpleasing appearance to an eye accustomed to neatness and precision.

His engravings, of which the following list specifies the principal, are sometimes marked with his name at length, and at others with the cypher which will be found in our Plate I. of those of the Italian School.—A large folio print of "The Nativity," after Titian, cut in wood in a very spirited manner. "The Holy Virgin embracing the Infant Child," printed in chiaroscuro, in three colours, and particularly from his own composition. Four prints executed in the manner of "St. Peter," "St. Philip," "St. Andrew," and "St. Jerome." A Philosopher sitting wrapped in his Mantelet, Portrait of pope Paul III. Three engravings of copies, of which the subjects are groups of academy figures, and ten engravings on wood of chalcographic figures.

The next engraver of decided talent that Italy produced was Marc Antonio Raimondi, whose name marks a momentable era in the history of engraving. He was born at Bologna in the year 1487 or 88, and died in the same city about the year 1539. Like many of his contemporaries of prédiosors, he was brought up to the labours of a goldsmith, but studied drawing, in which he so much excelled under Francesco Raibini, furnisher of France, but his attachment to whom, Raimondi Ueunit obtained the cognomen of Francia. His earliest prints, as far as is known, were "The four Heroes," and "Pyramus and Thisbe," the latter of which is dated in the year 1522, when he could have been only 14 or 15 years of age; these early works are both engraved after the designs of this master, and the letter F, which forms part of the monogram, alluded to them, may be supposed to stand for either Francesco or Raibini.

Our artist, however, is now generally known by his baptismal names, Marc Antonio. Being eager for improvement in his art, he travelled to Venice, where he first met with the works of the Germ. engravers, particularly a set of wood cuts by Albert Durer, representing "The Life and Passion of our Saviour." These pleased him so much, that he purchased them, though they cost him nearly all the money he had brought with him, and he copied them with great exactness on copper. The deception, it seems, answered well to Marc Antonio; for, as we are told by Vafari, that they were frequently sold for the originals. This circumstance, according to the same author, coming at last to the ears of Albert Durer, he complained to the senate of Venice of the injury which he had sustained, but all the reproofs he could obtain was, that Marc Antonio should not, for the future, add the cypher or monogram of Albert Durer to any of the copies he might make from his engravings. This story, if true, is not without an allusion, and one of the most striking is, that the copies which Marc Antonio made from the Life and Passion of Christ by Albert Durer, have not the mark of that artist at all upon them, but the cypher of Marc Antonio only. Vafari indeed might have mistaken the life of Christ for the life of the Virgin, by Albert Durer, because Marc Antonio copied them both with equal precision. The latter are much larger than the former, and have the monogram of Albert Durer represented in the same manner as upon the originals; and to the latter, Marc Antonio has not put his own cypher, except upon the first plate; but even that his monogram of Albert Durer also. Of course, these prints will much better a resemblance of the story above related, than those mentioned by Vafari.

When Marc Antonio quitted Venice, he went to Rome, where his merit soon recommended him to the notice of Raphael, who not only employed him to engrave a considerable number of his designs, but formed an intimate friendship with him. He it is, who has been said, though without sufficient authority, that he added him in tracing and correcting the outlines upon the plates.

The first plate he engraved from a drawing of Raphael's was "Lucet tua Ciboulinos," in which he seems to have exerted all his abilities to make it neat and delicate. Soon afterwards he executed the plate of "The Judgment of Paris," which, though not from Raphael, is here a marvellous freedom and spirit. Raphael's is so perfectly well pleased with the works of the admirable engraver, that he sent many proofs of these to his companion present, to Albert Durer, who was then so well worthy of its acceptance.

The great reputation which Marc Antonio acquired, under the patronage of Raphael, from many young Italian artists of Rome, was not confined to him; and among them were the following: Antonio Mates, Marco de' Raivena, Giulio Boretti, N. P. Ferrini, and Lucas Vico, who all of them became very famous, and be most beloved to be known abroad. Boretti of Tuscany, George Pantal, and James Bineck, with others, most of Germany, came into Italy, and frequented him there. For a great fame, and after his death, which of the subjects taken from the plates here given, he was committed to him by pope Clement VII. He recovered his freedom through the intercess of Durer. After
ITALIAN SCHOOL OF ENGRAVING.

After his release, Marc Antonio, to manifest his gratitude to Bandinelli, engraved, from a picture of his, that admirable print representing the Martyrdom of St. Lawrence; and succeeded so happily, correcting carefully several faults which were in the picture, that the pope, who was a great lover of the arts, upon seeing an impression from the plate, pardoned his offence entirely, and took him under his protection. We now see our artist in the zenith of his good fortune; but his decline was still more sudden than his advancement: for the city of Rome being taken by the Spaniards, A.D. 1527, Marc Antonio left in the pillage all the wealth he had accumulated. He retired afterwards to Bologna, where perhaps he died; but of this there is no certain account. The last dated print we have by him is, "The Battle of the Lapiths," engraved in 1539; after which time, we hear no more of him, or of his works. Malvizia indeed affirms, that he was afflicted by a nobleman of Rome; because he had, contrary to his engagement, engraved a second plate of the Murder of the Innocents, after a design of Raphael. This design was certainly twice engraved by Marc Antonio, with very small variations, as will be mentioned below. Baldinucci, following Malvizia, mentions this story; and adds, that Marc Antonio was married, and that his wife was also an engraver. But the total silence of Vafari as to this circumstance, renders it exceedingly doubtful.

The style and the principal works of fo distinguished an artist, the founder of the Roman school of engraving, call for particular comment. In his fifth lecture, delivered at the Royal Institution, Mr. Landseer says, "The style of Marc Antonio pooffes not the exteriors of oratory; but he pronounces every sentence so distinctly, with a confidence so modelled, and an emphasis so true to Raphael and to nature, that those who attend are convinced, without being persuaded. To speak without a metaphor, there is something in his manner of employing his graver, something dry, unambitious, severe, unattractive to the sense; which, by all found critics, has been thought to deferve praise, without defiring it; and peculiarly appropriate to the works of a painter, who not merely does not require, but will not admit, the aid of foreign ornament."

"The Dead Christ of Raphael, where the excess of his mother's sorrow is softened, but not subdued, by her divine resignation, he repeated with variations; of which the principal are, that, in the second plate, the Virgin Mary appears much younger than in the first, and her right arm divided of drapery; from which circumstance, it is known among collectors by the appellation of "The Virgin with the naked Arm." The second plate is more delicately engraved, but is feeble, when compared with the masterly vigour he has shewn in the first. The mutinies are here drawn with Marc Antonio's, inspired by Raphael's, usual superiority; but the drapery and ground are softened and enriched beyond the ordinary powers of Marc Antonio's graver, and are so much in the improved style of his pupil, George Penez, as may incline us to suspect that these parts have been engraved by his hand. Whether Raphael authorized or allowed Marc Antonio to substitute the younger Virgin, who seems more like the subject, for the elder, who is the mother of Christ, does not appear.

"In "The Virgin of the Palm," Marc Antonio discovers, if possible, a still more exquisite feeling, and of course produces a more perfect translation, of Raphael. Christ is bestowing his benediction with the simplicity of inspiration; and St. John receiving it with dignified and divine, though infantile, submission. The subordination of parts is just: the whole is perfectly graceful; and the head of the Virgin Mary, the most graceful part of that whole.

"Marc Antonio's powers as an engraver appear not to have declined from their acme, in his martyrdom of St. Lawrence, after Bandinelli. He not merely copied, but his long acquaintance with the works of Raphael enabled him, and his gratitude to Bandinelli, who had obtained his release from prison, dispose him, to improve the drawing of his original. The print is defective, yet not more so than many other of his works, in chiaroscuro: but, expression of the textures of substances, and the existence of reflex light, are here freely acknowledged; the folds of the draperies are ample; the drawing of the naked excellent; and the characters of the heads far better than would seem to belong to the reputation of Bandinelli."

The several monograms with which Marc Antonio marked his engravings, from time to time, will be found in Plate I. of those of the Italian School of Engravers; though a great number of them were published without any other mark than an intelligent eye will perceive, in the peculiar style and purity of outline of this accomplished artist.

Connoisseurs are extremely, and very justly, observant of the goodness of the impressions, in collecting the works of Marc Antonio; and early and well-prepared imitations fall for very considerable sums. Since they were first published, the plates have been successively the property of Thomas Baruccchi, Antonio Salamanca, Antonio Laiyert, and Nicholas Van Adel; lastly, they became the property of the print-dealer Rolfi, at which time, after being frequently re-touched, and of course very much impaired, they were, as works of art, utterly worn out. Thofoe impressions are the earliest, and by far the most valuable, which were taken before the name of any publisher was inscribed on them.

Baron Heinemcin, in his "Dictionnaire des Artifits," printed at Leipzig, A.D. 1778, has given a complete catalogue of the works of Marc Antonio, to which the curious reader is referred, and from which we have extracted the following list of those which are held in most esteem, beginning with his portraits.

Portraits.—An artist wrapped in a mantle, seated, and in an attitude of meditation; a little table, palette, and colours, in the back ground; supposed by Malvizia to be the portrait of Raphael, drawn and engraved by Marc Antonio; Aretin the Poet, with a long Latin inscription; one of the very finest works of the artist: the Emperor Charles V. in his youth; Pope Clement VII; both in medallions: Pope Julius II. holding a bonnet; Prince Octavius Farneze.

Subjects from Holy Writ.—"Adam and Eve," after Raphael, a very fine and rare print, the name which Strutt has copied and placed as the frontispiece to his second volume of the Lives of the Engravers; "Adam and Eve expelled from the terrestrial Paradise," after Michael Angelo; "Noah sacrificing after leaving the Ark;" "The Blessing of Abraham;" "God appearing to Isaac;" "The Escape of Joseph from Potiphar's Wife;" "David discomfiting the Philistines, and beheading Goliah;" "David," an erect figure, with the head of Goliah, a very rare print; all after Raphael.

"The Adoration of the Shepherds," either from a design by Marc Antonio himself, or after his first master Francia; two plates of "The Murder of the Innocents," after Raphael, in the second of which Marc Antonio has introduced the upper part of a small yew tree, called by the Italians la Felcetta, and which does not appear in the first. Good impressions of both these plates are extremely rare and valuable; "An Holy Family," from the thigh of the Virgin Mary being immoderately long, this print is distinguished among connoisseurs by the name of "The Virgin of the long Thigh." Another "Holy Family," wherein the Infant Saviour reproves on the knees of his mother,
ITALIAN SCHOOL OF ENGRAVING.

ther, who is bestowing her benediction on the little St. John.
This is commonly known by the name of "The Virgin of the
Palm." Another, called "The Virgin of the Cradle," from the
circumstance of the Infant Christ being represented in his
cradle; and two plates of the "Virgin and Child;" all after Raphael.

An "Holy Family," after Michael Angelo; a very rare
print of an "Holy Family," after Raphael, wherein St.
John is holding a red, and St. Elizabeth is spinning; an-
other "Holy Family," in which the Infant Jesus is re-
ceiving a fish from Tobit, distinguished by the name of
"The Virgin of the Fifth," and after a very celebrated pic-
ture which Raphael painted for the church of the Dominicans
at Naples, and which has since been in the gallery of the
Ecufral; "The Holy Virgin sitting on the Clouds, with the
Infant Christ," a plate which afterwards fell into the
possession of Agostino Carrache, who re-toucht it, and
added two fine heads of Cherubs; a fet (mentioned above)
of seventeen plates, coarsely copied from the wood-cuts by
Albert Durer, of the "Life of the Virgin Mary," and
marked with Durer's cypher, except the left, which has that of
Marc Antonio. These are in small folio, and very
rare. A fet of thirty-six small uprights, from Albert
Durer's "Life of Christ," marked with the ordinary tablet of
Marc Antonio, is extremely rare. A fet of thirty-six small up-
rights, called "The Life and Passion of Christ," copied from Durer, but marked with the
tablet of Marc Antonio. A duplicate fet of these are by
some critics supposed to be the production of Wierix, or some
other of the disciples of Marc Antonio, and this fet bears
the cypher of Albert Durer. "Christ at the Entrance of
the Temple, surrounded by his Disciples;" "St. Mary
Magdalen at the Feet of our Saviour;" "Christ celebrating
the Paffover;" "The Defeat from the Croft," in which, with
the holy women, is introduced Joseph of Arimathea.
Three prints, which are known among collectors by the
title of "The Virgin of Grief." In one the Holy Virgin
with extended arms is lamenting over the dead body of Jesus
Christ. In the second, of which we have spoken more par-
ticularly above, and which is also called "The Virgin with the
naked Arm," the holy mother appears much younger than
in the first, and a dead tree is omitted; in other respects the
two compositions are alike. And in the third, which is also
a dead Christ, his head reclines on the lap of the Virgin;
mount Calvary is in the back ground, and three disciples
with Nicodemus are present. A glorified Christ with the
Holy Virgin, St. John the Baptist, St. Paul, and St. Ca-
thene, called "The Five Saints." three of the cartoons,
viz. "The Death of Ananias," (engraved in conjunction
with Agostino Veneziano); "Elymas Struck Blind," and
"St. Paul preaching at Athens." Proofs of the latter,
before the two figures were placed within the balustrade of
the temple of Mars, are extremely rare and valuable. St. Ce-
cilia, with the Magdalen and other saints, known by the
name of "The Saint Cecilia with the Necklace;" "The
Martyrdom of St. Felicite." A duplicate plate of this
subject, in which the right ear of the saint is omitted, is
more scarce and valuable than the former. "St. Catherine
relying on her Wheel of Martyrdom." A fet of thirteen,
of Jesus Christ and the twelve apostles. All these are of
dolio dimensions, and after Raphael.

"The Martyrdom of St. Laurence," a large folio, after
Baccio Bandinelli, is a very fine engraving, which obtained
Marc Antonio's release from prison, and recommended him
to the favour of pope Clement VII. "St. George and the
Dragon," either from a composition by Marc Antonio him-
self, or after his first master Raphoillini. "St. Gregory cele-
brating Mafs," from Albert Durer's wood cut, entitled
"The Mystery of the Mafs."

Subj eets from Profane Histor and Greek Mythology —
"The Rape of Helen," a grand composition; "Jennes re-
treating from the Confagation of Troy, bearing off Anchi-
elles, and preceded by the young Acanthus;" "Venus ap-
pearing to Jennes in the Disguise of a Huntress," (an early
work of the master); "The Death of Dido;" "The
Death of Lucretia," inscribed in the Greek language,
"better to die than live dishonoured," and the first plate en-
graved after Raphael by Marc Antonio; a subject, by some
termed "Alexander the Great depositing the Poems of
Homer in the Coffcer of Darius," and by others "The
Books of the Sybil placed in the Tomb of Numi Pompe-
lius." A battle-piece, known among conmillers by the title of
"The Battle of the Cullafie," all after Raphael, and in
fifio.

From the same master he has engraved "The Three
Angles of the Lodge of Chigi," of which the subjects are,
ill. "Jupiter carrailing Cupid;" 2d. "Mercury defending
from Olympus;" and 3d. "Cupid and the Graces." A very
grand composition of "The Judgment of Paris," and
from Andrea Mantegna, "The Three Muses and Cupid," of
which the collector ought to be careful to obtain these impre-
sions that were taken before the name of Roffi was added as
the publisher. "Apollo leaning against the Shepherd
Hymenius, and accompanied by Cupid," is either after his
father master Raphoillini, or from a design by Marc Antonio
himself. A tablet is here fulped, from a tree, which is
inscribed the date 1506, and A.E. 19 is added, which
gives the year 1487 as that of his nativity.

"The Triumph of Galatea" is a capital print, of which the
best and rarest impressions are before any letters, and those
with the names of Van Aelst and Roffi are comparatively
worthlesl.

"Mount Parnassus" is a large and grand composition from
the celebrated picture in the Vatican, except that Marc
Antonio has very properly subfitted a lyre for a violin;
the instrument upon which Apollo is playing in the original
picture. It is not improbable that Raphael himself, having
discovered the anachronism, directed this emendation.

The above two are after Raphael. A very fine engraving of
a Bacchanalian subject, with children bearing baskets of
grapes, and Bacchus seated on a thron, is also after Raphael,
but was drawn by him from an antique bas-relief; "Bacchus
and Silenus," is by some critics said to be after Julio
Romano, and "Hercules smothering Antaeus," after Michael Angelo:
but others ascribe both these compositions to Raphael.

"The Battle of the Lapithae," the last work of Marc
Antonio, is of the frieze form, dated 1534, and after Julio
Romano. Of "Orpheus" the designer is not certainly
known. "Pyramus and Thisbe" is after Raphoillini.
"Le quos ego," or Neptune appeafing the Temple which
had suffered the Fleet of Jenes, is surrounded by a bor-
der, in which are nine small compartments containing sub-
jects from the Jeneid, and is after Raphael. Impressions
of this plate, before it was retouched, are rare and very valuable.
The disagreeable bardnch which the abdominal muscles in
the figure of Neptune have acquired in the retouching, renders them easily distinguishable.

The above are all of Julio dimensions. In quarto, Marc
Antonio has engraved a few of twenty amorous and indecent
subjects after Julio Romano, to accompany the sonnets of
Aretin, of "The Loves of the Gods and Goddesse," which
are, as they certainly ought to be, exceedingly scarce, and a
ITALIAN SCHOOL OF ENGRAVING.

A set of thirty-two, of "The Loves of Cupid and Psyche," after Raphael, each accompanied by eight Italian verses. "Porte Inventiones," &c.—"Le Stregozzo," the design of which is by some attributed to Raphael, and by others to Michael Angelo. Sometimes it is called, "Raphael's Dream," and probably with great truth, for though it differs from the rest of his works, yet it differs not so much, but that it may be the production of his mind, and it poffefles all the romantic wildnefs of a nocturnal chimera. A monstrous carcas is converted into a fort of triumphal car, in which is seated a correfcor; it is drawn by naked men, and a youth mounted on a goat is blowing a horn. It is in very large folio, and in the later impressions the initials of Agolino Veneziano are added to the mark of Marc Antonio. "Il Morbetto," or The Plague, another large folio after Raphael, good impressions of which are extremely rare. Three figures from Michael Angelo's Cartoon of Pieta, dated 1510, and known among collectors by the title of "The Climbers." "Il Pito," or The Triumph of Love, an allegory, by some suppoled to be after Andrea Mantegna. "The Emperor Trajan crowned by Victory," a bass-relief on the arch of Constantine; "The Chace of a Lion," from another antique bass-relief; "The Caffolette," a grand Bacchanalian procession, of the frieze form, nineteen inches in length; "An Offering to Priapus," the latuies of Apollon and Cleopatra; a bass-relief of "The Three Graces," and a dance of seven children, all after Raphael.

Agolino de Maffi, furnamed Veneziano, from the place of his nativity, and called in England Angolino the Venetian, was born at Venice some time about the year 1492. He travelled to Rome for improvement, and became one of the most celebrated of the numerous disciples of Marc Antonio, with whom he sometimes worked in conjunction. From the circumstance of his earliest known engraving being dated in the year 1520, Strutt supposes that he began to study under Marc Antonio, whilst that distinguished master yet resided at Venice. Marc of Ravenna was his fellow pupil; and Vafiari classed them among the very best of the Italian students who followed the art of engraving.

When the city of Rome was taken and sacked by the Spaniards in the year 1527, Agolino retired to Florence, and applied for employ to Andrea del Sarto, who was then in high repute, but del Sarto, dissatisfied with the deaf Chrift which he had already engraved after his design, refused to permit him to engrave any more of his pictures. Agolino afterwards returned to Rome, where he followed his profefional pursuits with great success, and where he died some time about the year 1540.

He generally marked his prints with the initials A. V., which were sometimes infcribed on a tablet. He imitated the style of his master with great attention, and, as far as regards manual execution, with considerable success: sometimes, indeed, he in this respect excelled Marc Antonio; but in point of taste, and in the purity and correctness of his outline, he fell far short of that distinguished artist.

Good impressions of the works of Veneziano are now become extremely scarce, and a compleat set is hardly to be obtained; among them will be found a few, wherein he has exprefled the flesh entirely by means of flippings, in a manner which, being imitated by Durer, grew by degrees into what is now termed the chalk manner of engraving. The following list is believed to contain the description or titles of his best performances.

Portraits of Charles V., after Titian, superbefh with sixteen Italian verses; another of the same emperor, inscribed "Progresis durum quinque sc," &c. &c. &c. &c. &c. XXVI. a profile of pope Paul III. in a leathern cap; the fame, wearing the papal crown, dated MDXXVI.; in all folio. Ferdinand king of the Romans, in 4to. Francis I., of France, dated 1536; a profile of the emperor Soliman, dated 1535; Barbarossa holding a turban; in all folio.

Subjects from Sacred History.—The Creation," a folio plate, engraved partly by Agolino and partly by Marc of Ravenna, and inscribed "Exc. Deus enim Omniris," &c. &c. Abraham offering up Isaac; &c. The Benediction of Isaac, dated 1522; the fame subject, with fome trifling variations, dated 1524; "The Passage of the Red Sea," engraved in conjunction with Mark of Ravenna; "The Fall of Manna," a plate which prefumptively was begun by Marc Antonio, and finished by Veneziano, all after Raphael and of folio dimensions. Samson bound by the Philistines, a circular print, nine inches in diameter, is supposed to be from a composition by Veneziano himself.

The Queen of Sheba visiting Solomon, after Raphael, has been attributed to the graver of Marc Antonio, but is by Agolino and Marc in conjunction, and one of their early performances. It is of the folio fize.

A set of the four evangellies, in 4to. is after Julio Romano. The Annunciation is after Raphael, and engraved by the friends and fellow students Agolino and Marc; The Nativity is after Julio Romano, and both are of folio dimensions.

St. John the Baptist in the Desert, of anonymous invention, dated 1523; perhaps designed by the engraver himself. The Magdalen of the Innocents, a rare engraving, is copied from the celebrated print of Marc Antonio; The Last Supper, in folio, after Albert Durer; the same subject in smaller folio, attributed to Raphael; Chrift bearing the Cross, in folio, after Raphael, dated 1519; The dead Chrift, after Andrea del Sarto, a folio print, with which, as mentioned in our biography, the painter was so dissatisfied, as to refuse Veneziano the liberty of engraving from his works during his own lifetime. Another dead Chrift, in small quarto, after Albert Durer, a very rare print; The Archangel Michael, in folio, after Raphael; The Holy Family, in small folio, marked only with the initials of our artist, and probably from his own composition; another Holy Family, after Francia, dated 1516; The Holy Virgin and Child, sitting on a Pedal, six friars and a nun are present, and above are two angels, holding a tablet with an Ecce Homo, in folio; The Crucifixion, with fix figures of saints and angels receiving the blood of the Saviour, dated 1528, and also in folio; St. Jerome, after Raphael, in quarto; St. Margaret kneeling, and putting a Demon of the Serpent Form to Flight, by means of the Mirror of Truth," an early performance of Agolino, engraved before he frequented the school of Marc Antonio.

Subjects from Greek Mythology and History.—Iphigenia en Tauride," an anonymous plate, in quarto; Diogenes lying on his Cloak near the Margin of a River, a small engraving after Baccio Bandinelli; The Loves of Alexander and Roxana, an anonymous plate, in folio, the design of which Vafiari attributes to Raphael; Tarquin offering Violence to Lucretia; and other the fame maller; a very fine copy of Marc Antonio's print of Lucretia, in quarto, with Latin verses beneath. Camillus redeeming the Tribute imposed on Rome by the Gauls," and a naked figure of Cleopatra, both in small folio, and after Bandinelli; a small figure of Mars, after Raphael; Vulcan presenting Venus with Arrows; dated 1530, and Venus seated on a Dolphin, both
ITALIAN SCHOOL OF ENGRAVING.

both in folio, and after Raphael; "The Assembly of the Gods," engraved by Agostino and Marc of Ravenna; attached to which, by the same artist, is "The Marriage of Cupid and Pliuche," both after Raphael. From the same painter, are "Leda cared for by the Swan," in 4to; "The Fall of Phaeton," in folio; and "Apollo and Daphne" in quarto; the latter of which is by some falsely attributed to the graver of Marc Antonio.

"The Dispute between the Muses and Pierides," an anonymous plate, in large folio, attributed to Vafiari to the pencil of Rosso, and by the French to that of Perin del Vaga: this plate was afterwards re-touched and re-published in 1553, by Eneas Vico; "The Metamorphosis of Neptune into a Horse," in 8vo, after Julio Romano, dated 1519; "A Bacchanalian Triumph," in 4to, after Raphael, or, according to Mariette, after Raphael del Colle; "The Entrance of Orpheus into Inferno," a small engraving, after Julio Romano, dated 1525; "The Infant Hercules destroying the Serpents," in small folio, after the same master; "The Death of Antaeus," in small folio, after Michael Angelo, wherein Earth is personified as an old woman, dated 1533; "Hercules killing the Nemean Lion," a small print after Raphael, dated 1528, and a frieze of considerable length, of which Mariette attributes the invention to Bandinelli, and of which the subject is a female figure on Olympus, blowing a trumpet, in presence of the assembled deities.

"Allegoric Inventions, &c."—"An old Man seated on a Bank, with a Cottage in the back ground," one of the few plates wherein Agostino has flipp'd the ground with the graver. Providence: on a tablet held by two angels is inscribed "Caufar. Cognitio:" this is a small folio, and after Marc Antonio; "The Cumaen Sybil," after Raphael, in 4to, and dated 1516; "The Cemetery," in large folio, after Bandinelli. This is the print sometimes called "The Skeletons of Baccio," wherein Death is represented tearing a book in presence of various other skeletons; "The Battle of Charles the Rash," a small folio, dated 1518; "The Climbers," being part of Michael Angelo's Cartoon of Pieta in large folio; "The Academy of Baccio Bandinelli," also in large folio; "A Combat between Five Warriors," also said to be from the celebrated Cartoon of Pieta, in 4to; "The Three Marys (veiled figures), on their Way to the Sepulchre," in folio, an anonymous design, but attributed by Huber to Michael Angelo; another from Michael Angelo's Cartoon of Pieta, in 4to, a very rare print;  "A Shepherd caring a Shepherdess," in folio, after Raphael; "An aged Philosopher measuring a Dist," after Dominico Campagnola. A very rare print in 4to, after Raphael, of "A Female resting her Right Hand on a Vale," "A Dance of Fawns and Bacchantes," of the frieze form, dated 1518, after an antique bas relief, but by some ascribed to Primaticcio. A set of sixteen plates of bronze and marble vases, from the antique, in small folio, inscribed "Sie Romae Antiqi Sculptores," &c. Another set of thirty-six, in 4to, of grotesque subjects, after Raphael, some of which are only marked with the cypher of Agostino; the rest are by other pupils of Marc Antonio. A set of forty-eight busts, in 4to; "The Arch of Constantine," in a circle, dated 1537.

Marc Ravigano, commonly known by the name of Marc of Ravenna, was born at Ravenna in the year 1496. He studied at Rome, and became the pupil of Marc Antonio, and co-disciple and friend of Agostino of Venice.

As long as Raphael lived, i.e. till the year 1525, our two engravers worked together, after which each began to engrave on his own account, and to mark his prints with his own peculiar cypher.

Mark died at Rome about the middle of the 16th century. Strutt says of him that he "imitated the bolder style of engraving which was adopted by his master, with great accuracy; but when he attempted to follow him in his neatest manner, he was not equally successful. He handled the graver with more freedom than his fellow scholar de Masi, who, however, improved him in neatness and precision. Ravenna drew well, as his best prints sufficiently testify; though not with that purity or outline which distinguishes the works of his master; neither are the extremities of his figures marked with equal correctness or judgment. His works, however, are jultly held in estimation by the curators.

The usual mark adopted by this artist is a cypher, composed of an R and an S joined together, which has been the occasion of several mistakes, not only with respect to his works, but with respect to himself; and has led several authors to suppose that there were two Ravernas, the one named Marco, and the other Silverio; and they have been confirmed in this opinion by Dr. Bandinelli, who tells us, that Marco da Ravigano, for so he wrote the name, marked his plates with an M and an R, which, in some few instances, he certainly did. Those, who do not suppose there were two Ravernas, have imagined that these two letters were designed for Raphael Sanzio, and placed upon the plate to denote that it was taken from a design by that master. This opinion, however, is easily confuted; for the same mark is found on "The Slaughter of the Innocents," after Baccio Bandinelli, and of course cannot, by any means, refer to Raphael. It certainly should be read Ravenna or Ravigano, feulfit. He sometimes marked his engravings with a single R without the S, and at others, as will be found in our Plate I. of the Monograms, &c. of the Italian School.

Of the engravings of Ravigano, the following are those which are held in most request, beginning with the Sacred Subjects.—A set of twelve, of the frieze proportions, from Biblical history, after Raphael; "The Slaughter of the Innocents," a large folio plate, after Bandinelli. A duplicate plate of the same subject, differently cyphered, and without the name of the painter; "The Transfiguration," marked with an R on the bole of a tree, under which a disciple is seated; "The Last Supper," marked R, and from the same original as that by Marc Antonio; and "The Virgin of the Long Thigh," varied from that by Marc Antonio, by the introduction of a small key, all in folio, and after Raphael; "The Holy Family," after Fohldore, in folio. A set of thirteen, of the Saviour and Apostles, in 4to, after Raphael, and distinguishable from those of Marc Antonio, by the cypher of Ravigano; "The Victory of St. Michael," in small folio, after Raphael; "The Cemetery of Memory of Death," in folio, after Bandinelli, but differing so widly from that by Agostino de Masi, both in particulars and the general composition, as to warrant an opinion that it is engraved from another design.

Profane Subjects.—"The Rape of Helen," and "Alexander depositing the Works of Homer in the Charter of Darius," both in folio, and after Raphael. A pair in folio, of "The Interview between Scipio and Hannibal," and "Scipio's Victory over the latter," after Julio Romano. A small anonymous print of an armed Jupiter, the design of which is attributed to Salviati; "Venus quitting Juno and Ceres," a small folio, from the fable of Pliuche; "The Triumph of Galatea," in large folio, marked with an R; and
and "Jupiter and Antiope," in small 4to., all after Raphael; "Euridice in inferno," engraved in the tale of Marc Antonio, apparently after Giulio Romano; "A nymph and Triton," in 4to., anonymous, but after Raphael; "Polyphemus, attended by Cupid, pursuing Galatea;" "The triumph of Galatea;" and "Apollo as a Shepherd guarding the Flecks of Admetus," all in 4to., and after the designs of Raphael. A set of three prints, called "The Nymphs of Marc Antonio:" the first, accompanied by Cupid, is drawn by two marine monsters, the second is watched by a satyr, and the third is drawing a thorn from her foot, all after Raphael; "The Birth of Venus," in folio; "Cupid mounted on a Dolphin," in 4to.; "Vulcan forging Arrows for Cupid," in 4to., all after the same painter; "A drunken Silenus, supported by two Bacchantes," an anonymous print, in 4to.; "A Satyr holding a Nymph in his Arms," anonymous also, but supposed to be after Giulio Romano; and "A Combat between a Satyr and a Goat," of anonymous design, both in 4to.; "The Combat between Entellus and Daret," also in folio, after Raphael; "Orpheus," in 4to.; "Poefy," a duplicate plate, or copy from that by Marc Antonio, of the same subject, in 4to., dated 1543; "Infant Bacchanales," from Giulio Romano, in folio. An emblematical subject, in which are represented a lion, a fox, and a dragon, with the word "Ergo," an oval print.

Antique Bas Reliefs, Statues, &c.—A Sacrifice from the antique, in 4to. The same subject reversed. A bas-relief, from the arch of Constantine, in folio. An antique frieze with architectural decorations: the subject is three cupids, or genii, two of whom hold shields, and the other a trident. The original is preserved in Ravenna, the native city of our artift, in the church of St. Vital, with the inscription "Opera hoc antiquum repertum Ravennæ in aed divi vitallis MDXVIII." A battle piece, in folio. A female conducting a lion towards a funeral pile. Notwithstanding that this print is imagined with the cypher of Marc of Ravenna, it is so much in the style of Marc Antonio, that some connoisseurs attribute it to his graver. A set of four bas-reliefs from the Trajan column, in small folio, and in a light unfinished manner. The antique group of the Laocoön, a large upright folio, and exhibiting the only instance which has come to our knowledge, where the artist has inscribed his name nearly at length, omitting only the letter A in Marcus. Another engraving of this group, in folio, marked with the ordinary cypher of our artist, and inscribed on the base "Ifrout in II. decinco P.V. Maronis." It is supposed by many that Raphael made the drawing for the latter print: both of them are rare and remarkable, as shewing the exact state of this wonderful monument of art at the time when it was discovered.

The remainder of Ravignano's engravings from the antique are the equilaterral statue of Marcus Aurelius, in folio, inscribed "Sic Rome acu sculpt. ante Perum Eccl. &c." The three Graces. A naked female drawing a thorn from her foot, called "The Venus of the Rabbit." Two females with a caffolette or censer, after Raphael. Statue of a man fitting, inscribed "Roma in Capiteli," all in 4to. Mutati [statue of] an emperor, marked with the large R, a small folio plate.

Julio Bonafoni, or Bonanone, was a native of Bologna, and for that reason is sometimes called Bolognese: he was born in the year 1498, and died at Rome in 1564. He studied the rudiments of art under Laurent Sabatiä, a Bolognese painter, but afterwards became the disciple of Marc Antonio. He worked from the pictures of Raphael, Julio Romano, and other great masters, and occasionally from his own designs. Excepting one or two subjects, in which he called in the assistance of the point (which, however, he never well understood the use of), his plates are executed entirely with the graver, in a manner though much varied from that of his tutor, yet evidently founded upon it. It is neither so firm, nor so clear and matterly. His drawing is often heavy, and the extremities of his figures frequently neglected. The folds of his draperies are seldom well expressed, and the back-gounds to his prints, especially his landscapes, are extremely flat and lifeless. However, with all these faults, which are not always equally conspicuous, his best prints are not without their merit; and though not equal to those of his master, are held in no small degree of estimation by the generality of collectors. One thing in particular is remarkable in them, namely, the attempt which he has made of preferring the matter, and a breadth of light and shadow, as well upon the groups of figures, as upon the figures separately.

Marietta has written a catalogue raifonnée of 160 feécker engravings by this master; and Mr. Cumberland a small book, wherein he bemoans Bonafoni much more praise than he deserves.

Bonafoni sometimes affixed to his prints his name at length, sometimes he contracted it, but not always in the same manner; and sometimes he employed the monogram, which will be found in our Plate I. of those of the Italian Engravers. The most esteemed of his engravings are those which follow.

The Portraits of Pope Marcellus II. in 4to., anonymous, and very rare; Philipps Hisparianum Princeps, Caroli V.; Ilius, in large 4to.; Cardinal Bembo, aged 77, after Titian; Raphael d'Urbino; Michael Angelo Buonarotti, aged 72, in a circle; Franciscus Florio Antwerp, a Belgic painter; Johannes Bernardins Bonafuscus; and Niccolo Ardishingello, Cardinalis, annum agens XLIII.

Sacred Subjects.—"The Creation of Eve," after Michael Angelo; "Adam and Eve in Paradise;" they are sitting in an arbour embracing each other; and "Adam and Eve after the Fall;" Adam is here digging the earth; Eve is spinning; and two children are present. These are in small folio, and from composition by Bonafoni himself, "Adam and Eve driven out of Paradise," a small folio, after Amico Aspertini, "Joseph fold to the Ishmaelites;" and "The Cup found in Benjamin's Sack," both after Raphael; "The Fall of Manna and Moes striking the Rock;" on the same plate, after Parmeggiano; and all in small folio; "Judith leaving the Tent of Holofernes," a large folio print, after M. Angelo; "The Nativity," designed by the engraver, in 4to. Another of the same subject, in folio, from a grand composition by Julio Romano; "The Adoration of the Shepherds," in folio, of anonymous invention, but attributed by Vasalla to Parmeggiano; "The Holy Family," a folio print, after Julio Romano; another "Holy Family," where St. Joseph is seated on an as, designed by Bonafoni; "A dead Christ," after Raphael; "The Entombing of Christ," after Titian; "The Resurrection," designed by Bonafoni himself; "St. Peter placed at the Head of the Church," after Raphael; "St. John and St. Peter healing the Sick," after Perino del Vaga; "St. Paul preaching to the People," an oval, after Perino del Vaga, all in small folio. A large folio upright plate, at the top, of "The Last Judgment," after Michael Angelo, inscribed "Julius Bonafonius Bonon, propria Michaelis Angeli pictura que eft in Vaticanvo, nigro lapillo excepta in aëre incidi"; "Jesse, David, and Solomon," in folio, from the celebrated picture...

"Profe/an Subles;" "Achilles dragging the Corse of Hector at his Chariot Wheels;" after Prudencio; "The taking of Troy," after the same painter, a large folio, engraved on two plates; "The Diffi/erence of the Fleet of Eneas," after an anonymous, but very indifferent design; "Alexander and Bucephalus," in folio, from a composition by Bonafoni; "Cimon nourished by his Daughter," of the frieze, after Poldore; "A Combat of Cavalry," being the first idea of Raphael for his battle of Alluta; "Scipio wounded and retiring from the Combat," from a design by Bonafoni; "The my/sterious Saturn with his Three Sons," after Julio Romano. A set of twenty-two small engravings, designed by Bonafoni; "The Rape of Europa," after Raphael, in large folio; "Mars and Venus," in folio, from the same print; "Vulcan discovering the Amours of Mars and Venus," in 4to, of anonymous invention; "Venus attired by the Graces," in 4to, after Raphael; "The Birth of Adonis;" "The Triumph of Cupid and Psyche;" and "Phaebus in his Car, attended by the Hours, with Time walking on Crutches before them, and a Man and Woman walking from Sleep," are all in small folio, and from compositions by the engraver himself; "The Distur/rance of the Children of Niobe," after Perino del Vaga, dated 1541; "The Fall of Phaeton," in large 4to, after M. Angelo, and a group of three females, after the same master, in folio.

From Antique Sculpture and Architecture, &c. - Small busts of Jupiter, Juno, Latona, Bellona, and Minerva, five plates; "Hercules and Dejanira;" "A Satyr and Nymph;" "The youthful Olympus holding a Flute;" "The Flight of Medea," a bas-relief; a ditto representing "A Female and Two Children seated;" "The Loves of the Centaurs," with grotesque foliage, all in 4to; "The Temple of Jupiter and that of Neptune," both in folio; and a considerable number of book-plates, the subjects of many of which are from the amours of the heathen deities.

Jean Baptista Franco, was born at Venice in 1498, and died in the same city, A.D. 1561. He learnt the principles of design in his native country; but travelled to Rome to perfect himself by studying the works of Michael Angelo. According to Vatari, he made a drawing after the famous Lait Judgment of that master, which passed in his time for a chef-d'oeuvre. Franco had an excellent taste in design, and perfect knowledge of anatomy. He excelled greatly in the correctness of his contours, and the learned manner in which he indicated the play of the muscles. But as a painter he was deficient; he knew very little of composition, or colouring, his pictures were therefore without harmony, and hard. He felt their imperfections, and quitting painting, applied himself to drawing and engraving. Of whom he learnt the art of engraving we are ignorant; it has been said he was of the school of Marc Antonio; but the mechanical part of his engraving bears more resemblance to that of Julius Bonafoni. He used the graver, and probably that instrument alone, notwithstanding that many of his prints appear as if done with the point. His taste was free, and he worked in a grand style; his figures were generally well proportioned, and his attitudes various and well contrived; his heads were often small, but always well designed and characteristic; and the other extremities were rendered with the hand of a master.

Franco generally marked his prints B.F.V.F. that is to say, Baptista Franco Venetus Feit; and his onl engravings are as follow: "Abraham receiving Melchisedeci;" "The Sacrifice of Abraham;" and "Moises striking the Rock;" all in small folio. "The Image of A/ma being received in the Descent;" in large folio. "The captive Kings brought before Solomon;" ditto. "The Adoration of the Shepherds;" "The Virgin sitting at the Feet of a Rock, carrying the Infant Jesus, and in the back ground the little St. John;" "St. John the Baptist lying on the Earth;" all in small folio. "St. Jerome holding a Death's Head;" a large folio print. "Jesus Dis-puting in the Temple with the Doctors of the Law;" "The Disciples laying the Body of Christ in the Tomb;" large folio. "Simon the Magician, practicing his Impostures before the Apostles;" "A Cyclop in his Forge, with Cupid at his Side;" "Herodes bending his Bow against the Centaur Nebris;" "Two Leopards, two Lions, a Wild Goat, and a Griffin," from the antique; "The Donation of the Roman Church, by the Emperor Constantine;" after Raphael; "A Bacchus," a grand composition, from Julio Romano; "Triumph of Bacchus," a grand composition, all in large folio; "The Deluge," in small folio.

Jacques Franco was born at Venice some time about the year 1560; and probably of the same family as Baptista. His taste in engraving bore much resemblance to that of Anguillino Carrache, of whom he was the contemporary. He was a good designer, and marked his heads and other extremities very well: among the number of his productions, the following are the most esteemed: - Part of the 4to engravings for the edition of Tasso's Jeurusalem, which was published at Genoa in 1590, after the designs of Bernardo Cattelli; the rest are done by Anguillino Carrache; a collection of portraits of great men, published in 1626, dated 1566; "The Crucifixion," a small piece, marked Giacomo Franco fec.; "St. Jerome," ditto; "Hercules between Vices and Virtue," from an antique bas-relief; besides many other plates after Baptista Franco.

Nicholas Beatrice, Beatrizi, or Beataziz, was a native of Thionville in Lorain, but studied engraving in Italy, and chiefly at Rome. He was born some time about the commencement of the sixteenth century, and continued practising his art at Rome till the year 1562, about which time he probably died. Whether he became the disciple of Marc Antonio, or of Anguillino of Venice, is not certainly known; Strutt thinks he studied under the former. A fe/ulous contemplation and imitation of Marc Antonio's excellent print of "Neptune calming the Tempell," after Raphael, certainly contributed to the formation of what little he possessed that might be called style in his art. Yet it is much more the merits of Michael Angelo, Raphael, and the other great masters after whom he engraved, than his own, which makes his prints desirable, for he neither drew accurately, nor had attained any considerable powers in handling his graver; and his knowledge of chiaro-viso was but very superficial.

The opinion which was held by many collectors, that Beatrizi was the author of the engravings which are marked with a small die, inscribed with the letter B, seems at length to be justly abandoned. They are the performances of a superior artist, and perhaps of Bartholomew Bemam. The marks which do belong to him will be found in our Plate 1, of the monograms of the Italian School of Engravers.
The plates by this artist which are most sought after, are those which follow, beginning with his

**Portraits.**—Pius IV. with a Latin inscription; Paul IV.; Paul V.; Henry II. of France, dated 1558; another of the same monarch, with initials, dated 1555; Hippolito Gualagante; Don Juan of Austria, in oval, with the battle of Lepante in a cartouch; and other accompaniments; a set of medallions of the kings of Poland. All the above are of folio dimensions.

**Subjects from Profane History, &c.**—"The Sacrifice of Iphigeneia," after del Sellaci, or Sacrifici; "The Rape of Goyamode," after Michael Angelo; "The Fall of Phaeton," after the same master; Strutt speaks highly of this engraving, but says it was not originally the work of Beartie; "A Bacchusian Piece," after Michael Angelo; "The Dream of Human Piece," after the same master; a very singular allegorical print, exhibiting the influence of the masters, and laid, by some, to be composed and painted by Michael Angelo, from a vision which he really experienced; "The Archers," from the same master; "Vertumnus and Pomona," from Jacobo Fiorentino; "The Combat of Reafon and Love," after Bac. Pandinelli, called here Brahin; "Combat of five Men against five ferocious Beasts; two Lions, a Bear, a Bull, and a Wild Boar," anonymous, worked 1532, attributed to Julio Romano; "Battle of the Amazons," after a grand bas-relief on a felipcular urn in the Capitol, a large piece, on two plates; "The Battle of the Dacians," from the Arch of Confiilantine, inscribed "Tabula marinae Pugne Dacie, &c. ; "The Emperor Trajan in a triumphal Car;" "The Pantheon of Agrigippo;" "The Temple of Fortune," from a drawing by Raphael; all in folio; "The Grand Circus," a large print engraved on two plates; "Front of the Farnese Palace," after Michael Angelo; "The Statue of Moses," from Michael Angelo; "Equestrian Statue of Marcus Aurelius," engraved in 1559; a standing figure of Christ, after Michael Angelo; "Statue of the Philosopher Anaximenes," reading," since retouched, and re-named "St. Paul;" "The Caffe of St. Angelo;" "Siege and taking of Thonville," a bird's-eye view, dated 1558. Most of the above are of large folio dimensions.

The foregoing artists worked with the graver only, but the art of etching had now travelled from Germany to Italy, and Leo Daras, otherwise called Leon Daven, or Louis d'Avenne, who was the countryman and contemporary of Beartie, is believed to have been among the very first who practised it in Italy. He was born some time about the year 1500; studied at Florence and at Rome, and returned to France, perhaps to Lorrain, or still more probably, to Fontainebleau, with Primaticcio, after whose compositions his principal works are for the most part engraved.

His style is singular, and though not imitable, has not often been imitated. His plates are chiefly etched in rather a coarse but spirited manner, in short hatchings; his lights are kept broad and clear, but his shadows want degradation, his outlines are stiff and hard, and his heads, hands, and feet, are not correctly drawn. The following list will probably be found to contain his best engravings:—"Venus blinding Cupid," designed by the engraver, in 4to. A pair of "Jesus Christ," and "The Holy Virgin," each surmounted by a glory and heavenly host, after Primaticcio; from whole pictures Daris also engraved, an "Holy Family;" "The victorious Saviour;" "Alexander and Bucephalus," an oval; "The Marriage of Alexander and Roxana;" "Cleopatra standing under a Tent, holding the Aip in her Hand, and retting the other on a Vase;" "The Continence of Scipio;" "The Rape of Europa;" "Danae in the Shower of Gold," an oval; "Jupiter pulling the Clouds to caus Rain on the Earth;" "Venus bathing," a grand composition, where there is in the back ground an old woman bringing refreshments, in a sculptured border; "Venus entering with Mars into a Tub;" on the foreground are cupids playing with the arms of Mars, and two women with vases; "The Forges of Vulcan;" "The Rape of Proserpine;" "The Chace of a Stag;" "The Repose of Diana after the Chace;" (the she is lying by the side of her game with a dog under her arm) marked Fontainebleau; "Hercules un#error to enter the Bath with Omphale;" ditto; "Hercules in the Arms of Omphale," surprized by Fawns, with Flambeaus; "Cadmus preparing to combat the Dragon;" "The Malequerade;" "The Elephant and the Caravan," all in folio, and after the pictures of Primaticcio.

After Rosso, our artist has engraved "Francis I. of France surrounded by his Court;" the same monarch entering the Temple of Glory; "Venus and Adonis;" and "The Dispute between Neptune and Minerva."—After Lucas Penni, "The Trojan Horse;" "Jupiter fented on his Throne;" "Psyche approaching the Dragon-guarded Fountain;" and "Parrnassus with Apollo and the Muses."—After Julio Romano, "The Combat for the Body of Periclos;" after Parmeggiano, "Cric and Ulysses;" and a battle, after an antique bas-relief, all in folio.

Lucas Penni was born at Perton about the beginning of the sixteenth century, and was the brother of Giovanni Francesco Penni, surnamed II Fattore. He frequented the school of Raphael, and studied a considerable time under Perino del Vaga. He possessed considerable merit as an illicrical painter, and George Ghisi of Mantua has engraved from several of his pictures. After visiting Genoa and Lucca, he travelled to England, where he was employed by Henry VIII.; he afterwards went to France, and practised the fine arts for a while at Fontainebleau. On his return to Italy he applied himself to etching and engraving, and we have several meritorious prints from his hand; he sometimes worked from his own design, but oftener from Rosso and Primaticcio. His mark was usually composed of an L and an R joined together, or separate; for he chose to add the word Romanus, or the Roman, to his name, or the initials of it; but it is necessary to caution the young collector, with respect
ITALIAN SCHOOL OF ENGRAVING.

Prefaced to these marks, all of which will be found in our Plate II. of monograms of the Italian Engravers, because they were used by other masters greatly inferior in point of abilities to Penni, and to state that his engravings are not only executed in a very spirited style, but also accurately drawn. He chiefly etched, but at times worked with the graver only.

The following is a list of his principal works:—"Two Satyrs giving Wine to Bacchus," "Leda drawing Arrows from Cupid's Quiver," "Sufannah at the Bath surprized by the Elders," all of which are from Reuss; but the four following are from Primaticcio: "A Abraham sacrificing Isaac," "The Marriage of St. Catherine," "Jupiter metamorphosing Calisto into a Bear," and "Penelope at work with her Woman," all of which plates are of folio dimensions.

At the same period with Penni lived Francesco Marcolini, of Forli, an ingenious engraver on wood, who engraved, printed, and published a volume, entitled "Giardino de Penfieri," ornamented with wood cuts after Jof. Salvati. The subjects are emblematical and satirical, and are executed with considerable delicacy for that mode of engraving. Marcolini was also an architect of no mean talent.

Another engraver on wood, Giovanni Niccolo Roffiliani, or Vicentino, also lived at this period, he was of Venice; of mediocre talent; engraved a few subjects after Raphael, and "The Entry of Henry III. into Venice.

Battista Vicentino, so called like Roffiliani, from his birth-places, has been sometimes mistaken for him. According to Vafari, he was born at Venice in the year 1509, and engraved, in conjunction with Battist del Moro, fifty subjects of landscapes and ancient edifices, in a firm and agreeable style; these are chiefly of folio dimensions, and among them are Monte Quirinalis, the Coliseum, etc. etc.

The Ghisi of Mantua, each of whom was successively termed the Mantuan, were a numerous family of artists. Jean Baptiste, the patriarch of this Mantuan race, was born at the commencement of the sixteenth century, and, according to Vafari, was the disciple of Julio Romano, and he was occasionally painter, statuary, architect, and engraver. In the latter art he worked with the graver only, and his style bears resemblance to that of Marco Antonio, when mingled with the work of his pupil Perin; as in the celebrated print of "Neptune rebuking the Winds," where the lines of the shadows are gradually blended into flutted light. Battista understood the human figure, but his drawing is mannered, and his effects deficient in harmony.

His usual mark will be found in our Plate I. of monograms of the Italian School, and his principal engravings are:—a large folio, of which the subject is a "Naval Combat," from a composition by himself, dated 1538; some heads of warriors, helmeted, in 4to.; "The Holy Virgin suckling the Infant Christ," in 4to. dated 1539; "David beheading Goliath," in folio, dated 1540; "A Warrior eloping with a Female," probably the Rape of Helen, 1543; "A River God," after Lucas Penni, in 4to.; "Mars, Venus, and Cupid," in folio; "The Conflagration of Troy," a capital print from his own design, of large folio dimensions.

Georgio Ghisi was born at Mantua A.D. 1524. He was the nephew, or, as others say, the son of Jean Baptiste, whom we have mentioned above, and appears to have learned from him the rudiments of engraving, though in the progress of his studies he much improved the style of his Predecessor.

Georgio was eminently successful in the technical and academical parts of the art; in particular he studied the extremities of the human figure with much attention; and executed the knitting of the joints and turns of the limbs with considerable accuracy. The knees of his figures especially, he frequently drew in a manner which has been justly admired. There is, indeed, a sameness of style in the drawing and marking of his figures, which has made it suspected that he always drew from the same individual model, and thus obscured a manner of his own, instead of rendering the forms of the great painters after whom he worked in all their variety. This may be the reason why he has succeeded so indifferently in working from Michael Angelo; whose forms he to a certain degree caricatured: the swelling of the muscles being too powerfully expressed, the lights became divided, the outlines confused, and the necessary degrees of roundness impaired in the effect. These faults may be but too obviously seen in "The Last Judgment," engraved after that celebrated master, where the dorsal and abdominal muscles, as well as those of the limbs, are marked in a heavy, affected, and unpleasing manner.

Such defects as these, however, which do not always predominate in the works of Georgio, are often more than counterbalanced by the degrees of truth and beauty which are found in them.

Indifferent Impressions of his prints are by no means rare, but such as are finely printed and well preferred appear but seldom; yet without feeling them, it is impossible to form an adequate idea of the merits of this engraver. His monograms will be found in our Plate I. of those of the Italian School: and the following are among his most justly valued performances.

The Mysteries of the Trinity," from his own composition; "The Prophets and Symbol," of Michael Angelo; a set of six upright folios from the pictures in the Sistine chapel; "The Last Judgment," of Michael Angelo, a very large upright, arched at the top, engraved on ten or eleven plates. The portrait of pope Julius II. after Raphael; and from the same master, "A Holy Family;" "The School of Athens," very large, and "The Dispute of the Sacramento;" his print of "The Dream of Raphael." is of doubtful original, for while some call it by this name, others term it "Michael Angelo's Melancholy." It is of large folio dimensions, dated in 1561, and represents an aged philosopher contemplating a shipwrecked vessel, while a nymph advances towards him: in the background are strange and fantastic appearances. Bafan says that Raphael had no hand in it, yet the words "Raphaelis urbinatus inventum," are affixed to it, and the style of composition and design appear to justify the inscription.

Of a long 4to. size are, a female sitting in a boat, to whom an old man is bringing a new-born infant, of anonymous invention; and a winged female holding a globe. The remainder are in folio, viz. an allegorical print, in compliment to the birth of the prince of the house of Gonzague, after Julio Romano; "Cupid and Psyche crowned by Hymen;" and "The Birth of Memnon," both after the same master; the latter one of the finest engravings from the hand of Mantuano; "Cephalus and Procris," from the same; "The Interview between Scipio and Haman, previous to the Battle of Zama;" "Regularis," revised by the Carthaginians; and "Zagar, regularis," all after the same master; "Venus at the Forge of Vulcan," after Perin del Vaga; "Mars and Venus," after Raphael del Reggio; "Diana and Endymion, after Lucas Penni; "The Adoration of the Shepherds," is very large, and engraved on two plates, after Angelo Bronzino; "The Last Supper," after L. Lombart; "Hercules vanquishing the Hydra of Lerna," after Bertani. Ma.
ITALIAN SCHOOL

cinated figures form a grand composition.

Adam Ghifii, also known by the cognomen of Mantuano, was a younger brother of George, and engraved much in the same style, though he was certainly somewhat inferior to his elder brother, both in correctness of outline, and the ability with which he handled the graver. The cypher with which he sometimes marked his engravings, will be found in our Plate I. of this of the Italian School, and among his best works are the following:—" Nativita de Nostra Signore," after Julio Romano, which is thus treated:—In the heavens is the Deity surrounded by the heavenly host; lower in the composition is the Holy Ghifi, sur-rounded by a radius, and on the earth is the Holy Virgin and Child, and St. Joseph; "The Presentation in the Temple," after Nicolas Martenini; a group from the marble of Michael Angelo, called "The Virgin of Pity," of which the subject is a dead Christ lying across the knees of his afflicted mother. Collectors should be careful to note, that in the early impressions, as the plate came from the hand of Adam Ghifii, the back ground is blank, but it has since been retouched, and a landscape background added by Ant. Leferi, who, however, has affixed his own name to the print. The above are all of large folio dimensions.

In 40. our artist has produced, "Mars preparing for Battle," and "Diana preparing for the Chase," either after Julio Romano, or from designs by himself; "Angelia and Medora;" "Diana and Endymion;" "Hercules and Ioli;" "The Choice of Hercules;" "Two Cupids conducting a Car with a river God;" and "Two Cupids riding on Dolphins," both of the oval form; and "The God Pan playing on the Syrinx, with Venus and Cupid lightening."

Diana Ghifii, of Mantua, was father of the two preceding. The year of her birth has not been recorded. She was a woman of considerable ingenuity, and probably learned drawing and engraving from her brother George, whole style she succefffully imitated. She employed no mono-gram or cypher, but marked her engravings, of which the following are the principal, with the name of Diana, sometimes without any addition:—" A Conversion Party of three Figures," and "The Holy Family," both of anonymous invention, and perhaps done from compositions by herself; another "Holy Family," in a landscape ornamented with ruined edifices, after Correggio, in large folio, dated 1577; another "Holy Family," after Raphael, where the little St. John is presenting a scroll to the Virgin, while St. Joseph, in the back ground, repoes on the base of a column, in folio; "The Virgin Mary caring for the Infant Christ," after F. Salviati, in small folio; "The Holy Virgin and Child resting on Clouds, and attended by the Archangels Gabriel, Michael, and Raphael;" this plate is probably engraved from her own composition, and the earlier impressions are without the inscription "Regina Angelerum:" it is in large folio; "The Institution of the Papacy, or St. Peter appointed Head of the Church," after Raphael; "The Woman taken in Adultery," after Julio Romano; "The Heroins of Horatio Coles," after the fame master, all in large folio; "The Continence of Scipio," in small folio; and "The Birth of Caesar and Pollio," which latter is perhaps the very best of Diana's engravings, are also after Julio Romano.

OF ENGRAVING.

We shall add to this list but one more, namely, "The grand Festival of the Gods," after the fame great painter, done from the celebrated picture in the palace del T. at Mantua. It is a very large production, which Diana, from a motive of convenience, has engraved on three plates.

Of Domenico del Barbieri, better known by the name of Fiorentino, we shall say but little; for, as an engraver, he merits not much, though he painted in fucceff, under the superintendence of Roffio, with considerable ability. He was born at Florence in the year 1506, or thereabouts; and travelling to Fontainbleau in the year 1544, worked with credit from the designs of Primaticcio and Roffio. His engravings, which are executed in a stiff and incorrect manner, are sometimes marked with his name at length, with the occasional addition of Fiorentino, and at others with the cypher which will be found in our Plate II. of the mono-gram, &c. of the Italian Engravers.

Befides several plates of groups, and sometimes single figures, from the late Judgment of Michael Angelo, he engraved a " Repofo," in which the holy family are attended by angels, a large folio; " The Holy Child," from Salvati, and an antique Baquet, from Primaticcio, both in small folio; "Mars and Venus," from Roffio, in 40.; and "An Angel, or Figure of Fame, standing on a Globe holding two Trumpets," in folio.

We have now to speak of that extraordinary artist, Francesco Mazzuoli of Parma, more commonly known by his cognomen Parmeggiano. He was born A.D. 1505, and died, at Caffel Maggiore, at the early age of 35; yet in that short life very high degrees of excellence were attained in the art of painting and etching, notwithstanding that no inconsiderable portion of it was fruitlessly spent in alchemical pursuits.

For an account of his merit as a painter, see MAZZUOLI. He acquired the first rudiments of art under the tuition of his two uncles at Parma, and at the age of 16 surprised the partiality of relationship, and even aitallished the exiling tale of that part of Italy, by the production of a picture of "St. John baptizing the Saviour in the River Jordan;" but the fame of Raphael and Michael Angelo soon attracted him from his native city to Rome, where he remained till Rome itself was facked, flattering with ardour from the works of those great artists, yet at times retarded, in no trifling degree, by his unfortunate predilection for alchemy.

It has been flated by some writers, and is generally be-\[\ldots\]
the least appearance of knowledge as an engraver. But looking beyond these defects to the sweet characters of the heads, to the elegant turns of the figures, and to the beauty and simplicity of the composition of these rude sketches, what is wanting in the excellency of the mechanical part of the art, is abundantly supplied to the judicious eye, in the fire and animation of the matter. The copies are always better than the originals, with respect to the regularity of the workmanship; but even the best of them are exceedingly defective in style and spirit, so that they are easily distinguished upon comparison. Good impressions of the originals are very rare; such, I mean, as are not re-touched. From the foulefs of the copper upon which he engraved, and the little skill he had in managing the aquafortis, his engravings are seldom clear or perfect in their appearance, though some indeed are greatly superior to others in this respect; and those perhaps he executed in the latter part of his life.

"It is also said that he engraved many prints on wooden blocks in chiaroscuro; and it is much more likely, as Bafan unjustly observes, that he was only the designer and director of these works, and that they were executed by Ugo da Carpi, Andrea Andrea, and other masters."

The alarms of war, much more the direst and horrors of a siege, are destructive to the pursuits of an artist. When Rome was taken by the Spaniards, Parmegiano retired to Bologna, whither misfortune pursued him. Many of his designs, etchings, and chiaroscuro blocks, were here stolen from him by an engraver, whom he retained in his service, and whom Huber calls by the name of Antonio de Trente, and De Piles, Antonio Frontana. They were afterwards recovered, or recovered in part; but whether by legal process, or the remorse of Antonio, has not been explained. Poor Parmegiano was for a time almost distracted by the event, which, with a debt due to the church, and other misfortunes, drove him from Bologna to Caftel Maggiore, where he soon after died of a fever.

The most important of the prints from the hand of this great master, are, "Moses and the Burning Bush," a small plate, and apparently one of his first attempts in etching; "Joseph solicited by the Wife of Potiphar," and "Judith with the Head of Holofernes," both in small 4to; an antique sacrifice; a set of thirteen small uprights, of Christ and the twelve apostles; "The Virgin Mary receiving Inspection from the Holy Spirit;" "The Adoration of the Shepherds," a small upright; "The Marriage of St. Catherine," in small 4to; "A Holy Family," where the Virgin is seated, and the Saviour is lying in a cradle; another "Holy Family," where St. John is presenting a babet of flowers to the Infant Christ, in folio; another "Holy Family," in larger folio, where a bishop and a saint are introduced; a very rare print, done with the graver, marked "Tranc. Parm. fecit;" and of folio dimensions, of which the subject is also an "Holy Family;" "The Entombing of Christ," a small upright folio, which Guido has copied of the same size; "The Resurrection of Christ," in 4to; "A Shepherd leaning on his Crook;" "A Mother instructing her four Daughters;" a back figure of a man with a woman seated by his side; all from his own compositions.

