UNIVERSAL DICTIONARY

OF

ARTS and SCIENCES.

BAT

BATTERY Point, in *Geography*, lies on the north or ſtarboard ſhore of the channel of Cork, in Ireland.

Battery, formed of *battre, to beat or ſtrike*, in the *Military Art*, denotes an eminence caſt up, on which to plant artillery, that it may play to better advantage. It conſiſts of an epaulement, parapet, or breaſt-work, about eight feet high, and eighteen or twenty thick. The platform of a battery is laid with planks, that the wheels of the carriages may not ſink; and it is made ſloping towards the parapet, that the guns may not recoil much, and that they may be more eaſily drawn back. See *Plate* II. *Fortif. fig.* 21. *n.* 2. and *Plate* VII. *fig.* 38.

In all batteries, the open ſpaces left to put the muzzles of the great guns out at, are called *embraſures*; and the diſtances between the embraſures, *merlons*. The guns are generally from twelve to ſixteen feet diſtant from one another, that the parapet may be ſtrong, and the gunners may have room to work.

There are alſo *batteries of mortars*, the ſame with thoſe of cannon, except that they have no *embraſures*; the ſhells being fired over the parapet, commonly at an angle of 45° elevation: and the ſlope of the breaſt work is made inwards, contrary to that of other parapets; having their platforms about ſix feet ſquare and eight feet aſunder.

The *battery* of a camp is uſually ſurrounded with a trench and palliſades at the bottom, as alſo with a parapet on the top, having as many holes as there are pieces of artillery, and two redoubts on the wings, or certain places of arms, capable of covering the troops which are appointed for their defence.

All field batteries conſiſt of four parts, viz. the *ditch*, the *parapet*, the *platform*, and the *magazine*; which ſee reſpectively.

The Sieur Remy, in his Memoirs of Artillery, has given a table for the ready finding of all the requiſites for the conſtruction of temporary batteries, and for their daily ſervice, the pieces being twenty-four pounders; and although theſe batteries are calculated only for ſieges, and are of the coffer-kind, yet from this table may be derived ſuch notions as will greatly help young artiſts on other occaſions.

It is alſo proper to mention the number of faſcines and pickets that is uſually expected every day from the labour of each man employed in that ſervice.

Of faſcines 5 or 6 feet long, and 5 or 6 inches thick, bound with two wyth bands each, one man will make 16 or 18 in a day, with two pickets to each.

Of faſcines 8 or 9 feet long by 8 or 9 inches thick, and two pickets to each, one man uſually makes 10 or 12 in a day.

Of faſcines 12 feet long by 9 inches thick, with three pickets to each, 8 or 10 are uſually expected from the day's work of one man.

The days here underſtood are ſuch in which the men may work about twelve hours.

In the following table C. ſtands for hundred.

444045

Printed by A. Strahan,

A TABLE for the conſtruction of Batteries.

Number of 24 pounders in battery.	Length of the parapet in yards.	Number of workmen to conſtruct the battery.	Number of workmen's tools uſed at the battery, viz. ſhovels, ſpades, pickaxes, mattocks, &c.	Faſcine-makers, each a bill and hatchet.	Faſcines of 8 or 9 feet by 8 or 9 inches.	Faſcines of 12 feet by 8 or 9 inches.	Faſcines of 5 or 6 feet by 5 or 6 inches, made by the cavalry.	Pickets from 3 to 6 feet long, and about 1½ inch thick.	Mallets to drive the pickets.	Hand-bills, 2 for each embraſure, beſide ſpare hatchets.	Planks for the platforms, 2 or 2½ inches thick.	Gunners to ſerve in the battery.	Soldiers to aſſiſt the gunners.	Powder for 100 rounds, at 12lb. each per day.	Shot of 24 pounds for 100 rounds.

When batteries are erected at leiſure, and are deſigned to ſtand for ſome years, they are beſt made of ſtone, or brick, or good loamy earth, as the materials may be moſt eaſily procured.