After Raphael, he has etched the celebrated cartoon of "St. Peter and St. John healing the lame Man," in small folio; of which Strutt says, that it is one of Parmegiano's finest and most determined etchings, adding, "we see he has mixed his own sweet manner with that of Raphael, in the treatment of the heads, and it seems to me to lose nothing by the alteration."

We conclude our list of his etchings with those of "Pine-

lop e engaged with her Women at Embroidery;" "Di-
genius bed with mathematical Diagrams at the entrance of his Tub;" and a small folio of the "Adoration of the Magi," in chiaroscuro.

Antonio de Trente was born at Trentin A.D. 1506. He studied under Parmegiano, though but three years older than himself, and became a painter of some merit, and an excellent engraver in chiaroscuro, which latter art he is professed to have learned from Ugo da Carpi. His style of engraving is by no means elaborate, and his extremities are often neglected, yet his prints are valued by connoissours. Respecting the robbery of his matter, of which Huber has accused him, though we have thought it right to mention the report, we shall not very strenuously insist on the fact. Authors agree that the plates and blocks were restored after a time, and differ in the name of the robber; under such circumstances it would be very unfair to brand with cyclopian notoriety the memory of Antonio de Trente.

His most remarkable prints are, "The Virgin Mary embracing the Infant Christ," from Beccafumi; another "Virgin and Child," from Andrea del Sarto; "The Tiburtian Sybil, pointing out the Saviour to the Emperor Augustus;" (which latter was printed in green ink,) after Parmegiano; a man holding a lyre; a back view of a man leaning against a bank, with a female head at some little distance, "Circe receiving the Companions of Ulysses," of the octagon form; "Pyrfche falted with divine Honours, of the same octagonal shape; all of folio dimensions, and after Parmegiano; "The Martyrdom of St Peter and St. Paul," a still larger print after the same master, is particularly mentioned by Vafari, in his life of Marc Antonio.

Nicolas Vicentino, known under the name of Boldrini, an engraver on wood, was born at Vienna some time about the year 1516. Of this ancient engraver there is very little known, but it is supposed he was a pupil of Titian, from whose designs he commonly worked. There is a large upright print by him, representing Venus naked, sitting on a bank with Cupid, and a squirrel appears behind on the branch of a tree; the figures, back-ground, &c are executed in a bold, fine style, chiefly with a sedge stroke; but there is some crofs hatching in the deep shadows. It is marked Titianus inv. Nicolas Baldrimins Vincentinus ins., 1566.

The following are among his best engravings, which are very rare:—A portrait of Jean Burel de Schwarzenberg, surrounded with a border of warlike implements, after Albert Durer, in folio; "The Adoration of the Kings," after Titian, marked with the cypher of Boldrini; another large print of "St Jerome at Devotion at the Foot of a Rock," in a landscape; "Saint Sebastian and St. Catherine," with four other saints, of a large size; both this and the last are from Titian; a large print representing a mountainous landscape, with animals, a female leading a cow, and a young man carrying a large tub; another large print of an old ape between two young ones, entwined with a serpant, intended as a fatire on the board of Bacco Bandi

nelli, that his Laocoen surpelled the antique. This woodcut has been attributed to Titian by some authors, and to Boldrini by others.

To Antonio Salamanca, who was born at Rome in the year 1508, have been attributed a whole length portrait of Bandinelli; "God creating the Animal World," after Raphael, both in large folio, with some other works, which are marked with one or other of the three monograms, which will be found in our second plate of those of the Italian School; yet Strutt doubts whether he was the author or only the publisher of these engravings.

Giovanni Giacomo del Caraglio, or Caralius, sumnered

vol. xiv.
ITALIAN SCHOOL OF ENGRAVING.

Jacobus Verosensis, was born at Verona in the year 1512, and died at an advanced age at Parma. Caraglio went to Rome to study under Marc Antonio Raimondi, whose style he imitated with great success, and he occupies a distinguished rank among the engravers of Italy. He was a very clever designer, and possessed great knowledge in drawing the human figure, especially the heads, which are in general very characteristic and expressive, but his draperies are not to be well drawn; the folds are not broad enough, and not sufficiently varied; and most of his prints are defective in the management of the chiaro-furo. Caraglio was also very skilful in engraving gems, and executed some medals which added to his reputation.

Sigismund I., king of Poland, being informed of the merit he possessed, invited him to his court, where he lived to a happy old age, rich in royal favour, and surrounded by his friends and pupils. He commonly marked his prints with his name, and occasionally with a cypher, which will be found in one second plate of monograms of the Italian Engravers. The following are among his best works:—"The Marriage of the Virgin," from Parmegiano, in large folio. "The Annunciation of the Virgin," marked "Titianis figurarum ad Coloniensem exemplar. Jac. Caraglio," in large folio. "The Suppliication of Tan-talus," after the same master, in large folio; "The Rape of Ganymede," after Michael Angelo; this plate is attributed to Caraglio, but it is without his name, in 4to.; a print in 4to. of an anatomical figure holding a skull in its hand, lying on a serpent, from P. Roffi del.; "Hercules receiving the Arrows of the Centaur Nessus," likewise from Roffi, in large quarto; "Hercules killing the Robber Cacus," after the same, in large quarto; a large square folio print, representing a number of young men and women cultivating a garden, in the middle of which is a statue of Priapus, after the same painter; a set of twenty prints in 4to. representing the statues of the heathen deities, with their attributes, in niches, from Roffi. Professor Chriftays that these are the figures or statues of the heathen deities, which appeared under his name, are not by him; I find these ancient plates come originally from James Bick." But here he is certainly mistaken; those by Caralibus are dated 1526; and the copies by Bick 1539, which is four years posterior to the first publication of them.

Jean Baptiste d'Angelo del Moro, born at Turin, was born at Verona in the year 1512. In his youth he frequented the school of Titian, but afterwards became the disciple of Franceso Torbido, called Il Moro; whom he inherited both in his name and fortune. Il Moro was both painter and engraver, and in the former art was esteemed a good colourist; his etchings are light but spirited, and he drew the extremities of the figure in a very masterly style. Among his works, we find fifty very fine in mezzotinto, which he engraved in conjunction with Baptista Vicentino, of whom we have before spoken, and also the following:—"The Nativity," after Parmegiano, in folio; "The Virgin bathing the Infant Jesus, with the little St. John," in folio; "A Holy Family," wherein angels are mimicking to the Holy Virgin and Child, an anonymous composition, but certainly after Raphael, in folio; another "Holy Family," from Raphael, in large folio; a battle piece, in large folio; "The Martyrdom of St. Catherine," from Bernardo Campi of Cremona; another large folio print, representing a shepherd, with his crook, accompanied by his dog, and visited by an angel; without name. There is a very grand composition by Julius del Moro, brother to the preceding artist, preferred in the folio, of the grand council at Venice, entitled "Papa Alessandro terzo che dona al Doge I lizzare a tromba nella Chiesa di S. Giovanni." Marc d'Angelo del Moro was the son of Jean Baptista, and was born at the same place, in the year 1534. He studied under, and was not inferior to, his father, either in painting or engraving. We are acquainted with a variety of his engravings, which are executed with considerable ability, amongst which are the following:—"The Nativity, or the Adoration of the Shepherds;" "A Holy Family;" "The Adoration of the Kings;" and "The Baptism of our Saviour;" all of large folio dimensions. This artist died at Rome in an early period of life.

Vincenzo Vico, or Vicius, or Vighi, was born at Parma A.D. 1512. It has been supposed that he learned the principles of design from Giulio Romano; and that, hearing of the great reputation which Marc Antonio had acquired at Rome by his engravings, he went to that city, and became his disciple. He was a man of talent, though inferior to his master; neither his chiaro-furo nor his manual execution are commendable; and in the latter a certain impropriety of temper is but too obvious; yet he understood the human figure very well, and, when he pleased, could draw correctly. But in many of his productions the extremities are hard and heavy, and the proportions neglected. His engravings are neither so neat nor so clear as those by Marc Antonio. Indeed he succeeded better when he attempted a more open style; a good specimen of which is, a female figure, with her right arm extended, over which appears an owl; flitting in the air, from Parmegiano; it is a half sheet print, dated 1548.

Vico sometimes engraved on wood, and it appears that his small works done in this style are ranged among his first productions. Of this number is a portrait of Charles V. surrounded with emblematical figures, in an oval, composed with taste, very correctly drawn, and cut with great care. Upon a piece of a ruin, which serves as a table: at the bottom, is this inscription:—"Inventor fèlèvumque ab aenam vico param faci." But Vico was also in antiquarian, and published a tract on medals, embellished with engravings by himself, and a collection of thirty-six plates of engraved gems after the antique. This artist ended his days at the court of Alphonso II, duke of Ferrara, but in what year his biographers have not recorded. Of his numerous engravings, the following will probably be found to possess the most merit.—Four medalions. Portrait of John of Medici, in large folio, dated 1550. Portrait of Cosimo de' Medici, in large folio. Portrait of Alphonso, duke of Ferrara. A facsimile, in the antique style, dated 1552, in 4to., of his own composing. A plate in small folio of the Three Graces. A Rosicrucian subject from the life of Virgil, inscribed "Virgillum studens meritas et fornicatum penna, Rome, 1547." The "Army of Charles V. passing
ITALIAN SCHOOL OF ENGRAVING.

paul the Elbas," from a composition of his own, a large upright plate, in an oval; "The Battle of the Amazons," the name, engraved "Delorum Amazonum," dated 1543; "Venus working at his Forge, with Venus on a Bed behind him," In the first impressions of this plate, Mars was represented with Venus, from Parmegiano. "The Combat of the Centaurs and Lapithes," after Roffi, in large folio, dated 1542; "The Dying of Cupid and Apollo in the Presence of the God," from Taccio Bandinelli; "The School of Lucio Bandinelli," with his portrait, after Parmegiano; "The Converction of St. Paul," after F. Savallini, all in folio; "St. George and the Dragon," from Giulio Caravaggio, a very rare print, in folio; "Judith with the Head of Holofernes," after Michael Angelo's celebrated picture, in the Sistine chapel, in folio; "Jupiter and Leda" and a large folio print of a bacchalian subject, both from the same master, marked Enca Vico, 1546. (This subject has been also engraved by Bertzietz.) "Christ taken from the Sepulchre," after Raphael, in folio. Another print by Christ, supported by Joseph of Arimathea, with the Virgin and other females bewailing him, a muffled-lined upright plate, from Raphael; "Lucetta robbing herself," with a Greek inscription; "Venus and Cupid," this has also been engraved by Marc Antonio R., "The Annunciation of the Virgin," a small plate from Titian. A set of vases from the designs of Polidoro da Caravaggio. A set of forty plates, of diffeies of different nations. And one of the Trajan column.

Martin Rota was a native of Schinovo in Dalmatia, he studied at Rome, where he passed his youth, but afterwards removed to Venice, and remained there till towards the close of the sixteenth century. Huber says he was born in 1501, but there can be no mistake, since his print of "Jesus Christ meeting St. Peter," after Raphael, is dated 1508. It is certain by what master he was instructed in the art of engraving; but his works prove him to have been a man of great ability. He drew the human figure very correctly, and shook the extremes in a very masterly style.

Rota worked entirely with the graver, which he managed with great dexterity, and without drybrushes, though his plates are not very elegantly finished. Among his works is a set of portraits of the Roman emperors from Julius Caesar to the emperor Alexander Severus, which he published at Venice in 1570. He commonly marks his prints with his name, and sometimes with the small wheel which will be found in our Plate II., of monograms, &c. of the Italian Engravers, and which constituted a sort of pan upon his family name. His principal works are as follows,—"The Last Judgment," a muddling and upright plate, dated 1569, from Michael Angelo Buonarroti. This excellent engraving, which is justly considered as the chief discovery of Martin Rota, has been copied very exactly by Leonardo Gautier; the difference, however, is easily discovered by comparison, the copy being much inferior to the original; that is, supposing the original to be a good impression. But a more striking distinction is to be seen in the face of the portrait of Michael Angelo, which is introduced in a small oval at the top; it is turned towards his right shoulder in the original, and towards his left shoulder in the copy. "The Resurrection," from his own design, dated 1577, executed in a very delicate style. Another "Resurrection" executed in a very coarse style; "The Slaughter of the Innocents," from his own design, in small folio; "Paying Tribute to Caesar," three figures, seen as low as the knees, in folio; "The Martyrdom of St. Peter the Dominican," a muddling-sized upright plate from Titian. A "Martyrdom," after the same master, in 4to; "Promethius chained to a Rock," after the same; "The Satyr Marsias flayed by Apollo," "Our Saviour appearing to St. Peter at the Gates of Rome," after Raphael, in folio; "A Last Judgment," from his own design, a very fine plate, dedicated to the emperor Rudolphus II., dated 1573, in folio. Another "Last Judgment," also from his own design, which remained unimpaired at his death, but was completed under the care of Anfelm Boote. It is disfigured from the former one, by two female figures in the middle of the picture, instead of an angel; this latter is the most rare, but the former is the finest engraving. "The Battle of Lepanto, and Defeat of the Turkish Fleet," from his own design, dated 1572, in large folio, a very rare print, as are also the good impressions of all the plates of this master.

Jerome Porro was born at Padua in the year 1520. He is not mentioned by Strutt, and very little is known of the events of his life, except that he resided for some years in the Venetian territory. He appears to have been a man of a mechanical turn of mind, and more remarkable for patient industry, than for much talent as properly constitutes an artist. Huber says, he invented and constructed a fort of falling cars, large enough to contain thirty persons, and there is yet preserved at Parma an engraved curiosity from his hand, of which it is difficult to say, whether it exhibits more patience or want of taste. The subject of this print is "The Battle of Christ," and the hatchings, which constitute the finding, are found, on near inspection with a magnifying glass, to consist of very delicate writings. Hence the chiaroosco is not effective, and the writing is not legible.

Among his other works, are a set of plates for an edition of the Orlando Furioso, which was printed at Venice in the year 1548, and is now become very rare. A set of one hundred engravings for "Les Impreffi degli Uomini Celesti di Camillo Camilli," and a set of letter-press engravings, neatly executed for a book of the funeral ceremonies of the ancients, by Thomas Portaci, printed at Venice in 1591; this was the last, and perhaps the best, work of Jerome Porro.

About the same time lived Antonio Fantuzzi, or Fantuzzi, an obscure Italian engraver, who etched a considerable number of plates in a coarse style, resembling that of Tempesta. He worked under Primaticcio, and marked his prints either with his initials, or the cipher which will be found in our Plate II., of the monograms, &c. of the Italian Engravers. Though his prints possess not much merit, rarity has conferred on them an imaginary value, and they are sought after by the curious, particularly a bacchalian subject, where Silenus is followed by a number of Satyrs, after Roffi, dated 1543; "The Contesse between the Muses and Pierides," in large folio, after Primaticcio; and, after the same master, "Alexander and Roxana," and "Alexander and Thaleides," dated 1543. A large print from the history of Ptolemy, of Jupiter, Minerva, &c. in an oval; "Titan reposeing on the Surface of the Sea," in folio, after Bologna.

Now also lived Andrea Schinovo, surnamed Maddolla, a celebrated historical painter, who performed some etchings somewhat in the style of Parmegiano, and a few prints in chiarooscuro, among which are, "T. Finding of Moses," in small folio, after Parmegiano; "The Fight into Egypt," in 4to; and "A Holy Family," in folio, after Parmegiano, in all of which the hatchings appear as if of white chalk on a blue ground; in the "Resurrection of Lazarus," the hatchings are of gold colour on a blue ground, and the name in "Christ laid in the Sepulchre," both of which are after Parmegiano; "St. Peter and St. John," after the cartoon of Raphael, is executed in the same manner, as is
ITALIAN SCHOOL OF ENGRAVING.

also the "Rape of Helen," in folio, from a composition by Schiavone himself; for an account of whose merits as a painter, see SCHIAVONE.

Paul Farinati was born at Verona in the year 1522, and died in 1604. He learned the first rudiments of art of Antonio Badia, but afterwards became the disciple of Nicolò Golfino. His genius, which began to unfold itself at a very early age, inclined him to historical painting, and he continued, occasionally, to practise that art until a late period of life. A picture from his pencil, of "The Miracle of the Loaves and Fishes," adorns the church of St. George at Verona, and he painted several for the Escorial, where he passed some years.

Farnaito's style of engraving was bold, free, and decided, and conformed almost entirely of etching; he sometimes marked his plates, which are somewhat numerous, with his name at length, and at others with the initials P. F. or P. V. F., the V standing for his native city of Verona.

His best productions in this art are, a figure of "St. John," a small upright, a ditto of "St. Jerome kneeling;" "St. Mary Magdalen, seated with a Book and Crucifix, &c.;" "The Holy Virgin with the Infant Christ and St. John," in folio; "Angels bearing the Cross," a small upright; "Veus and Cupid;" and "Venus at the Forge of Vulcan," both in folio. They are all after his own compositions.

The three following engravings are by Horatius Farnaito, who was the son and pupil of Paolo; he was of very promising talents, but died at an early period of life. Strutt says he would have equalled the greatest masters; but this may be saying a little too much. They are after his father's compositions, which may be one reason why they have generally been confused with his works.

Giacomo Batilla Fontana was born at Verona A.D. 1524. He worked at Venice great part of his life, and died in the service of the emperor. He designed as well as engraved, and we have several flight etchings by his hand, executed with the boldness and freedom of a master, though the drawing is by no means correct. Of these it may suffice to mention the following:—Several subjects from Virgil's Aeneid, in folio, from his own compositions; "The Vision of Ezekiel," in large folio; "The Martyrdom of St. Peter, the Dominican, in a Torel," from the famous picture by Titian; (Martin Ruts, and Le Ferre have also engraved from this picture.) "The Battle of Cadova, between the imperial Troops and the Venetians," a muddle-sized plate, lengthways, from Titian; "Our Saviour on the Cross," in large folio; and twenty-eight small plates from the history of Romulus, including a dedication to Ferdinand, Archduke of Austria, dated 1573.

Dominico Maria Fontana was born at Parma in the year 1543. Strutt has mistakenly dated his birth in 1673. He learnt drawing in the school of Bologna, and engraved chiefly after his dignities. Le Compte and others have confounded this artist with Dominico Fontana, the famous architect. The following are some of his works:—"A Flight into Egypt," the scene lies in a mountainous landscape; "St. John preaching in the Desert," in large folio; "Our Saviour speaking to the Women of Jerusalem, on his way to Mount Calvary," in folio, dated 1584; "Mount Calvary," with a Latin and German inscription; "The erection of the great Obelisk, before the Church of St. Peter at Rome," with all the apparatus necessary for the elevation of such an immense mass, marked Dom. Fontana inv. Scb. Bonifacio fe. 1586; a very rare piece, engraved on three large plates.

Veronica Fontana, who engraved small portraits in wood with considerable neatness for that mode of art, was daughter to the above, and studied the art of design under her father and Elizabeth Serani.

Christofano, or Christophor Bertelli, was a native of Rimini, in the duchy of Modena, and appears to have lived about the end of the sixteenth century, though his engravings are not dated. He worked entirely with the graver, but in a stiff mannered style.

From whom he learned the art of engraving is by no means certain, and by no means important, as he neither invented a style of engraving, nor improved on those already known. He engraved after Correggio and other Italian masters; and the following are among his works:—A Portrait of Octavius Farnefe, duke of Parma, in folio; "The Conversion of St. Paul," a very grand composition, from Pordenone, marked "Per me Christofano Bertelli," in large folio; "The Virgin with the Infant Jesus, and four Saints," after Correggio, in folio; another of "The Virgin and Child, with St. Georges," from the same painter; a folio print, representing the different ages of man, marked Christofano Bertelli, &c.

Ferrando, or Ferdinand Bertelli, was of Venice, and contemporary with the preceding artist, to whose family he probably belonged; he worked after many of the Venetian masters, but did not much distinguish himself, and we therefore only mention the following of his works:—"Our Saviour healing the Sick," marked Farinati pinx. F. Bertelli, exc. 1560, of large folio size; "Our Saviour on the Cross," after Julio Romano; "Venus reposing," after Titian, marked Nic. Bertelli, 1566. Specchio della Vita humana. In Venezia per F. Bertelli, 1566. Another, intitled "Onnium fere gentium nostrae satas habitus, a F. Bertello enca typis excuss. Venet. 1569," in folio.

Lucas Bertelli, likewise a native of Venice, was a printseller, but engraved some plates in the style of Cornelius Cort; among which are the following:—A Portrait of Hippolita Gonzaga, a daughter of Ferdinand, signed Lucas Bertelli, exc. in 4to.:—"The People of Israel tormented by Serpents," after Michael Angelo; a folio print of "The Baptism of our Saviour," signed as before, with four verses at the bottom, beginning "Non illi Christiani latices," &c.; another folio print of "The Magdalen washing our Saviour's Feet;" "The Flagellation," after P. Farinati, in large folio, inscribed as before; "A Crucifixion," in large folio; "The Delphic from the Cross," where Nicodemus is holding the nails, a meritorious print, signed as before; "The Four Evangelists sitting in a Table in the Temple, with their Attributes," from Michael Cotech, in large folio; "The Last Judgment," after J. B. Fontana; "An old Woman and Children, warming themselves at a large Fire," with eight verses, after Titian, in folio. N. B. This engraver flourished towards the close of the sixteenth century.

Fredericio Baroccio, was born at Urbino in the year 1528, and died at Rome A. D. 1612. He learnt the principles of design under Battista Franco at Venice, whom the superiority of his genius very soon enabled him to surpass. He went very young to Rome; studied with the pupils of Raphael; and, according to De Piles, was employed by pope Paul III. to paint several subjects in fresco. Barocci painted both portrait and history with the greatest facility, and particularly excelled in sacred subjects; it is said that he
he generally painted his Virgin Marys from his sitter, and Infant Christs from his little nephew.

He engraved several pictures from his own compositions, which, though light, and not well managed with respect to the mechanical part, are nevertheless most admirable, on account of the expression and excellat drawing discovered in them. His heads are very beautiful and characterful; and the other extremities of his figures finely marked. Amidst all the difficulties appear to have met with, in corroding his plates with the aquafortis after he had etched them, and his unskillfulness in handling the graver to harmonize and finish them, the powers of a master appear like the orb of the sun, when seen through the thin clouds of morning.

The following are among his best engravings, all of which are from his own compositions. A small print of "The Virgin and Child," which was never completely finished at the bottom; "The Virgin and Infant Jesus in the Clouds," fixed F. B. V. P. in 1480; "The Annunciation," a large upright plate, of which the good impressions are very rare; "St. Francis receiving the Stigmata," a small upright plate; "The extatic Vision of St. Francis," in which our Saviour and the Virgin appear to him, a large upright plate arched at the top, esteemed the most capital of the engravings of Barocci.

Battifia da Parma, or Parmeniois, was a native of Parma, born A. D. 1530. Huber, without advertising to dates, says he was probably a disciple of Parmeggiano; now Parmeniois, as we have already stated, died in the year 1540.

The truth is, Battifia studied at Rome, but under what master it is not known; and here he practised the art of engraving in a style somewhat resembling that of Cornelius Cort.

Among the most esteemed of his productions are the following:—"The Virgin and Child appearing to St. John the Divine," from Frederico Barocci, signed Battifia Parmeniois fec. Rome 1538, in folio; "Philippus II. Hispaniarum Rex, 1539," in large folio; "Christ baptized in the River Jordan," Batt. Parmeniois dedicavit, in large folio; "The Chastity of Joseph," in large folio, dated 1592; and "Mount Calvary," a very grand composition, marked as formerly.

Jacques or Jacobus Parmeniois, was another artist, probably of the same family, from whose hand we have a print executed in the style of Caraglio, of "The Martyrdom of St. Peter and St. Paul," and a middling-sized print lengthwise from Parmeniois, which is executed with some merit, in a light style, and has often been attributed to Caraglio, but the heads and other extremities are not so well drawn as we find them in the works of that artist.

Gaspar ab Aviso, Likewise called Gaspar Patarus, or Padovano, was born at Padua in the year 1530. He appears to have been the pupil of G. Ghisi Mattianni, whose style he imitated, but never equalled. His prints are dated from the year 1566 to 1580, and signed in different manners, sometimes with the monogram of Gaspar, which will be found in Plate II. of those of the Italian Engravers.

We shall notice the following of his productions: a print, in large folio, of "The Marriage of the Virgin Mary," from Paul Veranec, inscribed Gaspar ab Aviso Citadellensis fecit, 1577; "The Woman taken in Adultery," marked with his cypher; "The Scouring of our Blessed Saviour," a large upright plate, signed Gaspar ab Aviso Citadellensis fecit, Lacombe Bertelli Forms; "Our Saviour crowned with Thorns," marked as before, in large folio; "The Last Supper," from Lamb. Lombard, in large folio; "Apollo on Mount Parnassus, with Pegeus and the Muses, Homer, and Virgil," from L. Penni; a large volume in folio, in five parts, containing the portraits of the Emperors, Archdukes, Princes, &c. of the Austrian family. Each portrait is a large length figure, ornamented with an appropriate border. Here Gaspar has changed his usual manner of engraving, and something more of the line of the Sadeler appears in it. The figures, though stiff, are neatly engraved, and well proportioned.

Giovanni Battifia Cavalieri was born at Lagherino some time about the year 1520. He worked at Rome from 1550 to 1590. His style of engraving bears considerable resemblance to that of Eneas Vico, the disciple of Marc Antonio; though he has not, in every instance, attained the same degree of excellence.

Cavalieri understood the mechanical part of his art very well; but his prints are defective both in chiaroscuro and drawing, particularly in the extremities of his figures. He was a very industrious engraver, and, according to the abbe Marolles, his works amount to upwards of three hundred and twenty-seven; a great part of which, however, were but copies from the engravings of other masters. He sometimes signed his prints with his name, and at others with his cypher, which will be found in Plate II. of those of the Engravers of Italy.

Among the most esteemed of his works are the Frontispiece and Heads to the "Lives of the Popes," dated 1588; the plates to a work on the "Life and Miracles of Apollinaris, first Bishop of Ravenna," in folio, which are coarsely etched, and slightly finished with the graver; "Eccelesia Anglica Trophæa," in folio, from Nicolau Circignano; "The Ruins of Rome," from Jean Antonio Doldius, in 50 plates; "Jesus Christ teaching among the Doctors," from his own design; "The Last Supper," from his own design; "The Statue of the Virgin of Loreto;" "The House or Chapel of Loreto, and the Miracles which were supposed to be done there," 1569; "The Celebration of the Jubilee of 1583," in the back-ground of which is a view of the cathedral church of St. Peter. (Here the engraver is called, for what reason has not been explained, "Tridentini.") And "A Naval Battle with the Turks," for the work of Cecchi, of folio dimensions, "The Virgin of Silence," where the Virgin is reading, and the infant St. John making a sign not to disturb the sleeping Christ, accompanied by St. Joseph, from Michael Angelo, is in large folio; "The Conversion of St. Paul," after a picture of Michael Angelo, in folio; "The Martyrdom of St. Peter," in large folio, all signed with the engraver's name; "The Apostle St. Paul," after Michael Angelo, in large folio; "The Animals returning from the Ark," after Raphael, of the same size; "Moés flooding the Tables of the Law to the People," from the same master; "The Miracle of rokuing the thousand, in two large plates; "Jesus Christ appearing to St. Peter at the Gates of Rome," with the cypher of the engraver, dated 1560; "The Battle of Constantine against Maxentius," a large upright, all from Raphael; "The Slayers of the Innocents," after Raffael Bondelli, a grand composition, which was likewise engraved by Mark. of Ravena; "Saffaiah and the Elders," from Titian, in folio, dated 1560; "St. John preaching in the Wildness," from redessa del Sarto, a large folio print of "The Decent from the Cross," from Daniele de Volterro. The same subject was engraved by Dorniery, "The Virgin seated on the Clouds, with the Infant Jesus and Angels ministering to her," from Livio Agostini, in large folio; "The Elevation of the Cross."
ITALIAN SCHOOL OF ENGRAVING.

Crock," from the same master, signed "Opus Livio Agredi Forlivesis, Roma incldhat, Joan. Bapt. de Cavallerius," in large folio.

For an account of Paul Veronese, who etched some plates about this time and is a distinguished ornament of the Italian school, see the article CAVALLERUS.

Cesare Vecello was born at Venice some time about the year 1523, and died in the same city. He was the younger brother of the celebrated Titian, and probably the engraver of those wood-cuts which are generally attributed to that great artist. We have by this master a set of prints in etchings, etched in a free spirited style, from the designs of Titian, of the costume, or various dresses, ancient and modern, of different parts of the world: they were published at Venice in the year 1550, entitled "De glt Habiti antichi et moderni di diversa Parte del Mondo, Libri due fatti da Cefare Vecello." In the year 1664, another edition was published, more complete than the preceding, where the title is more fully explained, thus, "Raccolta di Figure delineate dal gran Titiano, e da Cefare Vecello fuo fratello, deligentemente e intagiate.

Joseph Porta, otherwise called Saulvati, della Grafagnano, was a native of Castelmurgo Grafagnano, born in the year 1532. He was the disciple of Franci Salvati, whose name he assumed. He settled at Venice, where he painted, both in oil and fresco, with great success; and performed several meritorious engravings on wood. M. Papillon says, that he has seen twelve prints by this master, executed on wood, of which the subjects were "The Prophets," and "The Sybil," "Psyche finding Cupid asleep," and "A Chemist in his Laboratory," a print ten inches by sixteen. He concludes: "But I alone possess a print by this master, much superior to the preceding, of "Jesu Christ on the Cross, accompanied by the Virgin, Mary Magdalene, and St. John," at whose feet is a little tablet, with the name of Joseph Salvati. The characters are very admirably executed, and the excellence of the design equals that of the execution." Porta's engraving of the Academy of Arts and Sciences, a very fine composition, in small folio, proves that in this instance Papillon is no exaggerator. Andrea Zucchi, and many other Venetian artists, have engraved from the pictures of this master, who died at Rome in the year 1585.

Julius Sanuto, or Sanutus, was born at Venice A.D. 1536, but is very little known. Among the small number of plates executed by this artist are the following: "The Birth of a monstrous Child," signed Jul. Sanutos, Venet. fec. This print is executed with the graver in a coarse heavy style, with single strokes, without any crofs hatching, and bears great resemblance to a wood-cut. "Venus and Adonis," after Titian, from the gallery of the King of Spain, marked Giul. Sanuto exc. 1550; "The Fable of Apollo and Marsias," a very singular composition, from Correggio, engraved on three large plates; on the middle plate of which is introduced the Parallels of Raphael.

Of Domincus Vitus it is only known that he was a native of Italy, born some time about the year 1536, and that he continued to engrave at least till the year 1580.

He was an ecclesiastic, of the order of Val-Ombrevue, a monastery situated in the Apennines, and was probably instructed in engraving by Agostino de Muits, whose style he imitated, and not unsuccessfully. He engraved several plates after contemporary painters, and likewise from the antique.

We have, by him, "St. Joachim holding a censer," from a design by Andrea del Sarto, dated 1580; "St. Bartholomew," inscribed "Dom. Vitus Ordinis Valliumtis Ma-

Raphael Guidi was born at Florence in the year 1549, and judging from his works, appears to have been instructed in the school of Correggio, or Agostino Carracci. He worked entirely with the graver, which instrument he handled with much facility. He drew correctly, and the exactness of his figures are very well expressed. Though Guidi cannot be said to have equalled Carracci, yet his prints manifest that he was a man of very superior talents. The following prints are by him, and will probably be found among his best performances: "King David playing on the Harp," from Josephine, in folio; the same picture has been engraved by Eg. Van Panderen; "The Creation," after Christopher Schwartz, in folio; "Jesu Christ in the Sepulchre," from F. Barocci, dated 1568; "Joseph carrying his Father from the Burning of Troy," from the same; "Jupiter grasping his Thunderbolts," from Poldoro; and "Vulcan" from the same master, both in folio. In larger folio, and engraved with much freedom after Josephine, is "The Fall of Icarus."

Bartolomio Paffarotti was born at Bologna in the year 1540, and died in the same city A.D. 1592. It is very likely that he learned drawing in the school of Thaddeus Zuccaro. Bartolomio was the most eminent of the numerous family of artists of his name, and excelled both in historical subjects and portraits. Huber claims for him the honour of having been the painter of the celebrated Academy at Bologna, where the Carracci so much distinguished themselves. He was a painter of great merit, and Ph. Thomassin, C. Cort, Ang. Carracci, and many other artists, have engraved after his pictures. He likewise produced many etchings from his own designs, and from those of F. Salvati, and P. Perugino, of which the following are best known, and probably possess most merit.

"The Virgin and Child, accompanied by St. John," from his own design, in large folio; "The Visitation of the Virgin," a rich composition, after F. Salvati; signed Bart. Paffarotus fec. a very rare print, in large folio, and another large folio print of "The Marriage of Jacob and Rachel," from P. Perugino.

Marini Kartus, or Mario Kartaro, was born in Italy some time about the year 1545, but the time and place of his death are unknown, and the events of his life are from what obscure. Basset says that "Marini kartus was an engraver, who flourished in Italy about the middle of the sixteenth century; Rodolphus Tafelius calls this engraver Marini Cartari, who, in the year 1587, engraved at Rome the portraits of the twenty-four first Roman emperors, from Julius Cesar to Heliogabalus. And Strutt thinks that he was probably a German, though he resided at Rome, and learnt the art of engraving in his own country; he copied several of the engravings of Albert Durer with some degree of prudence; they are executed entirely with the graver; but his principal works are etchings in a coarse, incorrect style, finished with the graver. Some of them are very large, and in general from his own designs." Kartus commonly marked his prints with a monogram, which will be found in our second plate of those of the Italian Engravers; and never with his name at length. The following are among his most distinguished productions: "The Adoration of the Shepherds," in a very neat style, executed with the graver only;
only; of Our Saviour crowned with Thorns," a large upright plate, also executed with the graver; "Diana and Endymion," a large plate lengthwise; "Christ praying in the Garden of Olives," from Albert Durer, marked with the name of Pollendo, and Andrea, 1668; "St. Sebastian, with a Bishop, Virgin and Child, in Rays of Glory," marked Bartolus Urbis; in large folio; a celebrated print of the same subject by Durer.

"The Defect of Christ into Hell," from Andrea Mantegna, etched in his rough style, in folio; "The Last Judgment," in large folio, from the famous picture by Michael Angelo, in which part the oval at the top, that in the original picture contains the painter's portrait, is left blank.

Andrea Andreani, called Mantau, was born at Mantua in the year 1510, and died at Rome in 1633. He learnt the elements of the art in the place of his nativity, but went afterwards to study at Rome. Andreani engraved on wood only, in the style distinguished by the appearance of chiaroscuro; which he performed by the help of two, and sometimes three blocks, but never more. Among his own countrymen, he had Ugo da Carpi, and Antonio da Trento for models, whom he seems to have followed very closely in the early part of his time; but at length he carried the mechanical part of the art to a far greater degree of perfection. His great merit, as an artist, is acknowledged by all who are conversant in prints; his drawing is executed in a very masterly style, and with great spirit; the heads of his figures, though slight, are characteristic and expressive; and he has displayed great judgment in the management of the various tints.

The number of prints by this master is very considerable, for besides those which he performed himself, he procured a great many engravings by other artists, retouched them when occasion required, and, adding his cypher, sold them as his own productions. This dexterous artifice, altogether unworthy of him, renders it very difficult to distinguish his works precisely; for, after all, it is most likely that many prints are attributed to him, in the engraving of which he had no concern. He commonly marked his prints with one of the cyphers which will be found in our second plate of Italian Monograms. The Abbé de Marot, mistakenly calls this artist Andrea; others have mistaken him for Andrea Mantegna, who lived nearly a hundred years before him, and others again for Albert Altdorfer, on account of the similarity of their monograms. We have endeavoured to exclude his adopted engravings from the following list of his works, and to select the best of his own. A portrait of Albert Durer: "The Parnassus of Sienna," after a drawing by Francesco Vanni, from Domenico Beccafumi, confining of eight subjects, had to be the most rare of all Andrea's engravings; "The Deluge," from Titian, a very large piece, on three plates; "The Army of Pharaoh passing the Red Sea," from the same; "The Adoration of the Magi," from Parmegiano, in small folio; "The Purgation of the Virgin," from Salviati, in folio, dated 1628; "The Virgin and child," from Biniardi, in small folio, etched by him himself, with the artist's cypher and the words Andrea Mantuano, Pittore Sanoche, 1591, in large folio; "The Virgin, St. John, and Infant Jesus, accompanied by a Saint," from Giac Ligezzi, in folio. Another folio print of "Our Saviour healing the Leper," from Parmegiano; "Jesus Christ healing the Paralytic," from Franciscus de Sianto da Saldania, in folio; "Christ parting from Pilate, who is washing his Hands," one of his most finished productions, on 1280 blocks engraved from a bas-relief of Giovanni Bologna, in large folio; "Christ bearing the Cross," after Al. Carboni, with the name of Andrea in Sienna, 1591, in folio; "The Entombing of Christ," a large folio print, dated 1591, from Giuff. Scilarì Vicentino, pittore excellente (Papillion mentions a Joseph Sciliar, an engraver on wood, to whom he attributes many print); a large upright plate, half figures; "St. Francis," marked with the name of Pollendo, and Andrea, 1668; "St. Sebastian, with a Bishop, Virgin and Child, in Rays of Glory," marked Bartolus Urbis, in large folio; an emblematic print representing the Christian after his spiritual warfare in the world, received as victor into heaven, and crowned by Christ; it is signed Bart. Franco de Venetiis, and bears the name of Andrea, in large folio; a print published after him, represented by a female figure, attired by the painter, fig. Jac. Ligustis, inv. et Andreae 1583, Presens, in large folio; there are different impressions of the same plate, with and without the device, "The Return of the Sibyls," from a group by the sculptor Giovanni Bonsignori, with three several views, dated 1584; another print of the same subject, a bas-relief of the same subject, on three blocks, dated 1585; "The Triumph of Julius Caesar," from Andrea Mantegna, the original of which is at Hall, in Cowes, it is cut on ten blocks of wood, including the title, and dated 1593; a large print of a scene in a play, entitled "Orphanio," represented by the academicians, called Intronati, in the presence of the grand duke Cosimo I. at Florence, from the design either of Marco Ricci, or Bart. Neroni.

Jacques, or Giacopo Palma, usually called the younger, in contradistinction to his uncle Giacomo, who was a very eminent historical painter, was a native of Venice, born A.D. 1544, and died in the fame city in the year 1628. Giacopo became the disciple of Tintoretto, whose style he followed during the earlier part of his life, but after-wards studied with great care and attention the works of Titian and other great masters, to complete his talent. Palma has etched a number of fine spirited plates in a flight style, to which he frequently signed his name at length, and sometimes used the monogram of a palm-branch, crouching diagonally the letter P, which will be found in our Plate II. of Italian Monograms.

The following are by him, and are his most esteemed prints:--Samson and Delilah," after Jac. Franco; and "Judith and Holofernes," both middle-sized plates lengthwise, marked with his name; "The Nativity," in small folio; "A Holy Family, worshipped by St. Jerome and St. Francis," half length; "St. John in the Desert," in folio; "The beheading of St. John," the same size; "St. Jerome in Conference with a Pope," in folio, very rare; "Pallas sitting on a Trophy, holding a little figure of Victory in her Hand," in large folio; "Paying Tribute to Caesar," the same; "The Woman taken in Adultery," the same; "Christ answering to the Pharisees, when they disputed his Authority," the same; "Christ appearing to St. Thomas," half length figures; "Two Men in Tur- tles," the same; "An Exalted, and naked Figure, with two Boys underneath," with the monogram of the artist, in folio.

Dominico Pellegrino Tibaldi, who excelled in the three arts of painting, engraving, and architecture, was born at Bologna A.D. 1546. He was the son and pupil of Pellegrino, known by the name of Tibaldi da Bologna, after whose compositions he etched several spirited plates. The following short list will probably be found to contain the best of Dominico's works on copper: "The Virgin of the Robes," after a picture by Parmegiano, in the gallery of Dreiden, in folio; "A View of a Fountain at Bologna," from John de Bologna, signed Domin. Tibaldi, 1571, in large folio; "The Trinity," a grand composition, after Horizon Samachini, in large folio; and a print representing "Prace, "
"Peace, laying the Instrumens of War at the Feet of Jove."

Camillo Procaccini was born at Bologna in the year 1549, and died at Milan in 1626. He very probably learned the principles of painting from his father Erecole Procaccini. Huber pronounces him the precursor of the Caracci, and calls our attention to the fulness of his conceptions, and the grandeur of his style. He resided chiefly at Milan, where he painted a great number of pictures, and died in that city at the advanced age of eighty. He amused himself much with etching, which he performed in a bold, masterly style. The heads of his figures are often admirable, and the other extremities very finely marked. Among other etchings, the following are the production of his needle:—"A Repose of the Holy Family," in which Joseph is represented in the front, a fore-shortened figure lying upon the ground, and leaping upon the fiddle of the ass, a middling-sized plate, lengthways; another "Holy Family," in which Joseph is represented giving an orange to the Infant Christ; a small upright; another "Repose," where the Virgin is represented suckling the Infant Jesus, in folio; "St. Francis receiving the Stigmata," dated 1552, in folio; (Julius Sadler has engraved the fancy subject.) "The Transfiguration of our Saviour," a large upright plate, of which it is very difficult to find a good impression.

Julius Caesar Procaccini, the brother of Camillo, mentioned in the preceding article, was born at Bologna in the year 1548, and died at Milan in the year 1626. He learned the principles of painting of his father, but completed his studies under the Caracci. He excelled in historical composition, and his works are very much esteemed. He etched for his occasional amusement, but we have never seen more than a single small plate by him, of which the subject is "The Virgin and Child."

Bernardino Paffier, or Paffieri, was born at Rome some time about the year 1542, and resided there most part of his life. In painting he poised some talent, and appears to have imitated the Zucchieri, but the attitudes of his figures are, to a certain degree, forced and uneasy. In the Abecedario he is called an universal engraver, but for what reason is not known, unless it means, that he occasionally practised all the branches of that art which were then in vogue. It is certain that he has engraved a considerable number of prints, which, in general, he first etched, and afterwards finished with the graver, in a bold, easy, and loose style. His works prove him to have been a man of ability, but his drawing is not always correct, nor are the characters of his heads always beautiful, or well chosum. He often signed his name at length; and sometimes used a monogram, which will be found among those in Plate II. of the Italian School. The following are the names of a few of his works, but no means uncommon:—"A Holy Family," where the Virgin is represented with a Bohman bonnet, dated 1545, in 4to.; "The Life of St. Bruno," represented on several middling-sized upright plates, in 4to.; and a considerable number of Holy Families, Madonnas, and other pious subjects.

Ventana Salimbene, called Bevilacqua, was born at Siena in the year 1555, and died in the same city in 1631. He learned the rudiments of his art of his father, Angelus Salimbene, who was the disciple of F. Zucchero. He was half brother to Francesco Vanni, whose style of painting he imitated; at Rome he chiefly worked in the library of the Vatican, and the church of St. John de Lateran. We have several fine etchings by this artist, in a bold, masterly style, and among them the following, all from his own compositions:—"The Marriage of the Virgin," a small upright plate, dated 1593; "The Salutation of the Virgin," in folio, 1591; a large folio plate of "God appearing to the Virgin seated in the Clouds, surrounded by Angels;" "St. Agnes," a half-length figure in 4to.; "The Baptism of our Saviour," and "Jesus Christ appearing to St. Catherine of Siena," both in small folio.

For an account of the merits of Antonio Tempesta, as a painter, see the article TEMPESTA, ANTONIO. Fertile and vigorous in his invention, and various and veritable in his artistic powers, he took up the pencil or the etching point with equal facility, and almost with equal success. Though he delighted in cavelades, battles, processes, and such other subjects as called forth his copious powers of composition, his prints are exceedingly numerous, amounting, according to Le Comte, to eighteen hundred, and according to Manette, to no fewer than two thousand!

Tempesta's style of etching, in perfect union with the general character of his art, was bold and free; the lights are kept broad on his figures; his figures are often grouped with grandeur, and he polishes a certain ardent liveliness of expression, both in his human figures and animals.

From this aggregate of his merits, some deductions must, however, be made. The muscles of his horses, which frequently occur in his battles and hunting pieces, are generally overcharged; his draperies are not elegantly drawn; his lights and shades are not collected into broad masses, so as to give unity of effect to his chiaroscuro, and his etchings are often coarsely corroded, so as to destroy the clearness and value of the middle tints.

Tempesta did not always mark his prints with the same cipher. We have collected his various marks, and they will be found in our Plate II. of the monograms, &c. of the Italian Engravers. The following list is selected from the best catalogues of his works:—"Our Saviour crucified between the two Thieves," in large folio, very rare; a set of middling-sized plates, lengthways, the subjects of which are taken from the Old Testament, and commonly known under the names of "Tempesta's Bible," a set of a hundred and fifty prints, from "Ovid's Metamorphosis," in 4to.; a folio print of "Diana and Actaeon;" "The Entry of Alexander into Babylon," of the same size; a set of twenty-four pieces, entitled, "Vita S. Antonii Abbasii, &c. In folio;" "The Labours of Hercules," in thirteen plates of octavo dimensions, comprising a frontispiece and dedication; "The Four Ages of the World," represented by the manner of living at those different periods; four hunting pieces, namely, a flag hunt, a hare hunt, a wolf hunt, and a wild-boar hunt, in octavo; another set of aches; another set of four field sports; two subjects of battles between the armies of the ancients, in folio; two more, of modern battles; another battle, dedicated to the duke of Gravina, dated 1600; another set of six battles, with a frontispiece, inscribed "Facundus quam st - omen ex. Tempestis f. de Wit ex," all of folio dimensions.

Of the illustrious family of the Caracci, we have already written as painters, see the article CARACCI LODOVICO, AGOSTINO, and ANNIBALE. It remains to add some account of their merits as engravers, and to point out their best productions in this art to the notice of connoisseurs and collectors.

Lodovico has left us a few small prints from his own compositions. His practice was to etch his designs, and employ the graver in giving them a few finishing touches, hence his plates are slight, free, and masterly; with the extremities of his figures tolerably well defined, and still better understood;
ITALIAN SCHOOL OF ENGRAVING.

Under flood; as is sufficiently obvious to an intelligent eye.
He generally marked his prints, of which we select the fol-
loving as the most worthy of notice, with the initials of his
name, but not combined in a cypher. “A Madonna and
Child, surmounted by Angel,” in 140; “A Holy Family,
wherein St. Joseph is leaning his Head upon his Hand;”
“The Holy Virgin fllicking the Infant Christ;” “A Holy
Family, in which the Virgin Mary is reading a
Book;” all in small folio; “Samson killing the Lion,” in
4to.; Frontispiece to the poems of Cesar Rinaldi, and a
folio print of the armorial bearings of the family of
Bonfigliolino, in which the figures of Hercules and Mer-
cury are allegorically introduced.
Agostino Caracci was the son of a tailor of Bologna,
who, desirous of educating his family in a superior manner,
intended Agostino for a scholar, but a strong inclination for
the pursuits of the fine arts becoming very manifest, the father
was induced to alter his design, and placed his son under
a goldsmith: here he learned the rudiments of engraving, for
the Bolognesi goldsmiths of that time were accustomed
to ornament their productions with engraving, which was often
executed with a degree of taste and beauty corresponding with
the general excelling state of art.

From this pursuit, however, the great success of his
younger brother Annibale, as a painter, appears to have had
an influence on his mind, and it was afterwards induced, from local circumstances,
with which we are unacquainted, to reframe the graver, and
for further improvement went to study in the school of
Cornelius Cort.

The professor Fuseli says, it was “a singular modesty
which prompted him rather to propagate the fame of others
than to display his own powers for perpetuity of name;” but who has pro-
duced the engravings which we shall enumerate, even if he had done no more, must certainly have provided some readiness
of exertion, could scarcely, indeed, have been “less affi-
dacious than his brother,” and might fairly rely on the art
which he did practice so successfully, for perpetuity of
name.

The truth has been, that his great merit as an engraver
remains unimpaired by time, and unimpeached by posterity,
while his picture of “The Three Nymphs in the Garden
Scene of St. Michael in Bologna,” was nearly “in a state of
element, when M. Fuseli was in Italy.

Strutt says that Agostino imitated the style of Cort “so
exactly, with respect to the mechanical part of it, that it was
not for the great superiority which appears in the drawing
of the prints of Caracci, it would be difficult to distinguish
them from each other; a striking influence of which may be
seen in “The Holy Family with St. Jerome;” from Cor-
reggio, which was engraved by both artists.

Agostino Caracci worked entirely with the graver, in a
bold free style; and his drawing of the naked parts of the
figure are admirable. The heads are remarkably fine; and
the extremities are marked in the most accurate and matterly
manner. His draperies are frequently stiff, and crossed with
a square second stroke, which gives them an unpleasing effect.
But, perhaps, his great defect is the prevalent fault of the
age in which he lived, namely, the little attention paid to the
chiaroscuro. The lights are too much scattered, and left
untinted, as well upon the distances, as upon the fore-ground
and principal objects; which not only destroy the har-
mony of the effect, but gives a slight unshapely appearance even to the neatest engraving. Bada speaks of them in these
words: “This excellent artist, equally gifted in the literature and fine arts, treated his engravings in so perfect a manner
that one knows not which to admire most, the correctness of the drawing, or the beauty of the performance. All young
artists ought carefully to observe, with what facility and per-
fection he expressed the extremities of his figures, and with
what art he executed even landscapes with the graver.”

The engravings of Agostino are numerous, though three
dimensions, generally speaking, are large. The following
list will be found to contain those of most merit and impor-
tance. His prints are marked either with the initials letters,
or some contrivance of his names, but not combined in a
cypher.

Portraits and Historical Prints from his own Compositions.

Anthony Caracci, the father of Agostino and Annibale, a
small print, but very rare; his own portrait; Henry IV.
of France, at the age of thirty-six; the emperor Augustus,
en medallion, with a reverse; but of Cofimo I., with orna-
tmental figures; a fine female head, cited by Malvasia;
portrait of a duchess with a pearl necklace; portraits of Jean
Tomaso Coflanzo, the prince of Christiana of Lorraine,
Ulysses Aldrovandus, Marc Antonio Raimondi, Tittiano
Vecelli, Anthony Carracci, as St. Joseph; “Adam rece-
iving the fatal Apple;” “The Virgin and Child;” “The
Virgin fllicking the Infant Jesus;” “A Repose;” “The
Virgin in the Clouds, with the Infant Jesus;” was engraved
by Marc Antonio, after Raphael; but Augustino, having put the plate into his possession, added two fine heads of
Cherubs; “The Virgin in Heaven, giving the Scapular
to a Saint;” a very fine engraving; “The Virgin sitting on
a Step near St. Joseph and an Angel, accompanied by the
Infant Christ and St. John;” a large folio print, very rare;
“The good Samaritan,” in folio. (The impressions of this
plate, without letters, are very rare; and those with the name of Bertelli are re-touched.) “The myriaphorous Cru-
cifix,” where a female figure represents Christianity and
another Judaism, in folio; “The Resurrection of Jesus
Christ,” in folio; “Le Nome di Dio,” representing the
popes and saint of Venice supplanting the Virgin and
saints to intercede for them, in an oval, surrounded with
accessories, and subfixed “Luc. Bertelli. Fami,” but with-
out the name of Augustino, who certainly engraved it, in
large folio; “The Pea-hen, with Diana en Medallion;”
beneath is a landscape, with the fable of Salmacis and Her-
maphrodite; and lower down in the plate are three elms,
with the dispute between Neptune and Minerva, the Three
Graces, and a bult of Minerva; these are all on one plate,
in large folio; the frontispiece to the book of Aldo Ma-
nuce, entitled “Vita di Cofimo de Medicis,” in folio. Another
frontispiece, after Antonio Campi, for the book, entitled “Cremona Fid. Isima,” in folio. (This is a very
rare book, consisting of thirty-three portraits, engraved by
Augustino.) Nine plates, from Tasso’s “Jerusalem Deliv-
erd,” published A.D. 1590. The rest of the plates for this
work were engraved by Giacomo Franco; “St. Francis
receiving the Stigmata,” a large folio print; “The
Girdle of St. Francis,” a grand composition, represent-
ing a faint distribution of the girdle of his order to differ-
cnt Christian sects; a large folio print of: “St. Jerome
kneeling at the Foot of hi Cave.” There are impressions of
the plate when it was about three parts finished, which are
extremely rare; the remaining part is a mere sketch, marked
with a very free touch. An impression of this print shows

Vol. XIX.
with what ease and vigour Aguglino managed his tool. There are impressions of the same plate, quite finished, by F. Villamena, his pupil. Two landscapes, in folio, with figures; "Cupid conquering Pan," inscribed "Omnis virtus amor. 1599;" "Et in omni laudis turba," as "Vase," in folio; "Perfeus in the Clouds fighting with the Sea-monster," in folio; "The Prefen-
tation in the Temple," signed Horace Samacchi, pinner, in large folio; "The Virgin and Child giving the Keys to St. Peter, accompanied by other Saints," Id. pinner, in folio; "The Adoration of the Kings," signed Balthazar, Persuari pinner, very large, engraved on copper plates; the same subject repeated, where one of the kings is killing the feet of the Infant Christ. There are impressions of this, both with and without the name of the painter, Marco del Moro; "The Virgin and Child, with Mary Magdalen, St. Jerome, and an Angel holding a Book," from Correggio, in large folio. This is known under the name of the Day of Correggio, which was in the academy at Pernas, is now in the museum at Paris. "An Ecce Homo," accompanied by the Virgin and other half figures, in large folio, from the same name; "Our Saviour shown to the People," half figure, after Velz. Strada; "The Body of our Saviour, supported by an Angel," half figures, the same size; "The Crucifixion, or Mount Calvary," in three very large plates, from Titoreto; "The Body of our Saviour on the Knees of his Mother," from a marble group by Michael Angelo, in large folio; "The Nativity," from Andrea del Sarto; "The Virgin crowned in Heaven by the Trinity," from Aug. Montaerti, in folio; "A Holy Family," from Fred. Barrocco. Another "Holy Family, with St. John presenting a Scroll," with the words "Ecce agnus Dei," from Raphael, in folio. Another "Holy Family, with St. Michael," from Laur. Sbattini, in folio; "The Virgin sitting in a Cenestent with the Holy Infant," from the same master, in folio. Another "Holy Family," placed high in the print, with St. Anthony and St. Catherine lower down, from Paul Veronese, in large folio; "The Holy Virgin opening her Cloak to protect Two Monks," in folio. Another large folio print of "The Marriage of St. Catherine," a grand composition. A very large upright print of "The Martyrdom of St. Juv-
tian," on two plates, all from Paul Veronese; "The Holy Trinity, in a radiance of Glory, between Two Columns," from Titian, in large folio; "St. Paul restoring a Saint to Life," from Antonio Campi, enframed "D. Paulus Miraculum in Neronis palatii factum," "The Virgin and Child surrounded by Angels," from Julius Campi; "The Virgin repoling, with the Infant Jesus and St. Joseph," from Bern Peiris, in folio; "The Virgin," a half figure, from Giacomo Francia; "St. Sebastian," in folio, from Francisco Franzi; "The Virgin suckling the Infant Jesus," from Jac. Ligotius, in folio; "St. Jerome," half length, from Varn, in folio; "St. Jerome contemplating the Virgin in Heaven," in large folio, from Titoreto; "The Temptation of St. Antony," in large folio, a print which, being without the name of Aguglino, has been mistakenly attributed to C. Cort.; "Mercury, and the Three Graces," in small folio; "Wisdom, accompanied by Peace, putting the God of War," the same size, both from Tintoret; and "Eneas saving his Father from the Destruction of Troy," a very large upright plate, from Barocci. The etchings of Annibal Caracci, the younger brother of Aguglino, and author of the Caracci Gallery, are performed with all the firm confidence and fire of a master. They are held in high and deserved estimation among artists and connoisseurs, and no collection of the productions of the Italian School should be without good impressions of the following:—"Christ crowned with Thorns," from a simple and admirable composition of his own, wherein the elevated dignity, yet meek submission of the Son of God, is contrasted to the brutality of the scoffers, in a most affecting and wonderful manner. In the opinion of Strutt, and of the present writer, this is one of the very small etchings of Annibal Caracci. It has been often copied, and in some instances to cradle well; the original is inscribed "A. C. inv. et fec. 1600." "A dead Christ on the Lap of the Holy Virgin," commonly known among collectors by the name of the "Christ di Capparolo;" "The Adoration of the Shepherds," called by the print dealers "The little Christs," from the circumstance of one of the shepherds introduced, being leaning against a manger, nearly in the middle of the composition: this also has been copied several times. The above are both of 4to. dimensions. Of the same size are "The Adoration of the Magi," and "Christ and the Woman of Samaria, "A Holy Family," where Joseph is seated, leaning against a column, holding a book, is a small plate lengthways; "The Virgin holding the Infant Christ, and giving Drink to St. John," is distinguished by the name of "The Virgin of the Porringer," another small plate lengthways; "The Defect of the Holy Ghost," a small upright plate, nearly square; "Sappho and the Elders," a middle-sized plate, nearly square; "Jupiter and Antiope," a small plate lengthways, dated 1592; "Silenus and two Satyrs," a small circular plate, of about eight inches and a half diameter, the border of which is ornamented with vine branches and grapes: this is commonly called the "Dish" of Annibal Caracci, having been engraved for the bottom of a fauer, belonging to cardinal Farnese; "The Virgin supporting the Infant Jesus, who is asleep," in 4to.; "The Virgin of the Nightingale," where the Infant Christ is taking a bird from the hands of St. John, of the same size; "St. Jerome of the Spectacles," a half figure; a small plate of "St. Francis sitting, holding a Skull on his Knees and a Crucifix in his Hand;" another, in quarto, of "St. Francis kneeling at the Foot of a Rock, with a Disciple before him;" "Apollo playing the Lyre, with Pan, or Mauryas beside him, biting his Fingers," a very rare print, in octavo; "An old Man speaking to two other Figures," of the same size; "Venus asleep, and Cupid observed by a Satyr," in quarto; another "Venus asleep, with Cupid and a Satyr," of the same size; "The Triumph of Bacchus," in quarto; of this subject Annibal engraved a duplicate plate, as is said, with the view of instructing Lanfranc in the art of etching. "Acis and Galatea watched by a Satyr," in folio. Francesco Caracci, commonly termed Franellichis, was the nephew of Aguglino and Annibal, and was instructed in the arts of design by Lodovico. With such opportunities and strong natural talents, he in a short time attained an extraordinary knowledge of the human figure, which he drew so correctly, as to adorn his learned relatives, and Strutt thinks he might have attained a reputation equal, if not superior, to any of the Caracci: but his unfortunate propertie
ITALIAN SCHOOL OF ENGRAVING.

fities to debauchery ripped all these fair promises in the bud. He died in an hospital at Rome, A.D. 1602, aged only 28 years.

Franceschini etched with ability some few prints from the compositions of his uncle Annibal, among which are the following. He usually marked his work with the monogram, which will be found in our Plate II. of the Italian Maiters:—‘The Madonna and Child seated on a Cloud;’ ‘St. Charles Borromius kneeling before a Table, contemplating a heavenly Light;’ two plates of ‘Angels teaching the Lession of Mortality,’ of which our art himself placed so heedless; a set of four plates of illustrious women of antiquity: a nely, ‘Semiramis,’ ‘Lucretia,’ ‘Artemisia,’ and ‘Portia.’ The latter are after Lodovico Carracci, and are very rare, and all his prints are of small dimensions.

Of that distinguished engraver Cherubino Alberti, who was living at the period now under our review, we have already detailed the biography, and dwelt on the leading traits of his excellence, under the article ALBERTI CHERUBINO. His monogram will be found in our Plate II. of these of the Italian School; and we are now enabled to render our final list of his performances somewhat more copious, by the addition of the following:—The Portraits of Pope Gregory XIII. in an oval, with accessory ornaments; Pope Urban VII. companion to the above; Henry IV. of France, also in an oval, with accompaniments; and Pietro Angelo Bargeo; all of folio dimensions, and from pictures by Cherubino himself.

Historical Subjects from his own Compositions—“Judith, with the Head of Holofernes, and a Sword,” in folio; “The Nativity,” a grand composition, dedicated to Pope Clement XII. inscribed “En Deo Omnipotens,” &c. both in folio, and marked with his cypher; “The Flight into Egypt,” where the air is led by an angel, accompanied by St. Joseph and Elizabeth, in large folio; another folio print of “The Virgin and Child with St. Joseph,” figured with Cherubino’s cypher; “The Body of our Saviour, carried through the Clouds by two Angels,” inscribed “Magnus pictator opus,” &c. in folio; “The Virgin and Child in the Clouds, surrounded by Cherubino’s Heads, and two Angels flouring Flowers,” entitled “Regina Caeli,” in folio; another folio plate of “St. Catherine of Siennaigmatized, and supported by two Angels,” 1574, marked with the artist’s cypher; “St. Christina and St. Francis figmatized, accompanied by two Angels,” 1579; “St. Charles in the Clouds surrounded by Angels, prostrating himself before the Virgin and Child,” 1612, all of folio dimensions; six subjects for ceilings, of children, after the pictures by Alberti, painted at Tivoli; five genii in the air, dedicated to Cardinal Vincenzo; the first is inscribed “Ex picturis, quis Cherubinus Albertus in ejus Villa Tusculana pinxit, has ipfem incidit, 1607,” in large quarto.

Historical Subjects from various other Maiters:—Standing figure of “Susanna leaning against a Pedestall,” on which is written, S. Susanna Vir. & Mart., lower down, Alexander Albertus inv. dedicated o Cardinal Rufficit, in large folio; “Our Saviour on the Crofs,” to the left is the Virgin, to the right St. John with extended arms, from Michael Angelo, in folio; a large folio print of “St. Jerome sitting meditating on a Crofs,” from the same master, engraved at Rome, A.D. 1575; another in folio, of “St. Andrew bearing a Crofs,” engraved in 1598, and taken from the Last Judgment of Michael Angelo; two other figures, in folio, from the Last Judgment, one inscribed “Nuda Verita,” the other “Petit ad Aether;” these are very fine engravings, and dated 1591; the figure of Choron, accompanied by two others, and same heads, from the same Last Judgment, engraved A.D. 1575; in folio; “Prometheus turn by the Volture,” painted for an angle of the Sfirmi Chapel, in folio, engraved A.D. 1583; a group of four figures, namely, “The Body of our Saviour;” “The Virgin;” “Necodemus;” and “Mary Magdalen;” in folio. The original sculpture by Michael Angelo, from which this engraving was made, was taken to France, and placed behind the altar of the cathedral, with the following inscription: “Poetissimum Michaeli Bonarotae opus, quamvis ab artifici eb vitium marmorii neglectum, exhumato auctore can. Cofins. Magnus Dux Eturiae Romae iunctum hic. P. I. anno MDCCXXXII.” Three prints representing “The Creation of Adam and Eve;” “Adam and Eve chased out of Paradise;” and “Adam and Eve subjected to Labour,” Rome, Fidius de Caravag, invent.; a large frieze, of “The Death of the Children of Niobe,” in five plates; another frieze, of “The Rape of the Sabines,” with a Latin inscription; “The Triumph of Camillus,” in the antique taste; “Plato,” a figure holding a flame; “Fortune,” with her left foot on a wheel; “The Presentation in the Temple,” from Raphael: it was published after the death of Alberti, in folio; “The Resurrection of Christ,” a grand composition, with an angel fitting before the door of the sepulchre, dated 1568, in folio; “Jesus on the Mount of Olives,” where an angel presents him with a chalice, dated 1584, and published in 1568, in folio, from Roffo; this, as well as the last, was published after the death of our engraver. “A Holy Family,” in large folio, after Raphael, engraved in 1582; a folio print of “Jupiter carrying Ganymede,” from the Vatican, by Raphael; two more: from the Vatican, on the same plate, of “The three Graces;” and “Venus quittino Juno and Ceres,” 1582; “The Adoration of the Magi,” a grand composition, after Rosso, dated 1574; “The Transfiguration,” marked with Alberti’s monogram, from the same master, 1574; “St. Stephen fioned,” an architectural design for a grand tabernacle, on two plates, Rome, 1575, in folio, all from Roffo; “The Baptism of our Saviour,” after Andrea del Sarto; “The Miracle of St Philip Benizio,” where those who had despised his exhortations were struck dead with lightning, from a picture by Andrea del Sarto, 1583; a folio print of “The Guardian Angel conducting the youthful Tobias,” from Pellegrino Tibaldi, 1575; “Our Saviour in the Garden of Olives, with his three Disciples,” engraved by Perin del Vaga, and Ch. Alberti, in folio; “The Nativity, or the Adoration of the Shepherds,” over head is a glory of angels, inscribed “Glia in Eccis,” in large folio, on two plates, from Thomas Zucchoro; another “Holy Family,” where the Virgin holds the Infant on a cradle, from the same master; “The Flagellation,” from a picture by T. Zucchoro, in the church of the Consolazione at Rome, in folio, dated 1575; “The Conversion of St. Paul,” a grand folio print, from the same master, dated 1575; “The Body of our Saviour in the Arms of God the Father, surrounded by Angels, with the Instruments of the Passion,” from the same; “The Assumption of the Virgin,” engraved in 1577, from T. Zucchoro, and dedicated to pope Ticoni, in large folio; another Assumption, a large print from T. Zucchoro, engraved in 1571; “The Virgin crowned in Heaven,” from the same master, engraved A.D. 1582.

We have already treated of the biography and merits of Lodovico Cardi, furnamed Ciovili, both as an engraver and painter. (See the article CARDI LUDOVICO.) His monogram will be found in our Plate II. of these of the Italian School.
Christopher Lederer was born at Nuremberg in the year 1560. He travelled to Italy in his youth, for the sake of studying the arts to advantage; and here, for some reason which has not transpired, he changed his surname for that of Coriolano, or Coriolanus. He resided at Venice for some years, where, according to Vasari, he engraved on wood a set of portraits of celebrated artists, a work which other writers have still more mistakenly ascribed to his son.

Now as these portraits first appeared in the year 1568, if Christopher was born in 1560, as Huber reports, and Bartholomew not until 1590, they could not have been engraved by either of the Coriolani. Again, he is said to have engraved the anatomical work of Vesalius, of which the drawings were supplied by Titian, but as this celebrated book first appeared in 1544, Lederer’s blocks must have been for some subsequent edition, if he cut them at all.

It appears much more certain that he engraved the figures for Ulysses Aldrovandini’s work on natural history, and for another book, entitled “Ars Gymnatica,” &c.

Bartholomeo Coriolano was the son of Christopher, and was born at Bologna in the year 1590. He learned the rudiments of art in his father’s house, but finished his studies in the Bolognese academy.

In return for the dedication to pope Urban VIII. of a capital work which he engraved on wood, after the Caracci, Guido, and other great masters, that pontiff bestowed on him a pension, and the order of knighthood. According to Papillon, our artist pretended to be a descendant of Cains Martius Coriolanus, the great Roman general, but this is most likely a mere joke, fabricated on the occasion of his military, or equeridian title.

He likewise engraved in chiaro-obfcurc, and his productions in that style are very much esteemed by connoisseurs. He had a good taste in design, his heads are finely characterized; and the other extremities of his figures are very well marked. In general he used no more than two blocks of wood; on the first he cut not only the outlines, but the darker shadows in imitation of hatching with a pen; the second served for the half tints; and with these two blocks, judiciously managed, he produced a pleasing effect. He signed many of his prints with his name at length, and the addition of the word Eques, which is known to be synonymous with knight. The following are among his most esteemed productions: “St. Jerome meditating before a Crucifix,” a small upright print from Guido; this is engraved on three blocks of wood, and inscribed “Bartholomew Coriolanus, Eques, filius, Bonon. 1607”; “Herodias with the Head of St. John,” also in chiaro-obfcurc, and from Guido; “The Virgin and Infant Jesus, asleep under Drapery,” on wood, from Guido; the same subject, in chiaro-obfcurc, very finely executed, both in 4to, and marked Barthol. fec. 1630; another “Virgin and sleeping Christ,” from F. Vanni, in chiaro-obfcurc, not marked, in large 4to.; “Peace and Plenty,” from Guido; “A Sybil sitting, holding Tablets,” both in 4to.; “The Fall of the Giants,” a large upright print, on four separate sheets which pale together, in chiaro-obfcurc; “The Seven Wise Men transported to Bologna,” in large folio.

The eldest Maria Coriolano, was the daughter of this artist, and learned engraving of her father, and painting of Elizabeth Strauss. We only know of a single etching by her, of “A Virgin and Child,” half figures.

Giovanni, or Jean Batifia Coriolano, was brother to Bartholomew, and was born in the year 1596, in Bologna; where he became the scholar of Valico, a painter of fame eminence.

As a painter, Batifia never acquired any great degree of reputation, but he engraved both on copper and wood, his works on the latter material being however greatly superior to his engravings on copper. The following may be reckoned among his best productions: a portrait of Vincent Guidi; another of Fortunatus Lietteus; another of James Cotinnus, Patricius Vercius, Coriolano, for all of whose dimensions; the figure of the Virgin in a palm-tree, commonly styled “Our Lady of the Palm,” before which is a small altar: “The Miraculous Image of the Virgin,” from Guido; “Christ crowned with Thorns,” from Ludovico Caracci; “A sleeping Cupid,” in chiaro-obfcurc, very rare, after Guido; a triumphal arch in honour of Louis XIII. in folio; “Paul Pauli Emblatam,” being a set of eighty-three prints, of which twenty-seven are by Coriolano, and the rest by O. Gato, and A. Parolini. There were two other engravers of this name, who lived some time about the same period, and probably belonged to the same family; but as their productions have nothing remarkable to recommend them, we will pass them over in silence. Giovanni frequented the Bolognese academy, and has engraved several things in a good taste. Of his prints could of allegorical and emblematical designs, frontispieces for books, and other ornamental plates; some of which he marked with a monogram, which will be found in our Plate 11. of those of the Italian Engravers. The following are among his most esteemed productions: “The Virgin with the Infant Christ seated on her Lap,” a small upright plate; “Venus threatening Cupid,” and “Venus challenging Cupid,” its companion, two small upright plates; “Hymen with two Lions at his Feet,” and “A Group of Genii,” from Ludovico Caracci, in folio.

Jean Frederic, the son of Matthew Greuter, of Straforburg, was born at Rome some time about this period. Our countryman, Strat, has entered into rather a lengthened argument with the foreign writers respecting the date of Jean Frederic’s birth, of which his merits as an artist do not appear to render him worthy. What does it signify when or where men are born, who are possessed of no greater talent or taste than this engraver? or whether or not there was a Frederic and a Jean Frederic also?

The son of Matthew Greuter, of whom we have given some account in our GERMAN SCHOOL OF ENGRAVING, resided at Rome, being educated to the profession of engraving by his father. Here he engraved a considerable number of plates with commendable industry, working with the graver only; but he neither drew well, nor polished feeling for art that might in any degree supply the place of drawing; yet his prints, of which we shall only mention a few, are sometimes bought after by the curious. Heracles in the Garden of the Hesperides,” from Pietro da Cortona; “The Forge of Vulcan,” after Lanfranc; and “A Battle,” from Tempell, both in large folio. “The Death of St. Cecilia,” after Dominichino, a large plate, nearly square. An emblematical subject relative to the progress of Christianity, a large folio print, from Roma; and “A Madonna and Child, with St. Francis kneeling,” from a composition by himself, arched at the top, of folio dimensions, and dated 1653.

He also engraved several portraits, and other subjects from Guido, Vouet, Stolla, And. de Ancon, and other masters.

Francesco Vanni, a very celebrated historical painter, was born at Sienna A.D. 1563, and died in the fame city in 1598. He was first the disciple of Salimbini, afterwards of Piazzotti, and at last of Giovanni de Vecchia; though in preference
preference to all thee, he adopted the style of Fred. Bar-rocchio. We have four small etchings by him: the Spirit, beauty, and correctness of drawing that appear in these prints, makes it to be regretted that he etched so little. The subjects of these etchings are as follow: "The Virgin contemplating the sleeping Christ"; "St. Catherine of Siena receiving the Stigmata"; "St. Francis receiving the Stigmata"; and "The Extatic Virgin of St. Francis," the faint is a half figure, and an angel appears above playing on the violin. Huber says that the beauty which is discoverable in this print cannot be too much admired. Agostino Caracci engraved from the fame design, with some variations.

Giovanni Maggi, or Magius, was born at Rome in the year 1566, and is better known as an engraver than as a painter; we have by him many fine etchings, which are not worthy of any very great commendation. In 1575, he published a collection of all the principal fountains in Rome, which he engraved in conjunction with Domenico Parachi. He undertook to engrave, on a very large scale, the plan of Rome, with all the streets and principal buildings, &c. but wanting money, the enterprise was never performed by him. We have by him, the portrait of a cardinal, as large as life; a landscape, with figures, ruins, &c. inscribed "J. Mauis, et fec. 1575."; and "Figura della Vita di Matteo, Joh. M. fec. 1607." in large folio.

Francesco Villamena was born at Allifiti, a city of Italy, in 1566, and died at Rome in 1626. He went to Rome under the pontificate of pope Sixtus V, and studied the best pictures and statues there. He flourished engraving under Cornelius Cort and his scholar Agostino Caracci, with whom he was contemporary. Villamena drew with considerable ability; he engraved in a bold open style, and produced a clear but not powerful effect; his lights, though broad, are too much spread over the whole engraving, which makes his prints appear unfinished. But this defect was common to the artifices of that age, and these faults in the prints of Villamena, are amply compensated by the beauties with which they abound, particularly with regard to the expression of the heads, and the excellency of the drawing. The extremities of his figures are also very finely marked. Some of the engravings of this artist are performed almost entirely with single strokes, without any crofs hatchings laid over them; and it was perhaps from them that Mellan originally took the hint, which afterwards became the marked peculiarity of his style. The number of Villamena's prints is very considerable: M. Mariette mentions three hundred and eighty; and he marked them either with his name, initials, or monograms, which will be found in our Plan II. of theo of the Italian School, we shall mention the following, from his own designs; a portrait of cardinal Cesar Barocci Soranus. in folio; and four other portraits of men of rank; "St. Therese in her Cell writing, under the Inspiration of the Holy Ghost," in folio; "Mary M. lies penitent at the Defert, crowned by an angel," in 4to. "St. Francis praying before a Crucifix," in folio; a set of six great fine little figures, on which is a beggar, accompanied by two children; a set of five figures, three of which are from his own design, and the two others from Ferrar Franzoni, in small folio; "St. Janes, appearing in the Air, to the Army of Ferdinand," a very grand composition; "A Man, angered by a Crowd of People, lighting in his own Defence," a large print, lengthways, commonly called The Boxes; a moderately-sized plate, in which is represented Joana Alto, the antiquary, standing in one of the streets of Rome. The following prints are

From various other Masters. "Moles exciting the Brazen Serpent," from Ferrar Franzoni; "A Holy Family, with St. John, Elizabeth, and St. Ann," a middling-sized upright plate from Raphael, dated 1602. Villamena repeated this print, and dated the second print 1613. "The Salutation of the Virgin," a large upright plate, from M. Arconati; "The Virgin and Infant Jesus worshipped by St. Francis;" "St. Bruno, with his Companions, donor Penance in the Desert," a large plate hanging from Lantefinis; "Christ taken from the Cross," a large folio plate, arching at the top, from Barocchi; another "Annunciation of the Virgin," a grand composition from Hans, Andreafus, in large folio; "The Presentation in the Temple," a middling-sized plate lengthways, from Paolo Veronece; "St. Bernard, and the Virgin in the Clouds," after F. Vanni; "Alexander at the Battle of Arbella," from Art. Temple, as a large plate, lengthways, representing all Heroic holding the Globe, with the armorial bearings of Cardinal Arconati," from A. Lerii; and another of the same kind with the arms of Cardinal Barocchi; the same subject with the arms of Spain, all which are of large folio dimensions; the battle of Lepanto in twenty plates, fifteen from the Old Testament, and five from the New, including La scena Genii figura della Rabbio, instagita da Francesco Villamena, dedicata al Cardinale Aldobrandino, Rom. 1626.

Leonardo Norfini, who assumed the name of Parafiole, from its being the family name of his wife, was born at Rome in the year 1575, and died in the same city, at the age of sixty; He was an engraver on wood of fame, and was much employed by A. Temple. At the command of pope Sixtus V, he engraved the plants, &c. for the herbal of Caflor Durante, the physician of that pontiff. The figures in Norfini's engravings, after Temple, are correctly drawn, and executed in a finished style, for that mode of art.

His son, Bernardino Norfini, likewise engraved on wood; he frequented the school of Jouphine, and began to make fine proofs in painting, when he died at an early age.

Isabella Parafiole, the wife of Leonardo, was a woman of great ingenuity, and composed a book of patterns for lace and embroidery, of the prints in which she engraved on wood. She likewise did a great number of plants for a herbal of prince Cesi of Aquaparta.

Jeroninio Parafiole, a lady of the same family, equally distinguished herself by engraving on wood; and there is by her hand a large print of "The Battle of the Centaurs," from A. Temple; it is coarsely executed, though with much spirit; but the drawing is not correct.

Odoard, or Edward Fialletti, was born at Bologna A.D. 1573, and died at Venice in 1638. He learned the rudiments of design of J. B. Cremensi, but afterwards travelled to Venice, and finished his studies in the school of Tintoretto. He was an historical painter as well as engraver, and his works in both arts are spoken of with the warmest commendation; Boccioni mentions thirty-eight pictures by Fialletti, which he painted for churches and other public buildings in Venice. He etched a great number of plates as well from his own designs, as from those of other artists. His etchings are executed in a light, but not exactly style. He drew correctly, frequently selected or invented very graceful attitudes, and composed his figures with much taste. If he had left no other mark of his merit than he preserved, they would have been sufficient to prove that he was a man of very great ability. He generally marked his etchings with a cypher, which will be found in our Plan II. of the Italian School. He shall mention the following productions of his genius, as well worthy of the notice of the connoisseur. A long etch from his own composition of Tritons, sirens,

Guido Reni, the celebrated historical painter, was born at Bologna in the year 1575; and died in the fame city in 1642. He learned the elements of drawing from Denis Calavart, whom he quitted, to study in the Bolognae academy. But of his great talents as a painter we shall treat under the article Reni, and have only to notice him here as an engraver.

There are a great number of prints by his hand, which are etched in a bold, free style. His heads are beautiful and expresive, and the other extremities are drawn with all that taste and judgement which might be expected from so great a master; though these are very slightly executed, their intrinsic beauty, and the vigorous but discriminating intention of the artist, is what is everywhere apparent to the eye of taste, and has in Countless cases, and entirely justified the Cece of the unwary connoisseur; but in general, the extremities of the figures in the plates of Cantarinis, are not marked that with admirable taste fo discernible in the works of Guido.

He sometimes marked his plates with his name, or monogram, which is among those of the Italian engravers in our Plate II. The following are among the productions of his hand, the whole number of which, according to Mariette, amount to two hundred and eighty-nine.

From his own Companions.—A bust of pope Paul V. in oval, very rare; the profile of a man; another, with a long beard; "The Virgin with the Infant Jesus, with St. Joseph in the back ground," in 4to. one of the finest engravings of Guido; "The Virgin with the Infant Jesus asleep at her Breast," a subject which Guido has treated in three different ways; another "Virgin and Child, with a Book;" the only plate which Guido has executed entirely with the graver; three other holy families, represented in different ways; "St. Christophe, with the Infant Jesus on his Shoulders, going over the Sea;" "St. Jerome praying before a Crucifix, in his Cave," in 4to.; "Cupid contemplating a female Figure, who holds a Compsa and Tablet;" "Two Children carrying a third on their Shoulders," in 4to.

The following are after other masters: "A Glory of Angels," after Lucas Cambiili, in folio. This print is reckoned Guido's master-piece. "The Entombing of Christ," a middling-sized upright plate, from Parmegiano, a very fine print; "The Infant Christ sitting on his Mother's Lap, laying his Hand on the Tabernacle, with St. Joseph," from Ang. Caracci, safely attributed to Annibal, in 4vo.; "The Virgin Mary buckling the Infant Jesus," from Caracci, in 4to. executed on a blank ground; "The Charity of St. Roch," dated 1612, in large folio. These are the principal engravings of Guido, of the whole of which Adam Bartfch of the library at Vienna has given a very good catalogue.

For an account of Francesco Brizzi, the pupil and assistant of Agostino Caracci, see the article Brizzi; and for the biography of Horace Borgiani, who lived also at this period, see Borgiani. The monogram usually affixed by the latter to his engravings will be found in Plate III. of those of the Italian School.

Raphael Scaminco, or Schaminoffi, was born at Borg S. Sepolcro in the year 1580. He was the disciple of Raphael dall Colle. He performed some few engravings on wood; and there are a considerable number of etchings by him.—Florent le Compte fays a hundred and thirty,—which are executed in a bold dark style. There is a coarseness in them, which gives them a disagreeable appearance at first sight; but on examination, they will be found to possess great merit. His knowledge of drawing seems to have been very extensive; and the characters of his heads are striking and appropriate. His monogram is copied in Plate III. of those of the Italian School.

The following are some of the best productions of his needle: "The Virgin and Child," a middling-sized upright, inscribed "Raphael Schaminoffi, Victor ex Civitate Birgi Sancti incipit, A.D. 16.5;" "St. Francis preaching in the Desert," from his own composition; a set of the twelve Apostles, a set of fourteen small plates, lengthways, intitled "Mytheria Rofarii beate Marie Virgem," published at Rome, 1609, all from his own designs; the fifteen Mysteries of the Rotary, in folio; "The Martyrdom of St. Stephen," a middling-sized plate, lengthways, from Lucas Cangiagi; "Mary Magdalu carried away by Angels," after the fame, in folio; "The Visitation of the Virgin," from Barboccio, in folio; a middling-sized plate, lengthways, from the fame master, of "A Re- po;" "The Holy Virgin in the Clouds, with St. Cecilia, and another Saint," from P. Veronese, in folio; "The Virgin Mary on a Globe, surrounded by Angels," from B. Cellati, in folio; a set of twelve wood-cuts of the twelve Apostles; another set of portraits of the first twelve Caesars, from Tempelli, also engraved on wood.

Jean Lanfranc. This distinguished artist was born at Parma A.D. 1581, and died at Rome in 1647. He first studied under Anguillino Caracci; but on the death of this master, went to Rome to complete his studies under his brother Annibale, where he was knighted by pope Urb. VIII.

His merit as a painter will be treated of under the article LANFRANC. We shall speak of him here only as an engraver.

The mode of art which he practised was etching, and his etchings, though bulky productions, possess merit. He commonly marked his plates with his name, or initials, but not combined in a cypher; and his most esteemed prints are mentioned in the following short list: „The Triumph of a Roman Emperor," in large folio; "An Emperor haranguing his Soldiers," the fame; the Bible of Raphael, from pictures in the Vatican, engraved in conjunction with Silio Baldocchioc, (of whom we shall next proceed to speak,) and dedicated to Annib. Caracci, 1667, in 4to.

Silio Baldocchioc was of the family of Rafa, born at Parma in the year 1581, and died at Rome in 1647. He was the contemporary and fellow-student of Lanfranc. There are some pictureque little etchings by him, in which we discover correctness of design, and facility of handling his tool. He marked his prints, of which those that follow are held in most esteem, Silio B. "The Statue of the Lacoecum, from the antique, in large folio; "The Apostle and the Angels, with the Chandeliers of the Cupola of Parma," from Correggio, six plates in folio; "A Holy Family, with St. John," a small upright plate of half figures only; Raphael's Bible, from the pictures of Raphael.
ITALIAN SCHOOL OF ENGRAVING.

Raphael in the Vatican, small plates, lengthways, engraved conjointly with Lar franc.

Octavius Leonis was born at Rome in 1542, and, under the instruction of his father, he acquired some degree of excellence as a painter. As an engraver, he is believed to have been self-taught; for, excepting the hints which he might have borrowed from Bohlauer and Agostino di Venereo, he imitated none of his predecessors. There are a set of twenty portraits, chiefly of distinguished artists, from his hand, engraved in a singular and striking manner. The hair and draperies are executed withrokes; the flesh is done in round dots; and the dark parts of the eyes and sharp shadows being affected with strokes, which are managed in a skilful manner, produce a pleasing effect. These heads are finely drawn, and some of them finished in a much higher style than is usual with painters, when they take up the point or the graver. The following are among the portraits: Esques Octavi Leonis, Lodovico Leonis, Johannes Carcioffis Barbiuri, Marcellus Provenzalins, Eques Christophler Ronchalis de Pomeraninis, Eques Joseph Citar Arpinas, Antonius Tempelr, Thomas Salinus, Don Antonio Barberinus, Pierre Jacopo Martello, a poet, whose portrait is adorned with pastoral allusions.

Remigio Cantagallina was born at Florence in 1570, and died in the same city A.D. 1622. He for some time frequented the school of the Carracci, but afterwards entered (with his two brothers Antonio and Giovanna Francisco) in the engraving of Julio Parigi. Remigio drew extremely well with a pen and ink, and sometimes, with great good fortune, imitated this mode of art in his etchings.

His etchings are chiefly after his own designs, though he sometimes engraved after other masters; and it is no small addition to the fame of this artist, that Callot and Della Bella were his pupils. The cypher which he commonly used is copied in Plate III. of the monographs of the Italian School. We shall specify the following of his works: "The Assumption of the Virgin, wherein she is crowned by two Angels," in 4to., after Callot; four small landscapes, dated 1629, from Rossi, a set of five landscapes; another set of twelve, in octagons, with the cypher of the artist; another set of six; another set of nine and twenty prints, the scenes of an opera; and the representation of the feet given on the Arno, at the marriage of the prince of Tuscany, from the designs of Julio Parigi, in folio, 1593.

We now approach two artists, both of them disciples of Cantagallina, of a very different kind from any of their predecessors, of more enterprising spirit and more original powers, if not of more vigorous intellect, than the schools of Italy have yet presented to our notice; but having already treated of the biography and professional merits of Callot and Della Bella, (see the articles BELLA and CALLOT,) before our classification of the engravers into the several schools of Europe was determined on, we can do little more in this place than add more copious lists of their very estimable engravings.

The number of Callot's engravings, considering the short period of his life, is not less wonderful than the various multitudes of figures by which some of them are peopled. The best catalogue with which we are acquainted is contained in the third volume of the Baron Heinrickin's Dictionary, from which we have extracted the principal, in conformity with our plan.

Subject from Holy Writ, and the Martyrdoms of the Saints:—"The Passion of the Red Sea," in 4to., of which four plates are defaced of pressing each of the two different plates in which the plate was printed. "Elia and the widow of Sarapha," "Ecce Ancilla Domini," or "The Annunciation," after Matteo Roselli, in 4to. This is a rare print, and is distinguished from another of the same subject, called "The Passion," as well by its being without the engraver's name, as by its Latin inscription "St. John preaching in the Desert," 410. "The Parable of the Prodigal Son," with a Latin inscription, 4to. This plate is solely the work of the graver. "Ecce Homo," after Stradan, 8vo., engraved at the age of eighteen. "Christ bearing the Cross," a small oval, engraved on a silver plate. "The Crucifixion," with the Virgin, St. John, and Mary Magdalene, embracing the Cross, in flat and mere print. "The Entombing of Christ," after Veronese, 4to., the work of the graver alone. "Our Saviour with the Disciples at Emmaus." "The Virgin Mary with the infant Christ," an oval. Another, wherein the Virgin is embracing our Saviour, 4to. Another of the Virgin, after Andreo del Sarto, wherein is introduced St. John and Elizabeth, 4to. Another, after P. Farinati, with the infant Christ and St. John, folio. "Our Lady, with three Ears of Corn," 4to. A Holy Family, dedicated to Minerva et majusor, &c. 4to. Another Holy Family, after Saller, in 4to. entirely performed with the graver. "The Assumption with the Cherubins," 8vo. There is another of this subject, called "The little Assumption," in an oval. "Benedito," another Holy Family, 4to. "The Triumph of the Virgin," folio, dedicated to Charles IV. duke of Lorraine, and Bart., folio. "St. John the Evangelist in the Isle of Patmos," in 4to. nearly square; "St. Francis?" of this subject there are two engravings, one known by the name of "The little St. Francis of the Tulp," and the other termed "The Tree of St. Francis," at the foot of which are several monks at prayers, 4to. nearly square; "The Temptation of St. Anthony," the first plate of this subject, (which is a large folio,) is dedicated to Mefi-Philippeaux de Valverie, beneath it are Latin verses with his coat of arms, and it is dated in 1675.

As Fufeli has painted three pictures from the same fairy scene in Shakespeare's Midsummer Night's Dream, to Callot, to show that his imagination was far from being exhausted on the subject of the temptation of St. Anthony, has engraved a drier plate from this celebrated legend, which is very considerably varied from that of which we have spoken; and, though not the best, the second is by much the fairest print of the two; for the plate, having been materially damaged by accidental contact with some acid, a good impression, before the accident, is now rarely to be met with. "The Martyrdom of St. Laurence," a small oval; "The Martyrdom of St. Sebastian," this is a large and grand composition, in form of a frieze; "St. Nicholas preaching in a Wood;" "The Miracle of St. Man facets;" this is reported to be the earlier of Callot's etchings, it is in folio, and the bas-reliefs are executed by broad and coarse hatching, and almost, if not quite, very large; in it is re-entered, with the guards of St. Man facets, a bishop of Tours, who is here represented as restoring to life the son of king Leucarue, who had fallen into a river in reaching for his tennis ball. "The twenty-three Martyrs of Japan," in 8vo.; "The first Pilgrimage, or carrying the Holy," a small plate, for which Callot himself is said to have entertained a great particularity, that he occasionally wore it, as some of the former orders of nobility are worn, fastened from a button hole of his waistcoat. The proofs which were taken before the plate was perforated to admit the ribbon or string are rare, and esteemed valuable among connoisseurs. "A Nun kneeling before a Crucifix," in 4to.; this piece is known by the name of "Santa Teresa," but it appears from the inscription that it is the portrait of Maria Vittoria, the foundress of the convent
ITALIAN SCHOOL OF ENGRAVING.

4. "Galeria Medicina," are not esteemed the best. "The Great Miseries, or Horrors of War," these admirable compositions are a set of eighteen 4to. plates, and were published by Israel in 1653. They were followed by "The Lesser Evils of War," on seven 8vo. plates, including the title, (which is by Ab. Boffe,) published in 1656. "Military Exercises," on fourteen small plates, published also by Israel. "Combat at the Barracks," a set consisting of eleven plates including the title. These prints are of different forms and sizes. They were originally published by Callot himself, at Nancy, in the year 1617, but have since undergone some alterations; the work is in 4to. "Naval Engagements," the combat of the victories gained by the grand duke of Tuscany over the Turks, and are also in 4to. dated 1617. "Seven Tilting Pieces," in 4to. engraved at Florence, four only of these bear the name of Callot. "Jousts and Tournaments," a set of five spirited prints in Callot's best manner, in 4to, of which the subjects are, 1. A plan of the Jousts and Tournaments. 2. A battle enclosed within oval lids, inscribed "Une degradation, &c.; 3. Several squadrons in battle array, enclosed in a similar manner, and inscribed "Mostra della Guerra, d'Amore," 4. Parties of cavaliers racing in a circle; 5. Four triumphal cars characteristic of the quarters of the globe, drawn by appropriate animals, and inscribed "Carra del Alba," &c.; they were published at Florence, and are after the designs of Callot's first Roman master, Giulio Papi. "La Guerra d'Amore," consisting of four 4to. plates, from the designs of the same master. They represent the ballets, &c. celebrated at Florence on the occasion of the arrival of the prince of Urbino, to see the grand duke and Tuscan nobility on the plain of St. Croix.

Provinial and Miscellaneous Subjects.—"The Giants," a large folio plate, in which Callot has introduced an assembly of the heathen deities, Temple of the Muses, &c. "The Giants struck by Jupiter's Thunderbolts," in folio, of the oval form, and now very scarce. "Pandora," a folio plate. The gods are here represented as assembled on Olympus, with Jove armed with thunder on his summit. "Catafalque de l'Empereur Mathias," a folio plate, dated 1619, and inscribed "Effigies celebrati in Florentia," &c. "A Gambling House," a folio plate, the subject a night-piece, with gamblers; Callot afterwards repeated this engraving, reversing the right hand to the left. "The Punishments," in 4to. this is regarded as one of the chef d'œuvres of the master, not only on account of its intrinsic merits, but of the great number of figures contained in it, of the composition and grouping of which we have already spoken. Its subject is the execution of various criminals. In the most perfect imitations of this plate, a small square tower appears above the houses, a little to the left of the middle of the print, and a very small image of the blest Virgin, is placed at the angle of a wall which forms the corner of a street, and is also near the middle of the engraving.

The following are generally known among collectors by the name of the three ovals; "The Abduction of the He-goat or the Sabbath;" "An Altar, with two small Figures at Prayers;" "A noble Female, standing before the Throne of an Emperor;" "L'Eloge della Regina di Spagna," containing twenty-six plates in 4to. after Ant. Tempesta. Of these Callot himself engraved only eight, the remainder are by Tempesta himself, or by anonymous artists; "The Whims or Fantasies" of the noble Jacques Callot, fourteen small plates of whimsical subjects, published by Israel in 1653, "Caprice de divers figures di Jacobo Callot in aquafortis," on sixteen small plates engraved at Florence: "The Caprices," which are copies, of an engraved at Nancy.
ITALIAN SCHOOL OF ENGRAVING.

Nancy. Beneath the title of the latter is inscribed "exced. Nancy," but the Florentine set is executed with superior taste and feeling; "Varie figure di Jacobo Callet, on seventeen small plates, including an historical title; " Balli di Stefania," on twenty-four small plates, including an historical title; each plate contains three figures; " Varie figure Gobbi di Jacobo Callet, fatte in Fiorenza," a set of sixteen small plates, generally called, in England, the Hunchbacks, or Pigmies. This is a droll set, and as the author may be said to have here presented us with a back view of nature, the title page is a figure who flew his posterior. Callet repeated this set with some variations "Les Guerra di Callot," twenty-five plates in 8vo., which are much sought after by connoisseurs. On a piece of drapery in the title page, is inscribed "Capitano di Baroni;" "March of the Bohemians," on four 4to. plates in form of frises. These are probably done from his lively recollections of the gang with whom he first travelled from Lorraine to Florence; "Nobility, or the Fashions of the Times," twelve plates in 8vo., on which are portrayed six of either sex with very amusing backgrounds.

There are four other similar prints, but of a larger size, by Callet, which are very finely executed, and which conflict the costume of the interior orders: 1. A Woman in a Corset trimmed with Fur 2. A Villager spinning. 3. A Countrywoman walking with a Basket on her Arm. 4. A Woman with her Face seen and Petticoat turned up. "Tragedia del Co. Bonarelli," on sixteen quarto plates, with a portrait; "The three Interludes of Florence," in 4to., after Giulio Parigi. These represent a festival given at Florence during the carnival, and are rare, particularly the two latter; the plates for "A Voyage to the Holy Land," confiding of forty-eight in 8vo., which Callet engraved for a Grey friar, with whom he had formed a friendship, and who published this voyage; "The Twelve Months of the Year;" these twelve prints are rare; they are after Jodogus de Monper, in 4to., and solely the work of the graver; "The Four Seasons," in 4to. extremely scarce. These prints are copied from four engravings which the Sadlers engraved after Baffani; "The current Coin of Germany, Italy, &c.," ten sheets, engraved at Nancy for Gallon of France, and published at Paris by Israel Silvestre in 1662; "A Woman sitting in a Field," a child in her arm, and another eating fruit, is seated under a tree, a small engraving, and very rare; two small prints, called by the French collectors "Deux Fillettes affiches," and "Deux Dames qui se promenent," are also rare; "Two Females habited an Allemande;" "A female Gardener with an Asf;" and "An old Man, accompanied by a little Boy," are small plates, with landscape backgrounds.

The following farcical subjects are executed on small plates, in the same style as the celebrated "Beggars" by this artist, and with equal spirit, viz. "A comic Figure," (a fort of Falstaff, with a large belly and wearing a sword); "Two Harlequins," who are dancing in grotesque attitudes; and "A Building;" "A Scaramouch," and "A Pierrot," three plates with theatrical backgrounds; "A Comber Merchant," another comic figure, bearing a pedlar's pack on his back, and holding a comb in his hand.

Topographical and other Landscapes. — "View of the Louvre, with the ancient Tower of Nelle," a folio plate; "View of the Pont-Neuf at Paris," ditto. These are of the best of Callet's landscapes. Another view of the Pont-Neuf was engraved by our artist in 1629, in which the ground was etched by Silvestre. This is a 4to. plate, and the impressions which are (on account of their rarity) most in esteem, are those which were taken before Silvestre touched the plate; "The Parterre of Nancy," where many persons are walking, a piece in the long and narrow form of a frieze; "The Garden of Nancy," an extremely rare print, inscribed J. Callet, inv. et fec.; "La Carriere," the new street of Nancy, in which is introduced a careful and tinting manner. This is also in the form of a frieze, and is earlier in preference are without the name of Silvestre; "La petite Place de Sienne," in 4to. "The Great Fair of Marigny del Faggettetta," called in England "The Great Fair of France," an account of its having been engraved in that city. It represents a fair which is annually held in honour of the miraculous conception; and is esteemed one of the most capital, and is one of the largest of the engravings of Callet, being in length twenty-six inches and sixteen in height. It consists of a bird's-eye view over a vast area, which is terminated by the church of the holy Virgin, and more remotely by distant mountains. Within the area thousands of figures, grouped with appropriate taste and skill, are engaged in all the varieties of business and entertainment which is presented by an Italian fair held under a gemalik. It perfectly suggested Milton's idea of "The busy hum of men;" and is in truth a surprising production, such as modern art, and modern attention almost would seem from in despirit. Yet so superior was the patent activity of the public of two centuries ago, and the patent skill of our artifit, that Callet copied this print, on account of the great demand for it, and even, as some authors have asserted, engraved a third plate of the same subject, with some slight variations. The first plate, which was published in the year 1629, is distinguished from the second, by the words "in Florence," which appear below at the right hand corner of the margin of the plate, whereas in the second plate, the words in the same part of the margin are "ze Florenti aet exculptis Novi," which latter word has occasioned it to be contradistinguished among connoisseurs and dealers, by the title of "The great Fair of Nancy." The first plate may also be known to persons of taste and discernment, from the second, by its superior style of execution: there is a certain spontaneity, the result of original feeling, in the first, which could not be copied even by the author himself, without some symptoms of restraint. The scarcity of good impressions also makes it bear a much higher value than the copy: for as it was far less successfully corroded with the aquafortis, the number of good impressions which the plate produced was much more limited.

A third plate of this subject is mentioned by Roux and Huber, but the present writer has not seen it, nor does it appear to have been seen,—at least it is not mentioned—by Strutt. Perhaps the copy by Savery may have led their authors into error on this point. The copy may easily be known from those by the hand of Callet, by its inferior merits, and by its being reversed. "La petite Foiere," (the little fair) otherwise called "The Players at Bowls," is not properly the representation of a fair, but of a village fête: Peasant are dancing in a ring, and the musicians are seated in a very large old tree, which has all the appearance of being a portrait. The players at bowls, are a group at the right hand corner of the print. Strutt says, that "this is one of the finest of Callet's works, and it is very difficult to meet with a fine impression of it, for the dilution and other parts of the plate failed in the biting." It is an oblong folio, and the proof impressions, which, of course, are much sought after, are before the name of Callet was engraved. "A landscape, in the front of which are two pinnacles. It is in 4to., and without the name of Callet. "A large Hunt;"
in the ordinary impressions of this plate, the small and dillent wild bear haunt is scarcely seen. It is a folio, and of the frieze proportions. "A double Rock in the Middle of the Sea," on the top of this double rock are two eagles with a banner, and an inscription in honour of Columbus, in 4to.; "The two jolly Mariners," a well executed plate, in 4to.; four landscapes, lengthways, in small 4to.; "The Grand Théfe," two emblematic plates in folio, dedicated to the duke of Lorraine; "A Vine Arbor," a small 4to. plate, the subject of which is a fete before the door of a country public house, with an inscription on the margin, signifying that this is the leaf plate engraved by the late Jacques Callot, to which the aquafortis was not applied till after his decease; from which it may be presumed that the death of our artist was somewhat sudden.

The following Portraits are also from the graver or etching needle of this distinguished engraver. Colmo III., grand duke of Tuscany, in an ornamented oval. François, grand duke of Tuscany, ditto, in 4to., very rare. Charles III., duke of Lorraine, in 4to. rare. Louis de Lorraine, prince of Paléolus, on horseback, 4to. Louis Marquis de Marignan, a general in the service of the emperor Charles V., 4to. Donatus Antelopenis, senator, commonly known by the name of "The Senator," in an oval, 4to. rare. Charles de Lorme, first physician to Louis XIII., in an ornamented oval, 4to. Giovanni Domenico Peri d'Archidoffa, in an ornamented border, commonly known by the name of "The Gardener," in 4to.

The reader may perhaps be pleased to be informed that a small portrait of Callot himself has been drawn and engraved by Michael Lasne. It has the following inscription, "Jacobus Callotus Nobilibs Lotharingius Caleographus."

The engravings of Della Bella are little lis numerous than those of Callot; though the largeness of Callot's exceed the dimensions of any of those of his successor. Their merits were in many respects very similar. If with the elegant lightness of form and exquisite taste of Della Bella, we see more in the fairy land of engraving, Callot posseffed more perflcility, more firmness of outline, and greater powers of composition; yet they are twin brothers in point of excellence, and, to the present heir, unrivalled in their department of art, though it must be allowed that Mons. Berthaud, the Parian, has, of late years, done fame very near approximations toward the merits of Callot and Della Bella. We are enabled to add the following list of select prints by the latter, to the fancy list of Strait, which the reader will find affixed to our biography of Della Bella:—

A portrait of Della Bella, sketched in the Perian habit, drawn and engraved by himself. Other portraits of Sigismund Boldrini, a noble Milanese; Mount-Joy St. Denis, king at arms, with a grand funeral procession in the back ground; a very rare print, in 8vo.; Horace Gonzales, in an oval; likewise very rare. Ferdinand II., emperor of the Romans, in folio. Bernardo Ricci on horseback, known as "Il Tedeschino;" Ferdinand II.'s juler, in folio. St. Antonii, archbishop of Florence, kneeling on the clouds, Della Bella's earliest engraving.
ITALIAN SCHOOL OF ENGRAVING.

grand subjects of battles, 1 A naval combat before the siege of Ré; 2. The defeat of the English in the battle of Ré; 3. The defeat and capture of general Louis, with a plan of the battle: these three plates were drawn and engraved by Della Bella, for the book of Valdor, entitled "Triomphe de Louis le Juple;" twelve prints of Moors, Hungarians, Latins, and Africans, on horseback, in corsi, with very fine backgrounds, in 1400; a set of sixteen small square subjects, representing warriors, hunters, shepherds, and peasants, &c. very rare, and attributed to Carlot; another set of eighteen, intituled "Raccolia di rari capricci, nuove intenzioni di Carstelli e Oramonei, possi in lucid siglo. Stefano Della Bella," of different sizes; another set of twenty, intituled "Vues d'édifices et de nombreux lieux" de Paris, by J. C. Della Bella, under his unfortunate malady, and finished by his pupil Galli-Brecci.

Antonio Francesco Lucini was also of Florence, and born in the same year with his countryman Della Bella, from the study of whose works, and those of Collet, he appears to have formed his style. His plates are marked with one or other of the monograms which will be found in our Plate III.

His principal works are a set of sixteen very rare prints of the battles and assaults of the Turks during the siege of Malta, from the pictures by Mattia Perse de Alesio, and a set on the Arno, of folio dimensions, after Della Bella, dated 1604.

Francesco Cozza has been already noticed as an historical painter in fætco. (See Cozza.) His prints consist of spirited etchings, in which the manual part is executed with more neatness than has often been attained by painters. In "St. Peter's Conscription," he has shown much good drawing, though the print is flight. The works we shall mention from his hand are: "A penitent Magdalene," and "A Roman Charity;" they are all from his own compositions, and of folio dimensions.

Cesare Baffano, or Baffani, was born at Milan in the year 1584. Under whom he studied, he has not been ascertained. He worked entirely with the graver, and his style bears considerable resemblance to that of Corolino Cort.

The most considerable work in which he was engaged, and which he executed in conjunction with Falcardo and Chamblerlano, is a set of sixteen plates, entituled "Il nuovo Senato di Giaeta," a very rare work, which both chesnek and Strutt have omitted to mention. It consists of heads of the Virgin Mary, Jesus Christ, and the Apostles, selected and engraved from pictures of the very full celebrity. The other known engravings of Baffano are: a portrait of Gasparo Astellina; an architectural Frondipiece for a work by Francis Pucolino, in folio; and "The Nativity," of the same dimensions.

His coadjutor Chamblerlano, or Chamblerlano, was originally a doctor of laws, but quitted the study of jurisprudence for that of engraving. The cypher which he affixed to his prints will be found in Plate III. of the monograms of the Italian School of Engravers; and we have already mentioned the leading events of his life under the article CAMBERLANO.

The principal engravings by this artist are: "A dead St. Jerome, lying on a Stone," after Raphael; a set of ten plates, after different masters, in folio, consisting of devotional subjects; "Angels holding the Instruments of the Crucifixion, Passion, &c." another set of fourteen, in small folio, after Raphael, of "Jesus Christ and the Apostles;" "Jesus Christ on the Mount of Olives, comforted by an Angel," from At. Calomini, in folio; "Jesus Christ appearing to Mary Magdalen in the Garden," etc.; "A leaf of fætco," 1615, in folio; two subjects of plates, dated 1688, in large folio.

Francesco Barbiere—Guercino da Cento is the name by which this justly celebrated painter is most commonly known; for an account of whole great merits as a painter, see the article BARBIERI GIOVANNI FRANCISCO. As an engraver, he has left but few memorials behind him; but those are executed with great freedom and spirit, in a manner much resembling those admirable drawings of his with a pen, which are held in such high estimation: "St. Anthony of Padua," "St. Peter in Grief," both half length, inscribed "Jean F. Barbieri f. 14.," in folio; "St. John," the same; "St. Jerome before the Crucifix," a portrait of a man with a hat on, and a curled beard; portrait of a man with curled hair; and a bust of a man in an elegant costume, all of folio dimensions; are probably all the prints that Guercino ever produced.

Lucano Borrioni was born at Genoa in the year 1592, and died in the same city in 1645. He learned the elements of art of his uncle Philippe Bertolotto, and Cesare Cort. His pictures possess much merit, are well colored, and carefully executed. He painted with the same facility in oil as in fætco; and whilst painting the ceiling of the church of Santa Maria della Navicella, he unfortunately lost his life by a fall from the scaffold.

He left three sons, all artists, among whom Francisco Marie distinguished himself most, by painting landscapes and marine subjects.

Borrioni etched many of his own compositions with a considerable portion of talent, among which the following will probably be found to possess much merit: a portrait of Guillemard; "St. Peter delivered from Prison," "The Vulture preying on Prometheus," all of which are in folio. Some Holy Families, Madonnas, and other devotional subjects, constitute the remainder of his works on copper.

Vincenzo Strada was the son of a Spanish painter of some eminence, but was born at Rome in the year 1591, during the residence of his parents in that city, where he died at the age of thirty-six.

His works consist of etchings from his own compositions, executed in a painter-like style; flight and rapid, but marvellously free. Those held in most estimation are: "Pompea Pilate, producing Christ to the People," half figures, in small folio; the fama subject, of the upright form; "St. Catherine adoring the Infant Christ," in folio; "Christ crowned with Thorns," in smail folio; "The Holy Family, with St. John," ditto; "The Holy Virgin supported by Angels," which are generally marked with the initial letter of his name.

Of Alessandro Algarodi, a Bolognese artist, who lived at this period, we have already treated. (See Algarodi.) To the engravings we have mentioned by him, the collector should add "The Cries of Bologna," consisting of eighty 4to. prints after Caracci, engraved by Algarodi, in conjunction with Simon Guain.
The etchings of Spagnoletto (for an account of whose extraordinary talents as a painter, see the article RIBERA) are executed in a bold, firm, and free style: his chiaroscuro is broad, powerful, and pleasing; and he drew with admirable skill. His heads, hands, and feet, are marked in a masterly manner; and among the former, those of his old men, which he was fond of introducing into his compositions, are deservedly admired.

In Plate III. of the monographs of the Italian Engravers, will be found the various cyphers with which he occasionally marked his performances, of which the following are justly held in esteem: "A dead Christ!" "The Martyrdom of St. Bartholomew," both of folio dimensions; in small folio, "A penitent St. Jerome, with an Angel blowing a Trumpet." (Note.—There are two plates of this subject, in one of which the angel is omitted.) Another St. Jerome, a small upright, where a skull lies on the ground, and the faint is reading; a folio plate of "Bacchus made drunk by Satyr," dated 1628; two small heads of old men, one of them with the face covered; "Dante crowned with Laurel, sitting in a Desert;" "Don Juan of Austria on Horseback," a folio plate.

The above are all from his own compositions; and we know of but one work of Spagnoletto that is after another painter, namely, "A Repose, during the Flight into Egypt." from Charles Saracenus, wherein angels are fothing the holy travellers with divine music.

Oliviero Gatti was of the Bolognese school, and apparently studied engraving under Agostino Caracci. He was born at Parma in the year 1598; but the time or manner of his death has not been recorded. Gatti worked chiefly, if not entirely, with the graver; and his prints have a considerable share of merit. He attended but little to the textures of various substances, and hence his execution is somewhat dry; but he possessed that first requisite of a good engraver,—found drawing.

His best prints are "St. Francis Xavier kneeling on the Sea-shore to take up a floating Crucifix," from his own composition, and of folio dimensions; a half figure of "The Holy Virgin carrying the Infant Christ," in 4to, after Garbieri; "St. Jerome embracing a Crucifix," a folio plate, after Agostino Caracci, dated 1602; an emblematic or heraldic subject from Lodovico Caracci, representing an armed knight, surrounded by Jupiter, Hercules, Neptune, Apollo, and Pallas, and an armorial bearing supported by two river gods, of a folio size; and a set of four ovals, in 4to, after Pordenone, of which the subjects are "The Dairy forming the World," "The Creation of Adam," "Abraham’s Sacrifice," and "Judith with the Head of Holofernes."

Giovanni Battista Vanni was celebrated to a certain degree in the three arts of architecture, painting, and engraving. He was born at Pisa in the year 1599, and died at Florence in 1660. He frequented different schools, and is believed to have learned etching from Julius Parmigianino. His etchings are performed in a painter-like manner, with freedom and spirit, but are deficient in correctness; and are marked either with the initial letters, or some contraction of his name. Of these the most distinguished are "The Door of the Cathedral at Parma," after Correggio, engraved on fifteen plates, and dated 1642; "The Martyrdom of two Saints," also from a picture by Correggio; and "The Marriage of Cana in Galilee," a large folio print, engraved on two plates, alter Paul Veronese, dated 1637; and juttly reckoned the master-piece of Vanni.

Giovanni Battista Mercati also produced some spirited etchings about this period. He was a native of Sienna, born about the beginning of the seventeenth century, but refired for the greater part of his life at Rome. His prints are light, yet manifest fine talles; and he etched both history and landscape.

The following will probably afford the collector the most satisfactory specimens of his powers: a set of fifty small plates of the ruined edifices of Italy, in a style which might be suspected to be borrowed from that of Silvestre, if Silvestre had then appeared; a set of four of the bas-reliefs which adorn the arch of Constantine, of the folio size, and circular form; "St. Bibian refusing to sacrifice to Jupiter;" Pietro da Cortona, in folio, dated 1656; and "A Holy Family, with St. Catherine," a small folio, after Correggio, dated 1626.

Giulio, or Joseph Cremonese, was born at Cremona in the year 1600, and refired at Ferrara. There is a picture of his, of St. Mark, preferred at the church of St. Benet, at Ferrara, which is mentioned with great praise in the Italian tour of Cochin. The following prints of mediocre pretensions are engraved by this artist from his own designs:—"Samson and Daiah;" "David, with the Head of Goliah;" a kneeling figure of "St. Roch," all of folio dimensions; "David contemplating the Head of Goliah;" a bishop of the order of St. Bernard; and, a study of a naked female; all of quarto size.

Pietro, and Jacques-Antonio Steffanoni, father and son, were born at Venice, the father in the year 1600, and the son in 1620. They went to Rome, where they engraved in conjunction with each other. There is a book, etched by Pietro, of inscriptions in drawing, containing of forty plates; and some prints for a work of antique gems, by Fortunius Licetus. This book was first printed at Rome A.D. 1637, and reprinted by J. A. Steffanoni at Padua in 1664. We have, among others, the following etchings by the son, which poffefs some merit:—"The Virgin and Child, with St. John and several Angels," known by the name of "The Virgin of the Swallow," from L. Caracci; another "Virgin and Child, with St. John," half figures, from Ang Caracci, both in quarto; a middling-sized upright print, of "A Merchant and his Family reduced to Beggary;" two more subjects of Holy Families, from Aug. Caracci; "The Martyrdom of St. Ursula;" and, her Companions," of the same size.

Jean Baptista Pafcalini, or Paquudino, was born at Cento, a village near Bologna, A.D. 1600, and frequented the school of Cyrus Ferri; though he does not appear to have made any meritorious progress in painting. He engraved a great number of prints from various Bolognese painters, but particularly from his countryman Guercino; whose bold spirited style in drawing with a pen he attempted to imitate with the graver, but he did not possess sufficient command of that instrument to succeed, neither is it at all adapted to such a purpose. The etchings of Pafcalini, according to Huber, always convey the idea of original compositions, but in this praise we cannot confequently join. Those among them which are entitled to most commendation, are "St. Felix, a Capuchin, kneeling before the Virgin and Infant Christ," in folio; "St. Diego," from L. Caracci, marked J. B. Centenisi; a large folio print of "The Death of St. Cecilia," from Dominichino; "The Aurora," a large print lengthways, on two plates, from the celebrated picture of Guido, which has since been finely engraved by Giacomo Frey, and also by Audeardo.

The following Subjects are from Guercino,—A small print of "Jesus Christ dictating to St. John;" a large upright print..
ITALIAN SCHOOL OF ENGRAVING.

print of "The Resurrection of Lazarus;" "Christ giving the Keys to Peter," a medallion upright; "Christ taken into Custody in the Garden of Olives," in folio; "The Apparition of the Angels, who came to Mary Magdalene the In-

struments of the Passion," in large folio; "The Pilgri.m on their way to Emmaus," in quarto; "The Incredulity of St. Thomas," in folio; a small folio print of "Orpheus playing on the Violin;" two Holy Families, both in quarto; "St. Charles Borromeus;" a medallion upright, entitled "St. Felice Capuchino miracolosamente revivido unan-

muito morto;" and "Tancred and Erminia," dated 1620.

Of Andrea Camassei, the two CURTI, FRANCESCO BERDINI; CAMELIO CONGIU, and GIULIO CARPIONS, who all lived at this period, we have already treated: as, see these articles respectively.

Guido, or Giulio Cesar Venuti, was born at Bologna in the year 1600. He learned drawing under Philip Brizio, who was of the school of Guido, and one of the best of his disciples. Venuti was a gentleman of fortune, and not professionally an artist, yet the meritorious plates which he etched con amore, have been thought worthy of a place in the Italian school. His etchings are performed in a slight style, and are marked with one of the two monograms which we have copied in Plate III., and their subjects are——"The Guardian Angel," in quarto; "Mithridates presen ized with a Cup of Poison;" "Tancred and Clarinda," all after D. M. Canuti; "The Virgin of the Rose," after Parmeggiano, all in small folio; and "The Holy Family repoling," after Annibal Caracci, in larger folio.

For the biography of Francesco Grimaldi, surnamed BOLOGNESE, see that article. His etchings are performed with painter-like freedom and spirit, and in those of landscape in particular, he discovers a founder knowledge of perspective, than perhaps had yet appeared in Europe, and his trees are ably characterized.

Of his numerous plates, which are almost entirely from his own compositions, we shall mention as worthy of pref-erence—a rich landscape, with buildings, and fishermen on the fore-ground; another, in which the baptism of our Saviour is introduced, both in folio; two ditto, in larger folio, of mountainous scenes, with figures and ruined build-

ings; two ditto, of the upright form, after Annibal Caracci, in one of which is a river winding through forest scenery; four ditto, from the same master. His view of Castel Gandolfo is a well-known and duly admired produc-
tion, which will long continue to be a favourite study with landscape painters, and of which there has been a finely engraved copy produced in our own country by Vivares and Chatelain.

Agostino Metelli (the elder), was a native of Bologna, born A.D. 1669. He studied successively under Gabriel Ferrantini and Dentone, and, besides his merit as an en-
graver, excelled in painting architectural ornaments both in fresco and in oil. He was invited to Spain by Philip IV.,
and died at Madrid in the year 1690.

His etchings are performed with no considerable portion of taste, and we believe are entirely of an ornamental character. His set of forty-eight frizes are after his own designs. Twenty-four plates of ornaments are partly taken from the designs of F. Curti, and are partly engraved by the younger Metelli, of whom we are about to treat.

Giofeco Maria Metelli was the son and scholar of Agof-
tino, and was born at Bologna in the year 1634. After acquiring the rudiments of art from the instructions of his father, he successively frequented, for his improvement, the schools of Alano, Guercino, Del Torro, and Canari.

The plates of Giofeco conflit chiefly of etching, which he executed in a light manner. His chief works are feebly, his drawing incorrect, from haste or negligence, and he gave no attention whatever to the art of expressing the textures of various substances; yet what he did, could only have been done by the practiced hand of an artist, and this circumstance combined with the intrinsic merits of many of the pictures after which he engraved, have made his prints (which are somewhat numerous) sought after by the con-

noisseurs.

The various mono types with which he occasionally marked them, will be found in Plate III. of those used by the Ex-

phants, and among his best works may be ranked the following:—A set of twelve large upright folio prints, from the most eminent pictures in the churches of Bologna; a set of twenty, from the history of Eneas, painted by the three Caracci, in the Farnax palace at Bologna, in large folio; a set of forty, in small folio, and of the upright form, of "The Cries of Bologna," from Annibal Caracci; "The Adoration of the Shepherds," a large upright folio, from Correggio; "The Martyrdom of St. Erasmus," from Poullin; "David and Goliath," from Titian; "The Invention of the Crofs," from Tintoret, all in large folio; "Lazarus at the Gate of Dives," after Paul Veronese.

He also produced several plates from his own compositions, particularly "The four-and-twenty Hours of human Fe-

licity," which were published at Bologna in 1675, and to which he afterwards added two plates, so that the complete set consists of twenty-six; and a set, of which we know not the precise number, called "Metelli's Collection of Pro-

verbs," published in the year 1678, both of which series are now become exceedingly rare.

Pietro del Po was born at Palermo A.D. 1610, and died at Naples in 1692. He travelled to Rome, and was much employed there in the adornment of churches, both as painter and architect, and also by the Spanish ambassador.

Del Po engraved a considerable number of plates which conflit of etching mingled with the work of the graver. The general style of his art appears to be studied from that of Dominichino; and the most distinguished of his prints are "St. John Baptized in the Wilderness:" "The Woman of Canaan;" and "A dead Christ on the Lap of the Holy Virgin," all in folio, and after Annibal Caracci; "The Madonna and Child attending to the divine Harloty of

Angels;" "St. Jerome on his Knees, confounded by an Angel;" and a set of the cardinal virtues, "Prudence," "Jus-
and "The Flight into Egypt," in folio, after Poullin; "Achilles and Ulysses," after the same master; "Venus and Cupid visiting the Forge of Vulcan," after Sisto Badalocchio; and "Neptune in his Chariot," after Julio Romano, of the octagon form; all of folio dimensions.

Giacomo del Po, and his father Therafre, the son and daughter of Pietro, also etched several plates, in a style resembling that of their father, among which is "Susanna surprised by the Elders," after Caracci, a folio plate, engraved by Therafre.

Simon Cantarini, surnamed Pefarese, was born at Pefaro, a city of Urbino, in the year 1610. He learned the rudiments of art under Ridolfi, but afterwards became one of the most distinguished of the pupils of Guido, whose style, both of painting and etching, he imitated with so much luc-
cess, that the works of the disciple are not unfrequently miftaken for those of the master.

Cantarini died at Verona, at the early age of thirty-eight. He produced a great number of prints, which are for the most part of religious subjects, and of which Adam Bartch has formed a catalogue which we believe is complete.
ITALIAN SCHOOL OF ENGRAVING.

Among these are four of what the Italians term Repofos, during the flight into Egypt, three, of which the Holy Family is the subject, and four, of the Madonna and Child; they are after his own compositions, and of 4to dimensions.

The remainder that are worthy of selection from the works of Cantarini are, "The Beatification of the Holy Virgin;" two plates of "St. John Baptist in the Wilderness;" "The Martyrdom of St. Sebastian;" "St. Anthony of Padua on his Knees adoring the Infant Saviour surrounded with a Glory of Angels," in folio; a small print of "St. Anthony of Padua kneeling before an Altar, holding the Infant Christ in his Arms;" "St. Benedict curing the Demoniac," from Louis Caracci, in folio; "A Guardian Angel conducting an Infant to Heaven;" "A Jupiter, Neptune, and Pluto, doing Homage to Cardinal Borghese," who is represented in heaven surrounded by genii, who display the attributes of the four cardinal virtues, in large folio; this print has been malignedly called the Quos ego, and it is one of the finest engravings by Pafarese, though long attributed to Guido; "The Rape of Europa," in folio, a very fine print, and very rare; "Mercury and Argus;" "Mars, Venus, and Cupid, at the Foot of the Tree," from P. Veronese, both in folio; "Venus and Adonis, with Cupid," in 4to; "Love and Fortune," in 4to. (connoissours attribute this print to Pafarese, though it is marked "G. Reums in. & fec."); and a frontispiece to a book, representing a coat of arms, supported by two angels, blowing trumpets; at the bottom is a river god leaning on an urn; a very spirited etching.