To conſtruct the profile of a battery, let its ground line be AB (*Plate* II. *Fortif. fig.* 23. N° 2.), BD that of the parapet, the inner ſlope of which is formed by making *Da* = 1½ foot, and the perpendicular *a* H = 6 or 7 feet; the crown of the parapet H I is formed by making *b* I a foot or two lower than *a* H; and the front of the battery I B is found by making *b* B = ⅔ *b* I when of earth, or = ⅙ of *b* I when of maſonry. If DC be made = 2½ or 3 feet, we ſhall have C the ſill of the embraſure, the floor of which CG is to dip a foot or two below the level line CF. The platform DE is 18 or 20 feet, the tail E riſing about 6 inches above the level line AB; the lower double line repreſents the ſleeper laid lengthwiſe, and the upper double line ſhaded with the lines acroſs ſhews the ends of the planks laid on the ſleepers. A gun on its carriage, with the wheels againſt the knocker at D, is annexed to the figure, for the purpoſe of aiding the apprehenſion. For the conſtruction of the embraſures, merlons, ramps, &c. ſee the articles reſpectively.

Battery, *Open*, is nothing more than a number of cannon, generally field-pieces, or ſuch as carry a ball not exceeding nine pounds weight, ranged in a line or row a-breaſt of one another, on ſome ſmall natural elevation of the ground, or an artificial bank about a yard or two high. Theſe cannons are ranged at the diſtance of about 15 or 16 feet from one another; their ſhot and loading utenſils lying by their ſide, and the powder lodged in a hole at ſome diſtance behind the battery.

Battery, *Covered*, is when the cannon and gunners are covered by a bank made of bruſh-wood, faggots, and earth; about eighteen or twenty feet thick, and ſeven or eight feet high. The cannon uſed in ſuch batteries are generally from nine to eighteen pounders; ſometimes twenty-four pounders are uſed in them. See Fascine *Battery*.

Battery, *ſunk* or *buried*, is that whoſe platform is ſunk or let down into the ground, with trenches cut into the earth againſt the muzzles of the guns, to ſerve for embraſures.

This ſort, which the French call *batterie en terre*, and *ruinante*, is generally uſed upon the firſt making approaches, to beat down the parapet of the place.

Batteries, *Croſs*, are two batteries at a conſiderable diſtance from each other, which play athwart one another at the ſame time, and upon the ſame point, forming right angles; ſo that they thus combine and produce a greater effect;

effect; becauſe what one bullet ſhakes, the other beats down.

Battery *en Barbe*, *Barbet*, or *Open Battery*, is a name given to a battery, when the floor of part of it is ſo raiſed that the guns placed on it have an advantageous command over ſome part of the neighbourhood, and when the guns thus raiſed fire over the crown of the parapet without any embraſure. Theſe barbets may be made either in a curtin, or at the faliant angle of a flanker. They ſhould be always 2½ or 3 feet lower than the crown of the parapet, and about 8 or 9 yards broad at the top, with a proper ſlope to the baſe, of a length ſuitable to the number of guns to be mounted on them, allowing about five or ſix yards for each, and at each end have a proper ramp for aſcending them. For the further illuſtration of their nature and conſtruction, let PQRVX (*Plate* III. *Fortif. fig.* 25.) be a common bank of a line, the parapet of which is RSTV; the inner ſlope RS being about 6 or 7 feet higher than QR; then the bank *mno*R, raiſed ſo high that the cannon may fire over the crown of the parapet ST, is the barbet, the height of which *np* is about 3 or 4 feet. On the top of the barbet is raiſed a platform, as in other batteries. Let the figures 26 and 27 repreſent part of the plan of a line, and one of its flankers, or of a battery conſtructed in ſuch a form; where *Aa* is the length of the barbet, or raiſed battery, ſuited to the number of guns to be uſed, which are to be drawn up the ramps placed at the ends; the breadths being about 8 or 9 feet, and the length *ab* about 7 or 8 yards.

Battery, *Cavalier*. See Cavalier.

Battery *d'Enfilade*, is one which ſweeps the whole length of a ſtraight line, a ſtreet, &c.

Battery *en Echarpe*, is that which plays obliquely.

Battery *de Revers*, or *Murdering Battery*, is one that plays on the back of any place; and being placed on an eminence, ſees into it.