Giovanni Andrea Strani was born at Bologna in 1610, and died in the same city in 1660. He was successively the disciple of Caveduno and Guido, and imitated the style of the latter, both in painting and engraving, with success. We have some masterly etchings from his hand, which may be regarded as original works, since they are from compositions by himself; these he commonly marked with his initials, G.A.S. or I.A.S. The following are generally, and we think judiciously, esteemed among his best productions:

"Judith, with the Head of Holofernes," half-length, in the background is an old woman, in folio; "The Virgin and Infant Christ sitting on a Cushion, with St. John at her side," in an oval (this is from Guido); a small print of "St. Michael overpowering Satan," a middling-sized upright print of "A Sybil sitting on a Bank, listening attentively to an Angel, who is placed behind a Pedestal," from Guido; "The Rape of Europa," (this print is attributed to Strani, but it is not in his style); "Apollo playing the Satyr Maryfan," a small upright plate in an oval; "Saturn sitting on the Clouds," in 4to; "Cupid standing on a Dolphin, shooting an Arrow into the Sea;" a bacchanalian subject of four children, one of whom holds a staff and goblet.

Elizabeth, was the most distinguished of the three daughters of G. A. Strani, who were all artists; and was born at Bologna in the year 1638; she learned the rudiments of design and painting of her father; and her historical pictures are mentioned with the greatest commendation. She died at the early age of twenty-six, as it is said, by poison, administered by some that were envious of her great reputation. There are many etchings by her hand, executed in a fine, spirited style, but the extremities are finely marked; among which the following are the most esteemed: a middling-sized upright plate of "The Virgin of Grief," surrounded with the instruments of the Passion, and accompanied by Angels; "The Virgin with the Infant Jesus, whom she holds on a Cushion, with St. John," in a circle; this very rare and excellent print was engraved by Elizabeth, at the age of nineteen, from a picture by himself, and is reckoned her best production; a small half length of "The Virgin, with her Hands crossed on her Breast;" "St. Enflecer," magnificently habited, in the act of proffering his hand, striking his breast with his hand, in folio; "The Decollation of St. John," on the foreground is a profile of Herodias, accompanied by two of her women: this print has been retouched in many parts with the graver, and is not executed in the style of Sirani; yet her name is affixed to it, and its authenticity may therefore be regarded as doubtful; "Lucretia stabbing herself," dedicated to the prelate Palocci.

Lorenzo Loli was born at Bologna in the year 1612. He was a favourite disciple of Guido, who was accustomed pleasantly to call him his gentleman of the bed-chamber; yet the improvement of a student is not always in proportion to the favour of his master, and Loli never attained any great degree of excellence as a painter; but there are many etchings by him executed in a free spirited style, from Guido, Strani, and his own designs, of which the following are held in most esteem: "A Flight into Egypt," in folio; "A St. John Baptist in the Wilderness, with St. John and Elizabeth;" another "Holy Family," with St. John, flowing on a Pedestal in the Background; a small upright plate; two plates of "The Madonna and Child," one a small upright oval; "The Assumption," where the Holy Virgin is represented as standing on a crescent, and angels worshipping (this is a rare print, and one of the very best productions of Loli); "St. Jerome in his Cell;" "Mary Magdalen meditating on a Crucifix, and Skull," both in 4to; the latter is perhaps the only plate upon which this artist has worked with the graver; "The Holy Virgin in a Radiance of Glory," in folio; "The Recompence of Study," a small plate, wherein Genius and the Sciences are represented as leaning on the horn of Plenty; "Hercules combating the Nemean Lion," and "Perseus and Andromeda," both of the folio size; "The Infant Hercules strangling the Serpents;" "A sleeping Cupid;" "Cupid breaking his Bow;" three small plates of infant bacchanalians.

Contemporary with this artist was Gaspar Dughet (furnamed Poullin from his very distinguished brother-in-law Nicholas). For the biography and general merits of these great artists, see the articles DUGHET and POUILLIN. Gaspar etched a few plates with spirit, (though not equal to that of his pencil,) among which are a set of four landscapes in circles, of a small folio size; and another set of four, somewhat larger.

Jean Dughet, the brother of Gaspar, received instructions both from him and Nicholas Poullin, yet never attained to eminence either in painting or engraving.

The following prints from his hand are admitted into the portfolios of the curios, much more on account of the original pictures by Poullin, whence they are taken, than from their intrinsic merits as etchings; namely, "The seven Sacraments," from the set of pictures painted for the Commandeur del Pozzo, which differ in many respects from those which were in the royal collection of France, and are now in the marquis of Stafford's gallery; these are in folio, so large that each subject is engraved on two plates. "The Judgment of Solomon;" "The Birth of Bacchus," and "Mount Parnassus," are also in large folio.

Pietro Tetta, sometimes called among the Italians Lucchini, from the place of his birth, was born, of indigent parents, in the year 1611, and poverty appears to have attended him throughout, notwithstanding his merits. From his youth he manifested a violent inclination to pursue the fine.
ITALIAN SCHOOL OF ENGRAVING.

fine arts, and it is said, travelled from Lucca to Rome in the habit of a pilgrim. Here, regardless of external appearances, and even of the ordinary laws of subsistence, he employed his time in drawing with the utmost fidelity from the antique statues, reliefs, and ruins, and in studying from the celebrated pictures with which that great metropolis abounded.

Under such circumstances, and entirely unknown to the great, Telita was soon reduced to distress; according to one of his biographers, his situation was most miserable, having hardly wherewith to cover his nakedness, or satisfy the cravings of hunger; and in this situation he was found by Sandrart, sitting among ruins, abstracted from all around him, and copying at antique bust-relief.

Struck with such meritorious raggedness, and naturally benevolent, Sandrart took our young enthusiast home with him, provided him with food and raiment, employed him to make copies of the great works in the Juttikian gallery, recommended him to other employers, introduced him to the schools of Dominichino and Pietro da Cortona, and would in other respects have rendered him a foyal being, as well as a great artist, but for Telita's natural aversion to company and conversation, which was so great, that even his patron could seldom obtain a word from him.

His propensities to art, solitude, and silence, which, with Sandrart's friendship, conducted him to the high degree of excellence which he attained, occasioned his death. In reaching for his hat, which the wind had blown into the Tiber, as he fast drawing alone, upon the banks of that river, he unfortunately fell in, and was drowned in the thirty-ninth year of his age.

The following summary is partly copied from the just estimate which Strutt has formed of the merits of this artist. He drew with great taste, and marked the extremities of his figures in a very masterly manner. The character of his heads are stylishly expressed, and the female faces are often very beautiful. When the extravagance of his fancy did not hurry him beyond the bounds of nature, his outlines are correct and elegant. The drapery of his female figures especially, are ample, flowing, and easy, and the feeling of his nude parts, whether for women or men, is superbly introduced, without academical ostentation. Yet, though his composition is frequently grand, and many of his figures highly graceful, it must be owned that awkward and constrained attitudes are sometimes introduced.

His style of etching is mild and free, bearing superior resemblance to that of Antonio Tempesta, and every where animated by the wild energy of his nature; but his light and shades are not collected into broad masses, and of course his chiaro-oscuro, like that of molt Italian engravers of the age of Telita, is deficient in force.

The monograph with which our artist usually marked his engravings, is copied in our third plate of those of the Italian Masters. His prints, in general, of which Mariotte compiled twenty-two, are held in high request by artists and connoisseurs, and among them the following are distinguished. They are all of folio dimensions, and none of them very large.

"The Sacrifice of Abraham;" "Agesid's ministration to the Holy Family," an emblematical subject, in which the infant Saviour is embracing a cross held by angels, very large; a large upright print of "Our Saviour crucified between the Two Thieves;" "The Martyrdom of St. Erasmus," inscribed "S. Erasme est pro nobis;" "St. Jerome at Devotion;" "St. Roch and Two Bishops praying for a Cancellation of the Plague;" "The Sacrifice of Camma," who having drunk of a poisoned cup at the celebration of her marriage with Smerdis, the afflamin of her first husband, presents him with the cup, a large print; "Thetis plunging Achilles into the Styx;" "Achilles dragging the Body of Hector round the Walls of Troy;" "The Death of Cato;" "The Sacrifice of Iphigenia," an allegorical print in honour of Pope Innocent X. with his medallion on a monument; "Sacrifices, at a Table with his Friends;" "The Study of Painting," dedicated to cardinal Francon; "The Lycceum of Painting," inscribed "Il Liceo della Pittura," (with a dedication; "The Patron Saints explained;" "Merit recompened, and Parnassus triumphant," "The Triumph of Love;" and "The Triumph of Bacchus.

Joan Cesar Telita was born at Rome in the year 1636, and passed for the nephew of Pietro, whose style of engraving he imitated. The following five are all we know of his works. A small quarto portrait of his uncle, entitled "Petrus Telita Lucensis, Pictor ac Inceptor Commentariorum. Cesar Telita fecit." "The Death of Dido, with Iris plucking off the Fatal Lock;" "The Centaur Chiron teaching Achilles to play on the Lyre, and throw the Javelin;" "The Emperor Titus confuting the Prophet Balaides in his Expedition against Jerusalem," from a picture by P. Telita, in the church of St. Martin du Mont, at Rome; all of large folio dimensions: and a very large and very rare print of "The Last Communion of St. Jerome," from a picture by Dominichino, which has since been engraved by Fagaraj and Giacomo Frey.

Hyacinth, or Jacinto Gemignano, or Jenimani, was born at Pistoia in the year 1611, from whence he travelled to Rome, and became the disciple of Pietro da Cortona. Here he lodged for many years with great reputation. He afterwards returned to Pistoia, and died there at the age of seventy.

His plates are not numerous, and consist almost entirely of etchings, performed in a flight manner, and from his own compositions, of which the following are the chief.

A set of twelve, in quarto, of groups of children variously occupied; "Cleopatra deliving the Pearl," in folio, and another folio plate from the reign of Semiramus, entitled "Semiramis jurat non mili devate radio regnantum caprile." "Giovanni Battista Bolognini was born at Bologna A.D. 1611, and died in the same city in the year 1688. He was instructed in the principles of painting by Guido, and soon became one of his best pupils. He painted in the style of his master, and his works are held in very great esteem.

We have many spirited etchings by Bolognini, from the compositions of Guido, which are executed in a flight style, resembling that of his master, but inferior in merit; among these, the following will probably be found most worthy of the collector's notice. "A Crucifixion," with St. John and the two Maries, standing at the foot of the cross, in folio; "Baccus and Ariadnes," a large print, lengthy, engraved on three plates; "St. Peter receiving the Keys;" and "The Murder of the Innocents," all of folio dimensions.

Salvator Rosa, (for an account of whom as a painter see ROSA, SALVATOR,) was born at Rinella, in the environs of Naples, A.D. 1615, and died at Rome in 1673. His etchings, though bold, present not the determining and characteristic ruggedness of his pencil. His drawing is incorrect; the heads of his figures are occasionally characteristic, but generally mean, but his chiaro-oscuro is broader and better than is to be found in the general style of the etchings of the Italian painters. Yet it is to be observed that, in point of executive power and feeling, his prints are far from being always alike. In his "Alexander visiting Diogenes," his
ITALIAN SCHOOL OF ENGRAVING.

line is dry and inexpressive, while in his "Meditation of Democritus," and his allegorical print commonly known by the title of the "Genius of Salvator," he has entered much more into the detail of forms, and expressed the substances of the bones, reptiles, &c. which he supposed about, with taste and with truth.

The cypher with which this great master marked his etchings, which amount to between eighty and ninety in number, all from his own compositions, will be found in our Plate III. of those of the Italian School.

The following list of his prints will be found nearly, if not quite, complete:—An octave book, containing six plates of banditti, in various military and other dress, some single figures, and others in groups; a set of six, consisting of tritons, nereids, and other marine monsters, in the lengthened proportion of friezes; a set of four, in small folio, of "Apollo and Daphne," "Glauces and Scylla," "Ceres instructing Phyllis in the Art of Agriculture," and "Jason and the Dragon;" of the same size are two plates of "St. William doing Penance," and "A Soldier sleeping on his Shield." "Plato with his Disciples in the Garden of Academus," "Diogenes throwing away his Cup," "Democritus meditating," "Alexander visiting the School of Apelles," and "Alexander visiting Diogenes," are of the same large folio dimensions: in the last, Salvator Rosa has committed a great and palpable blunder, for Diogenes is directing Alexander not to intercept the rays of the sun, but is himself placed between the sun and Alexander; an academy of philosophers, which is inscribed "Ingenius hiber Pictor," and "The Genius of Salvator Rosa," are also in large folio; and in still larger folio are "The Execution of the Tyrant Polycrates," a very grand composition; "The Discovery of Oedipus on Mount Cytheron;" "The Death of Regulus;" and (of the upright form) "The Fall of the Giants."

Carlo Sacchi of Pavia, whom Strutt, by mistake, called a native of Batavia, etched a few plates of small importance about this period. He was born in the year 1616, studied under Roffi and died in his native city in 1652; "The Adoration of the Shepherds," from Tintoret, and "The Holy Men's offering," from Paul Veronese, were among his best productions. Now also lived Luigi, or Alofins Saramuccia, who obtained the addition of Perugino, from the place of his birth. He studied under Guido, and, as an historical painter, attained some eminence, but never reached beyond mediocrity as an engraver. Among his best prints are, "Cardo crowned with Thrones," a folio plate after Titian; "Venus and Adonis," after Annibale Caracci; and a large folio print after Ludovico Caracci, from the legendary history of St. Benedict: The devil, it seems, had caused a large stone, which was to be used in building a certain church, to be invisible; and the paint broke the spell by the fire of his prayer.

Of Benedetto Castiglione, an artist of very superior powers, who engraved several large plates at the period now under our review, we have already treated. (See CASTIGLIONE, GIOVANNI BENDETTO.) His monogram may be seen in Plate III. of those of the Italian Engravers, and the following tasteful productions from his hand, may with advantage be added to those contained in our former list:—"The Genius of Castiglione," a folio print, which is generally placed as a frontispiece to collections of his works; a set of six heads, of which one is the portrait of the artist; "Tobit going forth to bury the Dead, with an Effecct of Night," in folio; another from the history of Tobit, which appeared without a name, and is in chiaroscuro, is also ascribed to Castiglione; "The Adoration of the Shepherds," a night-scene with "The Eruption of St. Peter and St. Paul;" another night-piece, with the effect of torch-light, of which the subject is "Philosophers visiting a Cemetery," all of folio dimensions; two of the proportions of a frieze, of which one is a "Pan instructing Apollo on the Flute," and the other "Silenus with his Flute, and a Shepherdess playing the Tyrannum;" "A Combat between two marine Harpies;" "A drunken Silenus, with three Satyrs;" a bacchalian subject, with a satyr on the statue of Priapus; a menagerie of hens, turkey cocks, and ducks; a landscape, inscribed "Gio. Benedetto Castiglione, Gen. fec. 1658;" another landscape in form of a frieze; "A Shepherd Boy watering his Flock;" "Shepherds riding and on foot, conducting their Flocks;" "A Capuchin Friar, marked with the letter T, discovering the Body of St. Jerome," in folio; and eleven small vignettes of various sizes, finished with the dry point.

Bernardino Capitelli was born at Sienna in the year 1617, and received instructions both from Caffani and Rutilius Manetti, but never attained to any considerable eminence. In his style of engraving, he mingled etching with the work of the graver, but his execution is careful and heavy, and his outline incorrect. Among other prints of his importance, he engraved the life of the patron saint (Bernard) of his native city, on 12 small plates; "The Miracles of St. Anthony of Padua;" a folio plate divided into compartments; "A Repose," from his master Rutilius Manetti; "The Marriage of St. Catherine," after Correggio; and "Ceres drinking at the Cottage Door," after Hollar, from the same picture which Count Goudt has engraved in a very superior manner.

Giacomo Picchi, or Puccini, was born at Venice, A.D. 1557. Under what matter he studied is not known, but he worked chiefly with the graver, in a stiff laboured style, without much effect; and the outlines of his figures are exceedingly incorrect. His brother William was likewise a Venetian engraver, and engraved the portraits for the "Conchilla Aedile," of J. B. Fabri. Giacomo, on some of his plates, flexes himself engraver to the king of France. The most considerable works he executed were a set of 30 portraits of the principal Venetian painters, affixed to an account of their lives by Carlo Ridolfi, published at Venice in 1648; most of the plates for a book, entitled "Le Glorie degli Incogniti;" a portrait of Alexander Farnese; "Diogenes, with his Lanthorn, fitting at the Entrance of his Tub," from P. Liberti; "A Holy Family," from the same painter; "Judith with the Head of Holofernes at her Feet," from Titian; and "A Holy Family," in a landscape, from the same, all of folio dimensions.

Giovanni Battista Galestruzzi was born at Florence, A.D. 1618. He learned the rudiments of painting from Francesco Furini, and was elected a member of the Academy of St. Luke at Rome, A.D. 1632. He is mentioned as a painter, but is much better known as an engraver. He engraved in a neat, correct, and masterly style, and was for some time the pupil of Della Bella, after whose death he finished some plates which had been begun by that master. His style bears some resemblance to that of Podefla. There are a great number of prints by his hand, which in general are marked with the cypher, which will be found in our Plate III. of the monograms of the Italian Masters, and of which Jean Jacques Roffi has given a catalogue.

Of the last the most considerable are, a set of antique gems, in four volumes quarto, with explanations by Leonard Agostino, published at Rome in the years 1657 and 1659; various sets of antique bas-reliefs and friezes, from Poldoro Caravaggi,
ITALIAN SCHOOL OF ENGRAVING.

Caravaggio, which appeared under the title of "Opere di Poldoro de Caravaggio"; "John Baptist beheaded in Prifon," from Battiffa Ricci; "Paris receiving the Apple," and "The Caduceus of Mercury," from Annibale Caracci, both in quarto; and the Maufolen of the family of cardinal Mazarin; a set of six prints in folio, from the Abbe Elpides Benedito.

Giovanni Francesco Venturina was born at Rome in the year 1610, where he studied and resided for many years, but afterwards removed to Florence. To judge from the style of his works, it would appear that he was the disciple of Gallefranci, or at least worked under his direction, after his removal to Florence. From the designs of that master, he has executed a good number of prints in a neat pleasing style, from which we collect the following:—affording the most satisfactory specimens of his talents: "Diana and her Nymphs sporting," from Dominichietti; "The Pulpit of St. Peter," from Bormini, in folio; a set of bird-eye views of palaces and gardens in and about Rome; and a set of ten prints, from Rafa of Tivoli, being a continuation of the fountains in Rome, engraved by Palda. He also engraved after Polydoro Caravaggio, and other painters.

Giovanni Battista Bonacini, or Bonacina, was born at Milan about the year 1586, and worked in his native country, and at Rome. His prints are executed in a stiff laboured style, entirely with the graver; and he appears to have studied in the school of Cornelius Bloysart; but he never arrived at any superior degree of excellence. Of his works we shall only mention the following:—four portraits, in folio, of pope Clement IX., Guido Viscenzi, Ernes Viscorti, and Giovannia Battista, Count Truchti; "The Alliance of Jacob and Laban," from Pietro da Cortona, in folio; "The Virgin with the Infant Jesus, and St. Martin feeding before him," from the same master, which is esteemed a capital print, in large folio; another "Holy Family, with St. John and St. Catherine," a middling-sized upright plate, from Andrea dal Sarto; and a medalion of pope Alexander VII., with an explanation, from Bormini, in folio.

Flaminio Torre was born at Bologna A.D. 1621, and died at Modena in 1664. He learned the principles of painting from Cavaldini, and completed his studies in the school of Guido. His chief excellence was in copying the pictures of the most celebrated masters, which he did to very exact, as to render it nearly impossible to distinguish the copy from the original. He etched several plates in a good style; and he copied the pictures of the Caracci; in the palace of count Tana at Bologna, for the purpose of engraving them, when, at the age of forty, he died at Modena, whether he had been invited by the duke; and they were afterwards engraved by Metelli and Torre's cousins. From among the prints of Torre we select the following, as most worthy of attention: —"The Virgin and Child, accompanied by St. Francis and St. Jerome," a middling-sized upright, from Lodovico Caracci; "The Patron Saints of the City of Bologna," a large upright plate, from Guido; and "Pompeo conquered by Love," a small upright, from Annibale Caracci.

Pietro Francesco Mola merits a distinguished place both among the painters and engravers of the Italian school. He was born, according to some authors, at Codr, a village on the frontiers of the Mulfene, in the year 1605; whilst others affirm that the place of his birth was Lugano, and the time 1621. From his childhood his talents were promising, and his father, who was a painter and architect, according these early dispositions toward the fine arts, placed him first in the school of Joseph, and afterward in that of Albano, at Rome. When he quitted the latter, he travelled to Venice, and studied the works of Titian, Tintoretto, Baffan, and Paul Veronese, with great affinity, and with so much advantage, that it is said Guercino became jealous of his progress, and that this jealousy occasioned his return to Rome, where queen Christina allowed him a pension, and where he was patronized by the popes Innocent X. and Alexander VII.

His friends seemed to multiply as his merits increased. He accepted an invitation to France from Louis XIV.; but during an altercation which he had with prince Pamphil, reflecting the value of a ceiling which he had painted, he was seized with a violent paroxysm of headache, and expired in about six hours.

For an account of his peculiar merit as a painter, see the article Mola. His etchings, though slight, are performed "with a master's hand and poet's fire." To a vigorous style of handling, he added correctness of drawing. He occasionally etched, as he painted, both landscape and history: his heads in the latter are beautifully characteristic, and carefully drawn; and in the former, his trees and his various grounds, &c., are touched with considerable taste.

"The Madonna suckling the Infant Saviour," a small upright, from his own composition; "A Holy Family, with Angels presenting Flowers to Jesus Christ," in folio, from Albano; "Joseph discovering himself to his Brethren," in small folio; and another "Holy Family with Angels," a folio print of the upright form, from his own composition; will be found among the best etchings of Francesco Mola.

Of the latter print, collectors should, if possible, obtain the imitations as the plate came from the hand of Mola; for it was afterwards worked upon with the graver by some unskilful person, who has much impaired the freedom and beauty of the etching.

Giovanni Battista Mola, born in the year 1622, was brother to Francesco, and was also the disciple of Albano. He etched a few plates, the style of which bears a distant and inferior resemblance to that of his brother, as may be seen in a 4to. print, after Albano, of "Cupid drawn in his Carriage."
became the disciple of Andrea Ferrari. Strutt says, that "as a painter it does not appear that he greatly distinguished himself; but several spirited and masterly etchings, which he produced, prove him to have been a very skilful artist. The heads of his figures are finely characterized, and the other extremities are well expressed."

Among the best of Podefta's prints, which in general are marked either AND. P., or Aud. P. in et loc., are the following: four Bacchicall subjects, in large folio, after Titian, one of which is from the celebrated picture of "Bacchanus leaving from his Car to greet Ariadne," which was lately in the collection of the earl of Kinmaird, and from which Mr. Bone has executed a most exquisite copy in enamel; "Love cultivating the Arts," an allegorical print in folio, dedicated to Guido; and a pair from "The Life of St. Liego," after Caracci, also in folio.

For an account of Carlo Maratti as a painter, see the article MARATTI. He was born at Camerino, in the marquisate of Ancona, A.D. 1628, and died at Rome in 1713. Strutt says, with great justice of his etchings, that "they are executed in a free and spirited style; much neater, and better finished, than those of painters usually are. The characters of the heads of his figures are finely expressed; and their graceful airs have been the subject of frequent commendation."

His engravings are somewhat numerous, and are held in great estimation. No collection of the works of the Italian masters should be without good impressions of the following: — A set of ten, from the Life of the Holy Virgin, after his own compositions, in quarto; "Heliodorus driven from the Temple," after Raphael, a large folio print, arched at the top, and engraved on two plates; "The Flagellation of St. Andrew," after Dominichino; "Joseph discovering himself to his Brethren," after Francesco Mola, of folio dimensions; "St. Charles Borromeo interceding for those afflicted with the Plague at Milan," a large upright, from Pietro Perugino; and (of the same form) "Christ discourseing with the Woman of Samaria," after Annibale Caracci; besides several plates of the Modonna and Bambino, of various sizes.

Giovanni Batalla Cavazza was born at Bologna in the year 1620. He was successively the disciple of Cavedone and Guido, and painted several pictures for the churches of his native country. He likewise engraved some subjects for his amusement, among which are the following: — "Christ on the Cross;" "The Resurrection of Jesus Christ;" "The Death of St. Joseph;" and "The Assumption of the Virgin;" all of folio size.

Dominico Maria Canuti was born at Bologna A.D. 1623, and died in the same city in 1684. This extraordinary artist, by the force of his own natural genius, acquired so much knowledge of design and colouring, that Guido beheld his works with astonishment, and received him among his pupils with pleasure.

Besides his pictures, we have a good number of etchings by his hand, in the style of Guido, whom he surpassed in manner, finishing, and boldness, if not truth, of fore-shortenings, which has ever been held one of the difficulties of art; though, in the general excellency of his drawing, and the spirit of his outline, he has not equalled that great artist. He commonly marked his prints with his name, or initials, among them the following will probably be found most worthy of notice:— Three portraits of Ludovico, Augustus, and Annibal Caracci, in 4to, 4. "The Virgin seated in the Clouds, with Christ feeding by her;" a small upright print, from his own composition; "St. Roch;" and "St. Francis praying," a small upright plate, from Guido, marked "Dom. Ma. Canuti fec."

Laurentio Paminelli was born at Bologna in the year 1629, and died at Parma in 1702. His instructors in the rudiments of art were Andrea Barone and Simon Cantarinii, but he also frequented the school of Flaminio Torre. From Bologna he went to Turin, and from thence to Mantua and to Venice. At Mantua he was employed by the duke in the adornment of his castle at Monmira, but at Venice, struck with the superiority which he perceived in Paul Veronese, his style of painting, and his notions of art in general, underwent a complete revolution. He afterwards returned to Bologna and established a school.

In Cochin's Italian Tour, he speaks highly of Paminelli's picture of "The Resurrection" in the church of St. Francis, and his few prints are sought after with justifiable avidity by the connoisseurs. They are chiefly from his own composition, and to the best of our knowledge "St. John preaching in the Wilderness," (a very fine etching,) and "The Martyrdom of various Saints," in one composition, afford the best specimens of his talents in this art; both are of large folio dimensions.

Of Luca Giardano, who was now living, we have already treated pretty much at large (see the article GIARDANO). His fa pezzo attended him in his voluntary offerings to engraving, as well as in his devotions to the holy art. Yet his taste allowed him to delineate the heads, hands, and feet in his etchings in a good style, and hence his works on copper are of a masterly character, though they possess not the fervency of the highest class of historical or epic compositions. His "Defection of the Priesthood of Baal in the Presence of Elijah and Abas," and "St. Anne received into Heaven by the Holy Virgin," which are both of folio dimensions, will at least justify thus much of approbation, as would also the following subjects from the Life of Christ, which are all in small folio, and from his own compositions, "The Holy Virgin and Infant Christ;" "St. Joseph and St. John;" "The Penitent Magdalen;" "Jesus Christ disputing with the Doctors;" and "The Woman taken in Adultery."

Horatio Brun, or Brunette, was born at Sienna A.D. 1630, but reided chiefly at Rome. He worked principally with the graver, imitating, though not very successfully, the style of F. de Poffy. "The Golden Age," "The four Seasons," "The Prodigal Son guarding Swine," a set of animals, all in folio, and an allegorical print of five folio subjects, which has been called "Numa Pompius, and the Nymph Egeria," are among the best of his engravings.

Lorenzo Tinti was born at Bologna in the year 1634, and was a disciple of Andrea Sirani. He was a painter of some merit, and he engraved many prints, among which is the frontispiece to the Herbal of D. Hyacinthe Angoum, which was printed at Bologna in 1666. He worked for some time at the court of Modena, where he engraved the pompous funeral of Francis I duke of Modena, from Francico Stringa. He also engraved from the celebrated masters of the Bolognese school, and from the pictures of Elizabeth Sirani.

Francisco Vaccaro, or Vaccari, was born at Bologna A.D. 1636. He studied under Albano, and wrote a treatise on perspective, for which he engraved the plates, and dedicated the work to countercello Decastelli. He likewise engraved a set of twelve perspective views of ruins, fountains, and edifices in Italy. He continued to flourish as an artist until the year 1670, after which we hear no more of him.

Giovello Zarlatti was born at Modena A.D. 1634, and
ITALIAN SCHOOL OF ENGRAVING.

Learned the rudimental principles of art of J. B. Spezzini, a Grecian painter. He was an engraver of merit, and executed some plates in a very spirited and pleasing style. His heads were generally beautiful, and his attitudes elegantly chosen. It is to be regretted that he died early, and engraved but little; nor are we able to specify any of his works.

The name of Bartoli, (for whose life see BARTOLI,) should have been honoured with a more ample list of his bolt productions than we were able to give at the time of publishing the third volume. The collector will probably be highly gratified to peruse the following.

After various Italian Masters.—A set of frescoes, from the Bible, on the chimney-pieces of the Vatican, by Raphael, in twelve small pages; another set of the same, in fifteen leaves; another set, from Raphael, intitled "Leonis X. admiranda virtutis imaginum;" a set of forty-three, of ornaments and figures, intitled "Parerga etque ornamenta in Vaticanii Palatii Kilifis," by Raphael; a set of four, of the divinities in cars; "Jupiter drawn by Eagles;" "Mars by Hories;" "Diana by Nymphs;" and "Mercury by Cockes;" the history of Conflantine in frizes of different forms, from the Vatican. "Gioe che fulmina di Giganti;" (Jupiter accompanied by all the Gods, destroying the Giants,) from the celebrated picture by Julio Romano, at the palace of T at Mantua, in nine leaves; "The History of St. Peter," from Lampi, in folio.

The following are from his own D.lfens. — An oval, in 4to, of "St. Stephen receiving the Crown of Martyrdom;" "St. Bernard chaining Satan;" a large folio print of the theatre erected in the cathedral of St. Peter, for the canonization of St. Peter of Alcantara, and "Mary Magdalene," engraved conjointly with Falda; the sepulchral monument of pope Urban VIII, intitled "Petri. Sanct, Bartoli del et fc. ;" and an ancient mausoleum, from Tivoli, with the figure of a lion, from P. de Cortona, in large folio.

The grand catafalco, or funeral procession of Sobieski, king of Poland, after Sebastien Cipriani, in large folio, was engraved by Francesco Bartoli, a Roman by birth, and the son, pupil, and successor of Pietro Santo, who sometimes worked on his father's plates, but was inferior to him in talent and reputation.

Giovanni Battista Falda, a very excellent engraver of landscape and architecture, was born, in the year 1640, at Valduggia, in the Milanese, from whence he travelled, for professional improvement, to Rome. Whole disciple he was does not appear; but he executed his plates in a clear neat style, bearing no small resemblance to that of Israel Silvestri. He drew and engraved a great number of views of palaces, churches, gardens, &c. in Rome and its environs, which he enriched with small figures, drawn and engraved with great taste. And in the year 1676 he engraved a very large view of Rome on twelve plates. His works are numerous, and deservedly held in high estimation. Among them the following will be found to deserve the particular notice of the connoisseur. Two fine views of the square of Navonne, intitled "Fontana in Piazza Navonna;" and "Altra Veduta in Piazza Navonna," erected by Bernini, in folio. Two other views, in large folio, of the Basilica at the Vatican, and the fountain of the Basilica. A very large view, lengthways, of St. Peter's, with twelve of the most celebrated edifices in Rome, on the same plate, very rare. A view of the interior of St. Peter of the Vatican, with the beatification of St. Francis of Sales, in large folio; and a very large view of the castle and bridge of St. Angelo, from Bernini.

Matteo Thommafo Piccioni was born at Ancona A. D. 1657, and became a member of the Academy of St. Luke in the year 1675. Piccioni holds a distinguished rank among those artists who worked in Mofafi, and executed in that style the pictures of the cupola of the chapel of St. Peter at Rome, in conjunction with Fabius Chirilloferi and Horace Manenti. He etched some few plates, among which are the following, all of folio size; "St. Luke painting the Virgin," from a picture by Raphael; "The Adoration of the Shepherds," from Paul Veronese; "A Holy Family," from the same painter; "The Virgin with the Infant Christ, who is represented sleeping, and St. John at his side," from Andrea Camadlet; and "The Infant Moses carried by his Mother in the Ark of Bulrushes," from the same painter.

Dominica Maria Bonarca was born at Bologna about the beginning of the last century; she learned the principles of drawing and etching of his uncle, D. M. Canuti. Among his works, those that he executed after Titian for an edition of the anatomical work of Vesalius, for the use of students, are the most esteemed, many of which, after being etched, were finished with the dry point. A monogram, which was common to him and Dominic Barciere, will be found in our Plate 111. of those used by the Italian Engravers; and the following are selected from the catalogues of his works, as those most worthy attention; "St. Ann teaching the young Virgin Mary to read," from Dom. M. Canuti, in folio; "St. Therese with the Infant Christ;" "The
Martyrdom of St. Chriatiana,' all of the same size, from Canuti; 'St. John baptizing Christ in the River Jordan,' from Albano, in large folio; 'St. John preaching on the Banks of the Jordan,' from L. Caracci; 'Lot with his Daughters,' from Ann. Caracci; and the done of the cathedral church at Parma, representing "The Assumption of the Virgin, with the Apostles and Angels," from Correggio, all in large folio.

Ambrogio Beoluzzi, or Beoluzi, an eminent painter and engraver of aquafortis, was born at Milan A.D. 1648, and died in the same city in 1766. He studied for some time under Gioseffo Dandini, called Montalti, but afterwards went to Rome, where he studied from the antiques and the most celebrated pictures, and Chiefly, in the school of Caro Ferri. His greatest merit consists in painting baroques, friezes, and other architectural decorations; but he etched some few plates, and among them the following. A portrait of Correggio, in profile, of 4to size; and the apotheosis of a princes, the bull of whom was engraved by Bonacina, and the remainder by Beoluzzi, from Ceccos Flori, in folio.

Gioseffo, or Jerome Rofti, or de Rubiis, the elder, was born at Rome A.D. 1642. He learned the principles of art under Simon Cambitini, and J. B. Romanelli. He executed a few large but meritorious engravings from various antique remains, among which are the following. A portrait of pope Pius V., from Sulpio Gata, in an oval; "Two Captains playing together," a small upright plate from Caracci; "The Virgin and Child, accompanied by St. Francis and St. Jerome," a middling-sized upright plate, inscribed "Herodes de Rubis pictor delineavit incidit;" "St. Charles Borromeus kneeling before a Croce," from Antonio Caracci, a rare print; and "St. Nicholas before the Virgin," from Francis Bonvilli, both in large folio.

Gioseffo Rofti, or de Rubiis, the younger, was born at Rome A.D. 1655, and was probably a relation of the above-mentioned artist. He always resided at Rome, and engraved a considerable number of prints, after different Italian painters. He worked in a stiff heavy style, with the grave alone, without much effect or correctness of drawing, and engraved a considerable number of portraits of the cardinals of his time; forming a series, which has since been continued by Peruzzi and others. Rofti likewise engraved some portraits of painters for the Florentine gallery. His best historical works are, "The Virgin and Child," from Correggio; "La Zingara, or the Repole in Egypt," where the Virgin is dressed in the Egyptian fashion, from a picture by Ann. Caracci, both in folio; and "The Martyrdom of St. Agapita," a large plate, lengthways, from J. Odazzi.

Giovanni Battista Teltani, was born at Genoa in the year 1649, and resided chiefly at Rome, where he engraved many plates from the pictures of various Italian masters. In conjunction with William Vallet and Stephen Picart, he executed the portraits of the heroes of antiquity, for Jean Angelo Canini, from antique gems and medals. He engraved in a very pleasing style, not unlike that of Meullan. The following prints afford satisfactory specimens of his talents. Two heads, of Socrates and Alexander; and another pair of Alpafa and Cleopatra, in 4to, for the work of Canini; "The Guardian Angel," in large folio, from Pietro da Cortona; and "The Baptism of Constance the Great," from Aug. Caracci, of the same size.

Gioseffo Teirana was born at Genoa in the year 1650. Whether he was the brother, or how he was related to the above-mentioned artist, are uncertain. He resided at Rome, where he engraved many plates in the style of Giovanni Battista. He was employed in a work which appeared at Rome in 1680, under the title of "Portraits of Cardinals now living," and from the rest of his works the following may be selected as affordingspecimens of his abilities both in portrait and history. A portrait of brother Jerome Comitibus, from P. de Cortona, in folio; "St. Margaret of Cortona kneeling before a Crucifix;" a subject of a Thebes, representing a Hydra, and Religion hovering in the air, holding a portrait of pope Alexander VII. On a little streamer is the following inscription; "Accedite et illuminamini," both from Cortona, of folio size; and two portraits, Flavius Card. Chiusius, after M. Morandi, and Aoylius Card. Homodeus, Jof. Tellana del. et fex, both in 4to.

Crecentius de Humfris, or de Onofrius, was born at Rome in the year 1650, and died at Florence some time about the close of the seventeenth century. He was the pupil of Gaflpar Poulin, and painted a great number of landscapes in the style of that master.

He also engraved landscapes in a very good taste, and we have an engraving by him, from a picture by Carlo Maratti, of "Diana at the Chase," for the prince Livius Odelschi, which is executed with freedom, and in a purity of style independent of most of the landscape engravings of that day. Thus, and a landscape with a waterfall, of an Italian landscape with water and figures, (both in folio,) and two heroic landscapes, one with Jupiter and Mercury, the other with Apollo in the clouds, both in large folio, afford excellent examples of the talents of this artist.

Giovanni Gioseffo dal Sole, was a native of Bologna, and became both a painter and engraver of some eminence. He received his first instructions of D. M. Canuti, and afterwards became the pupil of Lorenzo Pafiinelli. He succeeded in engraving both historical subjects and landscapes; and died at Bologna A.D. 1719, aged fifty-five years. We have several etchings by him, from his own compositions, among which are, "Jupiter and Juno presenting Mars with a Buckler," from a ceiling by Pafiinelli, painted for General Montecule, in folio; and "St. Francis Xavier preaching in the Indies," a large upright plate, from the same master.

Vincent Victoria, or Vittoria, was born at Valencia A.D. 1653. He travelled very young to Rome, and frequented the school of Carlo Maratti, where he made great progress. He possessed considerable knowledge of anatomy, and his portraits are particularly esteemed. Victoria is likewise celebrated as an antiquary and a connoisseur in works of ancient art; and possessed an excellent cabinet of gems, medals, and various antiques; he was honoured with the titles of antiquarian to the pope, and first painter to the grand duke of Tuscany. Among other literary productions, Vittoria is the author of "Observazioni sopra la Selima pittrice de Malzafia," a work which he celebrated J. P. Zenotti has endeavoured to refute. The portrait of our artist may be seen in the collection of those of the great painters of the Florentine school. He died at Rome A.D. 1712, aged 51 years. Among many prints that he etched in a flight style, the following are the best, "The Virgin and Child in the Clouds, with John the Baptist, St. Francis, and other holy persons below," from Raphael, inscribed "Vinc. Victoria del et sculpt. rare;" "The Last Supper," and "The Resurrection," both in large folio, from Caro Ferri.

Giovanni Gioseffo Frezza, was born at Canmorere, near Tivoli, in the year 1690. He learned engraving at Rome, under Arnoldos de Wader, and executed a great number of prints, after various Italian masters, in a neat careful style, finished highly with the graver; but without any force of chiaro-scuro, or boldness of execution. Sometimes Frezza imitated that style of Meullan, which consists of light contours of

ITALIAN SCHOOL OF ENGRAVING.

of lines, yet not very successfully, and we are obliged to pay of his numerous productions, that the extenuations of his figures in general are but poorly marked, and his drawing, though not very incorrect, is sometimes heavy. Among his engravings the following are held in most esteem. The Venetian gallery, consisting of seventeen folio plates, including the title, from Albano, published at Rome in 1764: "The Virgin sitting under a Tree feeding the Infant Christ," from L. Caracci; "A Holy Family, with the Infant napped in the Arms of the Virgin," from Carlo Maratti, both in folio; "The Assumption of the Virgin," dedicated to pope Clement XI.; and "The Judgment of Paris," dedicated to the marquis Pallavicino, both from the same master, of folio size; "La Zingaree," or the Repepe in Egypt, where the Holy Virgin is represented as a young attend, from Correggio, in large folio; a medallion-sized upright plate of "The Descent of the Holy Ghost," from Guido, very rare; "Polyphone on a Rock, and Galatea on the Water with Nymphs," a folio print; "Polyphone hurling a Rock after Acius and Galatea," in two plates. A set of six, including the title, from pictures in the chapel of St. Ann, in the church of the Madonna, at Monte Santo, from Niccolo Battoni, in folio. The first and second plates for the Crotaz collection, one representing "Venus," the other "Pallas," from antique paintings, in large folio, and the celebrated Centaurs (known by the name of Paria), done by Ariosto and Papas of Aphrodisium; and preferred in the museum Clementinum, from drawings by P. Battoni, and N. Honopoli, in large folio.

Giuseppe Diamantini was born at Rome in A.D. 1665, and spent the greater part of his life at Venice, where he died in the year 1722. His works, which has left us a catalogue of his etchings, seems to pay of this matter, that his greatest praise was having instructed Rafa Alba Carreria. Yet, according to Strutt, who professes, however, to have been but few of his works, "Diamantini etched in a free masterly style, with a fine point; the devices are spirited; the actions of the figures are often very graceful, and the heads and other extremities of them drawn in a superior style."

He was acquainted with the title of chevalier, and hence he often marked his prints, "Eques Diamantinus in f," The following are among the best of his works, almost all from his own compositions. "Hagar in the Desert," in an oval, of quartol size; "A Holy Family, with St. John," in folio; "The Marriage of Canaan," from Paul Veronese, in folio; "The dead Body of Christ, supported on the Tomb by an Angel," in an oval, dedicated to Gregorio Fab.; "Dido on the Funeral Pile, with Diana or Iris in the Air," in an octagon; "Venus, Ceres, and Pomona," dedicated to D. D. Ferdinand; "Mercury and Flora in the Air," dedicated to D. Aloys Pifani; "Night pursued by Phoebus, or the Morning Star," dedicated to Marc Angела Flavio Cmmm.; "The Sphere, or Atroctery," dedicated to Angelis, all of folio size; "Saturn, or a River God, with two Cupids," of octagon form; a medallion-sized upright print of "The Fall of Phaeton," a small octagonal print of "Mercury and Argus;" "Venus and Adonis," an octagon; another "Venus and Adonis," in quartol; a small octagon of "Jupiter and the Republic of Venice," a large upright print of "Time, or a River God sitting, and a Child, with his Eyes shaved, lying near him, accompanied by a Moon;" a medallion-sized upright print of "Time and Flora, crowned by a Genius;" also a Strength, or Hercules lifting by a Nymph, accompanied by Pan, in a large octagon; a small upright print of "Stars and Venus;" two more small uprights of "Diana and Endymion;" and "The Sacrifice of Iphigenia;" "Boreas leading away Orithoea," in a folio octagon; a small oval print of "Justice and Peace;" four small upright emblematical subjects; two large square ditto; and two other emblematical subjects, one a large hexagonal plate, and the other an oval.

Giuseppe Nicolo Nani was born at a short distance from Sienna, A.D. 1662. He learned the rudiments of art from his father Francesco Nani, but was sent to Rome at the age of eighteen, and entered the school of Ciro Ferris, under whom he studied two years, and acquired not only great command of the pencil, but a fine taste for design. He was recommended by his master to the grand duke Cosimo III., for whom he copied the pictures of Pietro da Cortona, in the Pitti palace; in which he succeeded so well, that the duke rewarded him very handsomely. He was likewise honoured with knighthood by the emperor Leopold, and had many other favours conferred on him by the great.

The style of Nani bears some resemblance to that of Paul Veronese. He died at Sienna in 1704, aged seventy-six. We have one small upright etching by this artist, representing "The Virgin with the Infant Christ and St. John," from a composition of his own.

Cesare Fantetti was born at Florence, A.D. 1660. The time of his decease has not been recorded, and of the events of his life it is only known that he worked at Rome after various Italian masters.

He engraved, in conjunction with Pietro Aquila, the paintings in the Vatican, known under the name of Raphael's Bible; the first thirty-six, and the forty-three, are etched by him, and the remaining fifteen by P. Aquila. Fantetti also engraved "Christ praying in the Garden of Olives," in folio, from L. Caracci; "Charity, with Two Children," from Ann. Caracci; "Lavinia," by Niero, in large folio, from the same painter; "The Death of St. John," of the same size, from Andrea Sacchi; and "Flora surrounded with Cupids in the Air," from Ciro Ferri; in an oval of folio size.

Francesco Bruni was a native of Genoa, and an engraver. He was born in the year 1660, and died in 1726, but we are not acquainted with the particulars of his life, and we only know of the following print by him, "The Assumption of the Virgin," in large folio, from Guido.

Lodovico Mattioli was born A.D. 1662, at Crevalcore, in the principality of Maffeian, and died at Bologna in 1741. At an early age he was sent to study in the school of Carlo Cignani. He drew with a pen in a very pleasing style, and etched from his own compositions and those of the Caracci, and other great masters, but especially after G. M. Crepsi, with whom he contracted a very intimate friendship. Among the etchings of Mattioli, the following will be found most worthy of notice; a landscape, with ruins and figures, in quarto; "The Annunciation," from L. Caracci, of the same size, a very rare print; "The Circumcision," in folio; from the same; "The Nativity," from Aug. Caracci, of the same size; "The good Samaritan," from Ann. Caracci; "The Death of St. Joseph," from Francefumi; "The Martyrdom of St. Peter," from Crepsi; and a figure of "St. Anthony," and another of "St. Vincent Ferreri," all of folio size, from Crepsi; "St. Lucy," a note of invitation engraved by Crepsi, and re-engraved by Mattioli. The figures for the poem of Bertoldo de Bertoldini, in twenty sheets, were drawn by Crepsi, and engraved under the direction of Mattioli.

William da Leone was born at Parma in the year 1654. He etched, from his own designs, two sets of animals, which are executed in a spirited style, and with some talent; we are able only to specify, in addition to these, the following engravings:
gravings by Leone: two landscapes, with animals, in quarto, and "Venus binding Cupid," from Titian, in folio.

Luca Carlevaris, furred Zenobia, was born at Udine, in Italy, A.D. 1665, and died at Venice in 1726. He excelled in painting landscapes and marine subjects. He likewise engraved a few views of Venice, consisting of one hundred large plates lengthways, which were published in 1705. His prints are light, but bold and spirited etchings; and give us clear ideas of the places they are intended to represent. We can only specify the titles of the following two: a view of the church of St. Nicolas de Castello, at Venice; and one of St. Marie Formosa, at the same place, both in folio.

Of the family of Crepi we have already spoken, as fee that article. Gioseffo Maria employed a long life of upwards of four score years, in the practice of the various arts of which imitation is the basis, in the course of which he etched several plates, which do credit to his general reputation, and which we omitted to mention in vol. x. Among them we venture to recommend the following as most worthy of the notice of the connoisseur.

A grand composition, in large folio, of "The Massacre of the Innocents;" two folio plates in the manner of Rembrandt, of which "The Resurrection" is the subject; "The miraculous Crucifixion of Pilate;" "St. Anthony," also in the manner of Rembrandt, and of the oval form; a folio plate of "Two Shepherds," one of them asleep, and the other making the sign of silence. A set of five, in the style of Salvator Rosa, of various mechanical occupations; and a very rare portrait of Michael Angelo Tamburini.

Pietro da Pietri, or Patti, was born A.D. 1665, according to some authors, at Rome; others place his birth at Piacenza, in the same territory. He learned the principles of art of Jos. Ghirzi and Carlo Maratti, who employed him in copying some of the principal works of Raphael, and other celebrated Italian masters. He died at Rome in the year 1716.

Notwithstanding that Pietri employed great part of his time in copying, we have several meritorious historical pictures by him from his own compositions; those especially, which he painted for the church of St. Clement at Rome. He etched some few plates, and among them the following will probably be found most worthy of notice. "The Assumption of the Virgin," a middling-sized upright; and "St. Lawrence the Jullianian," a small upright, both from his own compositions.

Francesco Antonio Lorenzini, known by the name of brother Antonio, was born at Bologna A.D. 1665. He was an ecclesiastic of the order of St. Francis; but turning his mind to the arts, he first studied painting under Lorenzo Paimelli; being, however, better pleased with etching, he was induced to throw aside his pencils for the love of aquafortis and copper.

In 1669 he travelled to Florence, where he engraved great part of the plates for the gallery of the grand duke of Tuscany, in conjunction with Theodor Ver-Cruys, Colmo Mogalli, and Pichianti; and during his absence from Bologna, he was agreeably surprised by finding himself elected a member of the Clementine academy. Lorenzini was a very industrious man, and left a great number of prints from different masters: which, however, it must be acknowledged do him no great credit as an artist; among them the following are the best: "Moses striking the Rock," a large plate lengthways, from Baffan; "St. Anthony of Padua performing a Miracle," from Paimelli; "The Martyrdom of St. Ursula and her Companions;" "St. John preaching in the Desert," all of large folio size, from Paimelli; "Jesu Christ in a Glory," with other figures, from L. Caracci; "The Virgin and Child," half figures, from Aug. Caracci, both in folio; "The Beatification of St. Dominic, accompanied by Jesus Christ, the Virgin, and Angels," from Guido, a large circular plate; "St. Philip Neri kneeling before a picture of the Virgin, surrounded by Angels," from Carlo Maratti; "St. John in the Clouds, surrounded by Angels," from Correggio, both in large folio; "The Annunciation," from Paul Veronese, in large folio; "The Baptism of our Saviour," of the same size; "The Refutation of Lazarus," on three large plates, all from Paul Veronese; "Jesus Christ on the Sea with St. Peter," from L. Cordi; "The Confutation of Noah's Ark," from Jac. Bassano; "Venus with Two Cupids," from Carlo Cignani; "St. Augunlino in the Air, surrounded by Rays of Glory," from Tintoret, all of large folio size; "Joseph sold by his Brothers," after Andrea del Sarto, in two large folio leaves; "Joseph in Egypt;" "Saul and David with the Head of Goliah," from Guercino; "The Pilgrims at Erezau;" "St. Peter delivered from Prison," both from the same painter, all in folio; "The Holy Women at the Sepulchre," from P. de Cortona, a circular print; and "St. Margaret of Cortona, to whom the Virgin appears in the Clouds," from Gab. Caltani, in large folio.

The monogram of Antonio Balestra will be found in our Plate III. of those used by the Italian Engravers. Of the leading events of his life we have already treated. (See BALESTRA.) His style of etching was bold and masterly, though flight; and his most esteemed prints are, a warrior's head, and two soldiers, both small plates; "The Holy Virgin seated in the Clouds, with the Infant Jesus and St. John, the Heads of three Cherubs appearing above;" "The three Angels visiting Abraham;" a vignette inscribed "Verona fideli," all small uprights, and rare. His portrait of the architect Michel San Micheli, surrounded with allegorical allusions, and marked with the engraver's monogram, is in small folio.

Benedetto Lutti was an eminent painter of Florence, who sometimes amused himself with etching, and whose works are generally and justly esteemed. He was born in the year 1666, studied under Antonio Domenico Gabbiani, and died at Rome in 1724.

Strutt says of this artist, that his merits procured him, from the elector of Mentz, the honour of knighthood, accompanied by a present of a crofs enriched with diamonds; but specifies only two of his etchings, both of which are become extremely rare. The subjects of these etchings are, a landscape after Guercino, in small folio; and "The Crucifixion, with St. John and Mary Magdalene at the Foot of the Crofs," a small upright, from a composition by Lutti himself.

Cofino Mogalli was a native of Italy, and the disciple of Giovanni Battista Foggini, a Florentine sculptor. He was born at Florence in the year 1667, and died in the same city in 1750. He worked in conjunction with Antonio Lorenzini, (of whom we have recently treated,) and other engravers, on the plates from the Florentine gallery, for the duke of Tuscany. We likewise have by him many plates for a book of Etruscan antiquities, published by Thomas Dempfer, at Florence, in 1724.

The following prints, from the Florentine gallery, are from the graver of the elder Mogalli, viz. "A Holy Family, or the Repose in Egypt;" from Albano, a circular print in folio; another "Holy Family," from Correggio, of the same size; "The Suppllication of Marias;" from Guercino, in large folio; "Eve presenting the Apple to Adam," from Gab. Caltani, in folio; "The penitent Magdalene."
Magdalen translated to Heaven by an Angel," from Caracci, in large folio; "Adam and Eve dismissed from Paradise," from CALARI, in folio; "St. Benedict instituting his monastic Orders," from P. VERONESE; "Jesu Christ at the Table with the Pilgrims of Emaus," from PALMA the elder; "The Marriage of St. Catherine," from Fra. Bartolomeo, all in large folio; "Virtutes Amor et Nomen," an allegorical figure from RIMINALDI, in folio; "David and Bathsheba," from FR. SALVATI; this and all the following are in large folio; "The Annunciation," from AND. DEL SARTO; "The Adoration of the Shepherds," from Titian; a bacchanalian dance by four figures; and PHILIP 11. KING OF SPAIN, also from the same painter.

Nicolas Mogalli was the son of Cosmo, and also an engraver. He was born at Florence in the year 1723, from whence, either for improvement or patronage, he travelled to Rome, where he engraved, with moderate success, from the cabinet of Portici, and the plates, after the designs of Casanova, for "Les Monuments antichi inediti spiegati et illustrati da Giovanni Winkelinman," a folio work, which was published at Rome in the year 1795.

Jacques Marie Giovanni, or Juvanis, was born at Bologna in the year 1696, and died at Parma in 1717. He was the disciple of Antonio Roli, and became a painter of some eminence. He also practiced engraving and etching, and executed many large works from I. Caracci and Correggio. The most considerable work he engaged in was a cabinet of medals for the duke of Parma, in several folio volumes. His prints are of very unequal merit. As far as they can be spoken of generally, they are executed with tolerable care and skill, but are deficient in chiaroscuro, and more or less fo in drawing. The belt of them are engraved from the pictures of the cloisters of St. Michael in Bocco, painted by I. Caracci, and other celebrated masters of his school, on 16 plates in folio; the cupola of the church of St. John of the Benedectines at Parma, representing "The Afection of our Saviour," &c. on 12 plates, from those justly famed pictures by Correggio, which can now only be known by the engravings, the paintings themselves being no longer in existence; the Holy Virgin in a landscape, with the Infant Christ in her arms, with St. Jerome and Mary Magdalen, the latter of whom is killing the feet of the child (a subject commonly known under the name of "The Day of Correggio"); the Virgin seated on a pedastal with the Infant Christ, known by the name of St. George, who is the principal figure, and by some esteemed the chef-d'oeuvre of Correggio; "St. Sebastian fastened to a Tree," with his Hands behind his Back," in folio, from Caracci; "Jesu Christ giving the Communion to his Apostles," from Francichini, a very excellent print of large dimensions, and of the upright form.

Andrea Proocaci was born at Rome in the year 1667, and was the pupil of Carlo Maratti. He became a painter of some celebrity, and was chosen by pope Clement XI. to paint the twelve prophets of the Old Testament, for the church of St. John de Lateran. In 1702, he was invited to Spain, with the title of painter to the Royal Cabinet. Here he painted several pictures for the royal palace, and died at St. Ildefonse, A.D. 1734. We have several engravings by this master, both from his own compositions, and those of other painters, among which the following are selected as most worthy of the notice of the collector: - "The Difficulties at Emaus," from Raphael; "The Adoration of our Saviour," a large group of figures, with a youth carrying his father on his shoulders, both from Raphael; "The Birth of Bacchus;" "Diogenes throwing away his Cup;" and "Clelia and his Companions falling into the Tiber," all from Carlo Maratti, and of folio dimensions.

Giovanni Dominico Picchianti was born at Venice A.D. 1670, and was the scholar of J. B. Foggia, a sculptor of some eminence. The productions of Picchianti have no great share of excellence to recommend them, for he worked in a coarse light style, and his drawing is rather mannered than correct. He engraved many of the plates from the pictures in the grand Florentine gallery, in conjunction with Lorenzo, Ver-Crux, and Mogalli; and likewise some portraits, among which are, those of an unknown female, from Raphael, in folio, a whole length of Sebastian del Piombo, from Titian, and cardinal Bettinczyr, from Cardinal Richelieu; those of cardinals Louis de Roffi and Julius de Medici on the same plate, are from Raphael, and all are of large folio sizes.

The best historical works of Picchianti are, "The Virgin sitting on a Chair," or the celebrated Madonna della Sedia of Raphael; a half figure of "The Virgin, with the Infant Jesus, and St. John," from Caracci, in folio; "Paying Tribute to Caesar," commonly called "Il Cristo della Monetta," from Titian; "The Virgin and Child," from the same painter; and "Agar returning to the House of Abraham," from P. de Cortona, all of large folio dimensions.

Francisco Antonio Meloni was a native of Bologna, and born in the year 1670. At an early age he appeared fond of painting, and was accordingly placed under Francichini; but time discovered that his disposition was not formed for the attainment of excellence in that art, and he then took up the graver with much better success. He engraved chiefly from the pictures of his master, and other Bolognese painters; but the latter years of his life were spent at Vienna, where he died in the year 1713. The following are reckoned among his best engravings: - "The Adoration of the Shepherds," a middling-sized upright plate, from Carlo Cignani; and "Aurora," from a ceiling at Forli by the same master, both in folio.

Of the merits of FRANCISCO and PIETRO AQUILA we have already treated. (See those biographical articles respectively.) But of artists to distinguished it has been judged proper to subjoin, in this place, lists of the principal works on which their reputation has been founded. The belt of these by the elder Aquila are "Saint Rosalie," from his own composition, in folio; "Mars binding his Arms to a Tree," in large folio; "Cardinal Camillo as a Captain," in folio; "Cardinal Joseph Marie of Toulouse," from P. Nelli, of the same size; "The Last Supper," from Albano, inquired "Unus ex vobis, &c." in large folio; the first vaulted roof of mosaic in the church of the Vatican, from Ciro Ferri; two cupolas, one in the chapel of the Holy Sacrament, the other in the church of St. Sebastian of the Vatican, from P. de Cortona; another cupola, from the same master, painted in the church of St. Philip of Neri, all large circular prints; a group of heroes, to whom Minerva presents a crown of laurel, and Mars a sword, a folio print, from AND. BONIFIG; "The Battle of Constantinople," and "Maxentius," from AND. CAMAFAST; and "The Triumph of Constantine," both very large; "The dead Body of Christ across the Knees of his Mother, accompanied by Mary Magdalen and St. Francis," from Caracci, in large folio; "The Arrival of the Body of St. Helga," announced by a Bishop to the Virgin, in folio; "The Repose," where the holy Virgin is represented seated under a tree with the infant, and in the background St. Joseph on his staff; "St. Peter's Bark," from Lanfranc, in large folio; a very large folio print of "Our Saviour in a Glory," with...
ITALIAN SCHOOL OF ENGRAVING.

with St. Ambrose, the Virgin, and St. Charles Borromerus, kneeling, from a grand altar-piece by Carlo Maratti; the vaulted ceiling of St. Francis Xavier at Naples, painted by Paul de Matthis, and engraved on three large plates, representing that saint overturning Idolatry, Heresy, and Mahometanism; "Venus in the Air, flaving Zenas his Arms fauned to a Tree," from Poullin.

From other Italian masters, Pietro has engraved "St. Luke," with the inscription "Ferax cum ferunt," &c. after Lazzaro Baldi, in folio; "The Sacrifice of Polixenes," from P. de Cortona, in large folio; "A Sacrifice of the Nymphs of Diana on their return from the Chase;" "The Rape of the Sabines;" and "The Triumph of Bacchus," four very much esteemed prints, all from the same master, in large folio; a large subject on two plates of "The Battle between Alexander and Darius," from the same master; "Moses defending the Daughters of Jethro, at the Fountain," from Ciro Ferri; "Moses striking the Rock," both in large folio; "The Holy Virgin appearing to St. Alexio, who is reposeing on a Bed, crowned with Stars," a large circular print; "The Veilings cherishing the sacred Fire, and the Orders of Augustus," a large upright print, all from Ciro Ferri; "The Holy Virgin in Heaven with five Saints, canonized by Pope Clement X," from Carlo Maratti, in large folio; "The Triumph of Christiani, represented by Religion sitting on the Clouds, receiving the Homage of the four Quarters of the World," in large folio; "The Virgin sitting to St. Luke for her Portrait," in folio, all from Carlo Maratti; "Death and the Holy Virgin, with the Apostles," from J. Morandi, in large folio; the Bible of Raphael, inscribed "Imagines Veteris ac Novi Testamenti, a Raphaelis. S. et. Urb., in Vaticano pictae Jo. Jac. de Rubis institutae," in fifty-five leaves. Cefare Fantetti drew and engraved the first thirty-six subjects, and the forty-ninth, all the others are by P. Aquila. The Farnefe Gallery, with the statues and ornaments, and a description in verse, by J. P. Bellori, in twenty-five leaves, of large folio size; a room in the Farnefe palace, with the ornaments and inscriptions, in thirteen plates, of folio size; "The Assembly of the Gods," painted in the garden of the prince Borghese near Rome, called "The Villa Farnesiana," entitled "Deorum Concilium ab Equo Joanne Lanfranco Varmenti, tun Spiantibus ad vivam Imaginibus, tum monochromatis atque Ornamentis Artis," &c. on nine large folio plates.

Marco Ricci, the celebrated painter of landscape and ruined edifices (for whose biography and general merits, see the article Ricci,) performed some etchings about this period, of which the best are a set of twenty-three, entitled "Varia Marci Ricci Pictoris praefectiulmi Experimenta ab ipso me atque inventa delineata a me Carolo Orfalone Veneto incisae," &c. anno 1730, printed on folio paper, but of different sizes and shapes. They are feeble in chiarooscuro, and though not entirely sufficient, display no great knowledge of the art of engraving.