Battery *joint*, or *par camerade*, or *cameretta*, is when ſeveral guns play at the ſame time upon one place.

Battery *en Rouage*, is that uſed to diſmount the enemy's cannon.

Battery *à Ricochet*, is adapted to the method of *ricochet* firing, firſt invented and practiſed by Vauban, at the ſiege of Aeth in 1692. The guns are loaded with ſmall charges, and are elevated, ſo as to fire over the parapet; and the ſhot is hereby made to roll along the oppoſite rampart. This method of firing with guns has ſince been applied to mortars and howitzers with great ſucceſs.

Battery *Coffer*, is that where the ſides of the wall and merlons only are formed of faſcines, and all the cavities or included ſpaces filled with earth.

To conſtruct a battery of this kind, mark out with a line the limits of the parapet eighteen or twenty feet thick; and three or four feet before the parapet, mark out with lines or ſtakes the limits of the ditch, ten or twelve feet broad, or even more, if earth is wanted; allowing eight yards in length for one gun, and ſix yards more for every other gun. On the outlines of the parapet cut a trench five or ſix inches wide and deep, and there lay a row of faſcines, the ends being jammed one into the other; and let them be ſtaked down. Lay on them another row, ſo that the joinings of theſe may not be directly over the joinings of the lower one, and let all the knots of the bands be turned inwards; ſtake theſe down; and on them lay in like manner a third and fourth row, &c. until the height be about three feet. The ſame kind of work being done at the ends, and for the epaulement if wanted, the coffer for the wall will be finiſhed. Then let the men be diſpoſed along the place intended for the ditch, and with proper tools break the ground and throw it into the coffer; where, as the earth is thrown in, other men are to ſpread it, and ſtamp it down with rammers; and thus the coffer is to be filled. When the wall is finiſhed, let the embraſures be ſtaked out (ſee Merlon), and a coffer formed in like manner for each merlon, which is alſo to be filled with earth, and rammed down. Proceed to complete it in the ſame manner with the Fascine *Battery*.

Battery, *Faſcine*. See Fascine *Battery*.

Battery, *Gabion*. See Gabion.

Battery, in *Law*, denotes an act that tends to the breach of the peace of the realm, by unlawfully ſtriking, beating, or offering other violence to another perſon.

Battery is frequently confounded with aſſault, though in law they are different offences; becauſe, in the treſpaſs for aſſault and battery, one may be found guilty of the aſſault, yet not convicted of the battery: there may therefore be aſſault without battery; but battery always implies an aſſault. The leaſt touching of another's perſon wilfully, or in anger, is a battery; for the law cannot draw the line between different degrees of violence, and therefore totally prohibits the firſt and loweſt ſtage of it: every man's perſon being ſacred, and no other having a right to meddle with it in any the ſlighteſt manner. Upon a ſimilar principle the Cornelian law "de injuriis" prohibited "pulſation" as well as "verberation;" diſtinguiſhing verberation accompanied with pain from pulſation without any. However, battery is in ſome caſes juſtifiable or lawful; as where one who hath authority, a parent or maſter, gives moderate correction to his child, his ſcholar, or his apprentice. Thus alſo on the principle of ſelf-defence, if one ſtrikes me firſt, or even only aſſaults me, I may ſtrike in my own defence, and if ſued for it, may plead "ſon aſſault demeſne," or that it was the plaintiff's own original aſſault that occaſioned it. So likewiſe in defence of my goods or poſſeſſion, if a man endeavours to deprive me of them, I may juſtify laying hands upon him to prevent him; and if he perſiſt with violence, I may proceed to beat him away. 1 Finch. L. 203. Thus too, in the exerciſe of an office, as that of churchwarden or beadle, a man may lay hands upon another to turn him out of church, and prevent his diſturbing the congregation. 1 Sid. 301. And if ſued for this or the like battery, he may ſet forth the whole caſe, and plead that he laid hands upon him gently, "molliter manus impoſuit," for this purpoſe. On account of theſe cauſes of juſtification, battery is defined to be the "unlawful" beating of another; for which the remedy is, as for aſſault, by action of "treſpaſs vi et armis," in which the jury will give adequate damages. Atrocious battery is ſubject to trial by inſpection in purſuance of the order of the court; in which caſe the battery muſt be alleged ſo certainly in the declaration, that it may appear to be the ſame with the battery inſpected. In the caſe of a perſon's beating the ſervant of another, beſides the remedy of an action of battery or impriſonment, which the ſervant himſelf may have againſt the aggreſſor, the maſter alſo, as a recompence for his immediate loſs, may maintain an action of treſpaſs, "vi et armis," in which he muſt allege and prove the ſpecial damage he has ſuſtained by the beating of his ſervant, "per quod ſervitium amiſit;" and then the jury will make him a proportionable pecuniary ſatisfaction. A ſimilar practice obtained among the Athenians; with whom maſters were entitled to an action againſt ſuch as beat or ill-treated their ſervants. A perſon guilty of battery againſt a clergyman, is liable to three kinds of proſecution for the ſame offence; an indictment for the breach of the king's peace, a civil action for damages, and a ſuit in the eccleſiaſtical court; firſt, "pro correctione et ſalute animæ" by *enjoining* penance, and then