Antonio Maria Zanetti was of a noble Venetian family, born in the year 1650, and died in his native city in 1757, according to Huber; but according to Strutt, he lived ten years longer. He acquired what is often termed a competent knowledge of drawing, at a very early age; and before he was fifteen, engraved some figures and some heads, with which he dedicated to Dr. Mead, the celebrated English physician.

The works of Zanetti consist of etchings and engravings in chiarooscuro; and, in the estimation of one countryman of Scott, they "prove him to have been a man of great genius and found judgment."

Affiliated by his relation A. M. Zanetti the Younger, and other artists, he engraved and published a large number of prints, taken from the drawings of Parmeggiano, Raphael, and other great painters, which he purchased at the sale of the Arundel Collection. They are divided into two sets; and both together consist of eighty-nine prints on copper and wood, with the portrait of Zanetti, engraved by Baldoni, from a painting by Roldan.

We come now to what must be a reproach either on his "genius," or his "judgment," or on both. Strutt adds, that "in order to render this collection the more valuable, he burnt the wooden blocks from which the chiaroscuros were printed, and destroyed the copper-plates, after he had taken off each a number of impressions as he thought proper, which, we are informed, was by no means very large."

Now no principal engraver desires that his works should ever become rare from any other cause than the extensive demand for them among the public; and the sublimation of nominal for intrinsic value, is an expedient worthy only of traffickers in art, and which "great genius" and "found judgment" would equally disclaim.

Zanetti resided for some time in London, and engraved here a set of twelve studies of heads, figures, &c. from his own drawings, which he tinted in a spirited style, and which, according to Strutt, do him great honour.

He also engraved in aquafortis another set of twelve plates, of which the subjects are animals and figures, after Calliglione; a set of the statues which adorn the library and palace of St. Mark at Venice; and a set containing of eighty plates of the engraved gems of antiquity. His cypher will be found in Plate III. of the monograms of the Italian Engravers.

Zanetti the Younger was nephew to him of whom we have just closed the account, and was born at Venice A.D. 1720; but the year of his demise has not been mentioned. He engraved in the tablet and style of his uncle, whom he assisted in his work after the statues at the palace of St. Mark, as well as in that after the drawings by Raphael, &c. which once formed part of the Arundel Collection. And in the year 1760 he published an excellent work, adorned with eighty plates, engraved by himself, and intitled "Varie Pitture a freccio de principali Maestri Venetian," &c.

Francesco Fontibello was born at Venice A.D. 1681. He learned drawing in the Roman academy, and studied for a time under Seb. Ricci, whose style of painting he imitated with no inconceivable degree of success, in the pictures which he painted for the Duodo palace, and the church of St. Salvador. In the year 1769 he travelled to Petersburg, with the view of bettering his fortune, where prefumptively he died, for we do not hear of his return.

He etched several plates with medicores, but painter-like ability, among which are a set of seven whimsical subjects from his own compositions, in small folio; and "The Holy Virgin appearing to St. Gregory at prayers," an upright of the middle size, from Seb. Ricci.

Carlo Carloni, or Carbone, was born at the village of Scania, in the Milanese territory, A.D. 1686, and died at
his native place in the year 1773. He was of a numerous family, of whom the greater part were artists. His father was a sculptor, and intended Carlo for that profession; but finding he had more inclination to become a painter, placed him under the Julie Quauno, under whose instruction he soon became remarkable for talent and industry, and occasionally both painted and engraved. In his pictures he produced a rich and agreeable effect, and made some advances toward combining the merits of the Roman and Venetian schools. Of his engravings, of which we cannot say quite so much, the following are held in most esteem: "A Holy Family, wherein St. John is killing the Feet of the Infant Saviour"; and "The Miraculous Conception," both of 4to. size; "St. Charles Borromeo administering to the Sick, during the Plague in Milan," in folio; three plates of ceilings, in 4to., in one of which is a group of children with flowers; and the death of a saint, of folio dimensions.

Andrea Zucchi was born at Venice in the year 1686, where he engraved a set of twelve plates of Venetian habit, and many other subjects for the libraries. In 1756, he was invited to Dresden to paint theatrical scenes and decorations; and on his return to his native city, he engraved most of the plates for the collection published by Lovio, containing in the whole of fifty-seven plates, from the most celebrated pictures at Venice; but his talents as an engraver never rose above mediocrity. Among his best productions, are: "The Angel Raphael conducting the young Tobias," in a large folio, from Tizian; "St. John the Evangelist," of the same size, from the same painter; "St. Barnabas Veronese, St. Peter, St. John, and other Saints," from the picture which D. Varotari painted for the church of St. Barnabas; "St. John the Baptist," from P. Veronese; "The Martyrdom of Paul Erizzo," from P. Longho; "The Nativity of the Virgin," from a picture by Nic. Bambini; "Manna gathered in the Desert," from Joseph Martino, a circular print; "Cybele on her Car drawn by Lions," from a sketch by Tintoret; and "Enrico saving his Father and Son from the Conflagration of Troy," after Sch. Ricci; all of large folio dimensions.

Francesco Zucchi was the younger brother of Andrea, under whose instruction he studied the elements of art. In the year 1725, he was invited to Dresden to paint for the electoral gallery, but was interrupted by the war, which obliged him to return to his native country, where he worked chiefly for the book-sellers. He engraved several of the plates from the pictures in the Dresden gallery; among which the following will probably be found on the whole to deserve a preference: the portrait of Elspeng, from Rubens; ditto of a woman who resembles the first wife of Rubens, both in folio; ditto of Jacques Antonio Muraci, from Jean da Antona, in an oval of folio size; "St. Helena worshipping the Cross," from Bettini Cignaroli, in folio; "The Martyrdom of Religion," an allegorical subject, in folio; "Religion and the Sciences contemplating the Portrait of a Cardinal," in folio; and "Apollo with his Lyre," surrounded with ornaments, of large quarto size.

Lorenzo Zucchi was the son of Andrea, and was born at Venice in 1754. When his father was invited to Dresden, in the year 1756, Lorenzo accompanied him, and having been instructed in the elements of engraving, he continued to practice in that metropolis with success, and was honored with the title of engraver to the court of Dresden. Most of his productions are from the Dresden gallery, and among them the following have been thought most worthy of notice.

Portraits.—Herman Charles Keiferling, count of the holy Roman empire, from Anna Maria Werner, in large folio; John Frederick, prince of Sapieha; Donaventura Ross, painter to Auguilius III.; Louis de Silviste, first painter to Auguilius III.; 1. Abbe Petro Metalla, Pope, &c. all of large folio size.

Various Subjects from the Dresden Gallery.—"The Seven Sacraments," from Joseph M. Crepsi; "The Martyrdom of St. Peter and St. Paul," from Nic. del Abbe; (P. Tanga likwise engraved this picture, which engraving, as well as that of Zucchi, will be found in the collection from this gallery; ) "St. Catherine receiving the Crown of Immutability," after a copy by Erazmus Queldens, from Rubens; "A grand Sacrifice to Venus," from G. LaFerre; "The Suppletion of Marvess," from J. B. Lang, all of large folio size; and "The Archangel Michael circulating the Dragon," from Steff. Torelli; "St. Joseph, with the Infant Child in his Arms," from Jof. Angelli, in the gallery of the count de Brail; two landscapes, entitled "Soggiorno pastoral," and "Campagne aperta," from Jof. Rosen; "The Birth of the Caeasars," two half figures, one of which represents Titus, marked Titianus, s. l. Zucchi delineat, et sculp. engraved in the style of Pitters; and "David with the Head of Goliad," from L. Jordam, all of folio dimensions.

Jerome Feroni was born at Milan in the year 1687. He painted the death of St. John the Baptist, for the church of St. Eugfforio, and afterwards travelled to Rome, where he worked some time in the School of Carlo Maratti; after whose pictures he etched the following subjects, in the flight pointed style of a painter, but with great taste: "The St. standing still at the Command of Joshua," "Deborah the celebrated Mother of Israel," after the Victory over Sisera; and "The Death of Sisera," all in large folio; "The Crucifixion of Joseph," in quarto; and "Judith beheading Holofernes," in folio.

Giovanni Antonio Faldoni, was born at Acolo in the year 1665. He learned painting under Antonio Luciani, and likewise practised engraving. Faldoni worked chiefly, if not entirely, with the graver, frequently imitating the style of Dellamana with no inconsiderable degree of success; on the whole, he merits the encomium of having been an artist of ability. His best prints are the portraits of the dukes of Venice, the procurators of St. Mark; various antique statues, making part of two volumes in folio, of Venetian antiquities; part of the designs of Parmegiano, for the collection in two folio volumes published by Zanetti; a portrait of Antonio Maria Zanetti, from Rubens, in folio; Marco Ricci, from Rubens, in folio; "Sebastianus Ricci Bellissimus Pictor, seu activi facile primum, annum agens LX," in folio; "A Holy Family in a Landscape, with Angels ministering," from S. Ricci, in large folio; "The Conception of the Virgin," from the same master; "The Nativity of our Saviour," from P. da Cortone; "David playing the Harp before Saul," from Jof. Gennareta the elder; "David dying from the Anger of Saul," from the same master, all of folio size.

Antonio Bulbi was a native of Caxa, in the kingdom of Naples, and was born in the year 1603. He studied the rudiments of painting under Solimine; and learned engraving of Maghar. He established himself as an engraver at Naples, and engraved for the most part after Solimine, but occasionally from his own compositions. The following are some of his best engravings: the portraits of the emperors Charles VI. in an oval of folio size; 1. Don Carlos, king of the Two Sicilies, of the first size and form; Nicholas Cyprianus, a physician; Maria Verdula Caraccioli, a nun; St. Ignatius of Loyola, in an oval, with engraved; and Raphael Marca, accompanied by an angel, also in an oval; "The Consecration of St. Mary the Egyptian," intended for the library.

Vol. XIX.
ITALIAN SCHOOL OF ENGRAVING.

Andrea Maglia was born at Naples in the year 1692. He engraved from the pictures of Solimene and other masters, but is very little known, and we are not able to specify any of his works. His son, Gioffeo Maglia, was the disciple of his father and of Solimene; and at expectations were formed, from the early specimens which he gave of his abilities, but he died young. There is a print by him, of "Christ appearing to St. William," of folio size, from Solimene, which certainly is a work of considerable merit.

Giovanni Dominico Camplia, was born at Lucques in the year 1692. At Florence he became the pupil of Thorano Redi, and Lorenzo del Moro; and at Bologna he studied in the school of Gioffeo del Sole. He drew most of the statues, busts, and portraits of the Florentine gallery, and compiled the typographical ornaments for that work. Camplia was invited to Rome, where he did the drawings of the sculptures of the Capitol, the first volume of which appeared in 1741. He has etched a great number of plates, with some talent, and among them the following portraits: Giovanni Lorenzo Bermini, Giulio Romano, Salvator Rosa, Leonardo da Vinci, and Giovanni Antonio Razzi; all of folio dimensions.

Giovanni Battista Tiepolo, was born at Venice in the year 1697, and died at Madrid A.D. 1770. In his youth he frequented the school of Gregory Lazaroni, and after having worked at Milan, and in other parts of Italy, he travelled to Germany, and painted, in the episcopal palace of Wurzburg, the hall, the staircase, and two altar pieces. He afterwards went to Spain, and painted in conjunction with Mengs, who became jealous of him; but for the detail of his merits in this art, see the article TIEPOLO.

Tiepolo engraved fifty-six subjects in a very superior style, exceedingly neat, and with talent, correctness, and spirit, from which the following are selected. "The Adoration of the Kings," in folio, from his own composition, which is generally regarded as his chef d'oeuvre. A set of fancy subjects, consisting of twenty-four plates, in quarto. And another set of fancy subjects, in ten plates, smaller than the foregoing. All from his own compositions.

Giovanni Domenico Tiepolo was the son of the preceding artist, and was born at Venice A.D. 1726. He learned the principles of drawing and painting of his father, and in 1745, painted the figures of the cupola of the church of St. Faustini, and St. Jovita of Breslau.

He also occasionally took up the etching point as his father had done, working sometimes in a style which bears resemblance to the etchings of Callighone, and on other occasions in that of his father. His belt prints are, a set of twenty-seven small plates, lengthways, representing in series, "The Flight of the Holy Family into Egypt," a set of twenty-six heads, of the same size, executed in the style of Callighone; "The Way to the Cross, or the History of the Crucifixion of our Saviour," in fourteen plates of quarto size; "The Miracle of St. Francis;" "The Miracle of St. Jerome," both in quarto; "The Republic of Venice receiving the Riches of Neptune," an allegory, in folio; "The Virgin in the Clouds appearing to St. Theodora, and two other female Saints;" and "St. Ambrose preaching to the People," both in large folio. The whole after the designs of the elder Tiepolo.

Lorenzo Tiepolo, brother to the above-mentioned artist, was also a painter, and etched in a style, and with a degree of taste which appears hereditary, from the designs of his father.

Giulio Giampigli, or Jampicoli, was born at Venice A.D. 1705. We are ignorant under what master he learned engraving, but his style greatly resembles that of the school of Wagner. He mingled etching with the work of the gravers, and engraved both history and landscape with success; the following few may be reckoned among his best productions. A set of thirteen landscapes, from Marco Ricci, in large folio. A set of pastoral subjects in four plates, each being inscribed with fine Italian verses; and four landscapes after Marco Ricci, and F. Zuccarelli, in large folio.

Francesco Polanzoni, or Polanfani, was born at Arezzo, near Venice, A.D. 1705, and reared at Rome. The most considerable work we have by him, is a set of twenty-two plates, of which the subjects are from the life of the Virgin, either after Poussin, or, more probably, from Jacques Stella (to whom Bailan attributed them). The following may also be reckoned among his best productions. A set of a female, from C. Cignani. A bust of a blind mimic, from Marco Benefici, "Mater amabilis," from Jos. Negar. Two other subjects from the same master, an Old Man with a Bag of Money; and an Old Woman with a Hand Grand, all of quarto size. And "An Old Woman washing herself over a Chatting-dish," from the same painter, in folio.

Giovanni Battista Pittoni, was born at Vicenza in 1692, and died at Venice A.D. 1757. He was the nephew and disciple of Francesco Pittoni, the Venetian painter, and his historical pictures are held in considerable esteem. There are some few etchings by this painter which are much valued by connoissieurs, and are marked sometimes with his initials, and at others Batista P. V. F. and sometimes with his name at full length, but we are unable to specify any of them.

Antonio Luciani was a native of Venice, and born A.D. 1720. He studied painting under Jacques Paccini, though he is better known as an engraver than as a painter. Luciani engraved from the works of Tiepolo, Caffana, Bombelli, and others, but his works are held in no very high degree of estimation, and it may therefore be sufficient to specify the two following prints by him. The portrait of cardinal Sforza Pallavicini, from Pietro Avogado; and that of the Je(u Tarsabini, from the same painter, in folio.

Domenico Roffetti was born at Venice in the year 1750. The prelude Giovanni Francesco Barbarigo, being very fond of this art in his youth, took him to Verona, where he pursued his studies for some time. He practised architecture, as well as engraving both on copper and wood, and when some years had elapsed, and his reputation was established, Roffetti was invited to Durlendorp, by the elector palatine, to engrave "The Triumph of Alexander," from C. Lafreri, on twelve large plates, which is become exceedingly rare, because, before many impressions had been printed, the elector had the plates gilt. This artist also engraved several of the plates for the collection of prints taken from the most celebrated pictures at Venice, which was published by Domenico Levits, and among which the following will probably be found most worthy of the notice of the connoisseur.

"Pope Alexander III, recognized by the Doge of Venice," after Paolo Veronese; "The Ambassadors sent by the Venetian Senate to the Emperor Frederic Barbaroufis," after the pictures of Carlo and Gabriel Cagliari, which are preferred in the hall of the grand council chamber at Venice. Another
OF ENGRAVING.

Another print, of which the subject is taken from the same embly, after Tintoret, whose picture is also preferred in the same public hall; "The great Victory gained by the Venetians over the Imperialists," from the same master; "The Popeapologizing to his Benediction on the dogs Zani, previous to his Battle with Barbarossa," after Francesco Bajano; "The Emperors Barbarossa prefate before Pope Gregory VIII.," after Frederico Zoccherio, and another with the Italian title "Othone vien licenciat dal Pontefice e dal Doge perche vada al trattar la pace con l'Imperadore suo Padre," also after Zoccherio.

The portrait of Thomasin Scammi, (a celebrated physician,) after S. Bombelli, is also engraved by Rossetti; and all the above are of large folio dimensions.

The names of some few of the engravers of Italy, who run their obscure and uninteresting careers about this period, have been purposely omitted, as being altogether unworthy of our records. Indeed, when we reflect on the advantages possessful by the artists of Italy, compared with those of inferior fortune it is to exit in the other countries of Europe, we cannot but perceive that intellectual life in the course of the century through which we have just laboured with due obedience to chronoligical order, to few engravers who are justly entitled to rank high in their profession, should have appeared in that highly favoured country, while France, Germany, and the Low Countries, with inferior opportunities, present a respectable display of talent in this art, and are even brighter with some rays of original genius. The history of Italian engraving is little better than a dull record of creeping mediocrity.

If the reader participates in our surmise, he will perhaps be led to reflect whether this effect may, with more justice, be attributed to dearth of that particular kind of genius combined with patient industry which is required to excel in this art? or to paucity of Italian patronage? or that no philosophical view was then and there taken of the principles and practical energies of engraving, though painting and the art of the flattery were abundantly honoured with the literary attentions of their Italian proficiors and critics? or lastly, how far it was owing to the circumstance of engraving being less studied and practiced in Italy, as a distinct profession from that of painting, than in the north of Europe?

The name and the works of Piranesi, which we now approach with all the refreshing pleasure with which weary attention is inspired by the appearance of a worthy object, may yield some salutary light on the diffucution of these questions, or will at least prove that the genius of Italian engraving had not fled for ever to les genical climates.

Giovanni Battista Piranesi, was born in the Roman territory early in the eighteenth century; Huber says in the year 1757, and died in the city of Rome in 1780. He was at once architect, antiquary, draughtsman, and engraver, and in all, but more particularly in the latter art, evinced the most vigorous and original powers. He appears to have had no tutor, at least none has been mentioned by his biographers, and excepting a sound mathematical foundation, with which books or a matter mutt premutively have supplied him, he built his style of engraving on his own strong and keen observation of nature. In his practical knowledge of perspective, as in his treatment of ruined edifices, he had no predecessor, and though he will always have numerous imitators, he has yet met with no rival in Italy, nor even in Europe, fave and except our own Edward Rooker, and another, whom, with flill more propriety, we Cyclopedia may call our own.

The authors of the French Encyclopedic say of Piranesi, that he was the best draughtsman of ruins, and the most pictureque engraver that the country produced. This cold praise, though not warm enough for the ardour of the subject. His professional industry was unremitting, yet his mind and his hand have so far outstripped time, that though we know this, we remain in astonishment at the vast quantity of his works, which, when their number and magnitude are taken together, exceed the productions of any other engraver whatever. A pile of more than twenty large folio volumes, replete with talent and intelligence, seems too mead to have been produced by the labour of a single individual, even after we have made ourselves acquainted with the rapidity of his powers; yet all these are etched from drawings made by himself, and some of these drawings, of which the subjects are the Greek temples at Pafiium, and which attest the vivid feeling and manly powers of execution which Piranesi poleded in that branch of the art, are now in the country, having been purchased within these few years in Italy, by Charles Lambert, etq. of the Inner Temple.

Towards the middle period of his life, or rather before, our engraver became a member of the Roman academy of arts, but on account of some tends, with the merits of which, if any merit attached to them, we are not acquainted, he was expelled by the voice of the majority of academicians. After some few years, however, had elapsed, and animosity was cool, motives were explained, or mistakes were discovered, and Piranesi was honourably invited by his brother artists to return. He was, about the same time, perhaps to give the greater credit to his return, created a Roman knight, but was always better known by his name than his title.

Of many irrefragable proofs that might be adduced to render idle the sophisms of those who affect that engraving is not an original art, Piranesi is one, having never to the best of the present writer's knowledge, engraved after any other pictures or drawings than were the production of his own hand, which sometimes present us with the magnificent remains of ancient Italy, and are sometimes the ready offering of a mind stored with architectural wonders.

Wherefore, unless those arts which are capable of independant existence, might justly lose their claim to originality, by condescending to copy, where the general and inexpressable interest of art and society require such condescending, no man, and no privileged body of men, should fancy of engraving that "it is not an original art," for no man of sense denies originality to a picture, because a sketch or cartoon of the same subject has previously existed, nor to the art of the sculptor, because he models in clay before he chisels in marble.

Though the human figures which he introduced into his landscapes, are extravagant in their attitudes, and ill drawn, they act the parts which they were intended to act; they serve to show the figures he has represented were inhabited (if not by whom,) and they are a scale whereby he induces the spectator unwittingly to measure the relative magnitude of these edifices which were the real and the edifying objects of his art. In his characteristic treatment of those edifices, and of the vases and other ornamental remains of antiquity, his line, varying as occasion admitted or required, was peculiarly expressive of stone, bronze, marble, and all the various materials of Greek and Roman sculpture and architecture confit, discriminating with exquisite observation and inimitable skill, whether those materials retained their original sharpness of workmanship, or were moulded by the hand of Time, or stained by the weather; or split and cracked by the frost, by Vandals or barbarity, or other sudden calamity; and whatever is subject, he always feems to have worked with easy vigour, with un-
ITALIAN SCHOOL OF ENGRAVING.

limited freedom of hand, and as if “out of the abundance of his heart.”

Trees do not often occur in the prints of Piranesi, but when they do occur, they most influence too much femeable foliage; yet the wild raggednesses and unexpected forms which characterize both these and the clouds which float over his landscapes—and even his ill-drawn figures—have a certain kind of enterprise, which accords with the forceful and chivalrous character of his characoer, and rather augments than diminishes, the general sentiment of romantic magnificence, which many of his compositions, and more especially the large frontispieces which fold into his large folios, inspire.

In some of the latter, all the grand architectural forms of Egypt, Greece, and Italy, appear to be assembled, as if by magic, and the mind of the spectator is led to wander, in poetic reverie, through irregular avenues of obelisks, sarcophagi, pyramids, columns, and triumphal arches. In others, which are of subterraneous character, the author appears to have penetrated the cemeteries of departed great men, and here, in solemn and forbidden things, are crawling and twining their flagrant convolutions among mouldering bones, broken sculpture, and mutilated inscriptions, and an air of dankness and desolation, and sepulchral gloom, is diffused through the cavern, as if Time and Eternity were beckoning to Oblivion, to break down what remained of the trophies of the brave, and obliterate the wisdom of the wise.

In his technical process, Piranesi was the first engraver who made free and abundant use of the rule, as may be seen in his interiors of St. Peter’s cathedral, his antique vases, and such other subjects as required it, or as admitted it only in certain parts: for he sometimes artfully contrived, in the same plate, the wilder fallacies of the etching-point, in the broken or worn eroded parts of his lights, with ruled paffages in his shadows, where the utmost regularity and perfection were preferred. Thought always accompanies his deeds, even where he seems most careless. The flex lights of a bright climate might seem, to the inconsiderate in a humid one, to partake of flimsy transparency. In the works of Piranesi, they show the judiciousness of his observation. If he was stimulate by an adventurous spirit, he was restrained by judicial caution, which let to easy on him, that he exerted it with the least seeming effort. In short, with the skill and conduct of a brave general, it was his to vary and adapt his mode of execution, and qualify his proofs, by the nature of the occasion which called it forth: he used the graver with boldness when he did use it, but used it only as an auxiliary to his etching. He knew that this was the main body of his native force, on which he could most depend. He doubtless felt that he was here the Alexander of his art, and that none could here, with any hope of success, dispute with him for the palm of victory.

The works of this artist in detail, would fill a volume; it shall therefore here suffice to say, that among the best of them will be found the frontispieces or title pages to his large volumes of Italian antiquities, containing, for the most part, of very rich compositions, forced of the fragments and monuments of antiquity. Several views of the Colosseum and arches of Constantine and Septimius Severus, at Rome; the pyramid of Cælium, with other Roman antiquities; the tomb of Cecilia Metella, on the Appian way; the fountain of Berenice, with the surrounding edifices; the facade of the Basilica of St. Mary, with other buildings; the church of St. Lorenzo on the Tiburtian way; (an admirable mixture of regular with irregular mode of execution, in the treatment of the architecture;) interior and exterior views of the Pantheon of Agrippa; a very large and magnificent view of the Sybil’s temple at Tivoli; another view of the same temple, somewhat smaller; another, with the cascades at Tivoli; the bridge and castle of St. Angelo; the Ponte Mola; the square of the Capitol; the square of Monte Cavallo; the grand fountain of Trevi, and the temple of Jupiter Tonans; all of large folio dimensions, and some of them so large as to fold into his imperial folios.

Francisco Piranesi was the son of Giovanni Battista, and was born at Rome in the year 1745. He became an engraver of landscape and ruined buildings, in which he imitated the style of his father, but, like other followers, was always behind, though his engravings of this kind produce so much merit, that were his father’s works annihilated, he would be entitled to hold rather an high rank in his profession. Francisco did not, however, confine the exercise of his talents to landscape and architecture, but engraved several plates of the celebrated statues of antiquity. He drew the human figure better than his father, but in his treatment of the antique was still an imitator, following, with much devotion, the style of engraving of Pitiier, of whom we shall presently speak.

Among the best of his prints are views of the Colosseum, the Pantheon the baths of Sulpicius Gallus, the baths of Diocletian, and the temple of Isis at Pompeia, all in large folio; and in very large folio, the illumination of the chapel of Paulina, in St. Peter’s cathedral; and among his statues the following are entitled to respectful notice, viz., the fitting Jupiter of the Museum Clementinum, the Venus de Medicis, the group of Cupid and Psyche, from the gallery of the Capitol, and Orfeles recognized by Electra, mistakenly called by some the young Papirius and his mother, from the original sculpture in the Villa Ludovisi, all of large folio dimensions.

Laura Piranesi, was the sister of the preceding artist, with whom she equally distinguished herself by engraving; the following views are by her hand, viz., the Capitol of Rome, the bridge of Salaro, the temple of Peace, and the arch of Septimius Severus, all of 4to size.

Giovanni-Mareo Pitteri, was born at Venice A.D. 1703, and died in the same city in 1767. He studied engraving for a short time under Jof. Baroni, whom he soon quitted for J. A. Faldini. The works of this admirable artist are executed in a very remarkable style, with tinge courtes of lines, though very differently disposed from those of Melian and his followers. They run perpendicularly from the top to the bottom of the plate, and the shadows are expressed by strengthening them as occasion required. The effect he has produced in this new mode of engraving is far more pleasing and harmonious than could have been expected, especially where, by partially blunting his lines, he has imparted fliny character and richness, to such parts of his prints as required it. This art is being always occupied with engraving, never travelled out of his native place.

Among his works, the following are most worthy of notice.

Wate-Loofh PoMtraits and Heads, all in large Folio.—A buff of himself, from Piazetta; a buff of J. B. Piazzetta, a Venetian painter; Charles Godkin, a Venetian comic poet; John Mocenigo, a Venetian nobleman; Joseph Nogari, a Venetian painter, with his hand on the hilt of his sword; and a young lady resting on her head, all from the same painter; count de Schonenbourg, field-marshall of the republic of Venice, from C. F. Ruffca; cardinal Quirini, marquis Scipio Maffei; Clara Maria Formari; and a sot of heads on eleven plates, which are presumptuously entitled God: the eternal Father! our Saviour, the Virgin Mary, the twelve apostles, and St. Paul, all from Piazetta.
ITALIAN SCHOOL OF ENGRAVING.

Piazzetta, according to Huber, but, according to Strutt, the latter are from his own designs.

Various Historical Subjects.—“Christ expiring on the Cross,” with the effect of night; “Religion and Heresy,” an allegory, both from Piazzetta; “A Holy Family,” from Pietro Longhi, in large folio; seven folio upright plates of the sacraments; six large folio plates representing scenes in the neighbourhood of Venice, from the fame master; “St. Peter delivered from Prison by an Angel,” after El-pagoo; the Martyrdom of St. Bartholomew, from the same master, both in folio, for the Dresden gallery; “St. Catherine of Siena” and “The Pentecost Magdalen,” from the same for the Dresden gallery; “The Drunken King,” after D. Tintoretto; and two ruffian subjects, after the same painter, (the Shoemaker, inscribed “Ne futor ultra cremidam,” and the Miller, inscribed “Sulut rotator f. forte contentus,”) all in large folio.

Conte Pietro de Rotari was born of a noble family at Verona in the year 1507, and having a natural turn for the fine arts, together with the means of indulging it, became succe:ssively the pupil of Robert van Audenarde and Anton Balbora. He studied with commendable industry, and travelled in quest of improvement, or of distinction as an artist, to Venice and to Rome, and afterwards to Vienna, Dresden, and Petersburg, in the latter of which cities, after a residence of eight years, he ended his career in 1704.

His engravings consist of slight, spirited, painter-like etchings, which are much sought after by the curious, and are executed from his own compositions, or from those of his master, Balletra. From among these, the following will probably be found most worthy of attention. The portrait of Filippo Baldinucci, writing; “St. Francis adoring the Crucifix,” a middle-sized upright oval, from his own composition; “The Education of the Holy Virgin,” of the same size, the head of an old man with a beard. Another head of an old man looking upwards, both in 8vo.; “The Three Angels entertained by Abraham;” “David with the Head of Goliath;” “St. Jerome;” and “The Interview between Venus and Dianas,” all of 4to. Eze, and, of some weight larger dimensions, three moncks of the order of St. Francis, after Balletra. The court also arrived at some eminence as a painter of portraits and history.

David Antonio Piazzato was born at Moreo, a bailiwick of Lugginis, in Switzerland, in the year 1705; but resided at Venice with an uncle, who was a merchant, and wished Piazzato to become one also, but finding he had no taste for the sea, he gave up this design, and placed him under Vincent Maratti, a good designer of architecture, and a master in perspective, with whom he made great progress. He afterwards travelled to Vienna with Daniel Gran, under whom he executed some very fine pictures, particularly a very superb ceiling for the Imperial Library. He worked with great success, both in oil and fresco, in most of the towns of Rome and Germany; and likewise amused himself with the point. Among his best productions in that way, the following may be reckoned. A set of twenty-four folio landscapes of Venice and its environs, from M. Ricci, with a dedication to count Algarotti; “Diana and Cupido,” from Solimene; “The Family of Darius before Alexander,” from P. Veronese; “Jupiter thundering against the Vices,” from the ceiling of the council chamber; “The Servant of Abraham with Rebecca,” half figures, from Ant. Bolluci; and “The Vocation of St. Peter to the Apostles,” from the same painter, all of folio dimensions.

George Piazzato was born A. D. 1710, and was probably of the same family with the preceding artist. We are ignorant of whom he was the pupil; but he worked some time at Milan, and from thence went to Venice, where he settled.

He etched the edifices which the celebrated architect Palladio erected at Padua, Vicenza, and other towns and cities of Italy, which was published by Papiolhi at Venice, during the years 1743 and 1745, in French and Italian, of large folio size. The etchings are well executed, and do honour to the taste and intelligence of our artist.

Jacques Leonardis was born at Parma A. D. 1712. He learned the rudiments of art of M. Bonvile, (a portrait painter,) and J. B. Tiepolo. He engraved from the most celebrated pictures of Venice, and, with commendable regard to the public delicacies, commonly made choice of those which had not already been engraved; though he generally succeeded so well in copying the characters and effects of his originals, that he need not to have been either afraid or ashamed of following other engravers, by working after the same pictures. The best of his productions are, “Cupid’s playing,” after Julio Carpioni; “The Rejoicing of Sileus,” from the same painter; “Neptune in a Car drawn by Tritons,” from Seb. Conca; “The Rape of Europa,” from the same master; two ruffian subjects, one representing “A Village Fair;” and the other “A Crowd of Beggars at the Gate of a Town,” from J. M. Crefpi; two comic subjects representing “The Divertions of the Carnival at Venice,” from Tiepolo; “The Golden Call,” from Tintoret; and “The Lair Judgment,” from the same master, all of large folio size.

Michael Sorelo was born in Spain, but in what year is uncertain. He settled at Rome A.D. 1750, and studied engraving under Giacomo Frey, (for an account of whom see GERMAN SCHOOL OF ENGRAVING,) and worked very much in the style of that very distinguished master. The most considerable work we have by Sorelo is a set of eight prints, engraved from the tapestry of the Vatican, after Raphael; he likewise engraved, after other Italian masters, several meritorious plates for the Museum Florentinum. From the mass of his works, the collector may, with advantage, select good impressions of the following, for his Italian portfolio:—“The Nativity,” where a shepherd, accompanied by his dog, is among the principal figures, from Corci; “The Purification of the Virgin;” and “St. Peter proclaimed Chief of the Church,” from Carlo Maratti, all in large folio; and “The Defeat of Christ into Hell,” in small folio; “The Resurrection,” dedicated to Antonio Colonna, “The Difficulties at Emmaus,” in large folio; “Christ represented as a Gardener,” or, the “Noli me Tangere;” “The Conversion of St. Paul,” from C. Maratti; the frontispiece for the Monologium Graecorum, from Seb. Conca; and an “Annunciation of the blessed Virgin,” from Felice de Caltro, (a Spanish painter,) both in large folio.

Paul Pilain, or Pilaya, was a native of Italy, and appears to have been born about the year 1718. The circumstances of his life have not been recorded, but he seems to have worked at Rome. He engraved the prints for a book entitled “Storia di Volfena,” by the Abbe Adami, with the portrait of the author, after the Cavalier Odana which book, according to Gaudenzi, was printed at Rome in the year 1737. He also engraved, in folio, the statue of the prophet Elias, from Aug. Cornelini, erected at St. Peter’s cathedral; the portrait of pope Benedict XIV. from J. B. Brughil, a Roman painter; “The Martyrdom of the Capuchin St. Federia da Simaringa,” from Seb. Conca, both of folio size; “The Miracle performed by St. Thoribio,” archbishop of Lina, while preaching to the
ITALIAN SCHOOL OF ENGRAVING.

Indians," in large folio; "Liberality" with two children, in folio; and "Clodius, disguised as a Woman, discovered at the House of Cesar," both from the same master, in large folio.

Niccolo and Antonio Billi were brothers, and born at Rome some time about the year 1719, or 1720. Of the family of this name, which were long known at Rome, as printellers, and some of whom were engravers also, we shall mention only these brothers, who engraved many portraits and devotional subjects at Rome, and various plates for the volumes of the antiquities of Herculanum, at Naples, executed in a stiff style, without much taste. Niccolo engraved many of the plates for the Museo Florentino, and among his productions are also the portraits of Fredericus Zuccharius, drawn by Campiglia; John Holbein, "se ipse pinxit." Pietro Leonardo Ghetti; John Marin Morandi; the cardinal Pompeo Aldrovandini, all in folio; the cardinal Joseph Spinelli Dom. Dupre pinx.; "The Infant Jesus," in an oval, of 4to. size, from J. Conc; "St. Philip of Neri, kneeling before the Virgin," from S. Conc; "A Holy Family," half figures, from Caracci, in 4vo.; and "The Flight into Egypt," from Guido, in large folio.

Carlo Gregorio, or Gregori, was born at Florence in 1719, and died in the fame city A.D. 1759. He learned engraving at Rome under the direction of Giacomo Frey, and worked for the greatest part of his life in his birthplace; after the celebrated painters of Florence. Part of the plates from the cabinet of the marquis Gerini, and some of those in the Museo Florentino, are by him, of which collections they constitute the best and greatest part. Among his productions the following may also be mentioned with approbation, viz. the portraits of Francisco Maria, grand duke of Tuscany, from Campiglia; his duchesses, Eleonora Vincentina of Gonzague, from the same painter; and Sebastian Bondelli, painted by himself, all in folio; the statue of the Virgin, brought to Bologna by angels, from a design by dal Fratta; St. Catherine Jannen, from F. Bartolozzi, all of folio size; "L’Iliasa of Cefare, a cui nell’Egitto molte Nazioni prefentarono vari donativi—Solodano d’Egitto," from Alexander Alivio, detto il Crupino; "Opus Bernardini Barbatello, detto Pocciatti, quod in facel S. S. Neri & Achillei in Atrio Templi S. Magdalene de Pariss Florentia adveritar;" fourteen subjects from the Lives of the Saints, at the church of St. Magdalene at Florence; these were engraved in conjunction with his son Ferdinand, in large folio; "The Virgin and other holy Women at the Sepulchre," from a picture by Raphael, in the cabinet of lord Sandsdale, in folio; St. Padio, a bishop of Florence, from Sig.etti, in 4to; St. Bonizella Cacciaconti, a half figure, from Ant. Bonfigh, in 4to; and the maupholium of the princess Elizabeth Charlotte of Lorraine, from Jof. Chamant, in folio.

Ferdinand Gregori was the son of Carlo, and born in the same city A.D. 1740. He learned the principles of drawing and engraving in his father’s house, after whose death he travelled with Vincent Vangelidi to Paris, to finish his studies under Wilks. He afterwards returned to his native country, and published several meritorious works, among which were a print of "The Death of St. Louis Gonzaga," after a design by J. B. Cipriani; and a portrait of Carlo Gregori, drawn and engraved by Ferdinand; "The Virgin fuxcking the Infant Jesus," from Carlo Maratti, in folio; "A deeping Venus," from Guido, in large folio; "St. Sebastian fuxcked to a Tree," a half figure, from the same painter; "Venus, discovering Cupid mounted on a Dolphin," from J. Cofanova, both in folio; two marble groups from Cellini, a Florentine sculptor, after the designs of Allegrenzi, in large folio; "A Holy Family," from a painting in frefco, by Andrea del Sarto, in small folio, with a very good effect; and "St. Stephen fuxcket," from Louis Carri, (whole picture has a grand character, which is very well preferred in the engravings) of folio size.

Antonio Joseph Barbazza, was born at Rome A.D. 1720. The life and works of this artist are very obscure, and we can only specify, that he was a member of the Bolognese Academy, and travelled to Spain in 1771. His pictures are left numerous than either his drawings or engravings, which are much esteemed by connoisseurs. Among his prints, four large heads from nature, in the style of pen and ink drawings, are justly intitled to high praise for their truth and originality; a group of musicians, among whom is a caricature of M. Perez, of musical celebrity, in 4to.; the plates for the book of father Bianchini, intitled "Iterica Ecclesiastica," in 4to; and some plates for the work of Mondalini, who published new editions of Virgil, and other of the classic authors of antiquity.

Jean Elias Morghen was a native of Germany. He was born in the year 1712, travelled to Italy in his youth, and remained there during the greater part of his life, residing for the most part at Florence. He made all the drawings, and engraved most of the plates, for the work which was executed under the patronage of the marquis Gerini, after the pictures of Francesco and other celebrated masters, which decorate the ducal palace of Tuscany. He also engraved and published, in 1767, "The Antiquities of Persia," on six plates, after drawings by Antonio Jofeg.

Philip Morghen was the son and pupil of Jean Elias, and was born in Italy, probably at Florence, in the year 1740. He went, either for professional improvement or employ, to Naples, where he executed a great number of the plates for the antiquities of Herculanum, including the portrait of the king of Naples, which serves as a frontispiece to the work.

Philip also engraved a set of twelve folio plates of statues at Florence, called the Apostles of Baudinelli, and thirty-one views of ruined edifices in and about the city of Naples.

His son, or his nephew Raphael Morghen, who has fignalized himself by the production of Da Vinci’s Last Supper, and other meritorious works, and who still lives and engraves at Florence, will become the worthy theme of future historians of the Italian school of engraving.

Francesco Londonio (whose name and merits appear to have been unaccountably overlooked by our countryman Strutt) was born at Milan A.D. 1733. He began his career in art with the study of historical painting, but soon abandoned the heroism and duplicity of man, for the honesty of the brute creation, and particularly attached himself to the painting and etching of domestic animals, in both of which arts he was eminently successful.

In the year 1769 he travelled to Rome, Genoa, Naples, and other parts of Italy, and during his stay in the latter city, he made occasional journeys to the surrounding villages, and studied nature with great attention, particularly those rustic and unfamillicd actions and feeces, which were congenial with the simplicity of his own habits and feelings. Here he passed the greater part of his time in etching and engraving, and here, as is believed, he died of an apoplexy in the year 1783.

Londonio engraved a great number of rural and pastoral subjects, conflicting for the most part of peasanfly and country, with the accompaniments of picturesque banks, trees, and water, in a style which, though original, and evidently the offspring of his own observation and feeling, bears strong resembirole to the best etchings of Bergbin and Vifcher; using
using the graver and dry-point, with great propriety, only as occasional auxiliaries to its etching-needle.

The works of this artit compose seven sets, confining in the whole of seventy-two plates, of which the subjects are the rural occupations of Italian peasantry, &c. One of these sets is dedicated to cardinal Pozebonelli; another to the earl of Exeter, and the rest to different noblemen and gentlemen who had befriended their author, who were most of them Englishmen. Londiino for times printed his plates on blue paper, and heightened his lights with white chalk, by which means he produced an agreeable effect.

A picture by this artist, of a Milancse peasant at the entrance of a hut, with goats, is now in the collection of the noble marquis of Stafford, at Cleveland house. His pictures are rare, and this is probably the only one in England: it has no very powerful chiaroscuro, but is painted with exquisite feeling, and great dexterity of pencil.

Gioffeo Camerata was born at Venice A.D. 1724. He studied engraving under John Cattini, and travelled to Vienna in 1742, where he learned miniature painting, which he ever after occasionally practiced. In the year 1751, he was invited to Drefden, to engrave for the great work from the Electoral gallery in that metropolis, but the war breaking out he returned to Italy. When peace was proclaimed, he once more travelled to Saxony with the electoral prince; soon after which he was elected one of the professors to the Drefden academy.

This laborious artist engraving a great number of plates, many of which were from his own designs: among them are the portraits of Marco Poierini, procurator of St. Mark, and doge of Venice; Simon Cantarini, another procurator of St. Mark, both of folio size; Sebastien Bombelli, in quarto; a whole length of Theret Zemelli, a celebrated dancer, dressed in the Turkish style; and a large figure of Madeumilelle Abuzo, in folio.

For the Drefden Gallery, Camerata engraved two parables from the New Testament, after Petri; "David with the Head and Sword of Goliath," in folio; "A Holy Family," after Julius Caesar Procaccini; "St. Roche relieving the People affected with the Plague," after Camillo Procaccini; "The Charity of St. Roch," after Caracci; "The Assumption of the Virgin," from the fame painter, all of large folio size; "The Woman taken in Adultery," after Bicheri, in folio; "The Charity of Joseph," from S. Cantarini, in folio; and the Old and New Testament, after And. Vaciari, in folio. Of his works of subequent date, the following are to be preferrd: "A Holy Family," after Procaccini, in folio; "The Portrait Magdalene," from a picture by P. Batoni, in the Drefden gallery, in large folio; "A Sleeping Shepherd," from J. M. Croqui; "St. George referred to sacrifice to the Idol," from Count Rotelli, both in large folio. Two half length figures, with long beards, after Dierich; and a Magdalene, in miniature; from Vander Werff, of the same size as the original. This was Camerata's last engraving.

Joseph Canale was born at Rome in the year 1728, and became a profitor of the academy at Drefden, and honorary member of that of Bologna. He studied engraving under the direction of that judicious celebrated master Giacomo Frey, and also frequented the school of Cavalier Benfellii. At Drefden much of his time was taken up in making the drawings from the pictures which were to be engraved both by himself and others, for the publication of "The Drefden Gallery." Canale had many pupils who did him honour; and his engravings are very numerous. Among then the following are some of those which are held in most esteem.

Portraits.—Marin-Mattia Peri; John Homer from Marco Benfellii, in quarto; Maria Antonia Wallerstein, electress dowager of Saxony, from a painting by Leutfi in crayons; the archbishop Bentevera Baruffi; Maria Josephina, queen of Poland, after Rotari; the portrait of the prince Xavier, after Capano, all in folio; and the monumental of cardinal Spinola at Rome, in large folio.

Historical Subjects.—"Immaculata dalla S. Virgine Maria transportata nella Basillica Lateranense," in small folio; "The good Englishman," after Signora Rafiali, from the Crayon cabinet at Dreyden, the same size; "The Philosopher," after Espayroi; "Glory," after Dominichino; "A Sybil," after Angelica Kauffmann; "Paris on mount Ida," after Vanloo; "Adam and Eve defiled from Paradise," after Albasius; "Chrift and St. John," after Vander Werff; "Christ appearing to St. Thomas," after Matt. Preti, for the collection from the Drefden gallery. (This plate was only etched by Camerata and finished by Jean Beauravel.) "A Turkish Woman," half length, from Dietrich; and "Spring," a half figure, from the fame master, of which the half three plates are of folio dimensions.

Bartolomeo Crivelli was born at Venice A.D. 1727. He became the disciple of Wagner, and worked under his direction, from the pictures of Guerardini, Tariarni, Tiepolo, and others, and he likewise engraved some plates for the institution at Bologna, but attained no very high degree of eminence in his art. Among other engravings by this artist are the following: Portraits of Christian, prince royal, and elector of Saxony; and Mary Ann, archduchess of Austria, both of folio size. Three subjects from the life of St. Peter of Petrunius. Four from Nicolò del Abate, in folio; viz. 1. A Company of Card Players. 2. A Group of Drinkers, diverting themselves, both half figures. 3. A Company of Militia. 4. Another Group of Militia, with a young Female playing the Harp. icord. "The Canonicals of St. Alexander Saul," after Matteo Bartoloni. 2. A Young Man and Female seated on a Couch, from Julio Romano, in small folio, from the Gallery of the king of Prussia.

Cesano Gandolfi was a native of Bologna, and the contemporary and fellow student of Crivelli, he engraved, after Nicolò del Abate, "The Nativity," with "The Adoration of the Shepherd," &c. from a picture in the state of Leoni at Bologna, in large folio, which latter engraving he performed to much merit as to make us regret that he engraved to little, and that we do not know more of this artist. Giannini-Baptista Brofetelli or Brofentini, was born at Venice in the year 1726. He always resided in the place of his birth, and was probably a pupil of Joseph Wagner. We are only able to specify the following engravings by him. The portrait of pope Benoix XIV. In one, a &cette with the same portrait; "St. Theodore in Roman," in folio. A set of twenty views of Venice, etched after Neg. Canale, in folio. Another contains the set of twelve large plates, from the same master, represent the ceremonies includit in the election of the doge of Venice, and at the annual marriage with the fain.

Bonigne Boffi was born, according to Pocci, at Petro d'Arciatto, in the Marche territory, A.D. 1727. At the age of ten, his father took him to Nuremberg, where he learned the elements of design; and from the time of the death of his father, he travelled to Rome, and under Pompeus Battoni, Huttin, Dierich, and diet. The latter advised him to practice etching, which he did till death. The seven years war, of which Saxony was anot the
the centenial feat, obliged Bobi to return to Italy, and in 1760 he was received at the court of the duke of Parma, where he lived honorably, occupied with letters and the arts. The following are among the best of his works. A portrait of the engraver Boetius of Dresden; "The Predestination in the Temple," (published at Dresden); a set of heads and other subjects on forty small plates, etched with taffe and in a very spirited style; a set of vases, and a maskerade, after Pettiot; four subjects of trophies; the Attributes of the Four Seasons, included in circular wreaths; two subjects of children, in small folio; a set of twenty-nine etched, and washed in with water colours to imitate the original drawings by Parmegiano; the cities of Piedmont; allegorical figures for an Epithalamium; and the celebrated St. Catherine, who was related to the house of Saurial, engraved the size of the picture, and a very capital print.

Antonio Baratti was born at Florence in the year 1727. He worked for the collection of prints after the bell pictures in the cabinet of the marquis Gerini, of which Mariette has published in a large folio, A. D. 1759, at Florence. He likewise engraved on various Italian mast.rs, and among others the portrait of Jean Bettni Cignaroli, after Della Rosa; of 40a. size.

Pietro Campana was born at Soris A. D. 1727. He learned engraving of Rocco Pozzi, and worked best part of his life at Rome and Naples. We find several of his engravings in the cabinets of Florence and Hereclianam, among which the following are most worthy of distinction: "St. Francis of Paul," a half figure; "Charity," in a small oval; "St. Peter delivered from Prison by an Angel," after Matt. Preti, from the Dresden gallery, in folio; the portrait of Pietro Berretini da Cortona, from the Florentine cabinet; and Bernardino Barbabelli, detto B. Pocettì, pittores Ferretti, both in folio.

Carlo Orliolini was born A. D. 1724, in the city of Venice, where he generally resided, and where he carried on a considerable commerce in prints. He engraved for the Florentine Gallery, and among the best of his prints are "St. Jerome meditating," inscribed "poll multas lachrymas," &c. from Ant. Baelteza, a much admired plate, in large folio. Four others from legendary stories of the saints Aloysius, Stanilus, Francis, and Bernard, and the High-priest, all of folio dimenions.

Bernardino Belotti, surnamed II Canaletto, was also born at Venice in the year 1724, and died at Varvovice in 1793. He was called Canaletto from his very distinguished uncle Antonio Canaletto, by whom he was instructed, and whose style he successfully imitated. After visiting Rome and other cities of Italy, he travelled to Germany, where he obtained the title of count Belotti, and made some stay at the courts of Vienna and Dresden.

The subjects of his prints, which conformed for the most part of etching, are landscapes, generally views, (or portraits of celebrated places,) which he treated in a picturesque taste, and which have been held in deserved esteem. The most remarkable of these are, a set of six views of Venice, &c. in folio; two other sets, each consisting of six architectural ruins in quarto; and a very large plate, entitled "The generous Turk," the whole of which were executed during his stay at Vienna.

Those which he engraved at Dresden are larger and more numerous. Among these we shall distinguish views of the port Wildfudder Thor, with the ramparts, theatre, and public library; the gallery of Zwinger, with the bridge at the entry of Oftet; interior of the Zwinger, with the pavilions and galleries; the Catholic church with part of the electorial palace; the bridge over the Elbe, with a profile of the Catholic church; the gallery and gardens of count Bruld; the church of the holy Virgin, &c.; the picture gallery at the above church, &c.; the square before the grand guard-house; the old market at the side of the church of St. Crofts; the church and street of St. Crofts; the ruins of the belfry of the church of St. Crofts, which fell on the 23d of June 1763, at the bombardment of Dresden; the ruins of a part of the suburbs of that city, before the port of Pirna; and two views of the new town and palace of Holland, with the equestrian statue of Augustus II.

Views in the Neighbourhood of Dresden.—The town of Pirna, on the side of the gate called Oberthor; the suburbs of the town of Pirna, before the waterman's gate; Pirna before the gate of Dochna; the façade of the palace of Sonnenlein on the banks of the Elbe, in the back-ground the city of Pirna; the ramparts of Sonnenlein, with the prirofis, &c.; the fortresses of Sonnenlein, from the road to Koeniglein; the rock and fortresses of Koeniglein on the south side; the rock and fortresses of the same city on the western side, with the castle of Lichtenstein in view.

Views in Warsaw.—The abode of the Bernardin monks, as it presents itself from the gate of Cracow; Warsaw, from the palace of Sapien, to the end of Szoliki, and from thence to the castle of Villanova, with part of the town of Prugue; the city of Warsaw from the palace of the Ordinate to the royal castle.

Dominico Cuneego was born at Verona in the year 1727. He learned the principles of drawing and painting in the school of Francesco Ferrari, but feeling a strong desire to become an engraver, he copied, without any previous instruction, various prints by the most celebrated engravers. His earliest engravings, (after these preparatory studies,) were the medals for the book of the marquis Giacomo Muschi Veronefse.

He afterwards went to Rome with Mr. Adams, the English architect, where he engraved certain Roman antiquities, and, we believe, some of the ruins of Diocletian's palace at Spalatro, after Clericiam; besides many other plates from celebrated Italian paintings; and most of the prints for the Scuola Fctica of Gavin Hamilton. Stuart supposes that he visited England, but this is perhaps a mistake into which he may have been led by the circumstance of Cuneego's having engraved for Boydell's collection, and for the Melis Ads. When he was about sixty years of age, he was invited to Berlin, to work perhaps as preceptor, in an academy of engraving, established by an individual named Pafeall; where he engraved a great number of portraits both in the line manner, and in aquatint, after Cuningham; but this establishment not succeeding, he returned to Rome in 1789; in which metropolis, as is believed, he died within these few years. In the following list will be found mentioned all his works that are of any importance.

Portraits engraved after Cuningham.—Frederick II. king of Prufly, a whole-length figure, with the two favourite leverets of the king, in aquatint; another portrait of king Frederick; two portraits of Frederic William, prince royal of Prufly; Frederica Charlotte, princes of Prufly, represented walking in a garden; and Frederick-Louis-Charles, Frederic-William, and the princes Frederica, whole-length figures, all of large folio size.

Subjects for the Scuola Fctica of Hamilton.—"The Creation of the Waters," in small folio; "The Creation of the Sun and Moon," in large folio; and "The Creation of Adam," in folio, all from Michael Angelo, in the Sistine Chapel; "Confraria, the Miltref of Raphael," after a picture by that master, at the palace Barberini, small folio.
ITALIAN SCHOOL OF ENGRAVING.

The Daughter of Robert Strozzi, a Florentine Noblemam, from Tommy, in folio; "The Rape of Ganymede," after Titian, in small folio; a head, with a long beard, after Botticelli; a bust of St. Jerome; St. Herminyma, from Guido; and an old man after the fame painter; a fine head of a Mary Magdalene, after the fame, in small folio; a half-length portrait of an old man, after Guerchin; "The Infant Prodigy," after a picture by the fame painter, in the palace Lancisoli, at Rome, all of folio fine; "The Birth of St. John the Baptist," and "Providence," surrounded by children, half of large folio fine, after J. Carlelo; "Galatea on the Water," after a picture by Agnusino Caracci, in the Paris Gallery; "Apollo and Semele," from Anchio Carracci; "A Penitent Magdalene lying on Thomas," after the fame; "A Young Man and Woman," after Guerchin; "Apollo supporting the wounded Hyacinth," after Domenichino, at Rome; "The Death of St. Cecilia," from the fame painter; and "Two Nymphs, accompanied by three Cupids," from Albani, all of large folio dimensions.

Subjects after various Masters. — Benedictus Jofephus Labri, Bolonienfis, And. Bdg. pinx. in large folio; Clement XIV. (Gangagenii) Gio. Dom. Campiglia pinx. in folio; Frederick Christian, prince royal of Poland, and elector of Saxony, drawn and engraved by Cumege, at Verona, also in folio; Eques Antonius Raphael Mangs, fe pilon pinx.; "The Virgin with the Holy Infant in her Arms," A. R. Mangs pinx. both in quarto; five large plates, from the pictures of Raphael Mangs in the library of the Vatican; "St. Baffi celebrating the Greek Mafia," after D. Subleyris; one of the altar-pieces of St. Peter's at Rome, executed in Mofa, large folio fine; "Juno with the Cupid of Venus;" and "Hebe presenting the Cup to Jupiter," (companions) of folio fine, both after Gavin Hamilton; the Allegro and II Penelope of Milton, folio fine; "Innocence, with a Lamb," a very interlacing print, with much of truth, finish, and simplicity of character and expression, and which does honour both to the painter and engraver; Briefs taken from the "Tent of Achilles, who is regretting her Lofe," Achilles mourning over the dead Body of Patroclus; "Voyage dragging the dead Body of Hector at his Chariot Wheel;" "A Pair of figures delivering the Body of Hector to Priam?" "Aromandus" the mourning the Death of Hector, all of large folio fine, from Gavin Hamilton; "Brutus seeking to revenge the Death of Lucetia," in folio, from the fame painter; a half-length of "The Virgin and Child," from J. B. Cignaroles; the fame Subject, from Correggio; "A Magdalene," from the fame painter; "The Apothece St. Andrew," after Guido Cagnacci; "St. Thomas of Villanovus," from Ant. Cavazoni; "A Philosopher with a long Beard," from Cellani; "The Sick healed," after L. Caracci, all of folio dimensions; "Chrift bearing the Crofs," a very grand composition, after Raphael, in large folio, and "Chrift laid in the Tomb," a very large upright plate, after Espignanetto; "The Godhead in the Heavens, attended by Angels," from Domenichino, in folio; "The Anunciation," from the fame painter, in large folio, from the chapel of Soffi; "The Visitation;" "The Nativity;" "The Circumcision;" all in large folio fine; "The Adoration of the Kings;" "The Prefentation in the Temple;" "The Flight into Egypt," of folio fine, in a circle: "A dead Christ, with the two Maries and Angels," in large folio; and a very large upright plate of "The Virgin in a Radiance of Glory, surrounded by Angels, and crowned by the Holy Trinity," all from Dominici; "Rinaldo asleep," Car of Arezzo, which is drawn by winged Demons; "Guadalcabara do Caro pinx. Rome, in folio Cortis, Dom. Caspari filii," of very large dimensions; "The Discovery of the Truth," a fine engraving, executed at Rome, in the palace of the marquis Cortis, in his large plate; independent of the general print of the picture; "The Dead Judas," from the Sacristy of the Valence, after Michael Angelo, a very large plate; the centres of the chapel from the same painter; and another tragedy, on which he worked for a long time, and found, in the Villa Medici, in 1707, in folio, and the prints of this engraving, executed in Italy, after Cortis, on large plates, incomparably fine, and very inferior, in taste and style, to the real representations of such objects, by Pierpont and Rocker.

Giovanni Batt. Capriano should not be left unmentioned, among the Italian engravers of this period. Of his biography we have already treated. (See CAPIANII.) He etched several plates with considerable spirit, and a simplicity of style in his handling, which borders on dryness, of which some are from his own composition, and some from those of other masters.

Among these are several portraits of distinguished characters, who lived in the time of Cromwell, of whom four heads of Milton, which being taken at different periods of his life, from infancy to age, from an interesting physiog-}

...
ITALIAN SCHOOL OF ENGRAVING.

this art till, were all executed at London, from which it appears that after he had once ingratiated himself into the good graces of Angelica, he engraved no more.

Giovanni (or John) Volpato, was born at Baffano, in the Venetian territory, in the year 1538, and in his early youth practised embroidery, which he learned of his mother, but afterwards applied himself to the study of engraving, which he followed for some time without any matter, urged by the force of his own inclination, or attracted by such beauties of the art, as he saw in the print shops of Baffano.

He made a journey to Venice for the sake of obtaining information on what had now become the settled subject of his studies. Here, for some reason that has not transpired, perhaps from youthful affection, perhaps from diffidence, he published his first plates under the assumed name of John Renard, and here he was first made known to the celebrated and benevolent Bartolozzi, who interested himself in the welfare of the young artiff, and imparted to him the information of which he came in quest.

Volpato now felt more confidence; no longer withheld his name from the public, and soon produced engravings after Amiconi and Pannetta, which obtained him approbation and encouragement, and were followed by others after Maiotto, Zucarelli, and Marco Ricci.

From Venice our engraver travelled to Rome, where his abilities soon established him as a reputable engraver, and where his largest and best works were performed. A society of amateurs, very fortunately for him, had about this time conceived the project of patronising the first engravers of the country, in the production of a set of large plates after Raphael's pictures in the Vatican; and among those who were engaged, none distinguished himself more by his industry, nor perhaps by his talent, than Volpato, who continued for many years to enrich the public with large plates, which have obtained him much praise from the critics and connoisseurs of the continent, and which are engraved after the very finest pictures that have been produced since the revival of art.

It is a noble race for an engraver to run, and his pupils and son-in-law Raphael Morgren is now following with superior brilliancy in the same course.

The works of Volpato have been the subject of eulogium with Roll, Huber, and some other of the German, French, and Italian writers upon art; but, in the estimation of the pre-Railist writer, are deficient in richness and variety, and are more the result of mechanical care and patient industry, than of taste and feeling. His lights especially, when compared with those of Gerard Audran, Giacomo Frey, or Robert Strange, or his countryman Schiavonetti, of whom we are about to speak, are either papery, or cold and metallic. There is no playfulness of pencil; no evidence of a mind that glows and moves through its work with painter-like felicity, but the spectator is perpetually reminded of the rigid and undeviating course of the engraving-tool; and though the chaste forms and pathos of Raphael will always give a certain value to the works of Volpato, and even afford some argument in favour of the dryness of his style, posterity will not place him in the very first rank of engravers.

Indeed, so dead was our artiff to the more exquisite susceptibilities of his art, so fo eager for the obtinement of profit, that (like those in our own country who have converted Macbeth into a burletta) he joined with Du Cros, and his little school of petty colourers, in a scheme for painting over with water colours, his smaller sets of engravings from the gallery of Caracci at the Farnese palace, and the Loggia and Stanzas of Raphael at the Vatican, besides some sets of prints on a larger scale, of views in Rome and its environs.

Now, in works of this kind, the addition of colour, especially if some of the pigments employed be opaque, (as is the case in the coloured prints of Volpato,) inevitably destroys the beauty of the engraving, which in its turn mars that of the colours. It is, therefore, a mode of mutual destruction in art, which is justly regretted by those who know, or who believe, that the art of engraving is capable of becoming, of itself and without extrinsic addition, an appropriate vehicle for rendering every perfection that painting has yet attained.

In England we are but emerging from the mistsakes into which coloured works of this kind, aided by the cupidity of dealers, had plunged the national taste. And we therefore may at least stand excused, if we dwell upon the misfortune to art that must ensue when a distinguished professor joins his efforts with those of the mistaken fons of commerce, to break down the natural barriers between one art and another, and obliterate the delicate lines of demarcation which the finger of science has traced upon the orb of the intellectual world.

"According to an ancient fable, which has an excellent moral, the blustering mufic of Pan did for a while seem successfully to silence the chafe harfony of Apollo; and as the fenes of the vulgar, we know, are powerfully affailed by red, blue, and yellow, however "ily spread," it may yet be some time before the multitude are sufficiently informed, entirely to discard coloured engravings, but as even the tea-gardens have at length shut out coloured flowers, we cannot despair. Though the gaudy bubble may float awhile in the dense atmosphere with which fashion has surrounded and chilled the sphere of British engraving, it will sooner or later burst; and though some few, perhaps more than a few, shallow and inaccurate observers may for a time be pleased to their cost, all mechanical modes of picture-making will eventually sink into contempt, and painting and engraving will triumph as distinct and separate arts.

"As we frequently hear the uninformed talk as if they conceived the highest effort of painting was merely to copy nature as nature appears to them, so it is very common to hear unreflecting people speak of engraving, as if it were no other than an art of copying that of painting; which, though a great mistake, is yet a very pardonable mistake on the part of those who have been led in error, when we consider the state in which the art of engraving has hitherto existed, and the difficulties, and the degradation, under which, in this country, it has hitherto laboured.

"Now engraving is no mere an art of copying painting, than the English language is an art of copying Greek or Latin. Engraving is a distinct language of art; and though it may bear much resemblance to painting in the construction of
of its grammar, as grammars of languages bear to each other, yet its alphabet and idiom, or mode of expression, are totally different; if English be made the vehicle of the same thoughts which have previously been imparted to us by painting, it affords the means of affecting our minds in the same manner; this similar affectation of the mind has led to the mistake, and little doubt may be entertained but that English would have been inconsiderately called an art of copying Greek, if we had never read any other English than translations from the Greek.

"The pretensions of engraving, as of all the arts denominated fine, are simple, chaste, unphilosoficated. Art ever disdains artifice; attempts no imposition, but honestly claims attention, as being what it is. A statue is to be looked at as being a statue, not a real figure; a picture, not as a portion of actual nature; a print, not as a copy of painting.

"Engravings, therefore, such as those of Volpato, are no more copies of Raphael's original pictures, than the same compositions, if sculptured, or modelled in low relief, would be copies. In both cases, they would be, not copies, but translations from one language of art into another language of art.

"But absurdity blossoms luxuriantly; when engraved on an original block of error, and this vulgar and erroneous notion, that an engraving is a copy of a painting, has been assiduously cultivated by the avarice or ignorance of the dealers in prints, who always follow and pamper the taste of the mob, be it ever so depraved, provide it be profitable. That graft was green, and that soldiers' coats were red, was known to the most ignorant of the gapping multitude, and has given wings to credulity, and currency to empiricism. Neither is it of the infidel's importance whether ignorance or the unprincipled love of gain have contributed most to the production of this effect; since the public taste in either case has equally sufficed. It is error sufficient to call for animadversion here, if the print-sellers, (possessing, or possessed by, this mistaken notion, and with the view of making the copy, in their own vulgar estimation, approach nearer to its original,) have caused colours to be literally and barbarously added to engraving; for to colour legitimate engraving is not less palpably absurd to an eye of tolerable discernment, than it would be to colour a diamond, which, as every one knows, would but obscure the native brilliancy and beauty of the stone. And if a good engraving must thus suffer by being coloured, so neither can bad ones be thus converted to good pictures: at the utmost, nothing better than a matter of mere production, (such as those by Volpato and Dueres, which have suggested the introduction of these remarks) can thus be generated, though with much more of the arts than the orfe in its constitution." Landfeer's Lectures.

Again, these observations acquire force in a compound ratio to the merits in point of colouring, of the pictures from which coloured plates may be engraved. For example, Fyt, Teniers, and Vandyke are among the number of those painters who are justly esteemed inimitable for the beauty and harmony of their colours, and dexterous management of their pencils. If children could be brought, even in the way of copying, to pencil and colour like Fyt, Teniers, and Vandyke, those masters would lose their high reputation, and this part of the painter's art would be in consequence so depreciated, as to become of very little value. To pretend, therefore, to emulate the merits of a finely coloured and beautifully pencilled picture, so as to meet the eye, and merit a place in the cabinet, of a man of taste,—and to do this on prints, by the fcore or by the hundred,—is little less ridiculous than to talk of a machine for playing on the violin or organ, or of a mill for making vermes.

We shall notice the works of this popular engraver, nearly in the order in which they were produced.

While at Venice, and under the tuition of Bartolozzi, he engraved "Portraits," of the doge Foscarini, and the procurator Falcal, of folio size, after Bartolozzi: a set of four from the Old Testament, in folio, from drawings by Bartolozzi, after the original pictures by Amicioni, of which the subjects are, 1. "The Finding of Moses;" 2. "Laban DIShiving for his Idols;" 2. "The Servitude of Abraham," and 4. "Moses erecting an Altar to the Lord." Eight conversational subjects, in small folio, after Maitoni; "The Or- gies, or Feast of Bacchus," an historical landscape, done for Wagner, after Zuccarelli: "A Philosopher profing before an Altar, surrounded by Ruins," from the fame mallor, both in large folio; an Italian landscape, with fishers; another landscape, and pedants; all from Zuccarelli; and two landscapes after the elder Brandir, ab of large folio size.

"Places engraved at Rome.—" The Four Sibyls of the Church of St. Mary of Peace," after Raphael, in large folio; "The Marriage of Alexander and Roxana," after the same painter; "Modesty and Vanity," after L. da Vinci, in square folio; "Periplus delivering Andromeda," from P. de Caravaggio; "Our Saviour praying on the Mount of Olives," from Coreggio, in large folio; "Mary Magdalen washing the Feet of Our Saviour at the Table of Simon the Pharisee," after P. Veron. ; "The Marriage of Cana," after Tintoret, both of large folio size; and "The Gannellers," after M. A. de Caravaggio, in folio; all of which were for Hamilton's collection.

"Subjects from various Italian Painters, all very large." The Defeat of the Crofts, from a painting by Raphael, in the Borghese palace; "The Holy Virgin," named "La Sagresta of Florence," from the same painter; "The Holy Virgin of St. Marks," after Mr. Bartonello; "The Marriage of the Virgin," from Guercino; "Pietà, or the Virgin of Pity;" and "Aurora," both from pictures by Guercino, in the Villa Ludovisi; "Day" and "Night," which form a set with the Aurora, by the same painter; "The Crucifixion," from a picture by Guido, in the church of St. Lorenzo, in Lucina; "The Venu" of Paolo Veron. ose, from the gallery of the Colonna palace; two subjects, with children, from Mola; a pair from the first navigator of Genoa, after P. Giusti; another pair after the same painter, taken from Genoffs Idylla; two landscapes from Claude Lorraine, of which the originals were in the Colonna palace; a set of six, or rather three pairs, after Gavin Hamilton, of which the subjects are 1. "The Death of Lucretia;" 2. "Innocence," a plate of considerable merit and beauty; 3. "Juno;" 4. "Hebe;" 5. "Il Penforato;" 6. "L'Allegro," and the two prophets and two girls, from Michael Angelo's pictures in the Sistine Chapel.

"The following are of smaller Dimensions." A set of thirty-six, in small folio, from the antique statues, with the dimensions, &c. an elementary work for students in the art; a set from the Farnace gallery, consisting of three larger and three smaller
smaller plates, coloured; a set of eight views at Tivoli, coloured by Durez and his affiliates; another set of twenty views in Rome and its vicinity, coloured in the same manner, both (edit) books; another of fourteen dittos; another set of forty, from the Museum Clementinum; another set, printed on four large sheets, from Raphael and Julio Romano.

It is much to the honour of modern Italy, that we have to close our catalogue of its school of engravers with the mention of two fans, than which no brighter have shone in the half-century of the art.

Luigi or Lewis Schiavinotti, was born at Baffano, in the Venetian territory, in the year 1765. His father was a flatterer, whose moderate circumstances enabled him to give to his eight children, the eldest of whom was Lewis, a useful but limited education. From his infancy he had a taste for drawing, and while his companions were at play, he was often seen kneeling on a stool in his father's shop, copying prints. By these, and other means he possessed, he acquired such proficiency, that Julius Golini (an able painter, to whom some of his early attempts were shown,) undertook to instruct him in the art of drawing.

At the age of thirteen, Lewis was placed under his care, and the high opinion which he had formed of the boy's genius, was confirmed by the rapid progress he made, while his amiable disposition endeared him to much, that Golini loved him as his own son. After three years, he severed, without instruction on the one part, and desire attention on the other, his tutor, unfortunately for our young artist, was asked by a mortal disease. Lewis attended him during his illness with filial affection, received with becoming reverence his dying counsel and admonitions, and had the heartfelt grief to see his master expire in his arms.

Being now left to pursue his own course, or, assisted only by such advice as could be obtained in a town where Golini had been the only painter, he turned his views towards count Remamini, who, though enabled by this title, is proprietor (as it should seem) of an extensive typographical and chalcographic concern, and has inherited on marble how much he feels himself honoured by having published some of the works of Bartolozzi and Volpato.

The works of these distinguished artists gave fresh impetus to young Schiavinotti's ardour for improvement, and becoming acquainted at this time with one Lorio, an indifferent engraver, who was barely competent to teach the mechanical process of the art, he applied to him for instruction. Unable to support himself and family by his graver alone, Lorio officiated as facriil to a church, and could offer our artist no better accommodation for a study than the facrily afforded, but which, his circumstances not allowing him to apply elsewhere, he was obliged to accept.

Schiavinotti remained with this master about twelve months, when finding he had exhausted his fund of instruction, and feeling an aversion to studying occasionally among dead bodies, he resolved to alter his situation. A copy which he had executed in the line manner, of a Holy Family, from Bartolozzi's print after Carlo Maratti, gained him employment from count Remamini, and attracted the notice of another printmaker of Baffano, of the name of Smithe; and between these rival printellers it is probable that Schiavinotti might have long continued to exist on such patronage as complined with their views of profit, but for the kinder and more advantageous notice of some Venetian noblemen, and the occurrence of other circumstances which ended in his migration to England.

As these circumstances have been detailed in print, in such a manner as to dignify a certain naturalized subject of these realms with the apprech of having taken mean and felish advantage of the yielding simplicity of Schiavinotti and the credulity of Bartolozzi, with the view of converting to his own use and profit the abilities of the former, and the hospitality of the latter; and as the accused party has publicly required time for the collection of such documents as might exculpate him from the charge, which documents he has not yet produced:—in such a state of evidence, it may be sufficient to lay of our engraver, that, after enduring some further difficulties and disappointments, and after residing a while under the roof, and receiving the instruction, of Mr. Bartolozzi, he, in concert with his brother Nicholas, commenced an independent establishment.

From Bartolozzi's house at Northend, he removed to Sloane square, and thence to Brompton, where he continued, to the hour of his death, to cultivate and improve the talent that Providence had bestowed on him, unchanced by the blinshine of patronage:—or cheered, orchilled, by such patronage only as confirmed with the purblind views of commercial speculators, and exposed to the thousand nameless wrongs,

"That patient merit from th' unworthy takes."

Some time about the year 1792, he entered into a partnership with certain printellers, of which he had soon reason to repine; and, the partnership being dissolved, and himself in possession of some few engraved plates, he dismissed a younger brother to the continent, on a printselling mission, which also ended in disappointments; for, the wrathful in- culation of Pelissan politics, and the inroads of French ambition, soon forest away the younger Schiavinotti from Berlin, which had been fixed upon as the head-quarters of their commerce.

During the short interval of peace between this country and France, he availed himself of the opportunity of visiting Paris, with the twofold object in view,—of improving his natural talent, of which he never lost sight,—and, obtaining such free access to the gallery of the Louvre, which was then thrown open to the public and supped to contain the finest pictures in Europe, as might enable him to gratify himself with the pleasure and advantage of selecting one or more subjects to engrave, suited to his own abilities. This is a gratification in which engravers of genius are but too rarely indulged. The difficulties and delicacies of selection, the demands of commerce, and the pubhsh state of English patronage, (which, with all its benevolence, and all its power, has not yet emancipated itself from the mistakes and the fetters of trade,) are bars which, in this country, none have been able to overlook; yet nothing is more readily obvious, than that other men can only judge of the talents of an engraver by what he has done, while the feelings of the engraver himself, if he has any, inform him, at the sight of a gallery of fine pictures, what latent germs of genius or talent he may possess, or the discussion of translating such of them as are passed with a spirit congenial to his own; what elements from the intellectual chaos of his untired powers may be called into existence; how far, through his means, the boundaries of the art itself may be extended.

The shortness, however, of that lucid interval, marred, in some degree, the excellence of our artist's design, and compelled him to compromise with the wishes of Europe, and his own untoward fortune. One of the subjects which he fixed up in was the Madre Dolorosa of Vandyke; but the return of war left him no alternative but to endeavour to satisfy himself as well as he could with a copy by another hand. The copy did not turn out very correct; yet from this indifferent copy, aided by Bolfwert's print from the
fame original, and his own aright recollections of Vandyke's picture, has Schia vonetti produced an engraving of very extraordinary merit, though on a much smaller scale than he had originally projected. What he intended to have engraved on an ample scale, for himself and the public at large, he was compelled by circumstances, which legislators and patrons would do well to attend to, to execute small, and part with the proprieties of the French national system.

A very few years before his death, he formed an intention, which he communicated to his friends, of returning to Italy, or at least of removing to a more southern climate; but that any serious apprehensions were entertained on the score of his delicate health, but because he felt the weight of taxes, and the want of encouragement: and, perhaps, observing how well the quakers of moonshakes pretention succeeded in this metropolis, and feeling how ill merit in his profession was rewarded, he thought there was left of solid appreciation among us, than really existed. What delayed his departure, or altogether withheld him from going, the present writer can only conjecture; for he was shortly after disappointed of engraving a large plate from Mr. Devlin's picture of "The Death of Lord Nelson,"—it being because the hundred guineas, which he required for the performance of the task, was too much, but because the sum which Mr. Brounly asked was too little. Perhaps he lingered here, and only delayed his departure on account of the continued war, and consequent difficulties of emigration; or, perhaps, he had reason latterly to entertain a better opinion of the taste and appreciation of the British public than he had before conceived, and began to find himself and his talent more an object of attention than his middle had hitherto allowed him to suppose.

That he did not go is, on the whole, to be regretted, as the soft and serene climate of Italy would probably have lengthened his life; and with length of life, his reputation would have extended, and the public at large have been proportionably benefited: for it has been justly said of his latter productions, that they were marked by a wonderful degree of improvement; and that, had his life been prolonged, the fruits of this improvement would probably have been multiplied in abundance. The circumference of his premature death gives, therefore, fresh cause to lament that the patience and the acquisition of genius are unalienable, and can never be bequested: and that talents, however rich, and however veritable, must inevitably perish with their possessor.

I died at his house at Brompton, of a pulmonary complaint, which had for some time been gradually and ruinously consuming him, on the 18th day of June 1816, and was attended to his grave, in Paddington churchyard, by a long and numerous procession of artists and amateurs, who loved and honoured his genius as an artist, and his probity as a man.

In his person, Schia vonetti was rather tall; the face proportion in the divisions of his figure gave him a graceful movement; his manners were gentle; in his address there was ease and affability; and perfection hung on his lips. He was dignified without solemnity, and grave without iniquity. His whole deportment was manly. His unadulterated character, equability of temper, and probity to others, won the good will of all who saw and conversed with him. In company with his brother artists, he seemed unconscious of his own superiority; though fitted to rank with the illustrious, he exacted no distinction of notice, but kept himself on a level with the lowest; and by the deference with which his spike furnished every one feel at ease in his society. This urbane manner is but too seldom an extrinsic accomplishment; but in him it was the unaffected expression of rare goodness of heart, and liberality of mind. It was not the result of a coarse material, but the polish of a fine one. Many acts of his private life might be adduced in support of what is here said in his praise:—one may be selected that exhibits a trait illustrative of his whole character. As soon as he began to derive profit from his profession, he devoted a portion of it to the support of his poorer relatives in Italy; and of late years he constantly remitted to his aged parent a stipend sufficient to ensure him comfort and respectability.

The same energy and elegant simplicity, which was observable in the personal character of our artist, predominated also in his engravings. He professed, in very high perfection, that art requisite both in painting and engraving, freedom blended with accuracy of delineation. This power, united to the grace and dignity which characterized his whole, enabled him to treat every subject on which he exercised his talents, with a truth, distinctness, and propriety of expression, rarely to be found in the works of other artists. By a varied choice of modes, and a bold and independent habit of thinking, in particular, by fixing his attention strongly on the merits of the best works of our countrymen Stringer and Sharp, he reenforced his mind from the dogmas of school discipline, (which it is said without any particular reference to his early tutors,) and did forth an original, and is not a lid-glass, a self-perfect engraver. In the works of common artists, we see only the labour of the hand; but in his, the hand is manifestly directed and controlled by the mind. What is their ultimate, was only his instrument: he handed it with perfect command; he thought over it with wise determination; and as Reganator in the world of art, as well as in the physical world, vigorously and successfully, and as master in the corruption of the soul. Schia vonetti has succeeded to all that Johua No. Cromeck (from whose school of this artist our account is partly extracted) has bestowed on him, for the dignified style with which he kept his hand from that mechanical sameness on all occasions, which we denote by this term, and as always preserving that superintending mental delicacy, that sense of knowledge, and that fine taste of nerves, which enabled him to vary and adapt the language of his art to the peculiar beauties and merits of the various originals, which from time to time he had to translate. Some of his first informed critics have praised the beauty of his manual execution. It is beautiful: but to lay it, is like praising the personal beauty of Lucretia. Dazzled by the fins beams which glitter on its surface, they forget not its depth, and know not the navigable benefits, of the current. But perhaps posterity will but gradually learn to appreciate its merits as they deserve.

That his powers were not less veritable than vigorous, may be seen by comparing his etchings with his chalk engravings, and both with his exquisitely finished plates in lines; of which latter, owing to the bad taste that has hitherto prevailed since his arrival in this country, the number is unfortunately small.

His principal engravings in the chalk manner, are, two, of "The Five Standard," which, with the tranversepiece, form a set of six plates, in full folio, all from his own designs: "The Median Encampment," after R. West, R. A., for Boydell's edition of Milton, large 4to.; "The Bed of Hippolytus," engraved by his pupil, after the Capture of Smyrna, from R. K. Porter, for Boydell; a set of the Crisis of London, large 4to., three, of a set of the romances, after R. West; all of which, leant on a Mithraic door, from Jollie's Reynolds; a set of four folio plates, from the designs of Benozzo, of "The Subversion of Louis XVI.," being his Capitivity.
ITALIAN SCHOOL OF ENGRAVING.

In the Temple;" "Queen Elizabeth receiving News of the Death of Queen Mary of Scotland," after R. Wechtel; "The red Slipper," from the same painter; two folio plates for Boydell's Shakspere, of which, one in particular, "The two Gentlemen of Verona," after Angelica Kaufmann, is a very capital print. The name and talents of Schiavonetti were but little known when he undertook this plate; and he engaged to engrave it for the low price of two hundred and eighty guineas. It is to the credit of the late Mr. Boydell, that he voluntarily increased this sum to three hundred. The portraits of Albert Rubens, after Rubens, in folio; the queen of Pofilia, after Titian; and the duke of York, after J. Boyd, both in folio; Mrs. Damer, after Cofway, in 4to.; and the right honourable W. Pitt, and lady Cawdor, in small folio, after Edridge.

But far beyond these in merit and importance, is a large folio print of "The Landing of the British Troops under Gen. Abercornbe, in Egypt," after de Loutcherbourgh, in which the fire, freedom, and vigorous chiaro-fuso of that master are most happily rendered, and for the production of which, the society in the Adelphi for the Encouragement of Arts, &c. did themselves the honour of presenting the engraver with a medal. By a judicious admixture of stippled hatchings, in imitation of chalk drawing when performed by the hand of a master, Schiavonetti has here revived with superior brilliancy and effect, the red chalk manner of engraving, which we call thus in contradistinction to Ryland's art of imitating stippled drawings, or what the French aptly term "en maniere de crayon noir," and has even enlarged the former boundaries of this mode of art. On the whole, this is probably the most perfect chalk-engraving that has yet been executed, and of itself, would be a monument of reputation in this branch of the art.

The chief of his etchings are, a set of twelve, in small folio, from drawings by W. Blake, of which the subjects are taken from Blair's poem of the Grave. These are works of great merit, and (as we venture to pronounce) of lasting reputation; and though it be too true, that, in the words of this poet

"The best concerted schemes men lay for fame
Die fall away; only themselves die fatter:"

they yet prove, in opposition to his leading sentiment, that it is not

"Aburd to think to over-reach the grave,
And from the w reminds of names to rescue our's."

Faithfully adhering to the character of art that is implied by the term etching, Schiavonetti is here flight and sketchy, and has produced his effects chiefly by the operation of aquafortis, with his usual fine feeling, and a congenial untried simplicity of style. The eye of discernment immediately feels that the same high finishing which he bestowed on his plates after Vandyke, was never intended, and that what was intended is precisely accomplished.

Of this series of meritorious etchings, which were printed with Blair's poem and an able preface by the professor Fubli, and published by Mr. Cronek, the subjects are

1. The Defect of Christ in the Grave; 2. The Defect of Man into the Vale of Death; 3. Death's Door; 4. The strong and wicked Man dying; 5. The good old Man dying; 6. The Soul hovering over the Body; 7. The Soul exploring the Reaces of the Grave; 8. The Counsellor, King, Warrior, Mother, and Child in the Tomb; 9. The Skeleton re-animated; 10. The Re-union of Soul and Body; 11. A family Meeting in Heaven; and 12. The Last Judgment. These are preceded by a portrait of Mr. W. Blake, the poetic designer of the work, after T. Phillips, R. A., in which our engraver has manifested great judgment and taste. It is also an etching, treated in the vignette style, with small affinities from the graver and dry-point, where a certain degree of mellowness of the blending were wanted, and the whole brought to a focus in the animated and thinking countenance, which is the proper subject of the print. Two etchings after Caracci, in folio, were afterward finished in aquafortis for Mr. Chamberlayne's work from the Royal collection; two unpublished large folio plates of "The Departure, and the Return, of the Savoyard Musicians," flight, but performed with singular felicity.

Finished Engravings.—"The Madre Dolorosa," or dead Christ on the Lap of his Mother, after Vandyke, which he engraved in small folio, for the French publication, after their national gallery at Paris, is of a distinct class and character, from the above; more elaborate, more difficult of accomplishment, and combining merits of a loftier and more exquisite kind.

Here the mellow and harmonious mixture of etching, with the work of the graver and dry needle; the various combinations, by means of these instruments, of clear, broken, contorted, and partially obscured, lines and stippling, by which he has expressed in their respective degrees of subordination to the purpose of the painter, rock, sky, hair, white and coloured draperies, and, above all, the anatomical markings, carnation tints, and fleshy texture, of the exquisitely finished naked figure of Jesus Christ, are truly admirable; and if not unparalleled, have certainly not been forf tangled. Nor are the extremities of every figure in the composition rendered with less of taste, knowledge, or skill. Boffart had engraved a larger print of this subject from Vandyke's original picture, a print of great merit; and to a mere observer, it is interesting to compare the details of the two engravings, and see how sedulously, and with what delicacy of discernment, the Italian artist has avoided every error, and improved every beauty, of the Flemings.

It is exceedingly to be regretted that among the works of Schiavonetti, we find few of this inimitable class, for no man more than he, has united the excellencies which must enter into the constitution of a highly finished engraving. Another of these highly finished engravings, which is also after Vandyke, and of large 4to. size, is a portrait of the painter himself, habited as a peasant, and the same general observations will apply to both, for both are admirable epitomes of the powers of Vandyke; of the latter it has been truly said, that "its excellence will be found to consist in its being at the same time a complete epitome of the original picture and of the powers which an engraver of genius can display upon so confined a subject as a half length picture, without landscape, sky, or any other accompaniment of back ground. It is throughout quite as well drawn as Vandyke's original; the texture of flesh is as perfectly expressed, with all its varieties and inflexions of surface and chiaro-fuso; nor is the drapery left welt felt and understood, nor scarcely left skilfully engraved, than the naked parts of the figure; all are sufficiently finished, but without petty trickery, or vain labour, and the eye sparkles with all the fire of Vandyke's."
very perfection of style, or at least approximates the nearest to it of any painter whatever, except perhaps Pyt, who exercised his powers on subjects of quite a different kind."

Another 4to. plate, which our artist engraved after a very excellent picture by R. Smirke, R. A. as an accompaniment to Joel Barlow's Columbiad, and of which the subject is "The Triumph of the Holy Inquisition," some plates which he engraved for Sharpe's British Classics, and two for an edition of Homer, after the academicians Fufeli and Howard, poffeffs merits of a fimilar kind, though, on an account of the smallness of the scale, they could not be so effectually displayed.

The remainder of his finished engravings in lines, are the novel scene in King Lear, after Smirke; and two or three other plates for the smaller edition of Boydell's Shakspere, which are among the very best in that motley and undigested work; and some fmall portraits, particularly one of Mr. W. Cunningham (an Irish gentleman, distinguished for his taste and patronage of the fine arts); another, of a writing master, well known and distinguished in his profession, and a fbell of Homer, from the celebrated marble in the Townley Collection, all of 8vo. dimensions.

His folio print, engraved in the fourth remove from Michael Angelo's celebrated Cartoon of Pifa, is of a middle character, less elaborate than his prints from the pictures of Vandyke, though somewhat more fo, than his etchings after the poetical sketches of Mr. Blake: in short, a graphic translation of a Cartoon, or preparatory study for a high-finifhed picture.

His academical knowledge and skill were here, perhaps more than in any other of his productions, called into action, and their strength put to the teft. Nothing fowed higher in these respects than the reputation of the great original, which is even, by Benvenuto Cellini and other excellent judges, esteemed the masterpiece of Michael Angelo; and this high reputation Schiafometti had not merely to fustain, but in fome degree to restore; for the Cartoon itself being destroyed (in a fit of envy, as it is faid, by Bandidelli, who was entrufled with the key of the apartment where it was placed,) and the details of its superfluous merits being known to us moderns, only through the media of Sangallo's copies, and the feparate groups which have been engraved by Marc Antonio, Aogino of Venice, and other contemporary artists, whose works we have already enumerated under an early part of this article of the Italian school, our engraver felt it to be his duty to collate these versions and fragments of the Cartoon of Pifa with conscientious scrupulosity, and, by balancing probabilities, to refore what may be called the true critical reading. An awful task! yet which he has performed with the ability and success of a confummate scholar in art.

The reader should be apprized, that the Holkham copy, which is believed to be the work of Belfianio de Sangallo (an artist who was never held in any very high degree of estimation) was painted in his old age, from a fmall drawing which he had himfelf copied from the original Cartoon in the year 1542, during his pupilage. It was made at the request of Vafari, and, through means of Montignor Jovio, came into the poffeffion of Francis I. of France, who highly esteemed it; from his collection it however disappeared, and no mention is made of it by the French writers for near two centuries. It was probably discovered at Paris, purchased, and brought to England by the father of the late marquis Townhead.

Schiafometti had not even this copy to work from, but a copy of this copy, and has therefore, with commendable regard for his own reputation, and that of Michael Angelo, and with due respect for the public, who always ought to be rightly informed upon such occasions, followed the recommendation which was publicly laid before him in the Review of Art, vol. i. and retraced with his dey needle under the few proofs which were received as presents by his friends. "Engraved by L. Schiafometti, after a copy painted by H. Howard, R. A. from da Sangallo's copy of his own study, after Michael Angelo's cartoon."

The fame respect for truth and the public, which dictated this recommendation and this conduct, requires us to mention that Schiafometti has corrected a general heave of drawing which prevails in Mr. Howard's picture, which heuves that accomplished artist no doubt found in the Holkham copy, but which is perfectly inconsistent both with the active sentiment of the subject, and the earlier graces of Michael Angelo's composition. A foot of one of the principal figures, which is there turned inward, he has turned outward; and, besides some other minor details, has added requisite strength to the limbs of the figure who is climbing the rocky bank of the Arno. Whether our artist has seen the small fragment of Michael Angelo's original, which is said to be still in existence at Mantua, or of what part or parts that fragment may consist, the present writer is not able to say; but Schiafometti was in possession of various old prints of its principal groups, of which we have already spoken in our accounts of Marc Antonio and his disciples, and which were executed for the most part during the lifetime of Michael Angelo, and from comparing them, and reflecting on the whole, has ventured on the above emendations of the extant copies.

As this cartoon of Pifa is esteemed to have been one of the most extraordinary works that has been produced since the revival of art, the reader will not be displeased to find here the following eloquent account of it, as delivered from the professor's chair of the Royal Academy of London, by M. Fufeli. It does not in all its details exactly tally with the print, but its general sentiment of impatient animation and patriotic ardour is precisely the same. "It represents an imaginary moment relative to the war carried on by the Florentines against Pifa; and exhibits a numerous group of warriors, routed from their bathing in the Arno, by the sudden signal of a war-horn, and rushing to arms. In imagining this transient moment from a state of relaxation to a state of energy, the ideas of motion, to use the bold figure of Dante, seem to have flowed into the artist's mind. From the chief, nearly placed in the centre, who precedes, and whose war-voice accompanies the trumpet, every age of human agility, every attitude, every feature of alarm, haste, hurry, exertion, eagerness, built into so many rays, like the sparks flying from a red-hot iron. Many have reached, some boldly leap, some have leaped, on the rocky shore; here two arms emerging from the water grapple with the rock; there two hands cry for help, and their companions bend over or rush on to assist them; often imitated, but inimitable, is the ardent feature of thegrim veteran, whose every sinew labours to force over the dripping limbs his clothes, whilst grating, he pushes his foot through the rending garment. He is contrived by the flender elegance of a half averted youth, who sedulously eagers buckles the armour to his thigh and methodizes hate; another swings the high-raifed hauberk on his shoulder, while one who seems a leader, mindless of dust, ready for combat, and with brandished spear, overturns a tired, who is crouched to grasp a weapon; one naked, limbfelt buckles..."
on the mail of his companion, and he, turned toward the enemy, seems to stamp impatiently the ground. Experience and rage, old vigour, young velocity, expanded or contracted, vie in exertions of energy; yet in this scene of tumult one motive animates the whole, cagernef to engage with subordination to command; this prefers the dignity of action, and from a struggling rabble, changes the figures to men whose legitimate contempt interests our wishes."

Three plates in lines, which he advanced no further than the aquafortis plate, will close our list of the works of this admired and regretted artist. The first, in the order of production, is a masterly etching of large folio size, after Trombley, of "The Death of General Montgomery," which was finished by Mr. Clemens (a German artist). It was performed several years ago, and discolored powers which ought to have made an earlier impression than they did on the eye and taste of the public. The next is "The Proceffion of Chaucer's Pilgrims to Canterbury," a large folio plate of the freezes proportion, after a very capital work from the pencil of the academicians Stothard.

Chafing every ambitious display of his own executive powers; reprefenting every idea and every feeling that was not homogeneous with the nature, and proportioned to the demands of the occasion, Schiavonetti has here, like the hero of the Odyssey, expressed, "no more than just the things he ought." The spirit which animated him in the performance of this work, like that which has animated the painter, seems to have glided from the elymin of the great artists of antiquity; there is the fame truth of Nature, and the fame unadorned clarity of style, pervading the whole;

"Enlightning every line in such a genius,
That they seem rather fallen from the skies
Than of a Mortal hand."

Since the lamented death of Schiavonetti, the proprietor of this plate has with some incommittency flated to the public, that, "in the present state of this etching, considered with reference to the peculiar circumstances of the cafe, perhaps no better mode could be devised of paying an imprefive and lasting tribute to his memory, and one in which all his admirers could participate, than by giving it to the public as he left it, a conferred monument of his genius;" he has before held forth a powerful additional motive to this end, a motive as powerful as taste and friendship themselves could have connected with such a purpofe, by informing his readers, that "the movement of the figures and the expression in their heads and characters are as finely maintained in outline, as they could possibly have been in the most refined print," which is pretty strong language, yet he has since announced Mr. Bromley and himself as the finishers of the plate.

Now, though the present writer does not think finifhing, in the engraver's art, is thus utterly thrown away, or contributes nothing in addition to an exquife outline, to the motions, characters, and expressions of a protracted group of figures, such as the Canterbury pilgrims; or though, regarding the above as an impiifioned, or hyperbofe lence from the pen of Mr. Cronck; he can make due allowance for the occafion which gave it birth, he yet thinks the imprefive and lasting tribute to the memory of Schiavonetti should have been paid; the monument which his genius itself had raised should have been conferred; and he therefore regrets those views of profit, or those hopes of reputation, or those ulterior mistakes which have prevented this confufation. Achilles and Ulyfles could not both be the heroes of the fame poem; and it would have been wise for Mr. Bromley, and well for the public, for him to have begun his Canterbury pilgrims on a fresh plate of copper.

The next, and the laft of our artist's performances, was an etching, of folio dimensions, of the portrait of Sir Joseph Banks, as president of the Royal Society, from a picture by T. Phillips, R.A. replete with that truth of character and mild force of execution, which usually distinguishes the works of this painter. To detail the merits of this work, would be but to call forth again our former praises; it is as masterly a display of his talent in the portrait branch of his art, as the etching of the Canterbury pilgrims is of his merit in the historical. This plate, as we are given to understand, is now finifhing by Nicholas Schiavonetti, who may naturally be presumed to be at least as well acquainted with his brother's style and professional intentions, as any engraver whatever.

Of Francesco Bartolozzi of Florence, the pupil of Wagner, but more the pupil of Italy and nature, and the principal instructor of Schiavonetti and Volpato, we shall say but little. He is still at upwards of fourscore years of age, confidered as speaking for himself by his productions, though doomed to linger out the evening of his glorious day, in Portugal, far from the haunts of fludious retirement, and amidst the din of arms. Till nature has closed her account with him, what bold author shall presume to estimate his worth?

Of him and his disciple Schiavonetti, we have already spoken as two of the brightest stars in our graphic hemisphere. The latter has fallen from his zenith; that Bartolozzi may long remain above the horizon, is our fervent wish.

But it has been emphatically said, that "stars teach as well as shine." On the continent of Europe, they teach and shine in vain, while war defolates the plains of the western peninsula; if Ate flings wide and wild her torch, in vain exist the charms and the leflons of art; in vain are the heavens serene, if an earthquake rages below.

ITALIC, or ITALIAN Hours, are the twenty-four hours of the natural day accounted from the fun fettling of one day to the fame again the next day.

This way of reckoning was used by the Jews of old, and is used by the Italians to this day.

ITALIC Character, in Printing. See LETTER.

ITALIC Scrit, is the name of a party of ancient philofophers founded by Pythagoras; fo called, because that philofopher taught in Italy, spreading his doctrine among the people of Tarentum, Metapontus, Heraclea, Naples, &c. See PYTHAGORIC SCrit.

ITALY, in Geography and History. In ancient geography, this country, the molt celebrated in Europe, was denominated Italia. It is bounded on the N. and N.W. by the Alps; on the E. by the mare Superum, that is, the Adriatic gulf, or gulf of Venice; on the W. by the mare Inferum, or Tuscan sea; and on the S. by the Ionian sea adjacent to Greece. In form, it has been compared to the shape of a boot, lying in an oblique direction from N.W. to S.E. From the Alps to the fretum Sculorum, or Strait of Messina, it extends from 47° to 37° 45' Lat. or about nine degrees. In breadth it is very unequal, in some places not exceeding 2°, and in others upwards of 8 long.; hence its length from N. to S. is about 600 miles, and its breadth varies from 1 to 360 miles or more. It has borne at different periods very different names. One of its moft ancient names was Italia, either from Italus, a king of that country, not known in history, or from a Greek word signifying an ox, an animal very common in that part of the
ITALY.

The country. It was denominated "Hesperia," on account of its western situation in respect to Greece. "Sparta," from Sparta; "Lattium," from the Latin; "Aufronia," from the Autes; "Osmantia," from a tribe seated between Paderium and Trastum. These names were originally appropriated to particular provinces, but in process of time they were applied to the whole country, which has been denominated the garden of Europe. The ancient inhabitants called themselves aborigines, offsprings of the soil; and the country was, at a very early period, peopled by colonies from Greece. The Pelasgi and Arcadians made settlements there, and the whole country was divided into as many different governments as there were towns; till the rapid increase of the Roman power changed the face of Italy, and united all the states in support of one common cause. (See Ross.) Under the dominion of the Gauls and Greeks, Italy, in reference to its inhabitants, was divided into "Gallia Cisalpina," "Italia Propria," and "Greece Magna:" the first comprehended the provinces lying between the Alps, and the Rubicon; the second included the intermediate provinces; and the third those adjacent to Sicily and Greece, and inhabited chiefly by Grecian colonies. It was divided into eleven small provinces or regions by Augustus; but according to the common and most approved division, ancient Italy consisted of two parts, viz.: "Gallia Cisalpina," and "Italia Propria:" the former, likewise called "Gallia Italiana," and sometimes "Galia," was bounded on the N. by Rhattia and on the S. by the sinus Liguricus, or Gulf of Genoa. This province, while under the Roman dominion, contained several tribes, which will be noticed in their places. Italia Propria was on all sides surrounded by the sea, except on the N. where it was bounded by an imaginary line, extending from the mouth of the Maatra to that of the Rubicon. It contained, among others, the following provinces, viz.: Etruria, Sabina, Latium, Campania, Samnnium, Apulia, Molapina, Lucania, and Bruttium. During the middle ages Italy underwent many revolutions, and frequently changed its masters. In the reign of Theodoric the Visigoths, under the command of Alaric, penetrated into this fertile country, which they plundered from the foot of the Alps to the heart of Sicily. The reign of the Goths in Italy ended in Teias, Totbin's son, who was defeated and slain by Nafres in the year 553. Italy now became a province of the Greek empire. The Lombards were a fierce nation, first discovered between the Elbe and the Oder, from thence they descended to the south and the Danube. They afterwards passed the Danube, wandered along the coast of the Adriatic, and in the year 566, aided by the Avaris, a Scythian horde, they undertook the conquest of Italy. Many provinces were added to their dominions, as a large portion of the Venetian territory, Tyroli, Milanch, Piedmont, the coast of Genoa, Mantua, Parma, and Modena, the grand duchy of Tuscany, together with a considerable portion of the ecclesiastical state.

Italy, in the modern acceptation of the word, includes both main land and islands. The former, by geographers, is commonly divided into upper, middle, and lower. Upper Italy, called Lombardy, contains seven dukhees, ten small principalities, and two republics. Middle Italy consists of the grand duchy of Tuscany, the ecclesiastical state, and two republics. Lower Italy includes a part of ancient Italia Propria, and the kingdom of Naples. The climate of this country differs with its different divisions. In mountainous districts the air is keen and piercing; the provinces, north and east of the Apennines, are mild and temperate; those on the S. of that chain are warm, sultry, and liable to torrents of rain. An account of the mountains, rivers, and lakes, bordering to Italy, or divided from other countries, will be found in the alphabetical order of this work. (See Alps, Atenines, Po, &c.) There is a very considerable diversity in the soil as well as the climate. The northern division exhibits the grand scenery of the Alps, contrived with delightful valleys and plains, watered by many streams which run towards the south to augment the Po. In the central parts are marshes, flagrant waters, and fruitful districts. A great proportion of the kingdom of Naples (which see) is hilly, but many tracts, though subject to inconveniences, are uncommonly fertile. Italy has been denominated the parent of plenty, and each province has its peculiar excellence and commodity; and, taken together, they all yield the comforts and luxuries of life in great abundance. In the time of Pliny, Italy was said to contain 14,000,000 of inhabitants. This was probably an exaggerated account. The present population, though not only by 2000,000, with the islands of Sicily and Sardinia, be estimated at more than 13,000,000. Naples and Sicily are supposed to contain 6,000,000; the central part about 3,000,000; and the northern about 4,000,000. The manners and customs of the natives are various and discordant. The real Italiens are in general well proportioned, affable, polite, provident in their accomplishments, and nice in all punctitudes of civility; observing, it is said, a due medium between the levity of the French and the gravity of the Spaniards. They are impetuous in their temper, keen in their retentions, revengeful in their manners, and superstitious in their religion. "Attached," says Mr. Phleytor, "to ancient customs, they apprehend no occasion for improvement. Conceiving themselves to be the conquerors of the world, they look on the rest of mankind with contempt. Out of a vain ostentation, they lavish their money on paintings, gardens, and statues, on costly garments, and a numerous retinue of servants; but this profusion does not seem to interfere with the economy of their tables, which are neither splendid nor expensive. Their dinner, consisting principally of roots and vegetables, is a flight meal compared with their supper, but is at all times accompanied by wine, drink, or strong. Their houses, furniture, and entertainments, are a composition of magnificence and meanness. While they delight in outward show, they bestow little attention on the comforts of life. Malappraisings, gaming, conversations, music, and religious exhibitions, are their chief amusements." The dress of the Italiens is not materially different from that of the inhabitants of the neighbouring countries; and it has been observed, with much justice, that Italy, instead of being visited by travellers for the sake of its inhabitants, is visited only for the sake of the places which they inhabit. There are some remains of forests among the Apennines; but the early civilization of Italy has been disadvantageous to the growth of timber. The botanical products of Italy are supposed to be equal to those of any European country, on account of the great variety of its soil, the irregularity of its surface, and the peculiar beauty of its climate. In the southern parts, cotton, rice, and the sugar-cane, indicate the fertility of the soil, and the warmth of the climate; and the fields and pastures bear a flourishing appearance, in their native products, to those found in the northern provinces of Spain. The Italian horses are of little reputation, and the cow, from which the noted Parmesan cheese is made, are described as of a deep red colour, long, lank, and ill-made. In Tuscany the art of fattening cattle is well understood. The buffalo is, in Europe, an animal peculiar to Italy. This animal in some respects resembles the hog, being fond of

Vol. XIX.
Italy.

wallowing in the mud; his flesh is coarse, and his hide, though light, is to firm as to have supplied armour to the military. The marmot and the ibex are reckoned among the animals of the Apennines, and the credited porcine is esteemed peculiar to the south of Italy. The Alpine district abounds in rich mines which are neglected: here are mines of silver, lead, iron, copper, and gold: in many parts there is excellent coal, and in detached hills throughout the country, marble, lime-stone, metallic ores and minerals are found. There are but few manufacturers in Italy in proportion to the fertility of the soil. Those of silk and wool are carried on to a considerable extent: but great quantities of the raw materials are exported. Besides these, wine, oil, and fruits are exported in abundance. The chief imports are hard ware, metals, cotton, woolen and silk stuffs, leather, timber, pitch, &c. The skill of the nates in liturgy, painting, and architecture, has been long the subject of admiration. The established religion is the Roman Catholic, confining chiefly in external observances, rites, and ceremonies. The pope is still looked up to as the head of the church; but his power and influence are now almost wholly destroyed. Before the late revolution, the form of government in the states of Italy was monarchical, and in the republics it was antecedental. The sovereigns governed their dominions with unlimited authority: in the republics of Venice, Genoa, and Lucca, the nobility shared in the management of the state. In the present unsettled situation of the country it is not possible to give any tolerable estimate of the revenues: they were reckoned between four and five millions sterling towards the close of the last century. Anciently, Italy gave birth to men illustrious in almost all the departments of science then cultivated: the generals, philosophers, historians, orators, and poets of Rome can never be forgotten. In the 16th century, when numerous tribes of barbarians overran the Roman empire, fearlessly a veldge of literature and the fine arts remained. From this period until the 18th century, the human mind sunk into profound ignorance, but since the revival of learning very many eminent persons have appeared in Italy that have advanced the sciences and the various branches of literature. The elegant arts of sculpture, painting, architecture, and music have likewise been cultivated with success.

We have already alluded to the early history of Italy, which, in a few lines, we brought down to the invasion, and, indeed, conquest of that country by the Lombards. The great object of ambition to this new race was the entire conquest of all Italy, and this, as in almost all other similar cases, proved the ruin of their empire by Charles the Great, or, as he is generally denominated, the illustrious Charlemagne, who was crowned sovereign of that country in the year 800. As, however, the Lombards had never possessed the whole of Italy, so the whole of it never came into the possession of Charlemagne, nor, indeed, since the time of the Goths, has the whole extent of this country been under the dominion of any single state. The undisputed territory of Charlemagne in Italy was restricted to Piedmont, the Milanese, and the Mantuan territories, those of Genoa, Parma, Modena, Tuscany, Bologna, the dukedoms of Triulz, Spoleto, and Benevento, the last of which contained the greater part of the present kingdom of Naples. The feudal government which the Lombards had introduced into Italy produced several revolts, as the different dukes inclined, either to change masters, or to set up for themselves. Several of these rebellions happened during the life of Charlemagne, which, by the vigour of his mind and the decisions of his measures, he found means to crush; but after his death, the sovereignty of Italy became an object of contention between the kings of France and the emperors of Germany. That monarch had divided his extensive dominions among his children; but they all died during his own reign, excepting Lewis, whom he associated with himself in the empire, and who succeeded to all his dominions after his death. Hence are dated those troubles with which Italy was so long overwhelmed, and of which, as they proceeded from the ambition of those called kings of Italy and their nobles, of the kings of France, and the emperors of Germany, it would be difficult to give our reader any satisfactory account, although we were to extend the boundaries of the present article much beyond the limits that can be allowed it. We shall attempt only an outline. At the time when Lewis, the son of Charlemagne, was declared emperor of the West, Italy was held by Bernard, the son of Pepin, brother of Louis. Though Bernard bore the title of king, he was only accounted a vassal of the emperor. He soon rebelled against his uncle, but being abandoned by his troops, and taken prisoner, he was deprived of his gift, and died in a few days; and in 823 the eldest son of the emperor was sent into Italy, of which country he was crowned king at Rome, and afterwards emperor of the West during his father’s lifetime. He also rebelled against his father, whom he took more than one prisoner, though in the end he was obliged to submit, and ask pardon for his offences. In the mean time the Saracens, taking advantage of the civil commotions, landed on the coasts of Italy, and committed such ravages, that even the bishops were obliged to arm themselves in defence of the country. Lothaire took but little care to put an end to these ravages, or to restore tranquillity, he even embroiled himself to far tied he had left almost all his dominions: at length he died, leaving his son Lewis the title of emperor, as well as that of king of Italy. Lewis applied himself to the restoration of tranquillity in his dominions, and the driving out of the Saracens from those places of which they had possessed themselves in Italy. This arduous task he fully accomplished, and obliged the infidels to retire into Africa, but in 875 he died, without naming a successor. After this event, the Italian nobles, headed by the duke of Tuscany, represented to the pope, that as Lewis had left no successor, the regal dignity, which had been so long usurped by foreigners, ought now to return to the Italians. The pope, however, crowned Charles the Bald of France emperor and king of Italy, on the condition of his acknowledging the independency of Rome, and that he himself only held the empire by the good-will and gift of the pope. This produced a serious conspiracy among the discontented nobles, of which the Saracens took advantage, renewed their incursions, and even threatened the ecclesiastical territories with the utmost danger. The pope earnestly solicited the emperor’s assistance, but that prince died before he could afford him any effectual aid, and being distressed by the Saracens on the one hand, and the Lombard nobles on the other, the wretched pontiff was forced to fly into France. Italy now fell into the utmost confusion and anarchy; during which, many of the nobles and states of Lombardy affirmed an independence which they have ever since retained. The pope, in 877, was re-conducted to Italy by Bonin, son-in-law to Louis II. of France, whom the pontiff would willingly have reigned to the dignity of king of the country, but he found his interest insufficient for the purpose, and matters remained in their former situation. The nobles became reconciled to the pope, but they renounced the authority of any superior, and every one claimed to be an independent sovereign of his own territories: they even applied to the pope, and requested him to join in afferti-
ITALY.

It being the independence of Italy, and obtained from his holiness the two following decrees, viz. That the popes, after their election, might be consecrated, without waiting for the presence of the king, or his ambassadors; and that Charles the Great died without sons, the kingdom of Italy, with the title of emperor, should be conferred on some Italian nobles. The emperor felt himself neglected and insulted, and complained bitterly of being deprived of his right, and the distinctions between the Italian nobles became more fatal than ever. Two of these noblemen, Berengarius, duke of Friuli, and Guido, duke of Spoleto, entered into an agreement, that on the death of the emperor, the former should have the kingdom of Italy; and the latter on the kingdom of France. Berengarius succeeded without opposition, but Guido was dishonoured; upon this he returned to Italy, and turned his arms against Berengarius, whom he drove into Germany, and obtained for himself the kingdom of Italy. He now employed himself in reforming the abuses of the state, and compelling the grantees formerly allowed the pope, out of gratitude for his having sanctified his usurpation, and declared him lawful king of Italy. After the death of Guido, Berengarius became king of Italy, without a rival, and held his kingdom during the space of twenty years. In 1243 he was treacherously assassinated at Verona. In 1247, after the kingdom had undergone many changes, and suffered much from the incursions and cruelties of the Hungarians, Berengarius, grandson of the first king of that name, became possessed of the sceptre. He did not assume the title of king till after the death of Lotharius, which happened in 1254; and in the mean time Italy was invaded by the united forces of Bavaria and Hungary. So formidable was their power, that Berengarius was obliged to purchase their departure with a large sum of money, which he raised by a very heavy personal tax laid upon every individual, without distinction of age or sex. In these efforts, Berengarius was more oppressive to his people than even the enemy had been: he, however, raised an immense sum of money, ten bushels of which he gave to the Hungarians, but kept the much larger portion for himself. After this he was attacked by Otho, king of Germany, who allowed him to retain his kingdom upon the hard condition of doing homage for it to the king of Germany. Berengarius did not readily submit to his fate: he rebelled against Otho, who, determined to support his authority by force of arms, brought an army into Italy, and was himself crowned king by the archbishop of Milan, and in the following year he received the crown from the hands of the pope. On this occasion, the holy pontiff and Otho went together to the altar of St. Peter, and bound themselves by a solemn oath; the pope to be always faithful to the emperor, and Otho to confound the welfare of the church, and to reform to it all its impropriety granted by former emperors. Otho bellowed rich presents on the church, but he likewise ordained that the election of the pope should be according to the canons: that the elected pope should not be consecrated till he had publicly promised, in the presence of the emperor’s commissaries, to observe everything formerly specified with regard to the rights of the emperors; that these commissaries should constantly reside at Rome, and make a report every year as to the manner in which justice was made, revised by them; and in case of any complaints, the commissaries should lay them before the pope; but if he neglected to attend to them, then the imperial commissaries might take what steps they pleased. Thus, however much Otho might allow the pope’s supremacy in spirituals, he plainly assumed the sovereignty in temporalis to himself, and thus Italy was, for upwards of 370 years, accounted a part of the German empire. The long period we deal of course at most cursorily in this sketch. We find, in 1215, Frederic II. acknowledged emperor, and crowned at Aix-la-Chapelle. Shortly after this he was urged by the pope to undertake an expedition into the Holy Land against the infidels, but he refused, under various pretences, obedience to the mandate of his holiness, which caused the most decided hostilities between the two great prelates. Frederic renounced all correspondence with the pope, and let his power at distance. The pope, convinced of his error, or at least of his not being able to support his power against that of the emperor, thought proper to lodge him by submissive apologies and gentle exhortations. They were accordingly reconciled. The pope shortly after this died, and Frederic, during the pontificate of Gregory IX., undertook an expedition to the Holy Land, leaving the affairs of Italy to the management of Berengarius, duke of Spoleto. The pope, hearing of his determination, prohibited his departure before he should be abolished from the confines of the church; but Frederic went in contempt of the church, and his success was very complete. The sultan ceded to him Jerusalem, and its territory as far as Joppa. Frederic had before acquired, by marriage, the title of “king of Jerusalem;” and now, by his moderation and great talents, he acquired the territory, to which were added Bethlehem, Nazareth, and all the country between Jerusalem and Tripoli. Tyre, Sidon, and the neighbouring territories; in return for which, the emperor granted the Saracens a truce for ten years; and in 1230 he returned to Italy. The reign of this prince, after his return from the East, was one continued quarrel with the pope. He was excommunicated by Gregory IX.; and in his turn he proclaimed everywhere that Gregory was the “great dragon,” the predicted “man of sin,” the “antichrist," &c. In 1232, Frederic, after various troubles, died. From this time, the affairs of Germany fell into the utmost confusion; and Italy continued long in the same disordered state in which it left it. Conrad, the son of Frederic, assumed the imperial dignity; but after his death, there were several candidates for the high honour. No emperor, however, was properly acknowledged till 1273, when Rodolph, count of Hapsburg, was unanimously raised to the vacant throne. During the interregnum which preceded the election of Rodolph, Denmark, Holland, and Hungary, entirely freed themselves from the homage they were accustomed to pay to the empire; and about the same time, several German cities created a municipal form of government, which continued till within these few years. Luke, Cologne, Brantwick, and Dantzick, united for their mutual defence, against the encroachments of the great lords, by a well-known association, called the Hanseatic league; and these towns were afterwards joined by eighty others, belonging to different states, which formed a kind of commercial republic. Italy also, during this period, assumed a new plan of government. From the time of Frederic II. we may date the rise of the German power in Italy. The Florins, the Piastras, the Guelphs, and the Ghibellines, &c, became independent. At the commencement of the fourteenth century, Henry VIII. undertook to reform the imperial power in Italy. For this purpose a diet was held at Worms, where Guelphs being granted for the emperor’s son-in-law, well known in history by the name of the “Roman expedition,” he set out for Italy, which was at this period divided by the factions of the Guelphs and Ghibellines, who were dividing one another without humanity or reserve. Pope Celestine V. had been obliged to leave Rome, which was in a state of anarchy, and owing to the divisions in that city, the holy pontiff, long
took up their residence in France, so that Rome seemed equally lost to the popes and the emperors. Sicily was in possession of the house of Aragon, in consequence of the massacre called the "Sicilian Vespers," which delivered that island from the tyranny of the French. Carobert, king of Hungary, disputed the kingdom of Naples with his uncle Robert. The old league of the Italian cities no longer subsisted. It had been formed with no other view than to oppose the emperors; and since they had neglected Italy, the cities were wholly employed in aggrandizing themselves at the expense of each other. In the midst of these troubles, Henry VII. appeared in Italy in 1511, and caused himself to be crowned king of Lombardy at Milan. But the Guelphs had concealed the iron crown of the Lombard kings, as if they regarded the right of reigning as attached to a circlet of metal. Henry, however, was not to be put off under such a pretence: he ordered a new crown to be made, with which the royal ceremony was performed. Henry was unable to reassert the imperial power in Italy, and his reign was terminated in a few months. From this time, the authority of the emperor in that country conformed, in a great measure, in the convenience of which the Ghibelines found in opposing their enemies under the faction of his name. The power of the pope was of the same nature, and he was probably less regarded in Italy than in any other country in Christendom. There was likewise a party who called themselves Guelphs; but they affected this distinction only to keep themselves independent of the imperialists. The most desperate wars were carried on by the different cities against each other: but it would be contrary to our plan to attempt to give a detail of them; and this is the least necessary, as nothing material was effected by their valor. By degrees this martial spirit subsided; and in the year 1492, the Italians were so little capable of resisting an enemy, that Charles VIII. of France conquered the whole kingdom of Naples in six weeks; and he might easily have subdued the whole country, if it had not been for his own imprudence. Another attempt on Italy was made by Louis XII.; a third by Francis I.; and during the reign of Louis XIII. and XIV., an obstinate war was carried on between the French and the Spaniards, in which the Italian states bore a considerable share. The war concluded in 1606, with very little advantage to the French, who had never been very successful in their Italian wars. A similar want of success attended them in the war which commenced fourteen years afterwards; but the farther particulars relating to these other contests belong properly to the history of the different states into which that country was divided.

At present, the whole of Italy is subject to the control of the French emperor, who led his victorious troops over the Alps, and made himself master of the Austrian dominions in Italy. The battle of Lodi decided the fate of Lombardy. Verona, Tortona, Bologna, and Urbino, quickly yielded to his arms. He even merited imperial Rome. The pope, incapable of resisting his power, begged for peace, which was granted him on the humiliating conditions, that his holiness should surrender to the conquerors an enormous pittance, and fatten, and a multitude of curial MSS. from the Vatican. With these the general was for the present content: he retired from Rome, perhaps, however, desirous of some new cause to enable him to enrich his country with further spoil. A pretence was soon given him. He had readily reached the boundaries of France, when he learned that the terms of the treaty had been wantonly broken by the subjects of his holiness. In the following year, 1797, he entered Italy again, and in one blow, well contrived, decided the fate of the ecclesiastical state. The banners of France now waved triumphant over the patrimony of the church. The pope was obliged to submit to whatever terms the conqueror should dictate. He agreed to the cession of Avignon, part of Venice, the cities and territories of Bologna, Ferrara, and Romagna; and to prevent the future power of the Roman pontiffs, the newly ceded territories, together with Reggio and Modena, were formed into one republic called the Cisalpine, and afterwards the Italian republic; while the Milanese, and other districts of Lombardy, were formed into another called the Ligurian republic. Thus the power and importance once annexed to the see of Rome were annihilated, and the influence of France in Italy established on the first foundation. In 1801 the Italian republic was, at the desire of Bonaparte, divided into twelve departments. We have seen, under the article France, in what manner Bonaparte, as well by a train of fortunate circumstances, as by his talents, obtained the honours of a consulship, in imitation of the office held in ancient Rome; and how he advanced from step to step, till he was proclaimed "emperor of the French," with unlimited power. This event occurred on the 14th of December, 1804, when he swore in the presence of the pope (Pius VI.), whom he had brought to Paris to be the witness of his own humiliation, "to govern solely with a view to the interest, the happiness, and glory of the French nation." He boldly asserted, in the presence of all the principal personages then assembled, that he ascended the throne by the unanimous wishes of the senate, the people, and the army, whose happiness or misery had constituted, and would for ever constitute the fates of his own pleasures and pains. "My descendants," said he, "shall long preserve this throne. In the field, they will be the first folders of the army, sacrificing their lives for the defence of their country. As magistrates, they will never forget that contempt of the laws, and the confusion of social order, are only the result of the imbecility and uncertainty of princes." The splendour of this show was introductory to a similar display in Italy. He had before been regarded as the chief of the Italian republic; but the name of a republic probably carried with it ideas abhorrent to his heart, and the very word grates on his ears. In the month of April 1805, he assumed at Milan the title of "king of Italy:" in this city he placed the iron crown on his own head, while senators from almost all the ancient states were assembled as witnesses of his elevation, and their own degradation. On this occasion he related all that he had done as a conqueror and a great statesman; saying, that the power of the French empire had nevertheless been far surpassed by the moderation which prevailed in its political transactions. "We had conquered," said he, "Holland, three-fourths of Germany, Switzerland, all Italy; but of so many provinces, we have only kept what was necessary to preserve us at the same point of consideration and power which France has always possessed. The partition of Poland, the loaves sustained by Turkey, the conquest of the Indies, and almost all our colonies, had destroyed the balance of power to our disadvantage." He is not accused all his glorious deeds, and all his generosity with regard to Germany, Holland, and Switzerland; and adds, "The union of the Italian republic to the French would have been an advantage to our agriculture; nevertheless, after the second conquest, we, at Lyons, confirmed our independence. We now do more. We proclaim the principle of the separation of the crowns of France and Italy, by fixing for that separation the moment it can be done, and without danger to our people of Italy. We have accepted, and will place upon our head, the iron crown of the ancient Lombards, in order to re-temper and consolidate..."
it; so that it may not be broken by the shocks by which it will be threatened, as long as the Mediterranean continues out of its habitual state. But we do not hesitate to declare, that we will transfer that crown to one of our children, natural or adopted, the moment we are freed from alarms for that independence which we have guaranteed to the other states of the Mediterranean." Upon the return of the emperor to his own dominions, it was announced to him that the Ligurian senate was waiting for an interview upon very important business. Accordingly, on the 25th of May, an extraordinary sitting of the Ligurian senate was held, when it was decreed that Genoa, its territories, and dependencies, should be annexed to the French empire. In his speech on this occasion, the emperor, having dwelt much at large on the advantage which would accrue to the continent in general, and to Genoa in particular, from this addition to his own dominions, added, "I will realize your expectations; I will unite you to my great people. I shall thereby acquire additional means of rendering that protection more powerful, which I have always been disposed to extend to you. My people will with pleasure receive you. They know that at all times you have been friendly to their armies; and that you have affixed them with all your force, and with all your means. They find, moreover, in your territory, ports, and an increse of maritime power, which is necessary for the support of their lawful rights against the tyrants of the seas.—Doge, and gentlemen of the deputation of the senate, and people of Genoa, return to your native country: I shall be there ere long, and will confirm the union which you and my people are about to form." At this meeting of the Italian legislature, the emperor presented prince Eugene Beauharnois to them as his representative, and vicerey of Italy; saying, that he himself would take an early opportunity of visiting all the departments of his new kingdom, in order that he might become better acquainted with their various wants. Since that period, in consequence of the success attendant on the wars between France and Austria, which were terminated by the treaties of peace of Presburg and Vienna, the whole Venetian territory, which pertained to Austria, the county of Gratz or Gorizia, the city of Trieste, Carniola, with its dependencies on the gulf of Trieste, and all the territories lying on the right bank of the Save, from the point where that river leaves Carniola, along its course to where it touches the province of Bosnia, six districts of military Croatia, Fiume, the Hungarian Litorale, Austrian Istria, together with the islands dependent upon the ceded territory, were added to the Italian dominions of the new emperor and king. On the 20th of March 1811, Benaparte had a son born by his present empress, the daughter of the emperor of Germany. To this son he instantly gave the title of "king of Rome," and required his minders, and the chief persons under his direction, to render due homage to the infant in his cradle: thus showing that he meant the prince Eugene, above noticed, only as his representative till one of his own children should be fitted to wear the sceptre of the Italian kingdom. Cellarius's Anc. Geng. Univer. Hist. Anc. and Mod. Geog. of Pinkerton, Playfair, and Smith, Holberg's Univer. Hist. And Public Papers in the several volumes of the New Ann. Regist. In the fifteenth century, when we first hear of harmony in four parts, and masses set to figurative music, it was for the use of the pope's chapel that the greatest efforts of genius in composition were excited among the candidates for favour in that art, by the double certainty of having their labours liberally rewarded, and their productions well performed. And if we find that many of the composers of the pontifical chapel were Netherlanders, and the figgers Spaniards, it does not necessarily follow that the Italians had either counterpoint, or the art of singing, from the Low Countries, or from Spain. The Roman college of fingers had been established and celebrated during so many ages, that we may almost imagine their foreigners went to Rome to learn music, as to teach it.