again for ſuch ſum of money as ſhall be agreed on for *taking off* the penance enjoined; it being uſual in theſe courts to exchange their ſpiritual cenſures for a round compenſation in money (2 Roll. Rep. 384.); perhaps, ſays judge Blackſtone, becauſe poverty is generally eſteemed by the moraliſts the beſt medicine "pro ſalute animæ." Bl. Com. vol. iii. and vol. iv.

Battery is ſometimes uſed in ſpeaking of the fabric of metalline utenſils. In this ſenſe, battery-works include pots, faucepans, kettles, and the like veſſels, which though caſt at firſt, are to be afterwards hammered or beaten into form.

Some make battery for the kitchen, *batterie de cuiſine*, comprehend all utenſils for the ſervice of the kitchen, whether of iron, braſs, copper, or other matters. Others take the term in a narrower ſenſe, and reſtrain it to utenſils of braſs or copper.

A ſociety for the mineral and battery work of England was incorporated by queen Elizabeth.

Battery, in *Electricity*, is a combination of coated ſurfaces of glaſs, ſo connected together, that they may be charged at once, and diſcharged by a common conductor. Mr. Gralath, a German electrician, was the firſt who contrived to increaſe the ſhock, by charging ſeveral phials at the ſame time. Dr. Franklin, after he had analyzed the Leyden phial, and found that it loſt at one ſurface the electric fire which it received at the other, conſtructed a battery, conſiſting of eleven panes of large faſh-glaſs, coated on each ſide, and connected in ſuch a manner that the whole might be charged together, and with the ſame labour as one ſingle pane; and by bringing all the giving ſides into contact with one wire, and all the receiving ſides with another, he contrived to unite the force of all the plates, and to diſcharge them at once. A more complete battery is deſcribed by Dr. Prieſtley, of which he ſays, that after long uſe he ſees no reaſon for wiſhing the leaſt alteration in any part of it. This battery (ſee *Plate* I. *Electricity*, *fig.* 1.) conſiſts of 64 jars, each ten inches long, and 2½ inches in diameter, coated within 1½ inch of the top; and contains in the whole 32 ſquare feet. The wire of each jar has a piece of very ſmall wire twiſted about the lower end of it, to touch the inſide coating in ſeveral places; and it is put through a pretty large piece of cork, within the jar, to prevent any part of it from touching the ſide, which would tend to promote a ſpontaneous diſcharge. Each wire is turned round, ſo as to make a hole at the upper end; and through theſe holes a pretty thick braſs rod with knobs paſſes, one rod ſerving for one row of the jars. The communication between theſe rods is made by laying over them all a thick chain. When part only of the battery is uſed, the chain is laid over as many rods as will furniſh the required number of rows of jars. The bottom of the box, in which the jars ſtand, is covered with a plate of tin, and a bent wire touching the plate paſſes through the box, and appears on the outſide. To this wire any conductor deſigned to communicate with the outſide of the battery is faſtened, as the ſmall wire in the figure, and the diſcharge is made by bringing the braſs knob to any of the knobs of the battery. When a very great force is required, the quantity of coated ſurface may be increaſed, or two or more batteries may be uſed. Franklin's Exp. and Obſ. ed. 1769. p. 28. Prieſtley's Hiſt. &c. of Electricity, ed. 1775. vol. ii. p. 99.