We know, in later times, that many of the greatest musicians of Europe have either had their education in Italy, or thought it as necessary to visit that country as the ancient Roman philopshers to travel into Greece, or the Grecians into Egypt. Orlando di Lafo, Handel, Haifle, Gluck, and J. C. Bach, went thither very early, and may be said to have formed their styles on the best models of that country. The first motets of Orlando that were published at Antwerp, by Tylman Sutato, 1555, were said to be made "à la nouvelle composition d'aucuns d'Italie;" as the first productions of Handel, that were published in England, were said to be composed "by an eminent Italian master;' Haifle was very young into Italy, and was a scholar of Alessandro Scarlatti; however, his clear and graceful style more resembled that of Vinci and Pergolesi, his competitors in the natural, simple, and elegant manner of writing for the voice, than that of either Scarlatti, his master, or Kaifer, his countryman, and first model. The late excellent composer, Mr. J. C. Bach, son and brother of two of the greatest musicians that ever existed, is allowed to have been a fine player on keyed instruments, before he went into Italy; but his vocal music is certainly more in the style of Italy, than of his native country.

If the great musicians of antiquity, whose names are so familiar to our ears, had not likewise been poets, time and oblivion would long since have swept them away. But these having been luckily writers themselves, took a little more care of their own fame; which their brethren of after-ages gladly supported for the honour of the corps.

But since writing and practical music have become separate professions, the celebrity of the poor musician dies with the vibration of his fingers; or if, in condescension, he be remembered by a poet or historian, it is usually but to blazon his inimitabilities, and throw contempt upon his talents. The voice of acclamation, and thunder of applause, pass away like vapours; and those hands which were most active in telling off temporary approbation, suffer the fame of those who charmed away their care and forrows in the glowing hour of innocent delight, to remain unrecorded.

It is better to say that the progress of music in every country depends on the degrees of civilization and culture of other arts and sciences among its inhabitants, and on the language which they speak, the accents of which furnish the subject and nerves of all vocal melody; great perfection cannot be expected in the music of Europe during the middle ages, when the Greeks, Vandals, Huns, Germans, Franks, and Gauls, whose ideas were savage, and language inarticulate and indolent, had fixed on its most humble provinces. All the dialects that are now spoken in Europe are a mixture of Celt and Latin; and as the inhabitants of Italy preserved the Roman language longer than those of other countries remote from the seat of empire, were vassals of the Latin tongue still remain in Italy than elsewhere. For though there are many terms in it that they were forced to receive from the barbarians who invaded them, yet the chief part of the language is still Latin corrupted, and sometimes flattened and improved. And as literature, art, and refinement, were encouraged more early in Italy at the court of the Roman pontiffs, than in any other country, modern music has therefore been furnished with its fable, its counterpoint, its new

ITALY.
meability, its religious and secular drama, and with the
chief part of its grace and elegance. Italy, in modern
times, has borne the seat of Europe what ancient Greece
was to Rome; its inhabitants have helped to civilize and
polish their conquerors, and to enlighten the minds of those
whole superior races and proverbs had frequently enlivened
them.

ITANBERA, a town of Brazil, in the government of
Minas Geraes; 36 miles W. of Villa Rica.

ITANNA, or Esterx, a kingdom of Africa, on the
Slave coast, about 60 miles to Bensu.

ITAPI, a town of South America, in the province of
Paraguay; 20 miles S.E. of Assumption.

ITAPIU, a town of South America, in the province of
Paraguay, on the Parana; 170 miles S.E. of Assumption.

ITATA, a town of South America, in the country of
Chili, on a river of the same name; 32 miles N.N.E. of La
Conception.

ITATI, a town of South America, in the province of
Buenos Ayres, on the Parana; 35 miles N.E. of Cor-
rrientes.

ITCH, in Medicine, a contagious disease of the skin,
which is characterized by an eruption of numerous small
pustules, more especially about the fingers, wrists, and the
bending of the joints, accompanied by the most importunate
itching, without fever.

This disease seems to have been included, together
with the running, or moist tetter, under the appellation of
ulcerating phoros (μέλανος) of the Greeks, and condescended
one form of the scabies of the Latin writers. In the
writings of the moderns, it is sometimes denominated
phoros, but more frequently scabies; the term phoros, indeed, when
used by the Greeks without any epithet, signifies the scaly
etter, which is analogous to their lepra (see Willan on
Cutaneous Diseases, Order ii. Genus 2.) and not a putrid
disease.

The eruption of scabies begins most commonly on the
limbs, and especially about the wrists and fingers, in the
form of minute pustules or watery pimpls, which are ac-
panied by a lassation of violent itching, which is greatly
increased by external warmth, and therefore is particularly
troublesome soon after the patient gets into bed. It attains,
however, a considerable variety of forms, in different in-
stances, and even in different parts of the skin, of the
complaint, which the vulgar have noticed, and distinguished by par-
ticular appellations. What they denominate the ranit itch, is
often seen early in the progrest of the disorder, or in mild
cases; and consists of a numerous crop of pimply eruption
which spreads over the whole body, arms, breast, and lower
extremities; but, on the trunk of the body especially, the
characteristic ichorous pustule commonly appears here and
there intermixed with the papule, and the final tendency of the
eruption is to the putrid form. In other cases, large
watery vesicles are seen diffused over the thighs, arms, hands,
and region of the stomach, in which case the disease is pop-
larly termed the stony itch. And not unfrequently the
eruption over the arms, wrists, and fingers, consists of large,
yellow pustules, which become confluent, and form crusts
or scabs as the matter dries; this has been termed the peky
itch, not from its connection with any syphilitic contagion,
as some have been led to imagine from the term; but from the
resemblance of the pustules to those of the distinct small-
pox. Some writers have mentioned a febrile itch, and have
included the putrid syphilitic eruptions under the term itch;
but these eruptions, as well as the affections of the skin ori-
ginating from the true fevers, differ essentially from scabies
in their form, and in the absence of that incessant and im-
portunate itching, which accompanies the latter. The term
febrile itch has sometimes been applied to the prurigo; it
would seem, when it was accompanied by a particularly irri-
tating and inflamed state of the skin.

The prurigos eruptions, indeed, which Dr. Willan has
described as constilling of pimples, which do not become
putrid in general, or discharge any fluid, even when the
tops are rubbed off, after continuing some time, are apt to
become putrid and contagious; that is, to degenerate into
scabies, if they are long neglected, or where cleanliness
is not sufficiently attended to. And there is an eruption,
which is not very uncommon, partaking, in its appearance,
of the character of prurigo and impetigo conjoined, which is
contagious in its double character, and exceedingly obli-
date. In work-houses, moreover, a virulent scabies is often
seen, which appears to be a mixture of the poison of prurigo
with that of itch, and which affects the whole body, with
febbly and itching ulcerations, that are communicated by
the contagion, under the same name. In short, it is extre-
mely difficult to joint a certain diagnosis of the scabies
from the variety of forms under which a contagious and
putrid eruption appears, under different circumstances.

See Prurigo.

The itch is most frequently communicated from one person
to another by contagion, that is, by actual contact; as by
heeling, shaking hands, &c. with a person infected, or by
using the clothes, linen, &c. which had been previously used
by such a person. But in some cases it seems to originate in
individuals, who neglect or do not pay those the proper mean
of cleanliness, and in others is the result of the conversion of
the papulose diseases (the lichen and prurigo of Dr. Willan's
arrangement) into a putrid disease. When the complaint is
communicated by contact with the person or clothes of one
already infected, it is doubled commonly conveyed by a
fart of inoculation of the ichorous or purulent matter,
discharged from the pitsules. Some, however, have attrib-
uted the disease itself, as well as the ready propagation of
it, to the existence of certain minute infects, which breed in
the furrows of the cuticle, and which are conveyed from
one person to another by such intercourse as we have just
mentioned. Bonomo, an Italian physician, was one of the
first to describe this infect, and his account was made known
in England by Dr. Mead. (See Philos. Trans. vol. xiii.)

It has been since called the acarus scabies, and has been par-
ticularly described and figured by Degeer (Hill. des In-
sectes), and others. Linnaeus considered it the same with
the acarus no rite, which breeds in hair; but Degeer has
threw this to be a mistake. These infects, which we concede
we have never been able to detect in any case of scabies, are
told to be found, not in the large pustules, but in the recent
watery pitsules, and still more commonly in the furrows of the
cuticle, near them, in the hands and fingers.

Cure—A great variety of remedies have been employed at
different times for the cure of this filthy complaint; and
generally, indeed, it is not very difficult of cure, although
the remedy is also filthy like the disease. Sulphur, both
taken internally, in conjunction with some neutral or alka-
lime salt, and applied externally over the parts affected, in
the form of an ointment, is found to be the most certain and
efficacious remedy. The white hellebore, applied either in
an ointment, or in a strong decoction as a lotion, has con-
derable influence over the disease; and some of the prepara-
tions of mercury, such as the white precipitate, the oxy-
muriate, or corrosive sublimate, &c. as well as the muriate
of ammonium, potash in a flake of a deliquecence, &c. are
also occasionally referred to, in various combinations, with
success,
ITC

fucefa. A number of other medicines, both external and internal, are recommended by the older writers, especially the juices and decoctions of several roots and plants; but it seems altogether unnecessary to enumerate them, since recent experience has decided upon the superior efficacy of the remedies just mentioned. See Turner on Diff. of the Skin.

ITCHAM, in Geography, a town of Hindooistan, in the circuit of Ellichpore; 48 miles S.S.W. of Ellichpore. N. lat. 20 38'. E. long. 77 38'.—Ailse, a town of Hindooistan, in the circuit of Cacoce; 30 miles S.S.W. of Ganjam. ITCHAU, a town of Hindooistan, in the circuit of Hindie; 30 miles N. of Hindie.

ITCHE, a town of Thibet; 95 miles S.W. of Chatechou.

ITCHING River, in Hampshire, is navigable for barges up to Wreccister city, of which an account has been given in our article CANAL: since which, there have been attempts, and one is now making, for obtaining an act for further improving this navigation. About 1802, a bridge was built over this river at Northam. At Wood mills, on this river, ships' blocks are manufactured by machinery, but in a manner far less complete and ingenious than the block machines by Mr. Brunei, which are erected in the dock-yard at Portsmouth, of which we intend to give some account under our article Block MACHINERY.

ITCHORSKA, a town of Ruffia, in the government of Irketk, on the Lena; 83 miles N.E. of Kirendik.

E.T. Ch. Petals long, inserted into the calyx. Capsule of one cell, and two valves.

Obf. 1. Herter has the honour of having first declared the Itea and Cyvilia of Linnus to be one and the same genus, from the conformity of the flower, and two-celled fruit of each.

1. I. virginica. Linn. Sp. Pl. 289. Trew Ehret. 55. t. 98. "Leaves ovate, acute, ferrate."—A native of North America, flow ring from June to August—This tree reaches to the height of five or six feet. Its stem is branched all the way up. Leaves slightly serrated, reflexed, light green. Flowers white or yellowish, composed of numerous spikes three or four inches long.—Linnus remarks that this species is very similar in appearance to Prunus Padus, the Bird-cherry.

ITEA, in Gardening, contains plants of the hardy, deciduous, shrubby kinds, of which five—most cultivated are, the Virginian Itea (I. virginica); and the entire-leaved Itea (I. cyvilia).

Method of Culture.—The first sort is capable of being increased by layers, which should be laid down in the autumn, when they will put roots so as to be fit to take off by the following autumn, when they may be removed into the nursery, or the places where they are to grow. It does not succeed well on dry gravelly soils.

It is also capable of being raised from seed; by sowing it in the spring, as soon as procured from abroad.

The second species may be increased by layers or cuttings, planted in pots of good mould in the spring; in the latter case, placing them in a mild hot-bed, till they have struck root, afterwards removing them into separate pots, placing them in airy situations in the green-house or other proper place.

Plants of the first kind are very ornamental in the borders and clumps, and those of the latter among green-house collections, or those in other protected places.

ITENG, in Geography, a small island in the East Indian sea. S. lat. 64°. E. long. 132° 15'.

ITERATION. See Reiteration.

ITERI, in Geography, a town of the island of Sardinia.

ITTFU, a town of Egypt; 8 miles S. of Tahta.

ITHACA, a town of New York, at the southern extremity of lake Cuyaga; 30 miles S. of Cuyaga. N. lat. 42° 27'. W. long. 76° 33'.

ITHACA, in Ancient Geography, one of the Greek islands, situated in the Ionian sea, between Dulichium and Capalenis, famous for being the birth-place of Ulysses, the son of Laertes. It had the advantage of a town and a good port: it is now called "Theaki," and its port "Valthis." Its circuit is reckoned about 40 miles. Some ruins still remain, which tradition reports to have been part of the palace of Penelope.

ITHCYPHOS, in Surgery, curved or deformed in the back.

ITHOME, in Ancient Geography, a town of Megalens, north of Megalens, so called from the mountain on which it was erected and well fortified, being encompassed with a stone wall. In it was a statue of Jupiter the "Saviour," and also a fountain called Arsinoe, which was supplied with water from another fountain called Clepsydra. Nepturine and Venus had each of them a temple in this place; and the mother of the gods had a superb statue of Parian marble. This town contained also a temple dedicated to Megalens, daughter of Triopas, whose statue was formed partly of gold and partly of the marble of Paros. It had likewise a temple, in which were deposited and preserved the victims appropriated to the sacrifices. Besides, it was adorned with all the statues of the gods which were worshipped in Greece. It had a theatre which had been a temple dedicated to Serapis and Isis. The citadel was constructed on the summit of the mountain, and at the gate by which they passed to Megalopolis was a statue of Mercury.
Jupiter was worshipped in this place under the appellation of "Ithamatus" by the people of Mennia; and as they pretended that he had been educated in their country, they appropriated to him a peculiar worship; and while the festival, called "Ithamata" lasted, they were accustomed to carry water during the whole day from the fountain Clepsydra into his temple. Games accompanied this festival, and also trials of skill on various instruments of music. Paean, in Mennia.

ITHYTERION, Jupiter, in Antiquity, a staff of laurel, which prophets usually carried in their hands, otherwise called scepter.

ITHYSCLIOX, in Surgery, an oblique curvature of the spine.

ITINERANT Judges, or Justices, such as were formerly sent with commissions into divers counties, to hear chiefly those causes called pleas of the crown; the fame with what are otherwise called justices in eyre. See Justice.

ITINERARIUM, in Surgery, a name given by Hildanus, and many other writers, to a staff used in the operation of cutting for the stone.

ITINERARY, the description a traveller gives of the course of his journey, and of the curiosities, &c. he observed therein.

The Itinerary of Antonine fweets all the grand Roman roads in the empire, and all the stations of the Roman army. It was drawn up by order of the emperor Antoninus Pius; but is now very defective, having suffered much under the hands of the copyists and editors.

Itinerary Column. See Column.

ITING, in Ornithology. See Gracula Calva.

ITIOBARA BAY, in Geography, a bay on the coast of Brazil. S. lat. 6° 20'. W. long. 37° 46'.

ITIUM PROMONTORIUM, in Ancient Geography, a promontory of Gaul, mentioned by Ptolemy, and supposed to be at the mouth of the Somme, in France, and extending towards the north. According to D'Anville it is Grisnecfs.

ITIUS PORTUS. See Icicus Portus.

ITKARINSKII, in Geography, a town of Russia, in the government of Kolivan; 150 miles E.N.E. of Kolivan. N. lat. 55° 36'. E. long. 87° 44'.

ITONA, in Ancient Geography, a town of Epirus.—Also, a town of Italy.—Also, a town of Aia Minor, in Lydia.—Also, the name of two places, one in Eceotis, the other in Lydia.

ITORUM URBS, a town of Italy, on the route from Orcobii to Rimini, near the mountains; mentioned by Strabo.

ITRABO, in Geography, a town of Spain, in the province of Granada; 10 miles W.N.W. of Motril.

ITRI, a town of Naples, in the province of Lavora; 3 miles S.E. of Fondi.

ITSA, a town of Japan, in the island of Ximo; 10 miles N. of Taiferro.

ITTENDAL, a town of Sweden, in the province of Helsingland; 15 miles N. of Hudwikswal.

ITTERGAU, a fertile district of Upper Hefte, watered by the Itter, which runs into the Eder, two miles S.W. of Vohle.

ITTER THAL, ITTER-EX-VAL, or Birgstad, a town of Upper Hefte; 24 miles W. of Caffel.

ITTIGIUS, Thomas, in Biography, who flourished in the seventeenth and eighteenth centuries, was born at Leipsic about the year 1654. Here he pursued his studies, and was afterwards appointed afferior of the faculty of philosophy at the same place. Being admitted to the ministry, he discharged the duties of that office in different churches in that city. In 1686, he was admitted to the degree of doctor of divinity, and in the following year he was appointed first professor extraordinary in that faculty, and then professor in ordinary. He took a considerable share in publishing the "Leipsic Acts," and besides other employments, filled the post of superintendent of the ecclesiastical district of that city. He died in 1701, and was author of "A Treatise on Burning Mountains;" "Diftertation de Hierarchia Divinae Apollonii, etque proximae;" "Prolegomena ad Jofephi Opera," and many other works, which were highly esteemed by his contemporaries. Lardner, in his fourth vol. speaks of him as the very learned Ittigius. The same author refers to his opinion in other places. Moreri. Lardner.

ITU, in Geography, a town of South America, in the province of Buenos Ayres, on the Parana; 132 miles E. of Corrientes.

ITU, in Geography, a town of South America, in the province of Buenos Ayres, on the Parana; 132 miles E. of Corrientes.

ITU, in Geography, a town of Spain, in the province of Leon; 13 miles S.S.W. of Ciudad Rodrigo.

ITUANA, in Ancient Geography; an estuary of Britain, which is unquestionably the Solway Firth, which now divides England from Scotland on the west side.

ITUREA, a province of Asia, so called from Itur, the son of Ithamned, sometimes erroneously called Jeter. It was situated on the other side of Jordan, on the N. side of the half-tribe of Manaireb, between that and the territories of Damascus; so that it made one part of Cœle Syria, and lay on the side of Judea, as Idumea lay on the other. The Itureans were famous for drawing the bow, but they were a fierce people. Itura was invaded by Ariobulus, who succeeded his father Hyrcan; but being taken ill in the midst of his successefs, he was under a necessity of being brought back to Jerusalem, and to leave his brother to complete the conquest of that province; an achievement which he soon accomplished, causing all the Itureans, either to be circumcised and incorporated with the Jews, or else to depart into some other country.

ITURISSA, a town of Hispamia, in the country of the Valesones. Ptol. In the Itinerary of Antonine it is placed 180 miles from the Pyrenees.

ITWA, in Geography, a town of Bohemia, in the circle of Pillera; 3 miles N.W. of Teuling.

ITYCA, in Ancient Geography, a town of Africa, in Libya, which was a colony of Tyrians.

ITYPHALLOPHORI, in Ancient Mythology, attendants on the orgies of Bacchus, who accompanied the Phallophors, habited like fawns, counterfeiting perfons drunk, and finging, in honour of Bacchus, songs suitable to their functions. See Orphos.

ITYS, in Ancient Geography, one of the rivers of Britain, which runs into the sea opposite to the isle of Skye.

ITZHOE, in Geography, a town of the duchy of Holstein. This town has a very ancient origin; it is named from a fortres built in the beginning of the ninth century by order of Charles the Great, issued in 809, to repel the incursions of the Danes into Germany. This fortres was called Esleho, or Ihloho. In process of time it was surrounded by a number of houses, which, about the middle of the 13th century, obtained the privileges of a town. It has since been several times destroyed; but is now a small, agreeable, and well built town, partly situated on the river Stoe, which runs into the Elbe, and has been erroneously mentioned by some travellers as a canal cut from that river. It is distant from Hamburg 47 miles, and 12 from Glückstadt. The church, which is in the market-place, is
very small, but the tree is high, of a particularly light architecture: it stands on four small iron pillars, which, at a distance, are hardly perceivable. N. lat. 53° 57'; E. long. 9° 35'.

Gen. Ch. Common Calyx roundish, of about five subovate, obtuse, nearly equal, permanent leaves, containing many florets. *Cor. Compound* convex, having numerous male florets in the disk, and five female ones in the circumference; that of each of the male monopetalous, funnel-shaped, five-toothed, the length of the calyx; of the females wanting. *Stam.* Filaments five, fimbriate, the length of the floret; anthers erect, approximated. *Styl.* German oblong, the length of the calyx; styles two, capillary, long; frigmas acute. *Peric.* none, except the unchanged calyx. *Seeds* follicular, naked, as long as the calyx, thicker about the upper part, obtuse. *Recept*b. befit with linear scales.

1. *I. annua*. Linn. Sp. Pl. 1452. Schmid. Id. 59. t. 16. "Leaves lanceolate, ovate. Stem herbaceous."—A native of South America.—This *annual* refers to the height of five or six feet. *Root* fibrous, branching. *Stem* jointed, furrowed, red, hairy; pairs of opposite branches formed at each joint. *Leaves* opposite, on footstalks, ovate and pointed, veined, reddish above, and green underneath. *Claw* axillary and terminal, blueish, or of the same colour with the stem, interfused with long, pointed, ferrate bracteae.

IVA, in *Gardening*, comprises plants of the hardy, deciduous, shrubby, herbaceous, annual kinds, of which the species commonly grown are, the annual iva (*I. annua*), and the shrubby iva, or balfard Jefuita's bark-tree (*I. frutescent*.)

Method of Culture.—The plants of the first sort are raised by fowing the seeds on a moderate hot-bed in the spring, and when they are fit to remove, placing them in another hot-bed, treating them as the lefs tender annual sorts. But in the second sort, the young branches should be laid down in the spring, when they will put out roots in about six months; or cuttings may be planted in a fady border in May, and when they have taken root, removed, with earth about their roots, to the places where they are to grow. The plants succeed best in a dry soil, and warm sheltered situation.

Plants of the first sort afford ornament among the lefs tender annuals, and thole of the latter in the warm borders and clumps in shrubberies and pleatground.

IVA, in *Geography*, a town of Japan, in the island of Nippon; 30 miles S.S.E. of Nagita.

IVA, in *Agriculture*, the name of one of the canoes or boats used by the inhabitants of the South sea, for short excursions to the coast. It is well-fitted and flat-bottomed. See BOAT.

IVA, in Geography, czar of Ruflia, was born in 1438, and ascended to the throne in 1462. At this period Ruflia was divided into a number of petty principalties; some of them were subject to the czar of great duke, and all, together with him, tributary to the Tartars, who allowed a minister over that prince. The following is given as an account of the fervitude of the great duke. 'It is recorded by Gorodtzhov, the Polish historian, and quoted by Cosx in his work: 'Whenever the Tartar ambassadors were sent to Moscow to collect tribute, the great duke used to meet them and offer, as a mark of his respect, a cup of mare's milk; and if a drop chance to fall upon the name of the horse on which the Tartar ambassador was sitting, he would not let it stick. When they reached the hall of audience, the ambassadors read the khan's letter seated upon a carpet of the choicest furs, while the great duke with his nobles knelt, and listened in respectful silence.' Ivan, who may be justly esteemed the founder of Russian greatness, was a man of gigantic stature, and of corresponding resolution and vigour, accompanied with the ferocity of a barbarous despot. In the course, however, of a prosperous reign of above forty years, he gave a new aspect to the Russian affairs: he annexed to his dominions several neighboring principalities, subdued Novgorod, and reduced his country from the Tartar yoke. He had no sooner delivered Ruflia from this dependence, than his alliance was curved by many European sovereigns, and during his reign, for the first time, the emperor of Germany, the pope, the grand signor, the kings of Poland and Denmark, and the republic of Venice, felt their interest to send ambassadors to the Russian court. The talents of Ivan were not confined to military affairs. Ruflia was indebted to him for the improvement of her commerce, and for opening a more ready communication with European nations. Under his auspices, the knowledge of gunpowder, and the art of casting cannon were first brought into Ruflia by Arriffotte of Bologna: he employed the fame artil, and some other foreigners, to re-coin Russian money, which had hitherto been disfigured by Tartar inscriptions: he engaged, at a vast expense, Italian artists to engrave the castles of Moscow and Novgorod, with walls of brick, and to erect several churches and other public structures with the same materials. For his various services he obtained the title of Great. It should be observed, that the manners of Ivan were refined and polished in some degree by the example of his second wife Sophia, a Grecian princess, daughter of Thomas Paleologus, a lady of comfitnate beauty and winning address, who, to all the softer graces of her sex, added a genius and manly spirit, and who, while the infufion of this lord and noble, and the arts of peace, animated him to those glorious enterprizes which occasioned the aggrandizement of his country. He is represented as being liberal and unfeeling, given to piety, though he punished it severely in others, and an object of dread to all who approached him. He died in 1555, in the 67th year of his age, and the 25th of his reign. On each side of his remains were deposited those of his father, Vafili Vasilievitch, and of his son, Vafili Ivanovitch, who succeeded him on his throne, and expired in 1533. Cosx's Travels, vol. ii.

IVA, in Geography, followed his father Ivanovitch in the year 1530. Being only three years of age, he was left under the care and superintendence of graces, who faithfully performed the duty committed to them, and defended the plots of the young prince's uncle, who were
defends of depriving him of his crown. At the age of 19 he sent a splendid embassy to the emperor Charles V. the chief purpose of which was to obtain from Germany proper perons to assist him in the civilization of his subjects, and in introducing arts and manufactures. More than 300 artificers, of all professions, actually arrived at Lubec in their way to Moscov, but were prevented from proceeding on their journey by the intrigues of the inhabitants of that town. Ivan II., raised the superstructure of the Russian grandeur, of which his grandfather had laid the foundation. He instituted a standing army, trained his soldiers to the use of fire-arms, and accustomed them to more regular discipline. By means of this formidable body, he extended his dominions on all sides, conquered the kingdoms of Kafan and Astrakan, and rendered the Russian name respectable to the distant powers of Europe. He gave to his subjects the first code of written laws; he introduced printing into Russia; he promoted commerce, and regulated all the duties connected with it. While involved in a war with the Poles, a domestic conspiracy, in 1566, occasioned by his tyranny, threatened to deprive him of his crown. Such was the danger, that he thought it best to make a signified abdication. This produced the propitious effect of awakening the dormant loyalty of the people; but as soon as he had resumed the reins of government, he put to death the leaders of the conspiracy, and secured himself against any future rebellion, by the institution of a body of guards drawn from the remote provinces, and attached solely to himself. Thence he augmented, till at length they proved ready instruments of despotism. He entered into a friendly intercourse with queen Elizabeth of England, to whom he proposed an alliance offensive and defensive. Though the queen did not agree to his proposal in its full extent, yet a treaty was made, which was the commencement of the intercourse which has since subsisted between the two nations. In an invasion of Russia by the Poles, the city of Novogored incurred the suspicion of having, by its principal inhabitants, held a correspondence with the king of Poland. This accusation was punished in the most barbarous manner by the czar, who, in the course of a few weeks, adjudged several thousand perons to death. In 1571, after Russia had been decimated by the plague, the Crim Tartars, instigated by the Poles, made an irruption into the southern provinces, and advancing towards Moscov, entirely defeated the Russian army, which made a stand within 18 leagues of the capital. Ivan, upon the news, shot himself up in a fortified citadel, with his two sons, and most valuable effects, and by this cowardly desertion, allowed the Tartars to enter Moscow, which they plundered and burnt, with a wanton destruction of the inhabitants. The czar's most formidable enemy was Stephen Batorii, king of Poland, who, with the king of Sweden, declared war against Russia in 1579, took Narva and Riga, and became masters of the whole of Livonia. The Russians murmured at his conduct, and some of the nobles ventured to make remonstrances against his suffering foreign enemies to ravage the country, and requested that he would permit his eldest son to appear at the head of the army. The czar, suspecting that the princes had urged the noble to this step, misrepresented him in very severe terms; and, attempting to justify himself, the father's anger was roused to such a pitch, that he gave him a violent blow with a staff tipped with iron, which had him at his feet, and which in four days proved fatal. The savage monarch, who did not probably Intend his son's death, pitied from the extreme of anger to that of sorrow: he refused to take food or change his dress for several days, and endeavoured to expiate the deed by a magnificent funeral. An unla-

peaceful attempt to chastise the Tartars, who had made a new incursion into the Russian territories, was the last act of this reign. He negotiated with them and returned to Moscov, when the approach of his own death awakened in him a desire of conferring benefits on his people. He now endeavoured to correct abuses introduced by his long wars, performed many acts of clemency, enjoined his successor to liberate prisoners, repeal taxes, and redress the injuries which his brutality had inflicted. He expired in 1589, in the 54th year of his age. He has been reckoned among the great monarchs of his country, on account of his spirited and successful attempts to free it from a foreign yoke, and to introduce arts and civilization. He left two sons, of whom Feodor or Theodore succeeded him.

**JUAN. GEORGE, in Biography.** See the article Degree for an account of this naval commander, eminent for his mathematical knowledge and skill in practical astronomy.

**Juan, St. in Geography.** One of the Cape Verde islands. See Brazil. —Alfo, the capital of California. N. lat. 20° 25'. W. long. 114° 0'. —Alfo, a town of Mexico, in New Biscay; 75 miles S. S. W. of Paral. —Alfo, a town of South America, in the province of Panama, between Panama and Porto-Bello. —Alfo, a sea-port town of Mexico, in the province of Nicaragua; 35 miles S. E. of Leon. N. lat. 12° 10'. W. long. 87° 38'. —Alfo, a town in East Florida; 12 miles N. of St. Mark. —Alfo, a small island in the North Pacific ocean, near the coast of New Albion, between the islands of St. Clements and St. Diego. —Alfo, a town on the W. coast of the island of Luson. N. lat. 17° 12'. E. long. 120° 48'. —Alfo, a town of South America, in the province of Mexico; 76 miles E. N. E. of Trinidad. —Alfo, a town of Paraguay; 270 miles S. S. E. of Asuncion. —Alfo, a river of New Mexico, which runs into the Gulf of California, N. lat. 29° 10'. —Alfo, a river of Spanish North America; in the province of Nicaragua, which forms an outlet for the lake of Nicaragua to the gulf of Mexico. It has been proposed to make use of this river in order to open a communication between the Atlantic and Pacific oceans. It is said to be navigated by the Indians through its whole course, and was reported in the reign of Charles V. to be as considerable as the Guadalquivir at Seville. The length of the river St. Juan is by the latest English maps about 100 miles; and it is navigated by large flat-bottomed boats and canoes, laden with tallow and other effects, which they carry to Porto-Bello, at the distance of 80 leagues; but they are obliged to unload at three places, probably rapidly, where canals would be required. At one of these, the castle of our lady, called by the English the fort St. Juan, is placed on a rock, and though small, strong enough to protect the entrance. It has 36 cannon and a battery; level with the water is a platform, and towards the land it is defended by a ditch and rampart, reaching to the river. The usual garrison is 100 men, besides 16 of artillery, 40 musquetiers, and 20 militia; which last manage the barks, two being placed every night up and down the river. There are 18 flaves, male and female, for the service of the garrison, which is supplied with provisions, flesh, fowls, garden stuff, maize, and other articles, from the city of Granada, at the distance of 60 leagues; and there are always provisions for nine months. But the climate is unhealthy, as it rains almost perpetually, and a recruit of 50 men from the capital, Granada, is necessary to supply the places of those who die. This fortress is regarded as the key of New Spain and Peru; and by taking it, and the port of Realjo, an enemy would become master of b- the oceans. Such is the account of Alecdo, cited by Pinkerton in the 31st volume.
of the Geography, to which we refer for some further particulars relating to the projected pilgrimage by the lake of Nicaragua between the two fore-mentioned oceans.—Alto, a town of South America, in the province of Quito; 15 miles N.W. of St. Joachim de Omaguass.—Alto, a river of Popayan, which runs into the Pacific ocean, N. lat. 3° 32'.

Juan Batalla, St., a town of South America, in the province of Chiriqui; 250 miles E.S.E. of Santa Cruz de la Sierra la Nueva.—Alto, an island in the Pacific ocean, discovered by Quiros in 1606. S. lat. 26° 14'.

Juan de Bamarquina, a town of the island of Cuba, on the N. coast. N. lat. 22° 1°. W. long. 77° 54'.

Juan Capistrano, St., a Spanish settlement and mission in N.W. America, founded in 1766; situated in a small cove on the Pacific ocean.

Juan de Chacana, St. See Canary.

Juan de Dios, St., a town of New Naverre; 240 miles W. of Cafa Grande.

Juan Fernandez. See Fernandez.

Juan de la Estrella, or de la Cordillera, a town of Chili; 150 miles N.N.E. of St. Vago. In its neighbourhood are gold mines. S. lat. 53° 25'. W. long. 66° 57'.—Alto, a district of South America, lying to the east of the Andes, with a town of the same name; called also Chacapoyas—Alto, a town of Peru, and capital of a jurisdiction in the district of Truxillo. S. lat. 6° 12'. W. long. 77° 28'.

Juan de Fosas, St., a large bay or gulf of the North Pacific ocean, on the W. coast of North America. In 1592 captain Vancouver gave it the name of the gulf of Georgia, which fec. Its entrance lies in N. lat. 48° 25'. W. long. 122° 57'.

Juan de Guare, St., a town of the island of Hispaniola; 80 miles N.W. of St. Domingo.

Juan de Nava, two small islands in the Indian sea. S. lat. 10° 26'. E. long. 52° 45'.

Juan de los Llanos, St., or San, a province of South America, in New Granada, which forms a confederable district, if it be extended as far as the Orinoco; but as the capital town is on the western skirts, the extension given by La Cruz seems very arbitrary, there being no Spanish settlement in that direction. This territory consists of prodigious plains, extensive for 2 or 300 leagues. The town was founded in 1555, and was formerly celebrated for gold mines, which have now declined; and the inhabitants rarely exceed 50; 50 miles E.S.E. of Santa Fé de Bogota. N. lat. 3°. W. long. 73° 26'.

Juan del Oro, St., or Caravela, a town of Peru, and capital of a jurisdiction, in the viceroyalty of Buenos Ayres, and dioceze of Cufco; 150 miles S.E. of Cufco. N. lat. 14° 40'. W. long. 69° 30'.

Juan de Padro, St. See Panto.

Juan de Porto Rico, St., a town and capital of the island of Porto Rico, situated on a peninsula in the N. coast of the island, having a good harbour, defended by a citadel and castle; populous and well built, the size of a bishop and residence of the governor. The town was founded in the year 1514; but in 1794, when it was in a flourishing state, it was attacked by Sir Francis Drake, who destroyed all the ships in the harbour, but could procure no farther. In 1597 it was taken and pillaged by the earl of Cumberland. N. lat. 18° 35'. W. long. 67° 20'.

Juan de Rey, St., a town of Mexico, in the province of Guanajuato; 25 miles N. of Guanaca.

Juan Rio, a town of the island of Cuba; 26 miles E.S.E. of Spiritu Santo.

Juan d'Ulua, St., a small island in the gulf of Mexico, near the coast of Tlacuah, at the mouth of the river Vera Cruz. On the little island is a fortress to guard the entrance into the harbour of Vera Cruz.

IVANGOROD, a town of Russia, in the gulf of St. Peterburg, on the Neva, near the Baltic, built by Ivan Boltovitch; surrounded by a field-wall, and defended by a number of small towers. S.W. of St. Peterburg, N. lat. 59° 16'. E. long. 24° 14'.

IVANITS, a town of Croatia, on the river Lanj; 34 miles N.E. of Carinhal. N. lat. 49'. E. long. 17° 16'.

JUANNA. See Hirzuan.

IVAPECANGA, in Lima, a name given to authors to the climbing plant, of which the bark, an ingredient of medicine, is the root.

JUAR, in Geography, a town of Thules of India, in the desert of Delhi; 17 miles S. of Oudh.

JUAB, in Geography, king of Numidia, the son of Hanchus, a descendant of Miffon, founded the city of Pompey against Julius Cæsar. He defeated Carabin, of Cæsar's lieutenants, in Africa, who perished in the action; and after the battle of Pharsalia he united his forces to those of Scipio. They were joined by Cato, who repaired the pride of Rome, by preventing him taking place above Scipio. He was conquered in a battle at Thapsus, and was totally abandoned by his subjects. Seeing that all was lost, he killed himself, as did Petronius, who had shared his good fortune and his adversity. His kingdom became a Roman province, of which Ballad was the first governor.

Juba II., king of Mauritania, son of the preceding, being very young at the time of his father's death, was left as a captive in Cæsar's triumph. The conqueror required him for this act of humiliation by affirming him the advantages of an excellent education, in consequence of which he became one of the most learned men of his time, and attained a conspicuous place as an author, by which he attained to more glory than he could have derived from the inheritance of a kingdom. He gained the hearts of the Romans by the courteousness of his manners, and Augustus rewarded his fidelity by giving him in marriage Cleopatra, the daughter of Antony, by conferring upon him the title of king, and making him master of all the territories which his father once possessed. Juba governed his dominions with a spirit of justice and lenity which gained him the esteem of his subjects. He distinguished himself as a writer by various learned works, which related to the history and antiquities of the Arabians, Assyrians, and Romans. He wrote also the history of theatres, of painting and painters, of the nature and properties of different animals, and a particular treatise on the virtues of the herb Euphorbia. He died about the year 24 of the Christian era, leaving a son, Ptolemy, afterwards put to death by Caligula. Juba is quoted with great applause by Pliny, Strabo, Phuntarch, Tacitus, and some others authors. His popularity, as a sovereign, was so great, that the Mauritians rewarded his benevolence by making him one of their gods. The Athenians raised him a statue, and the Ethiopians did him homage as a deity. Unver. Hist. Suec.

Juba, in Geography, a town of Syria, on the right banks of the Euphrates, on a narrow strip of land, formed by the winding of the river; 90 miles W.N.W. of Bagdad. N. lat. 55° 42'. E. long. 41° 58'.

JUBAL, an island in the Red sea, N. lat. 27° 30'. E. long. 66° 40'.

JUBBEL, a town of the Arabian Irrak, on the Tigris, 50 miles S.E. of Al Medain.

JUBBA, a town of Bengal; 45 miles W.N.W. of Ramgur. N. lat. 23° 58'. E. long. 84° 58'.

JUBE, the sheol, Read Left, or gallery over the chamber.
JUBILEE, among the Jews, denotes every fiftieth year: being that following the revolution of seven weeks of years; at which time all the laws were made free, and all lands reverted to their ancient owners. The jubilees were not regarded after the Babylonic captivity.

The word, according to some authors, comes from the Hebrew גּוֹבָל, which signifies ἔτη οἰκίας; but this must be a mistake, for the Hebrew שֵׁלוֹשִׁים, גּוֹבָל, does not signify ἔτη; neither do its letters, taken as cyphers, or according to their numerical power, make that number; being 10, 6, 5, and 30, that is, 48. Others say, that גּוֹבָל signifies a roman; and that the jubilees was thus called because proclaimed with a ram's horn, a memory of the ram that appeared to Abraham in the desert. Maimon chooses to derive the word from גּוֹבָל, the name of a musical instrument, which, for that reason, was called by his name; whence the word גּוֹבָל and גּוֹבָל come to signify the year of deliverance and remission, because prefixed with the sound of those instruments, which was no more than the horn of a ram. Hottinger, ver. 1350, c. 30, § 48. Others say, that גּוֹבָל signifies דַּתֶּן, which signifies a roman, and that the jubilees was thus called because proclaimed with a ram's horn, a memory of the ram that appeared to Abraham in the desert. Maimon chooses to derive the word from גּוֹבָל, the name of a musical instrument, which, for that reason, was called by his name; whence the word גּוֹבָל and גּוֹבָל come to signify the year of deliverance and remission, because prefixed with the sound of those instruments, which was no more than the horn of a ram. Hottinger, ver. 1350, c. 30, § 48. Others say, that גּוֹבָל signifies דַּתֶּן, which signifies a roman, and that the jubilees was thus called because proclaimed with a ram's horn, a memory of the ram that appeared to Abraham in the desert. Maimon chooses to derive the word from גּוֹבָל, the name of a musical instrument, which, for that reason, was called by his name; whence the word גּוֹבָל and גּוֹבָל come to signify the year of deliverance and remission, because prefixed with the sound of those instruments, which was no more than the horn of a ram. Hottinger, ver. 1350, c. 30, § 48. Others say, that גּוֹבָל signifies דַּתֶּן, which signifies a roman, and that the jubilees was thus called because proclaimed with a ram's horn, a memory of the ram that appeared to Abraham in the desert. Maimon chooses to derive the word from גּוֹבָל, the name of a musical instrument, which, for that reason, was called by his name; whence the word גּוֹבָל and גּוֹבָל come to signify the year of deliverance and remission, because prefixed with the sound of those instruments, which was no more than the horn of a ram. Hottinger, ver. 1350, c. 30, § 48. Others say, that גּוֹבָל signifies דַּתֶּן, which signifies a roman, and that the jubilees was thus called because proclaimed with a ram's horn, a memory of the ram that appeared to Abraham in the desert. Hottinger, ver. 1350, c. 30, § 48. Others say, that גּוֹבָל signifies דַּתֶּן, which signifies a roman, and that the jubilees was thus called because proclaimed with a ram's horn, a memory of the ram that appeared to Abraham in the desert. Maimon choose...
century, which is the true date of its origin. He takes notice of the various changes which it underwent with respect to the time of its celebration, the various colours with which the ambitions pontiffs covered it, in order to render it respectable and alluring in the eyes of the multitude; and exposes these illusions by many convincing arguments, the gravity of which is enhanced with an agreeable and temperate mixture of decent raillery. He proves, with indisputable evidence, that the papal jubilee is an imitation of the "sacred games" that were celebrated with such pomp in pagan Rome. He points out the gross contradictions that reign in the bulls of the different popes, with respect to the nature of this institution and the time of its celebration. Nor does he pass over in silence the famous traffic of indulgences, the worldly pomp and splendour, the crimes, debaucheries, and disorders of every kind, that were observable at the return of each jubilee year. He lays also before the reader a historical view of all the jubilees that were celebrated from the pontificate of Boniface VIII., in the year 1302, to that of Benedict XIV., in 1751, with an entertaining account of the most remarkable adventures that happened among the pilgrims who repaired to Rome on these occasions.

One of our kings, viz. Edward III., caused his birthday to be observed in manner of a jubilee, when he became fifty years of age, in 1360, but never before or after. This he did, by releasing prisoners, pardoning all offences, except treason, making good laws, and granting many privileges to the people.

We have lately, viz. in 1809, had a jubilee, on occasion of our sovereign George III., having attained to the fiftieth year of his reign. There are particular jubilees in certain cities, when several of their feasts fall on the same day; at Puy en Velay, for instance, when the feast of the Annunciation happens on Good-Friday; and at Lyons, when the feast of St. John Baptist coincides with the feast of Corpus Christi.

In 1649, the Jesuits celebrated a solemn jubilee at Rome; that being the centenary, or hundredth year from their institution, and the same ceremony was observed in all their houses throughout the world.

**JUBILEUS, or JUBLIO.** is used among the Romans, to signify a religious who has been fifty years in a monastery, or an ecclesiastic who has been in orders fifty years. Such veterans of religion are dispensed with in some places from attending matins, or a strict observance of any other of their rules.

JUBLIO is also extended to any man a hundred years old; and to a profession or predestination for fifty years, "Stager non invenitur in scriptione, inquiratur de memoriis, quantum septuagesima saeculis est, et in ultima aeternum." JUBO, in Geography, a kingdom of Africa, on the coast of Ajan, near th. East Indian sea, with a capital of the same name, subject to the Portuguese. N. lat. 5° 9'. E. long. 43° 30'.—Mbf, a river of Africa, which runs into the Indian sea, a little to the N. of the equinoctial line, E. long. 42° 46'.—Alto, a town of Africa, in the kingdom of Benin.

JUBONEs, a river of Peru, which runs into the Pacific ocean,

S. lat. 5° 26'.

JUCAR, a town of Mexico, in the province of New Biscay; 110 miles N.W. of Patral.

JUCASSETZ, a town of Scclovia; 25 miles S. of Efsak.

JUCATAN. See YUCatan.

**JUDA, in Botany,** the name of a distinct genus of plants, otherwise called *Yucca.*

**JUCENDRO,** in Geography, a town of the island of Madagascar. S. lat. 23° 10'. E. long. 47° 14'.

**JUCK AS JERVI,** a town of Swedish Lapland; 145 miles N.W. of Torne. N. lat. 67° 50'. E. long. 25° 46'.

**JUCKATAGHERI,** a town of Hindoostan, in the Carnatic; five miles E. of Muglee.

**JUCKING,** the notes of a cock partridge, inviting the hen to come to him. Thefe serve the sportmen in good stead for finding the places where they are.

**JUCLEZ,** in Geography, a town of Turkftein; 45 miles S.W. of Turkftein.

**JUCURUTA,** in Ornithology, a very beautiful species of owl, found in the Brazil, and variegated with black and yellow.

**JUD,** in Mining, is applied, in the collieries in Derbyshire, to a certain depth of coal in the face of their work, which will fall at once, after the holers have undermined the same, and the hammer-men have applied their wedges near to the roof: it is also called the web, and the rib of coal in some places, and is limited, like the face of the coal, by parallel vertical lines or long, longy joints; the backs of Newtonian colliers.

**JUDIAC AURICULA.** See *Auricula.*

**JUDIEL.** See *Juda.*

**JUDAH,** in Scripture Biography, the fourth son of Jacob and Leah, was born in Metopotamia, A.M. 2240, B.C. 1753; and was always regarded as the chief of Jacob's children. The privileges of the first-born seem to have been transferred from Reuben to him, after the incest of Reuben with Bilhah his father's wife. For the blessing pronounced by Jacob on his death-bed to Judah, see Gen. xlix. 8-12. That part of it which occurs in the 49th verse, seems to imply, that the royal power should not go out of his family, and that the Messiah should derive his birth from it.

**JUDAH, Leo,** in Biography, a learned Protestant divine, son of John Judah, a German priest, was born in the year 1482. When he was about twenty years of age, he was sent to Bafel to pursue his academical studies. Here he had for a fellow student, the afterwards much celebrated Zuingle, and from him, who had at a very early age, been shocked at the superstitious practices of the church of Rome, he received such impressions, and was directed to such enquiries, as predisposed him to embrace the reformed religion. Having obtained his degree of M.A. he was appointed minifter of a Swiss church, to the duties of which he applied himself with main and zeal. This industry led him to renounce the distinguishing tenets of pcpney, and an adoption of those of the reformation. He openly preached in defence of the Protestant religion, was appointed by the magnificats and ecclesiastic assembly of Zurich pastor of the church of St. Peter in that city, and became very celebrated as an advocate, as well from the zeal as the spirit, of the fyllons to which he was a co-ferer. At the desire of his brethren, he undertook a translation, from the Hebrew into Latin, of the whole Old Testament. The magnitude of the work, and the difficulties with which he proceeded to it, were more than he was able to bear, and before he had completed it, he fell a sacrifice to the plagues in 1545, when he was but sixty years of age. The translation was finished by other hands, and was printed at Zurich in 1543, and two years afterwards it was reprinted at Paris by Robert Stevens, accompanying the vulgar version, in adjoining columns, but without the name of the author of the new version. Judah was likewise the author of "Annotations"
JUDAH, Tribe of, in Scripture Geography, a canton of Palestine, which extended S. of Benjamin, about 27 miles, quite to the mountains of Soor, or Edom, which were the frontiers between it and Idumea. It was bounded on the E. by the Dead sea, and on the W. by the tribes of Dan and Simeon, both which lay between it and the Mediterranean. Judah was reckoned the largest and most populous tribe of all the twelve, and the inhabitants were the stoutest and most valiant. It was, moreover, the chief and royal tribe, from which the kingdom was denominated. The land was beautifully variegated with fertile plains, hills, dales, lakes, and fountains, and it produced great plenty of corn, wine, oil, fruits, and pastures, except where it lay contiguous to Idumea. It was properly in this territory of Judah, that the Canaanites dwelt, and here Abraham and his descendants sojourned, till they went down into Egypt. The most remarkable places of this tribe were Azekah, Bethlehem, Bethzor, Emmaus, Engedi, Hebron, Libna, Makkedah, Maon, Mephida, Tekoa, and Ziph; which see respectively.

One of the principal prerogatives of this tribe was, that it preferred the true religion, and the public exercise of the priesthood, with the legal ceremonies in the temple of Jerusalem; while the ten tribes gave themselves up to idolatry, and the worship of the golden calves. This tribe, at the Exodus, was composed of 74,600 men, capable of bearing arms.

JUDAH, Kingdom of, a denomination given to the meaid kingdom of roboboam, in contradistinction to that of Israel, upon the revolt of the ten tribes. The crown passed from Benjamin (from Saul and Ishbobeth) into Judah, which was David's tribe, and that of the kings his successors, until the Babylonish captivity. And after the return from that captivity, although this tribe did not reign, it gave the sceptre to those who did reign, and in a certain sense reunited in itself the whole Hebrew nation, which from that time was known only as "Judah," Jews, descendants of Judah. See Jews and Israel.

JUDAIUS LAPIS, a small, grey, soft, brittle stone, in form of an olive, having lines drawn regularly on its surface, as if they were formed by art.

This is a kind of extraneous fossil, being a spone of an echinus marinus petrifed. This stone has by many been supposed to be a fossil body in its native figure, but is really the remains of a spone of an echinus, filled with a plated fpar. It is very common in Syria, and is sometimes found with us. See Spar.

These extraneous fossils are the petrified spines of echini, acicula echinorum, or tecolith of Phiny, which the chalk strata, and those of the Bath freestone in England, produce in great perfection and variety of shapes; some of them occasioned by disease in the animal, as is probable, from the observations of Mr. Sowerby. It is not very common, that the spines are found attached to the foill echinii: a specimen of this kind, imbedded in a black flint, fold for 20 guineas, we are told, at the sale by auction of the late Sir Alton Lever's museum. The foill spines of most of the echini differ so much from the recent spines, that Linnaeus doubted whether they really were such, a matter now placed beyond any doubt, by the discovery of specimens like that above mentioned.

JUDAISM, the religious doctrines and rites of the Jews, which, as well as their commonwealth, (see THEOCRACY,) are attributed by Mofes wholly to God. Judaism was but a temporary dispensation, and was to give way, at least the ceremonial part of it, at the coming of the Messiah. For a complete system of Judaism, see the books of Mofes. Judaism was anciently divided into several sects; the principal whereof were the Pharisees, Sadducees, and Essenes; which see respectively.

At present there are two sects among the Jews, viz., the Caravites, (which see,) who admit of no rule of religion but the law written by Mofes; and the Rubabinists, who add to this law the traditions of the Talmud. See RABBINISTS AND TALMUD.

It has been observed that Judaism, of all religions, is that which is the most rarely abused. In the 18th of Edward I. the parliament granted the king a fifteenth for the expulsion of Judaism.

In England formerly, the Jews and all their goods belonged to the chief lord where they lived, and he had such absolute property in them, that he might fell them; for they had not liberty to remove to another lord without leave. Mat. Paris tells us, that Henry III. sold the Jews to earl Richard, this brother, for a term of years, that they for the extraivenal, come cofererat.

They were distinguished from the Christians both living and dying; for they had proper judges and courts wherein their causes were tried, and they wore a badge on their breast over their clothes a frame of a table; and they were fined, if they traded abroad without such badge. They were never buried in the country, but always brought up to London, and interred without the walls.

JUDAN, in Geography, a town of Hindostan, in Bag- lana; 20 miles W. of Junere.

JUDAS MACCABEUS. See Maccabeeus.

JUDEA-TREE. See Maccabean.

JUDEA, in Geography, a town of Hindostan, in the circur of Gurrah; 10 miles E. of Mahar.

JUDE, or the Epistle of Jude, a canonical book of the New Testament, written against the heretics, who, by their impious doctrines and disorderly lives, corrupted the faith and good morals of the Christians.

The author of this epistle, called Judas, and also Thaddeus and Libanus, was one of the 12 apostles; he was the son of Alpheus, brother of James the Less, and one of those who were called our Lord's brethren. We are not informed, when or how he was called to be an apostle; but it has been conjectured, that before his vocation to the apostleship he was an husbandman, that he was married, and that he had children. The only account we have of him in particular, is that which occurs in John, xiv. 21, 22, 23. It is not unaccountable to implore, that, after having received, in common with the other apostles, extraordinary gifts at the pentecost, he preached the gospel for some time in several parts of the land of Israel, and wrought miracles in the name of Christ. And, as his life seems to have been prolonged, it is probable that he afterwards left Judea, and went abroad preaching the gospel to Jews and Gentiles in other countries. Some have said that he preached in Arabia, Syria, Mesopotamia, and Persia; and that he suffered martyrdom in the last-mentioned country. But we have no account of his travels upon which we can rely; and it may be questioned whether he was a martyr.

In the early ages of Christianity, several rejected the Epistle of St. Jude, because the apocryphal books of Enoch, and the apocryphal books of Mofes, are quoted in it. Nevertheless it is not to be found in all the ancient catalogues of the sacred writings; and Clement of Alexandria, Tertullian, and Origen, quote it as written by Jude, and reckon it among the books of sacred scripture; in the time of Eusebius it was generally received. As to the objections that have been
been urged against its authority. Dr. Lardner suggests, that there is no necessity for supposing that St. Jude quoted a book called Enoch, or Enoch's prophecies; and even allowing that he did quote it, he gives it no authority; it was no canonical book of the Jews; and if such a book existed among the Jews, it was apocryphal, and yet there might be in it some right things. Instead of referring to a book, called the "Assumption or Ascension of Christ," which probably was a forgery much later than its time, it is much more credible, that St. Jude refers to the vision in Zech. vi. 1-5. It has been the opinion of several writers, and among others of Hammond and Benson, that St. Jude addressed his epistle to Jewish Christians; but Dr. Lardner infers, from the words of the inscription of the epistle v. 1, and v. 3, that it was delivered for the use of all in general, who had embraced the Christian religion. The last mentioned author supposes, that this epistle was written in the year of Chr. 64, 65; or 66. Lardner's Works, vol. vi. See Eponym.

JUDEA, in Ancient Geography, a province of Asia, more anciently called the land of Canaan, the land of Promise, the Holy Land, and Palæstine; which see. It was called Judea, from Judæa, whose tribe was the most considerable of the 12, and possessed the most fertile part of the whole. It did not assume the name of Judæa, till after the return of the Jews from the Babylonian captivity, though it had been denominated, long before, the kingdom of Judah, in opposition to that of Israel. After their return, this tribe, which was the only one that made a figure, settled in the Chephar-falen, and in the adjacent territories, and then spread through the whole country, so that the name of Jehudah and Jehudim extended itself to all the rest. (See JUDEA.) Judea was also called Syria, Palæstina-Syria, Cele-Syria, and Phenicia. It was also called Idumæa, merely because the Idumæans feigned on some parts of it during the Babylonian captivity. The modern name, especially among Christians and Mahometans, is Palæstine; which see.

Before the arrival of the Hebrews, Judea was governed by Canaanitish kings, each in his respective city. (See CANAAN.) When Joshua conquered it, he governed it as the viceroy of Jehovah, according to the form of the Jewish theocracy. The elder succeeded Joshua, about 15 years; after which the Israelites fell into a kind of anarchy for seven or eight years. They were governed by Judges for about 317 years; then by kings from Saul to the Babylonian captivity about 507 years. After the captivity, Judah continued subject to the kings of Persia, then to Alexander the Great, and his successors; sometimes to the kings of Syria, sometimes to the kings of Egypt; paying, nevertheless, great deference, in matters of private government, to the high priest, and to princes of the family of David. From the time of the Maccabees, they continued in possession of the sovereign authority, till the reign of Herod the Great, about 133 years. See Jews.

JUDENBACH, in Geography, a town of Germany, in the principality of Coburg; 12 miles N.E. of Coburg.

JUDENBURG, a town and capital of Upper Stiri, on the river Main, on a plain surrounded with lofty mountains, always covered with snow. It has a castle, college, and two convents. The French took it in 1797; 32 miles W.N.W. of Gratz. N. lat., 47° 19' E. long., 14° 25'.

JUDGE, an officer appointed by the sovereign powers of any country, to distribute that justice to their subjects which they cannot administer in person.

The character of Judge is part of the regal authority, whereof the king and chief judges are members.
JUDGES. See HELL and TARANTUS.

JURISPRUDENCE. See ITINERANT.

JUDICIAL MAGISTRACY, or Advocate General, the supreme judge in martial law as to the jurisdiction and powers of military courts. It is incumbent upon this person, as well as upon his deputies, to be well acquainted with the laws of the land, that they may admonish the court or preside when their proceedings are tending to infringe the civil law. He is register of courts-martial, and should take down the evidence in the very words of the witness. He is neither a judge nor a juror as to the charge.

JUDGES, in Scripture, is applied to certain eminent persons chosen by God himself to govern the Jews, from the time of Joshua till the establishment of the kings. For the nature and duration of their office, and the powers with which they were invested, see JESUS.

The judges were not ordinary magistrates, but were appointed by God on extraordinary occasions, as to head the armies, to deliver the people from their enemies, &c. — Salm. has observed that they not only presided in courts of justice, but were also at the head of the councils, the armies, and of every thing that concerned the government of the state; though they never assumed the title either of princes, governors, or the like.

Salam remarks seven points wherein they differed from kings.
1. They were not hereditary.
2. They had no absolute power of life and death, but only according to the laws, and dependently upon them.
3. They never undertook war at their own pleasure, but only when they were commanded by God, or called to it by the people.
4. They exacted no tribute.
5. They did not succeed each other immediately, but after the death of one there was frequently an interval of several years before a successor was appointed.

6. They did not use the ensigns of sovereignty, the sceptre or diadem.
7. They had no authority to make any laws, but were only to take care of the obervation of the laws of Moses.

Godwin, in his "Moses and Aaron," compares them to the Roman dictators, who were appointed only on extraordinary emergencies, as in case of war abroad, or conspiracies at home; and whose power, while they continued in office, was great, and even absolute. Thus the Hebrew judges seem to have been appointed only in cases of national trouble and danger. This was the case particularly with respect to Othniel, Ehud, and Gideon. The power of the judges, while in office, was very great; nor does it seem to have been limited to a certain time, like that of the Roman dictators, which continued for half a year; nevertheless it is reasonable to suppose, that when they had performed the business for which they were appointed, they retired to a private life. This Godwin infers from Gideon's refusing to take upon him the perpetual government of Israel, as being inconsistent with the theocracy.

Besides these superior judges, every city in the Hebrew commonwealth had its elders, who formed a sort of judicature, with a power of determining lesser matters in their respective districts. The rabbies, say, there were three such elders or judges in each leffer city, and twenty-three in greater. But Josephus, whose authority has greater weight, speaks of seven judges in each, without any such division of greater and less. Sionius (De Republ. Heb. 1. vi. c. 6.) supposes that these elders and judges of cities were the original constitution settled in the wilderness by Moses, upon the advice given him by Jethro (Exod xxvii. 21, 22.) and continued by divine appointment after the settlement in the land of Canaan; whereas, others imagine that the Jethronian prefectures were a peculiar constitution, suited to their condition while encamped in the wilderness, but laid aside after they came into Canaan. It is certain, however, that there was a court of judges and officers, appointed in every city, by the law of Moses. (Deut. xvi. 18.) How far, and in what respects, these judges differed from the elders of the city, it is not easy to ascertain; and whether they were the same or different persons. Perhaps the title elders may denote their seniority and dignity; and that of judges, the office they fulfilled. The lower courts of justice, in their several cities, were held in their gates. (Deut. xvi. 19.) The three or five tribes had each its respective prince, whose office related chiefly, if not altogether, to military affairs. We read also of the princes of the congregation, who presided in judiciary matters. These are called elders, and were seventy in number. (Num. xi. 16, 17, 24, 25.) But it does not appear whether or not this con
tinuity of seventy elders was a perpetual, or only a temporary institution. Some have supposed that it was the same that afterwards became famous under the appellation of Sanhedrin; but others conceive the intendment of the seventy elders to have been only temporary, for the assistance of Moses in the government, before the settlement in the land of Canaan; and that the Sanhedrin was first set up in the time of the Maccabees. See SANEDRIN.

JUDEA, in Mina, is applied, to the coal-pits of Nottinghamshire and Derbyshire, to a piece of board cut to a wedge-like shape, which should fit exactly into any part of the excavation made under the face or bank of the coals, by the holer, in order to loosen them. The length of the judge is regulated by the depth or width of the jud, or web of coal which will fall at once; and the overlooker is required daily to try the judge in the holling, to see that the holer.
JUD

holders undermine sufficiently far back; and yet, in order to save themselves trouble, do not make the hole higher than the judge, and thereby cut away and waste the jud of coal. These proceed of coal-digging are particularly described in Mr. Farey's Report, vol. i. p. 344.

JUDGES, or Book of Judges, is a canonical book of the Old Testament, containing the history of the Ibramite judges, of whom we have been speaking in a preceding article.

The author is not known: it is probable the work did not come from any single hand, being rather a collection of several little histories, which at first were separate, but were afterwards collected by Ezra, or Samuel, into a single volume; and, in all likelihood, were taken from the ancient journals, annals, or memoirs, composed by the several judges.

The antiquity of this book is unquestionable, as it must have been written before the time of David; since the description (chap. i. v. 21.) was no longer true of Jerusalem, after he had taken possession of it, and had introduced a third class of inhabitants of the tribe of Judah. Eichorn acknowledges, that it doth not bear any marks of subsequent interpolation. Dr. Patrick is of opinion that the five first chapters are a distinct history, in which the author gives an account of several memorable transactions, which occurred in and about the time of the judges; whose history he would not interrupt by intermixing these matters with it, and therefore referred them to be related by themselves, in the second part, or appendix. In these he first gives an account how idolatry crept into the tribe of Ephraim, then how it was propagated among the Danites; after which he relates a most heinous act of adultery, committed in the tribe of Benjamin; which introduces the history, first, of the almost total destruction of that tribe for their countenancing that detestable fact, and then of its reformation. Eichorn also supposes that these chapters are distinct fragments of a less certain date, but posterior to David (chap. xviii. v. 31.), under whom the house of God ceased to be in Shiloh.

JUDGMENT, or the second operation of the mind in the acquisition of knowledge (the first being perception), is a faculty of the soul, by which it perceives the relation between two, or more, ideas; or the concurrence or coincidence of two ideas, or the want of concurrence or coincidence. Two ideas, being compared together, concur, as in the instance of milk and whiteness; and they coincide, as in the God and Creator; or they do not concur, as vice and usefulness, or they do not coincide, as man and brute.

Thus, when we judge, that the sun is greater than the moon, the underling first compares the two ideas of the sun and the moon; and, finding the idea of the sun greater than that of the moon, the will perfectly acquires in that perception, nor puts the mind upon any farther enquiry.

It is not the understanding, then, that judges, as is ordinarily thought; judgments and reasonings on the part of the understanding, are but mere perceptions; it is the will alone that judges, by acquiring, in what is represented to it by the understanding.

The only difference, then, between perception, judgment, and reasoning, so far as the understanding is concerned in them, is this; that it perceives a thing simply, without any relation to any other thing, in a simple perception; that it perceives the relations between two or more things in judgments; and, lastly, that it perceives the relations that are between the relations of things in reasonings; so that all the operations of the understanding are in effect no more than pure perceptions.

Thus, when we perceive, for instance, twice 2, or 4, this is no more than a simple perception; when we judge, that twice 2 are 4, or that twice 2 are not 5, the understanding does no more than barely perceive the relation of equality that is between twice 2 and 4, or of inequality between twice 2 and 5. Farther, reasoning confits in perceiving the relation, not between two or more things, for that would be a judgment, but of two or more relations of two or more things; thus, when I conclude, that 4 being less than 6, twice 2 being 4, are by consequence lefs than six; I perceive not only the relation of inequality between 2 and 4, and 6 (for this were only a judgment), but also the relation of inequality between the relation of twice 2 and 4, and the relation between 2 and 4; which constitutes a reasoning.

The understanding, therefore, only perceives, and it is the will that judges and reason, in allenting voluntarily to what the understanding represents.

Indeed, when the things which we consider appear clear and perfectly evident, it seems as if it were not voluntarily, that the mind contents itself with the. whence we are led to think, that it is not properly the will, but the understanding that judges of them. But to clear this point it must be observed: that the things which we consider, never appear entirely evident, till the understanding has examined them on all sides, and has perceived all the relations necessary to judge of them; whence it happens, that the will, not being able to will any thing without knowledge, cannot act on the understanding; that is, cannot defer it to represent anything new in its object, as having already viewed it on all sides that have any relation to the question in hand. It is obliged then to rest in what has been already represented, and to cease to agitate and disturb it any farther; in which cession it is that judgment consists.

This rest or judgment, then, not being free when things are in their last evidence, we are apt to imagine, that it is not the effect of the will. So long as there is any thing obscure in the subject that we consider, or that we are not fully satisfied that we have discovered every thing necessary to resolve the question, as it happens in most of those things that are difficult, and that contain various relations; we remain at liberty not to acquiece: the will may command the understanding to pursue its enquiries farther, and to make new discoveries, whereby it is, that we are more ready to allow the judgments formed on these subjects to be voluntary.

Many philosophers, however, maintain, that even the judgments which we form on obscure things are not voluntary; and will have our confessing to the truth to be an action of the understanding, which they call affect, to distinguish it from our confessing to goodness, which they attribute to the will, and call it content.

But their error is owing to this, that in our preference we frequently see things to be evidently true, without the least reason to doubt of them; in which case the will is not at liberty either to give or refuse its assent: but it is not so in matters of goodness; there being nothing, which we do not know some reason for forbearing to love. So that we here perceive a manifest indifference, and are fully convinced, that when we love anything, even God, for instance, we love our liberty, and do it voluntarily. But the use we make of our liberty is not so apparent, when we confess to the truth especially when it presents itself perfectly evident; and this leads us to think, that our consent to truth, that is, our judgment, is not voluntary; as if an action, to be voluntary, must be indifferent; as if the blessed above did not love God volun-
JUDGMENT.

rarily, because they cannot be diverted from it by any other thing; nor we confer freely to this evident proposition, that twice 2 are 4, because we have no appearance of reason to diffuse us from it.

Mr. Locke (b. iv. c. 14.) distinguishes between knowledge and judgment; the former being that faculty of the mind, by which it certainly perceives, and is undoubtedly satisfied of the agreement or disaffrage of any ideas; the latter, or judgment, is the putting of ideas together, or the separating of them from one another in the mind, when their certain agreement or disaffrage is not perceived, but presumed to be so; which, as the word imports, taken to be so before it certainly appears; and if it ceases or separates them, as in reality things are, it is right judgment. A judgment, called by Mr. Locke a mental proposition, is that union or separation of the ideas which is the result of the act of judging; and this may exist without any connection with words; though, as men are very much used to connect ideas with words, it is very difficult to treat of judgments as distinguished from verbal propositions. (See Proposition.)

The four kinds of judgment are: reasoning, fancy, intuition, and testimony. See each of these articles respectively. The definition commonly given of judgment, by the more ancient writers in logic, was, that it is an act of the mind, by which one thing is affirmed or denied of another. Dr. Reid thinks this to be as good a definition as can be given, and prefers it to some others; but it is evidently liable to objections, which he has flated. Judgment is a solitary act of the mind, and the expression of it by affirmation or denial is not at all essential to it; and therefore the definition must be restricted to mental affirmation or denial, which, as he says, is only another name for judgment. Besides, affirmation or denial is very often the expression of testimony, which is a different act of the mind, and ought to be distinguished from judgment. Judgment, as Dr. Reid proceeds to observe, is an act of the mind specifically different from simple apprehension, or the bare conception of a thing; for although there can be no judgment without a conception of the things about which we judge, yet conception may be without any judgment. Judgment can be expressed by a proposition only, and a proposition is a complete sentence; but simple apprehension may be expressed by a word or words, which make no complete sentence. It is self-evident, that every judgment must be either true or false; but simple apprehension or conception can neither be true nor false. Again, one judgment may be contradictory to another; and it is impossible for a man to have two judgments at the same time, which he perceives to be contradictory. But contradictory propositions may be conceived at the same time without any difficulty. Dr. Reid observes, that there are some notions or ideas that ought to be referred to the faculty of judgment as their source; because if we had not that faculty, they would not enter into our minds; e.g. we could not have the idea of any relation without some exercise of judgment; and yet the relations of things constitute one great class of our notions or ideas. It is further remarked, that in persons come to years of understanding, judgment necessarily accompanies all sensations, perception by the senses, conceptions, and memory, but not conception. The man who feels pain, judges and believes that he is really diseased; a person who perceives an object believes that it exists, and is what he distinctly perceives it to be; nor is it in his power to avoid such judgment; and the same may be said of memory and conceptions. All operations of this kind are accompanied with a determination that something is true or false, and a consequent belief. If this determination be not judgment, it is an operation without a name; for it is not simple apprehension, neither is it reasoning; it is a mental affirmation or negation; it may be expressed by a proposition affirmative or negative, and it is accompanied with the firmest belief. "Thee," says Dr. Reid, "are the characteristics of judgment, and I must call it judgment, till I can find another name for it." The judgments we form are either of things necessary, or of things contingent. Our affent to necessary propositions is not grounded upon any operation of sense, of memory, or conceptions, nor does it require their concurrence; it is unaccompanied by any other operation but that of conception, which must accompany all judgment; and therefore this judgment of things necessary may be called pure judgment. Our judgment of things contingent must always rest upon some other operation of the mind, such as sense or memory, or conceptions, or credit in testimony.

In common language, there are many forms of speech which show that the senses, memory, and conceptions, are considered as judging faculties. Evidence is the ground of judgment, and where evidence is perceived, it is impossible not to judge. Dr. Reid, adhering to the notion of judgment, which, he thinks, is peculiar to Mr. Locke, and which we have already flated, expresses his opinion, that there can be no knowledge without judgment, though there may be judgment without that certainty which we commonly call knowledge. In order to avoid disputes about the meaning of words, this author wishes to be understood as giving the name of judgment to evety determination of the mind concerning what is true or what is false. This, he thinks, is what logicians, from the days of Aristotle, have called judgment. "Whether it be called one faculty," he says, "as I think it always has been, or whether a philosopher chuses to flip it into two, seems not very material. And if it be granted, that by our senses, our memory and conceptions, we not only have ideas or simple apprehensions, but form determinations concerning what is true and what is false; whether these determinations ought to be called knowledge or judgment, is of small moment."—Philosophers, says the same writer, "have never been able to give any definition of judgment which does not apply to the determination of our senses, our memory, and conceptions, nor any definition of simple apprehension which can comprehend these determinations." Judgments of this kind may, in the strictest sense, be called "judgments of nature," nor do they admit of improvement by culture.

Dr. Reid further observes, that some exercise of judgment is necessary in the formation of all abstract and general conceptions, whether they be more simple or more complex; in dividing, in defining, and, in general, in forming all clear and distinct conceptions of things, which are the only fit materials of reasoning. He adds, that all our notions of relations may more properly be ascribed to judgment as their source and origin, than to any other power of the mind. The notions of unity and number are so abstract, that it is impossible they should enter into the mind until it has some degree of judgment. Judgment is also an ingredient in all matters of taste; in all moral determinations; and in many of our passions and affections. So that this operation, after we come to have any exercise of judgment, mixes with most of the operations of our minds, and, in analyzing them, cannot be overlooked without confusion and error. Reid's Essays, c. vi. chap. 1.

Judgment, in a Legal Sense, is a sentence or decision pronounced by authority of a king, or other power, either by their own mouth, or by that of their judges, and officers, whom they appoint to administer justice in their stead.

Judgments are the sentence of the law, pronounced by the
Judgment may be given not only upon the trial of the
thing, but on a default, confession, demurrer, or an outlandy,
which is a judgment in itself. After time vested in a cause,
the plaintiff may, if he thinks proper, accept of a judgment
from the defendant; but on such a judgment, a writ of error
may be had without putting in bail, which cannot be done
on a judgment after verdict. All judgments given in courts
of record must be entered; in order to which the plaintiff's
attorney, four days after the record is brought into court,
may, if the judgment is out, enter judgment by the usual
course of the court; but he cannot do this sooner, because
the defendant must have time to bring in a writ of error, or
to find out matter for an arrest of judgment. The defendant
may oblige the plaintiff to enter his judgment, in order that
he may plead it to any other action; and judgment upon a
demurrer to a declaration, &c. which does not pafs upon the
ments of the cause, is no bar to it, though other judgments
may be pleaded in bar to any action brought again for the
same thing. Judgments are to continue till they are re-
erred; but an action of debt will lie on a good judgment, as
well after a writ of error is brought, as before it. If a
plaintiff does not take out an execution within a year and
day after judgment is obtained, the judgment must be re-
ved by a jurejectio.

JUDGMENT for CRIMES. succeds trial and conviction,
in such crimes and misdemeanors as are either too high, or too
low, to be indicted within the benefit of clergy. For when,
upon a capital charge, the jury have brought in their verdict
guilty, in the presence of the prisoner; he is either imme-
dately, or at a convenient time soon after, asked by the
court, if he has any thing to offer, why judgment should not
be awarded against him. And in case the defendant be found
guilty of a misdemeanor, (the trial of which may, and
does usually, happen in his absence, after he has once ap-
pear'd,) a capias is awarded and issued, to bring him in to rec-
eive his judgment; and, if he abscends, he may be pros-
eaed even to outlandy. (See Arrest of Judgment.) When all
resources fail, the court must pronounce that judgment,
which the law hath annexed to the crime. Judgment, in case
of treason or felony, must be by an express sentence, an out-
landy, or adjudication; and no judgment can be inflicted con-
ttrary to law, or that is not a punishment of act of parliament.
These judgments are of very different kinds, some are capital,
 extending to the life of the offender, and constititing generally
in being hanged by the neck till dead; though in very
atrocious crimes other circumstances of terror, pain, or dif-
grace, are superadded; as in treasones of all kinds, the offen-
der is sentenced to be drawn or dragged to the place of execu-
tion; in high treason affecting the king's person or govern-
ment, embowelling alive, beheading, and quartering; and
in murder, a public dissection. In case of any treason
committed by a female, the judgment is to be burned alive.
But the humanity of the English nation has authorized, by a
tacit consent, an almost general mitigation of such part of
these judgments as favour of torture or cruelty; a pledge or
hurdle being usually allowed to such traitors as are condemned
to be drawn; and there being few instances (though ac-
cidental or by negligence) of any person's being embowelled
or burned, till previously deprived of senbacation by Branding.
(See Execution of Criminals.) Some punishments conflit
in exile or banishment, by abjuration of the realm, or trans-
portation; others in loss of liberty, by perpetual or tempo-
rary imprisonment. Some extend to confiscation, by for-
feiture of lands, or goods, or both, or of the profits of
land for life; others, when a disability of holding offices or
employment, be it for, employees, and the like. Some,
though rarely, occasion an extirpation, or dismembering, by
cutting
cutting off the hand, or ears; others fix a lasting stigma on the offender, by slitting the nostrils; or branding in the hand or cheek. Some are merely pecuniary, by flogging, or disrepu-
tionary fines; and lastly there are others, that confit
principally in their ignominy, though most of them are mixed
with some degree of corporal pain; and these are inflicted
chiefly for such crimes, as either arise from indigence, or ren-
der even opulence disgraceful. Such are whipping, hard
labour in the house of correction or otherwise, the pillory,

Judgments for Debts are acknowledged by a person
in giving a general warrant of attorney to any attorney of the
court in which it is to be acknowledged, to appear for him
at the suit of the party to whom the fame is to be done,
and to file common bail, receive a declaration, and then to
plead, non sain informatas, I am not informed; or to let it
pass by nihil dictis, he says nothing; upon which judgment
is entered for want of a plea. Judges that sign judgment
of lands, are to set down the day of the month and year
in which they do it; and they shall be good against pur-
chasers only from such signing. Where a person has
acknowledged a judgment for the security of money,
and afterwards, on borrowing more money of another
person, mortgages his lands, &c. without giving any notice to
the judgment to the mortgagee; in such case, if the mort-
gageur do not within six months pay off and discharge
the judgment, he shall forfeit his equity of redemption, 4 and 7
Will. and Mary. Acknowledging a judgment in the name
of another person, without his privy or consent, is made

Judgment, Action of Debt on, lies for a person who hath
once obtained a judgment against another for a certain sum,
and who has neglected to take out execution upon it; such
person, in his fresh action, shall not be put upon the proof
of the original cause of action; but, after shewing the judg-
ment once obtained, still in full force, and yet unsatisfied,
the law immediately implies, that by the original contract
of society the defendant hath contracted a debt, and is
bound to pay it. This method seems to have been invented
when real actions were more in use than at present, and dam-
ages were permitted to be recovered thereon; in order to
have the benefit of a writ of captas to take the defendant's
body in execution for those damages, which procels was
allowable in an action of debt (in consequence of the statute
25 Edw. III. c. 17), but not in actions real. Wherefore,
since the difpute of these real actions, actions of debt upon
dgment in personal suits have been partly much discon-
tenanted by the courts, as being generally vexatious and op-
pressive, by harafting the defendant with the costs of two
actions instead of one. Blackft. Com. b. iii.

Judgment of God. See JUDICUM DEI.

Judgment, Execution of. See EXECUTION, &c.

Judgment, Mafi of. See MASS.

Judgment, Property by. A judgment, in consequence of
some fuit or action in a court of juftice, is frequently the
means of vesting the right and property of chattel interests
in the prevailing party. In this case we must distinguish
between property, the right of which is before vested in the
party, and of which only possilion is recovered by fuit or
action; and property, to which a man before had no de-
finite title or certain claim, but he gains as well the right
as the posffision by the process and judgment of the law.
Of the former sort are all debts and chothes in action; as if
a man gives bond for 20l., or agrees to buy a horse at
a flated sum, or takes up goods of a tradelma in an im-
plied contract to pay as much as they are reasonably worth;
in all these cases the right accrues to the creditor, and is
completely vested in him at the time of the bond being
sealed, or the contract or agreement made; and the
law only gives him a remedy to recover the possilion of
that right, which already in justice belongs to him. But there
is also a species of property, in which a man has not any
claim or title whatsoever, till after suit commenced and judg-
ment obtained in a court of law; where the right and the
remedy do not follow each other, as in common cafes, but
accure at one and the same time; and where, before judg-
ment, no man can fay that he has any absolute property,
either in possifion or in action. Of this nature are such
penalties as are given by particular statutes, to be recovered
on an action popular; or, in other words, to be recovered
by him or them who will fine for the fame; in which cafe a
fuit and judgment at law are not only the means of recover-
ing, but also of acquiring property. Another species of
property, that is acquired and loft by fuit and judgment at
law, is that of damages given to a man by a jury, as a com-
penation and satisfaction for fome injury fultained; as for a
battery, for imprifonment, for flander, or for trefpafs.
Here the plaintiff has no certain demand till after verdict;
but when the jury has affifted his damages, and judgment
is given thereupon, whether they amount to 20l. or 20s.,
he infantly acquires, and the defendant loses at the fame time
a right to that specific sum. To this kind of property may
also be referred all title to debts and expences of fuit.

Judgment, Villainous. See VILLAINOUS.

Judicature, the quality or profeflion of those who
administer juftice.

In which fene jufticature is a kind of prirefhold. In
France, officers of jufticature are venal.

Judicature is also used to signify the extent of the
jurifdiction of the judge, and the court wherein he fits
to render juftice.

Judicium Dei, Judgment of God, was a term anciently
applied to all extraordinary trials of fecret crimes; as thofe
by arms and single combat, and the ordeals; or thofe by
fire, or red-hot plough-shares; by plunging the arm in boil-
ing water, or the whole body in cold water; in hopes God
would work a miracle rather than suffer truth and inno-
cence to perih.

"Si super defendere non possit, judicium Dei, seil, agua vel
ferro. fieret de co juditia?"

These cufions were a long time kept up, even among
Christians; and they are still in use in fome nations. See
ORDEAL, WATER, CUSMAT, DEUE, and CHAMPION.

Trials of this forte were usually held in churches, in pre-
ence of the bishops, priests, and secular judges; after three
days faining, confession, communion, and many adjurations
and ceremonies, defcribed at large by Du Cange.

Judicium Parium denotes a trial by a man's equals, i.e.
of peers by peers, and of commoners by commoners. In
magna carta it is more than once infifted on as the principal
bulwark of our liberties, but especially by chap. 29, that
JUDITH

The greatest difficulty in this narration is to fix the time, when the event, which it records, happened. Some place it before, others after the captivity; and some finding inconvertible difficulties in reconciling it with the history of the Jews, Assyrians and Medes, have maintained, that it is only a parable and allegory, and not a true history. The Greek and Syriac versions seem to prove, that it occurred after the captivity of Babylon. The Vulgate may be explained as referring to the time preceding the captivity. Neither faced nor profane history, in the time of Manasseh, or in that of Zedekiah, either before or after the captivity, say any thing of a king of Nineveh, named Nebuchodonosor, who in the 12th and 17th years of his reign conquered a king of the Medes, called Arphaxad. It would also be hard to find at this particular time an high-priest of the Jews, whose name was Joachim or Eliakim. We should likewise meet with invincible difficulties, in reconciling the Greek text and the Syriac with the Latin of St. Jerom; and should there be perhaps less, if we were to adhere only to the Vulgate, and reject the Greek, Syriac, and old Italian versions. If the names were granted, it is not easy to determine whether we should adopt the Greek or the Latin text. As to the Syriac text, it was taken from the Greek, and from the Greek only one might infer that the story of Judith was translated and written after the captivity; but if we follow the Latin, it may be placed before the captivity. The Greek text is very ancient; some suppose it to be the invention of those who lived under Commodus, after A.D. 180; but it must be more ancient, because it is cited by Clement Romanus in his epistle to the Corinthians, written above 120 years before. The Syriac likewise is very ancient, and translated from some Greek text more correct than any we have at present; but the same as to substance. The Latin version, or the old Vulgate, is made likewise from the Greek, but it is very defective. St. Jerom's Vulgate was translated from a Chaldæan text, which St. Jerom took to be the genuine original of Judith; but he leaves the subject in a very perplexed and unsatisfactory state. With the old Latin version before him, he omitted what was superfluous; and referred all that was found agreeing with the Chaldee, and probably added what was wanting, so that his version is rather a reform of the old, than a translation altogether new; and some words are observed in it which are taken from the old Italian. They who maintain, that the history of Judith contained what passed before the captivity, and in Manasseh's time, believe it sufficient to demonstrate, that there is nothing in the history repugnant to this assertion. The opinion, which places the history of Judith after the captivity of Babylon, is founded principally on the authority of the Greek version, which is certainly, as we have already said, very ancient, and it may pass for an original, there being nothing more ancient and authentic; for it is dubious, whether St. Jerom's Chaldee was the original text of this work. After all, what seems demonstrative for the opinion, which places this after the return from the Babylonish captivity, is the import of the Greek, chap. iv. 2. In this opinion almost all the ancients, and many of the moderns, have concurred. Enquiries place it in the reign of Cambyses, Socculus in that of Xerxes, Sulpitius Severus in that of Ooma; others antiochus Epiphanes, and in the time of the Maccebes.

Dr. Prideaux supposes, that the Nebuchodonosor of the book of Judith is Saofilamhu, king of Babylon, who commenced his reign in the 31st year of Manasseh, and that Arphaxad...
phoxad is Dioces, king of Media; and that the destruction of Holofernes and his army at Bethulia took place in the 44th year of Manafeh, B.C. 655. He further supposes, on the authority of St. Jerom, that this book was originally written in the Chaldee language, and translated by Jerom into the Latin tongue, which is the translation that is now extant in the vulgar Latin edition of the Bible. The English translation, which we at present have among the apocryphal writings in our Bible, as well as the Syriac, was made from the Greek.

Whether the book of Judith be authentic and canonical is a point that has been very much disputed. The Jews read it in St. Jerom's time; St. Clement hath cited it in ch. 1. ad Corinth., as well as the apolitical consilwation, Clemens Alexandrinus, Origen, Tertullian, St. Ambrose, and St. Jerom. Jerom says, in his preface to the book of Judith, that the council of Nice received it among the canonical books, though no canon was made to approve it. St. Athanasius, or the author of the Synoptic, gives a summary account of it. St. Aulinn, and the whole African church, received it. Pope Innocent I. and pope Gelarius, acknowledged it. The council of Trent hath also confirmed this book. The Romanists, on the contrary, having received this book into the canon of divine writ, hold the history recorded in it to be true. On the other hand, it is the opinion of Grotius, that it is wholly a parabolical fiction, written in the time of Antiochus Epiphanes, when he came into Judæa to raise a persecution against the Jewish church; and that the design of it was, to confirm the Jews under that persecution, in their hopes that God would send them a deliverance; accordingly, "by Judith is meant Judæa; by Bethulia the temple or house of God; and by the sword which went out from thence, the prayers of the faithful; that Nebuchodonosor doth there denounce the devil, and the kingdom of Assyria, the devil's kingdom, pride; that by Holofernes is there meant the instrument or agent of the devil in that persecution, Antiochus Epiphanes, who made himself master of Judea, that fair warrior, so called, because delirious of relief; that Eliakim signifies God, who would arise in her defence, and at length cut off that instrument of the devil who would have corrupted her." Many learned writers among the Protestants, though they do not adopt the peculiar fancy of this great man, agree with him in the general, that this book is rather a parabolical than a real history, designed for the instruction and comfort of the Jews under that figure, and not to give them a narrative of any thing that was really done; and their reason is, that they think it utterly inconsistent with all times, where it hath been endeavoured to be placed, either before or after the captivity of the Jews. Dr. Prideaux thinks that by putting it in the time of Manafeh he removes all the objections which are alleged to prove its inconsistency with the times after the captivity, which he thinks are unanswerable.

After examining a variety of objections relating to this book and its history, Dr. Prideaux concludes, "that if any one will still contend, that it is only a religious romance, and not a true history; that, according to the intention of the author, the scene of it was put under the reign of Xerxes, when Joakim, the son of Joatham, was high-priest, and the civil government of Judea, as well as the ecclesiastical, was in the hands of that officer; and that the inconsistency of so many particulars in that book, with the state and transactions of those times, was only from the ignorance of the author in the history of the said times, and his unskilfulness in placing the scene of his history in them; I say, if any will insist on all this, notwithstanding what is above said, I shall not enter into any controversy with him about it: only thus much I must insist on, that if it be a true history (which I am inclined most to think, though I will not be positive in it), it can fall no where else but in the time where I have laid it." The author of the book of Judith is unknown. St. Jerom seems to think that it was written by Judith herself; others imagine, that the high-priest Joachim or Eliakim, mentioned in this book, was the author; but all this is mere conjecture. Those who believe that the history of Judith happened in the time of Cambyses, and after the captivity of Babylon, suppose that Jotham, the son of Jofedek, then high-priest, wrote it. The author, whoever he was, does not appear to have been contemporary with the transactions. He says, that Achor's family was still in his time subduing in Israel, Judith, xiv. 6. and that the festival instituted in memory of Judith's victory was still celebrated, Judith, xvi. 31. Dupin on the Canon. Prideaux's Comm. v. 1. Calmet.

IVERSKOI, a town of Ruffia, in the government of Novgorod; 80 miles S.E. of Novgorod.

IVES, Simon, in Biography, was a lay vicar of St. Paul's cathedral, till driven thence by the republicans; when he became a singing-master, and a teacher of music in private families.

During the reign of Charles I., Ives stood high as a composer, as we are told in the M.S. account of the maque intitled "The Triumphs of Peace," written by Shirley, a dramatick of the second class, which was acted at Whitehall in 1633, and the whole expense of the production defrayed by the gentlemen of the four inns of court, as a testimonial of duty and loyalty on his majesty's return from Scotland, after terminating the disputes of that kingdom.

A very circumstantial account of this maque by the lord commissitioner Whitebeck, in his own handwriting, has been preserved. It was the property of the late Dr. Morton of the British Museum. In this narrative, the commissioneer, who was the principal manager of the exhibition, says: "I made choise of Mr. Simon Ives, an honest and able musician,

Handing,
Ives, St., in Geography, is a populous borough, market
and sea-port town, in the hundred of Penwith and county
of Cornwall, England. It is situated near the north-east
angle of a fine bay, which is bounded by bold rocks of black
killas. The church is a low, but spacious building, having
a nave and two aisles; from its situation near the town, it is
frequently covered, at high tides and tempests, with the
spray of the sea. The chief articles exported from this
town are slate and pitchbarks. The latter are in moln feasons
taken in the bay in great abundance; and at the time of large
draughts, it is usual for all the inhabitants to contribute
their allience: the thumps are then defected; and if it should
be Sunday, even the church is likewise abandoned.
This port, as well moln others on the north coast, is
greatly incommoded by the shoals of sand driven in by the north-well
winds; and the town, as appears from Landis, has also suf-
fered from the same cause. In the reign of queen Mary, St.
Ives was governed by a portrewe and burges; but was not
incorporated till the sixteenth year of Charles I, who con-
firmed some former privileges, vell the future government
of the town in a mayor, recorder, twelve capital and twenty-
four inferior burges, and granted the inhabitants four an-
ual fairs, two weekly markets, Wednesday and Saturday,
and also endowed a grammar school. Two members are
returncd to parliament from this borough: the right of
election is poll-fed by the corporation, and all the inhabit-
ants paying foot and lot; the number of voters being about
250. St. Ives is distant from London 275 miles; the
number of houses was estimated, under the population act
of 1802, as 540, inhabited by 2714 persons. Beauties of
England and Wales, vol. ii. Polwache's History, &c. of
Cornwall.
Ives, St., a market town and parish in the hundred of
Huntingdon, Huntingdonshire, England, is situated on the
banks of the river Ouse. It was called, in the Saxon times,
Shepe, and is mentioned by that appellation in the Domesday
book: but it afterwards obtained the name of St. Ives from
Ivo, a Perian archbishop, who is reported to have traveled
through England, preaching the gospel, about the year
660. On the spot where the remains of this font were
reported to have been found, abbot Eadnoth built a church;
and soon afterwards, anno 1017, a priory was erected by
earl Adelmar, who brought hither some Benedictine monks
from the abbey of Ramsey. After the dissolution of
monasteries, the ficate of this priory was granted, 26 Henry
VIII., to Sir Thomas Audley. The priory, barn, and dove-
house are yet standing, but do not exhibit any thing worthy
of notice. The parish church is a neat edifice; its bire is
me at once blown down. The other places for religious wor-
ship in this town are, two meetings for Baptists; one for
Quakers; and one for Presbyterians: the latter had its rise at
the period of the civil wars of the seventeenth century, when
the ejected minister of St. Ives was supported by the in-
habitants in opposition to the reigning powers. Great part
of the town was destroyed by fire on the 30th of April 1689;
it began in a milk-house at the end of White-hart-lane; and
laid in ashes the dwellings and property of upwards of an
hundred families. The lower part of the town, from its ac-
cinity to the river Ouse, has been frequently overflowed.
Over the river is a stone bridge, with four pointed, and two
semicircular arches. The charter for the market was granted
by king Edward I, about the year 1290: it is held on
Mondays, and is one of the largest in the kingdom for
cattle, sheep, pigs, and poultry; being considered as second
only to that of Smithfield in London. Here are also two well
frequented fairs, held annually, at Michaelmas and Whit-fun-
tide: the former sprung from an annual meeting appointed
in 1323, to be held on the feast of St. Michael; the latter
was granted by charter of Henry I, dated in 1116, and
was privileged to continue from "Whit-Monday till the
Monday following, and all that day." Several breweries
and malt-kilns are established in the town: the mns and pub-
lie-houses are numerous. Many charitable donations are
recorded upon two tablets in the church, but the gifts are not
large. St. Ives is 66 miles distant from London: the popula-
tion, as returned under the act of 1801, amounted to 2290,
inhabiting 478 houses. In the pits in the neighbourhood
of this town, the cornua ammoni, belemnites, and other fossils,
are occasionally found. Beauties of England and Wales,
vil. vii.
IVETAUX, Nicholas Vaugue lin, in Biography, cele-
brated as a French poet, was born at Frejus, near Pa-
lis, about the year 1559. His father, Vaugue lin de
Frejus, was eminent for his poetry, and had the office
of lieutenant-general of the bailiwick of Caux, which he readily
made over to his son, but he was ill adapted to the duties of
the situation, and after another change or two he was ap-
pointed preceptor to the duke of Vendome, natural son of
Henry IV. He was next engaged in the same busines with
regard to the dauphin, afterwards Louis XIII, but not
providing satisfaction, he was discharged with a pension and
two abbacies. These, on account of some irregularities, he
was obliged to resign, and then retired to a good house in
the Faubourg St. Germain, where he adopted an epicu-
remen life: after this he retired to a country hat in the dioce of Meaux, where he died, in 1649, at the age of
ninety. The works by which he is known are "Institution
d'un Prince," a poem written with force and solidity, and
containing excellent lessons of morality: and " Stanza,
Sonets, and other Poems." Moreri.
JUFFERS, among Carpenters, a term used for pieces of
wood about four or five inches square, and of several
lengths.
JUFOSTA, in Geography, a town of Arabia, in the
province of Oman; 160 miles E.S.E. of El-Catif.
JUG, an earthen pot or pitcher to hold drink: also a
term used in many parts for a common, pailure, or mea-
down.

JUGERUM, a Roman measure, the double of the acuta
quadra tus. It was a square of 120 Roman feet. The
jugerum was divided into 12 uncia, and the uncia into 24
frupula.
The kernel is sweet and well-tafted, affording a wholesome and pleasant oil.

-Jacq. 1st. Rar. t. 191.—Leaflets about fifteen, oblong-lanceolate, serrated. Fruit globular, roughish, dotted.—Found from Pennsylvania to Florida. It flowers in April and May.

There is also a large tree. *Leaves* composed of five or seven pairs of leaflets, which are acute and serrated, emitting a strong aromatic flavour. Outer cover of the nuts rough; these are rounder than the common walnut. *Shell* hard and thick; kernel very sweet. The wood is the most valuable of all walnut-trees, being very finely veined, and capable of receiving a high degree of polish. There were large trees of the Black Walnut in Chelsea garden in 1759, which had produced abundance of fruit for upwards of forty years.

There are several other species of *Juglans*, chiefly, if not entirely, natives of America, all remarkable for the excellence of their wood. Willdenow enumerates eleven—professor Martyn eight.

Of the *J. chinensis*, or the Ash-coloured Walnut, Jacq. 1st. Rar. t. 192; and *J. baccata*, the pulpy-coated walnut, figured in Sloane’s *Jamaica*, t. 157. f. 13, are the only remaining Linnaean ones. Of the genus of the latter we presume there must be considerable doubt.

*Juglans*, in *Gardening*, comprises plants of the deciduous, hardy tree kind, of which the species mostly cultivated are the common walnut-tree (*J. regia*); the white walnut-tree (*J. alba*); and the black walnut-tree (*J. nigra*).

It is remarked of the first for Martyn, that, as “they all vary again when raised from the seed, and that as nuts from the same tree will produce different fruit; persons who plant the walnut for its fruit, should make choice of the trees in the nurseries, when they have their fruit upon them.”

The principal varieties are, the oval walnut, the round walnut, the large walnut, the small-fruited walnut, the double walnut, the early walnut, the late walnut, the tender-thinned walnut, and the hard-thick-thinned walnut.

Method of Culture.—It may be observed that all the forests are capable of being increased by planting the seed or nuts, which in the first species should be of the best varieties when intended as fruit-trees, which, after they are become perfectly ripe, and have been preferred in dry land till about the end of February, should be set either in flight drills, five or six inches apart in the rows, and a foot distant, or by the dibble, at the same distance, putting them into the depth of two or three inches, the ground having been previously well dog over.

When the plants have had two years’ growth in the field-bed, they should be removed into nursery rows, thinning the top roots, but preferring the tops entire, putting them at the distance of two feet and a half from row to row, and a foot and a half in the rows; they should remain in this situation till they have attained five or six feet in height, training them with fingle items; after which they may be removed into the situations where they are to grow.

When the trees are intended for timber, it is a good practice to plant them out at once where they are to grow, as they thrive faster, and form better trees.

But in raising the walnut for fruit, Mr. Bousher recommends flat-planes, tile-thords, or slates, to be buried eight inches deep, under the nuts when they are set; the distance to be six inches, and the depth two inches. After two seasons, they should be removed early in autumn, and planted fourteen or sixteen inches asunder, on the same kind of bottom.
tom, or any hard rubbish, to prevent them from striking downwards, and to induce them to spread their roots on the surface. At the end of two or three years this should be repeated again, making the bedding at the depth of fifteen or sixteen inches, and planting them two feet alander; here let them remain three or four years, when they will be fit to remove for the last time. The soil for fruit-trees should be dry and found, with a sandy, gravelly, or chalky bottom. The trees managed in this way will have higher flavoured fruit, ripen earlier, and bear a plentiful crop twenty years sooner than in the usual method. The best manure for them is ashes, spread the beginning of winter, the land having been first ploughed or dug over.

And as plants raised from the nuts of the same tree bear fruit of very different qualities, he advises the planting one of the belt forts on the common walnut-tree; by which method the planter is secure of his fort, and will have fruit in one-third of the time that he would obtain it from the nut. This method can, however, be practicable only in few situations. The length of time in which the walnut bears well from the nut, is about twenty years.

The nuts of the two other forts are procured from America by the merchantmen.

Plants of the first fort are cultivated for ornament, as well as the nut or fruit which they afford. The fruit is used in two different stages of its growth; as, when green, to pickle; and when ripe, to eat the kernel. For the first purpose, the young green walnut, when about half or three parts grown, before the outer coat and internal shell become hard, is most excellent; for which they are generally ready in July or the following month, and should be gathered by hand, choosing such as are as free from spocks as possible.

The fruit is discovered to be fully ripe by the outer husk easily separating from the nut, or by the husks sometimes opening, and the nuts dropping out; it is usually about the latter end of September, which, in trees of considerable growth, is commonly beaten down with long poles; for, as the walnuts grow most at the extremity of the branches, it would, in very large spreading trees, be troublesome and tedious work to gather them by hand. As soon as gathered, they should be laid in heaps a few days to heat and sweat, to cause their outer husks, which closely adhere, to separate from the shell of the nuts; then be cleared from the rubbish, and deposited in a dry room for use, covering them over close with dry straw, a foot thick, where they will keep three or four months. They are always ready for sale in the market, in large towns, where, at their first coming in, they are brought with their husks on, and sold by the fack, or bushel, but afterwards cleaned, and sold both by the measure and the thousand.

Plantations of these trees are therefore profitable, in their annual crops of fruit, while growing, and in their timber, when felled or cut down. These, as well as the other forts, may many of them be admitted into clumps or plantations, in large pleasure-grounds, for variety. After one or two years, the other forts are nearly as hardy as the first, but till that time should be protected against frost in the winter season.

Jugulans Regia, Common walnut-tree, in the Materia Medica. The unripe fruit has an atstringent bitter taste, and has been long used as a pickle. This is the part directed for medicinal use by the London college, on account of its anti-aphthic virtues. Its effect in destroying worms seems to be confirmed by the testimony of several authors; and in proof of it: poisoning this vermifuge power, we are told that water, in which the green shells of walnuts have been macerated, on being poured in a garden, was found to drive all the earth-worms together as far as the water extended; and that the worms, by being immerged in a strong infusion of these shells, were immediately fixed with ipaifs, and died in two minutes afterwards. An extract of the green walnut is the most convenient preparation, as it may be kept for a sufficient length of time, and made agreeable to the stomach of the patient by mixing it with cinnamon-water. This fruit, in its immature state, is also said to be laxative, and of use in palpitations of the heart and chronic rheums. The Wirtemberg Pharmac. directs a tisue for the above purposes to be prepared of its juice. The kernel of the walnut is similar in quality to that of the almond and hazel nut, and affords an oil, which amounts to half the weight of the kernel. This oil is said not to freeze by cold, and to answer the medical purposes of the oil of almonds. Vinegar, in which walnuts have been pickled, has been found to be a very useful gargle. Woody, Med. Bot.

Juglers. See Provincial Paris.

Jugon, in Geography, a town of France, in the departament of the North Coasts, and chief place of a canton, in the district of Dinan; 10 miles W. of Dinan. The place contains 428, and the canton 991 inhabitants, on a territory of 14½ square miles, in 8 commune.

Jugrat, a town of Hindustan, in the circus of Chandere; 15 miles N. of Chandere.

Jugular, among Anatomy, is applied to certain veins of the neck, which terminate in the subclavians. See Vena

Jugular Vein, how to poultice in bleeding. See Venection.

Jugular is also applied to certain glands in the neck, in the spaces between the muscles. See Glands.

Jugulares, in the Linnaean System, is the name of an order or division of fifth, the general character of which is, that they have ventral fins before the pectoral fins, and ossified bronchial. This order comprehends six genera, viz. calliophorus, uranophorus, trachinus, gadus, blennius, and kana; which see respectively.

Jugurtha, in Biography, king of Numidia, was the natural son of Massinissa, one of the three sons of Massinissa, who, after the death of that prince, possessed the kingdom jointly. Mucipira, the survivor, and who inherited his father's kingdom, educated his nephew Jugurtha with his two sons Adherbal and Hermapho; but as he was of an aspiring disposition, he sent him with a body of troops to the assistance of Scipio, who was besieging Numantia, hoping to lose a youth whose ambition seemed to threaten the tranquility of his children. His hopes were frustrated; and Jugurtha returned with great glory, having also acquired the friendship of his general Scipio Africanus. Mucipira appointed him successor to his kingdom with his two sons, but the kindness of the father proved fatal to the children. Jugurtha called Hermapho to his pottage, and obliged him to fly to Rome for safety. The Roman people listened to the well-grounded complaints of Adherbal, but Jugurtha's influence prevailed among the senators; and the suppliant monarch, forsaken in his distress, perished by the arrows of the enemy, and with every circumstance of cruelty. These atrocities excited such a flame at Rome, that the senate, in effect, declared war against Jugurtha. Caecilius Metellus was sent against him, and by his firmness and success, the Numidian was forced to seek support from his savage neighbours. A variety of actions ensued, in which the Roman arms were mostly successful, though Jugurtha, skilfully pursuing the Numidian mode of warfare, did not cease to harry his enemies, and

Vol. XIX.
oppose obstacles to their attempts. Manes and Sylva succeeded Metellus, and fought with equal success; at length they persuaded Bocchus, a Mauretanian king, who was in alliance with Jugurtha, and his near relations, to enter into negotiations of peace. By tempting offers he agreed to betray Jugurtha, and put him into the hands of his enemies: he was accordingly delivered up to Sylva, after a war of five years. Sylva carried him in chains to Cirta, whence he was sent to Rome in the year 106 B.C. and the joy testified on beholding him there in the condition of a captive, was a proof of the dread which he had inspired as an enemy. He was exposed to the view of the Roman people, and dragged in chains with his foes to adorn the triumph of Marius, after which he was insulted by the populace, and remanded to his dungeon, where he was either starved or suffered to perish with hunger. He left two sons, whose spent their days in captivity; and his dominions were divided between Bocchus, the remaining heirs of Maffinius, and the Roman republic. Cirta, Bell Jugur. Universal History.

JUHOO, in Geography, one of the mouths of the Indus; 10 miles W. of the Ritchel.

IVICA, IVICIA, EBYFUS, the largest of the Pituge islands. 

See Pituge.

This island is about 15 miles long from the island of Majorca, which lies to the N.E. It is commonly said to be seven leagues long, and about 45 broad in certain places and 22 leagues in circumference. It is high, and covered with mountains, whose verdant declivities present an agreeable and picturesque prospect from the sea. The soil is adapted to every kind of culture. This isle is divided into five parts, or quartons, viz. the plain of the city, St. Eulalia, Balanzar, Pormany, and the Salines. The Plain of the town occupies a space of about 14 league, and contains 300 houses, separated into little hamlets, the population of which is estimated at about 2000 inhabitants. The canton presents on all sides well cultivated gardens and vineyards. The city furnishes a fort of militia, consisting of about 1200 men, for the safety of the district. The district of St. Eulalia has a territory of about four leagues in extent, bordering on those of Balanzar and Ivica, and lies to the N.E. of the latter. The number of houses is about 700, dispersed, without forming towns, villages, or hamlets. They are inhabited by 4000 persons, distributed in two parishes. A river, bearing the name of the Saint, flows at the foot of the mountain, where the spire of the church of St. Eulalia rises. The other parish is called St. John’s. This district furnishes a contingent of 700 men for the security of the island. The territory of the district of Balanzar extends over about three leagues, and joins those of Ivica, St. Eulalia, and Pormany. The houses are reckoned at about 400, and the inhabitants may amount to 2000. The parish church is dedicated to St. Michael. The contingent for the safeguard of the island consists of 300 men. On the coast is situated the creek of Balanzar, near a mile in length. At the end is the little port of San Michela, which can only admit small vessels. This port is at the mouth of two rivers, the sources of which are upwards of a league in the interior. The district of Pormany has a territory four leagues in length, bounded by Balanzar, Salinas, and Ivica. The soil presents a fertile plain, on which are about 1450 houses, containing at least 2000 inhabitants, and furnishing a contingent of 350 men. The principal church is consecrated to St. Antony, and its ledge, or towers, commands the port, and is guarded by two pieces of cannon, and four artillery men. The other church is dedicated to St. Joseph. The district of Salinas, or las Salinas, takes its name from the salt found there, and is bounded by the districts of Pormany and Ivica. It is two leagues in extent; the houses are reckoned at 130, and the population at 200 persons. The contingent consists of a company of 100 men. On a beautiful plain in this canton is situated the church of St. George. Port St. Antony, or Porto-magno, or Pormany, lies on the opposite coast. Ivica, though its mouth is difficult of entrance, is sufficiently spacious to accommodate a squadron; but in the winter season it is only fit for small vessels. The inhabitants of Ivica have criminal as well as civil laws peculiar to themselves. This island belongs to the Spaniards.

IVICA, the capital town of the above described island; which has a good port, situated to the S.E. below a small hill, under the cannon of a fortress constructed in the time of Charles V. Some ancient authors ascribe the foundation of this city to the Pharians, 663 years B.C. It was called Pituge, because it is covered with pines and firs. Others attribute it to the Carthaginians, 70 years after Carthage was founded, alleging that the name Eubius in the Phanic language signifies arid. The Romans had it in their possession; it was afterwards occupied by the Moors; but the Africans were expelled by John, prince of Aragon, arch-bishop of Tarragona; and it has since remained under the spiritual jurisdiction of this city. The town, which is situated on a mountain, is honoured with the title of a hospice, and it is also the seat of government. It has a cathedral, as many in matters as parishes, one hospital, several churches, and some barracks. The town is well fortified, and has two entrances, viz. the New Gate, and the Principal. The suburbs, commanded by the cannon of the town, contain one church, called St. Elmo, well filled with fables. The port, though spoilt by the mud, is large enough to contain a squadron; it is the largest, most convenient, and best fitted in the island. The N.E. wind is the only one from which it is not protected. The English took possession of this port in 1706, but the Spaniards have again obtained it. The governor has an affessor, and some other persons, who assist him in taking cognisance of all civil, criminal, and military matters, from whom the appeal lies to the captain-general of Majorca. Including the inhabitants of the suburb, the population is estimated at 2000 families, comprehending 3000 persons. N. lat. 38° 58', E. long. 1° 22'.

JUICE, a liquid substance, which makes part of the composition of plants; being diffused among all the solid parts, and serving for their nutrition and growth.

The juice, or sap, is that to plants, which blood is to animals.

There are juices of divers kinds, aqua, vinum, oleaginos, gummum, resinent, and bituminous; and of all tinctures and colours.

Juice, Spanisb. See Liquorice.

Juice is also applied to several, and even to all, the fluids, or humours, in an animal body.

Juice is also applied to the vapours and humidities included in the earth.

Juvet, Concretcb, in Mineralogy, a name given by many authors to such substances found in the bowels of the earth, as have once been in a state of liquidity, and are capable of being rendered fluid again by art, by means of heat, moisture, or common agents.

Others apply the word concrete to all these substances which may be separated from fluids by chemical operations, whether they are afterwards fluidible in them again or not; such are the particles of spar, separated from water by a flow distillation, and remaining at the bottom of the vessel.

The concrete juices of the earth are supposed to be the principal
principal things which give the virtue to mineral waters: for those which receive no concretion, and are only mingled with the waters in their passage through that part of the earth where they are evaporated, on the water's being exposed to the air, though they may give a briskness to it, while entire in it, yet are not to be impugned to give the principal virtue. These fluid and volatile juices all fly off in the analyses of the waters, but the concrete juices are more permanent, and leave certain sediments which render them visible and palpable, after the distillation of the waters with which they are mixed. When these happen to be simple, and of the same species with those known in a solid state, it is easy to deduce the virtue of the waters from them, and to know what must be the effect of such fluids as carry spar, sulphur, vitriol, or other well-known substances, into the blood; but it seldom happens that these things are thus contained simple and entire in the waters, they are often broadened variously with one another, and often not the whole of the known body is contained, but the principles that constitute some part of it, such as the acid of vitriol without its metallic part, the bals of tea-falt without its acid, and so of the rest.

Salts and earths are evidently the most sensible and the most common matters which are mixed with water, and it is from them in general that the medicinal springs take up their virtues. There is scarcely any earth that does contain some sort of mineral falt, capable of being washed out by water, though it be generally in imperceptible quantities; but where the earths are richer in these farts, the waters not only take them up, but carry also with them the several finer particles of the earth itself, in which they are bedded, and rising up to some small distance from the place, they make medicinal springs, of virtues answerable to the peculiar species of the falt that was lodged there. We are always able to separate, by analysis, the farts and the earths of the mineral waters; but when we have done this, we are not arrived at the end of the task, for they are often such mixed substances, that we can neither know them perfectly as they are, nor separate them.

The four most known and frequent of those concrete juices which are called farts, are alum, nitre, vitriol, and culinary falt; but the examination of the waters of different medicinal springs shews us, that there are in the earth others very different from these, and that there are in great numbers. There is in Asia a native alkali falt, or natrum, and in all the mineral waters we celebrate, there is a peculiar falt separable by evaporation, which is more nearly allied to this than to any of the other four, to one or other of which it has been the custom to reduce all farts; and yet different even from this in some respects. Besides this, those juices of the saline kind, whose disposition to concretion is not yet finished, and whose state is, as it were, but in embryo, or the first stage of being, are not to be known, when separated from the waters to which yet they may have perhaps given virtues greater than the concrete, in what we call its more perfect state, might have given; nay, even those that are more formed, and are already concreted, or in a state capable of concretion, have not simple and homogeneous substances in each of the species. The falt that is called culinary falt, is observed to have two different portions mixed together; the one is condensed and crystallized by cold and in moisture, after the evaporation of a part of the water wherein this falt hath been dissolved; and the other will not be crystallized nor condensed, but by a total evaporation of the water. The portion of this falt that is crystallized by cold and in moisture, is the most sulphurous, and by its sulphuritv it will mix itself with the sulphurous falt of calcined tartar dissolved in a moist air, or in common water, without turbidness, and without coagulation; but that portion of this common falt which is not condensed but by the total evaporation of the water which had dissolved it, hath an acidity which instantly congeales the falt of tartar dissolved, and all other farts in the same plate which are sulphurous and nitrous. It is evident, that while this falt is in its embryo falt, the one or the other alone of these two very different substances of which it is contained, may be mixed with the waters of a spring, and communicate virtues different from those which the whole body of the falt would have done. This falt also being procured by evaporation of the water, or by any other analysis of it, could not be known or referred to the common farts, and much less if in the earth, as may very easily happen, it should be united with some one of the constituent parts of some other falt, in the same difunct or unfashioned state.

The vitriol which in a moist air yields an efflorescence upon fulphurous marcasite, has likewise a juicy portion, condensible only by a total evaporation of its aqueous humidity; this is of a very acrimonious tafle, of an unctuous substance, and easily runs to water in a moist air. This juicy portion of vitriol is very different from that which shoots and condenses in the fluid liquor, by means of the cold. These crystals are pure vitriol acid, aureole, and on being mixed with the fulphurous and nitrous farts, a great quantity of earthy matter precipitates out of them; but the other portion will mix itself with these farts in solution, without turbidness or emotion, not having, like the former, that acidity upon which the fulphurous or nitrous farts can act; which is exactly contrary to what happens to common falt, of which the first portion is the most fulphurous, and the latter portion the most acid. Nitre is also, like the red, composed of two different salme portions, the one more fulphurous, which crystallizes with the cold, and in moisture, and the other, which remains dissolved after all the crystals are obtained, and which cannot be obtained in a dry form, but by the evaporation of all the humidity. This is less fulphurous than the other part obtained in crystals, and has some acidity which the other has not.

The first embryos of mineral farts are nothing else but vapours or juices not concreted, but totally volatile or vaporous; of these some may be condensed, and in part fixed by the action of fire, or diffused from their natures, and made capable of concretion by means of the air, as is observed in certain nitrous, aluminius, and vitriolic farts. The fulphurous part, which is formed in the lime, made of certain hard stones burnt in the fire, which is generally allowed to be a species of nitre, has certainly its seminal being in these crude stones, and in that state of its being, is very different from that which we find after it has passed the fire, which, from cold and coagulative, changes into castic and resolutive. This cold and resolutive quality of this falt, in its first state, manifests itself sufficiently in the waters of certain rock springs, which are very limpid and cold, and breed cold and scherous turnours under the throats of those people who ordinarily drink them, as in the Alps, &c. See Broussais.

The seminal matter of this falt then is wholly altered in its nature by fire, and is rendered fulphurous and castic as nitre. Fire is able to exalt and alter the state of being of this falt, but it is no more able to produce it in these stones than in the shells of oysters, &c. of which also a lime is made, which yields a falt not more fulphurous than this. De Claus, Offens. fur les Lacs Miners.

The second being of alum and vitriol must, in the same manner, be in those substances out of which those farts
are extracted by water, after they have been calcined by fire, or exposed to a flower calcination in the open air. They are not found in these stones before these processes, yet it is sufficiently evident that the fire and air could not produce them, but could only exalt them there.

All these varieties to which the several mineral falls are liable in the different strata, and in which they may be absorbed together, and united by water under the earth, do not only render the judging of the mineral waters, which partake of them by analyses very uncertain, but even, in many cases, perplex and confound us, by the very means by which we hope to understand them.

Juices, Mineral. Many countries afford these, and give marks by them of treasures that might be turned to great account, were the proper manner of affaying them known, which is by first properly reducing them to a dry substan- tice, so as to come at the solid matter they contain. With a view to the discovery of metallic veins, the ejection of salt-works, vitriol-works, alum-works, borax-works, and the like, the curious on this subject may find many excellent hints for further discoveries in the clofe of Agricola's work, "De Re Metallica;" and the view is farther carried on by Boyle, Becher, Stahl, and Homberg. The Royal Academy of Paris have also given some hints that may be of use, in their Memoirs; and some practical things are recorded in the Philosophical Transactions. We have accounts in the Philosophical Transactions of white and thick fluids like cream, found in mines at very great depths, and containing mineral particles. The bottoms of our coal-pits sometimes afford this liquor in very large quantities. And some of the iron mines in Shropshire, particularly that called the White mine near Hales in that county, affords a great quantity of this sort of juice. It is thick as cream, white, and of a sweetish taste, but with a vitriolic twang behind it. This is contained in the nodules of iron-iron, which are here a sort of calcifer, very large, composed of thick crusts, and some of them holding near a loghead of this sort of liquor. Phil. Trans. N. S. 100. See Esmiuros.

姐UILLAC, in Geography, a town of France, in the department of the Corrèze, and chief place of a canton, in the district of B barley; 19 miles W. of Tulle. The place contains 20,010, and the canton 40,612 inhabitants, on a territory of 125 kilometres, in 10 communes.

IVINGHOE, is a market town and parish in the hundred of Cotfow, and county of Buckingham, England. It is situated on the declivity of a chalk hill, near the ancient Iceneld-street, 35 miles distant from London, and consists of two streets, containing, at the time of the last population report of 1800, 78 houses, and 452 inhabitants. In the church, which is a handsome structure, is a altar-tomb, said to be that of a brother of King Stephen. A market was granted to this town in the year 1518: it is now held on Saturday; but it is so small, that it may almost be said to be discontinued. Here are two annual fairs. The parish of Ivinghoe is very extensive, being fourteen miles in length, and containing several hamlets. In one of these, St. Margaret's, which is about five miles distant from the town, are the remains of the monastery of Mureley, founded by Henry de Blois, bishop of Winchester, in the reign of Henry 1. for nuns of the Benedictine order. At the dissolution the estate was granted to Sir John Dance; it has been lately sold by Mr. Catherall, in whose family it has been during several generations, to Mr. Mercer. The building was, in 1802, almost entire: the parlour and hall, which are of Totalhouse stone, appear to be of the age of Henry VII.

LIVIRA, in Botany, a Caribbean name for a species of Sterculia, called by Anquetil l'eiva prunus, Pl. Guian. v. 2 604. t. 270. See Sterculia.

JULIES. See Zizithus and Rhannus.

JULI, in Geography, a river of South America, which rises W.N.W. of Omaquaza, which gives it name; but afterwards, being joined by several small rivers at St. Salvador, it is called Juli. On the borders of the province of Chaco, it unites with the Vermejo in 8. lat. 24° 50'. Its whole course is S. E. nearly 300 miles.

JUJUMORA, a town of Hindooftan, in the circar of Sumbulpoor; 20 miles S.S.E. of Sumbulpoor.

JUKAN, a town of Hindooftan, in Guzerat; 20 miles N. of Nomagur.

JUKUMA, a town of the duchy of Courland; 32 miles E.S.E. of Goldingen.

JULI, in the House of the Ancients, Athens, lib. xiv. a song for woolen manufacturers; but afterwards the same author says it is the name of one of the songs or hymns in honour of Ceres, and it was, in fact, a hymn sung by the Greeks, and after them by the Romans, in the time of harvest, in honour of Ceres and Bacchus, in order to render those deities propitious.

The word is derived from mãe, or μαύ, a juice. This hymn was sometimes called demiutule, or demiutule, that is, the Chie of Ceres.

JULIPE, or JULAP, Julapium, in Pharmacy, and derived, according to Menage, from the Arabic gjétub, or rather from the Greek Ιυλαπο, Olearius derives it from gulap, a Persian word, signifying roof-water; it is a safe, agreeable, extemporaneous potion prescribed to sick persons; usually composed of common water, or simple distilled water, with one-third or one-fourth of its quantity of distilled spirituous water, and sweetened with sugar, or proper syrups. This is sharpened with vegetable or mineral acids, or impregnated with other medicines. Juleps are sometimes used as the ordinary drink in certain diseases, but more usually as a vehicle for other forms of medicines; serving chiefly to dilute, to correct the pemail humours, to reinforce the declining force of the heart, and promote sleep.

In dispetatories, we have several different juleps; the principal of which are, the camphor julep, julepum a camphora. See Camphor.

The cordial julep, which is made by mixing four ounces of simple cinnamon-water, two ounces of Jamaica pepper-water, volatile aromatic spirit, and compound spirit of lavender, of each two drams, and an ounce of syrup of orange-peel; and is given in the dose of two spoonfuls, three or four times a day, in disorders accompanied with great weakness and depression of spirits.

The expectorating julep is formed by mixing four ounces of the emulsion of gum ammoniac with two ounces of the syrup of squills. Two spoonsfuls of this julep may be taken every three or four hours in coughs, athmosms, and obstructions of the breast.

Myrk julep is made, by rubbing half a dram of musk, and half an ounce of sugar together, and adding gradually two ounces of simple cinnamon-water, and as much of peppermint-water, and allo two drams of the volatile aromatic spirit. Two spoonsfuls of this julep may be taken every two or three hours, in a low state of nervous fevers, hiccupping, convulsions, and other fapmodic afections.

The jutfine julep is prepared by dissolving two drams of salt of tartar in three ounces of fresh lemon-juice, strained; when the effervescence is over, add of mint-water, and common water, each two ounces, and of simple syrup one ounce. This julep removes ficksnes at the lochoch, relieves vomiting;
promotes perspiration, and may be of service in fevers, espe-
cially of the inflammatory kind.

The common julep is made, by diffusing four grains of
emetic tartar in eight ounces of water, and adding to it half
an ounce of the syrup of clove July-flowers. This julep may
be given, in the beginning of fevers, in the dose of one table-
spoonful every quarter of an hour till it operates.

JUL. Mephitis. See Pervont Windsor.

JULETA, in Geography, a town of Sweden, in Suder-
mania; 35 miles N.W. of Nykoping.

JULFAR, or Duncarb, a town of Arabia, in the
province of Oman, situated on a bay of the Persian gulf; 100
miles N.W. of Oman. N. lat. 26° 37'. E. long. 57°.

JULGANO, a town of Hindoostan, in the Candejbe;
40 miles E. of Bahourmopur.

JULGONG, a town of Hindoostan, in the circuit of
Aurungabad; 15 miles S.W. of Aurungabad.

JULI, or Caesar, Petrified, in Natural History. Small
foliil bodies are found in the chalk-pits, near the bottom of
the chalk series in Cherry-Hinton, in Cambridgeshire, which
Mr. Parkinson has described in the 1st volume of his Organic
Remains, p. 476, and considers them as the juli of the larch,
or some other tree. Dr. Parfons having considered them as
parts of the roots of some plant, both of which opinions we
consider as very far from probable. Dr. Woodward,