However complete the battery above deſcribed appeared to be at the time of its conſtruction, later electricians have diſcovered many imperfections to which it was ſubject; of which the principal are thoſe that reſult from the form and ſize of the jars, the ſubſtance of the glaſs, the height of the coating, and the connections within the battery. In conſequence of theſe imperfections in its ſtructure and contrivance, it is prevented from receiving more than about half the charge which it ought to receive in proportion to the quantity of its coated ſurface.

The moſt perfect batteries of modern conſtruction, ſince that of Dr. Prieſtley, have been made in Holland for Teyler's muſeum at Haerlem, by Mr. Cuthbertſon of Polard-ſtreet, London, then reſiding at Amſterdam. Of theſe batteries there are two, differing in their magnitude and mode of conſtruction, but allowed to be equally perfect. The firſt was completed in the year 1784, and is compoſed of 135 jars in 9 boxes, each containing 15, which may be uſed ſeparately or combined, as the nature of the experiment requires. Each box is a ſeparate battery of itſelf; and the deſcription of one box with a view of the figure, will be ſufficient for explaining its conſtruction and uſe. In *Plate* I. *Electricity*, *fig.* 2. is exhibited a perſpective view of Teyler's firſt battery, with its parts arranged in proper order for receiving a charge from the electrical machine. Each box, as we have already obſerved, contains 15 jars; each jar is 11 inches high, and 6 inches in diameter, contracted at the mouth to 4 inches, and coated ſo as to contain about 140 ſquare inches; and thus the whole battery will contain about 132 ſquare feet of coated ſurface. Each box is divided into 15 partitions, 5 of which are in the length and 3 in the breadth; the height of the ſides of the box being ſomewhat lower than the coating of the jars, as are alſo the partitions in which they ſtand. The lid of the box is made without hinges, for the convenience of releaſing it from the box, that it may be removed while experiments are performed. It is taken off by lifting it upwards. The outſide coatings of the jars are connected by means of croſs wires paſſing under the bottom of each jar; and thoſe on the inſide by means of a braſs frame, bearing 15 braſs balls, fixed upon the frame above the centre of each jar. All theſe balls, excepting the four at the corners, have wires ſcrewed to them and hanging downwards into the inſide of each jar; but the wires of the four corner jars are ſcrewed to a foot, which is cemented to the bottom of each in the inſide. Upon theſe wires the whole frame reſts, and is kept in its proper poſition. The four corner balls have holes, which receive the ends of the wires, and terminate at a proper height from the jars. By this contrivance the inſide connecting frame may at any time be eaſily removed; and as this part of the machine is important, the conſtruction of the ſaid frame is ſhewn ſeparated from the battery in *fig.* 3. It is according to the above conſtruction that Mr. Cuthbertſon forms his preſent batteries, excepting that he has increaſed the ſize of the jars, ſo as to make one battery contain about 17 ſquare feet; and he engages to prove by experiment, that the batteries of his conſtruction are far ſuperior to any others. Teyler's ſecond grand battery was finiſhed by Mr. Cuthbertſon in 1789. This is the largeſt and moſt complete battery that was ever made. The whole battery, ſtanding in proper order for receiving a charge, is exhibited in *fig.* 4. It conſiſts of 100 jars of the ſame ſhape with that of thoſe already deſcribed, only that they are ſo enlarged in ſize, that each of them contains 5½ ſquare feet of coated ſurface, inſtead of 140 inches, and the whole battery contains 550 ſquare feet of coating; and for conveniency, it is put into four ſeparate caſes, each containing 25 jars in the form of a ſquare, 5 on each ſide. The boxes are lined with lead on the inſide for forming the outſide communication; each jar has a perpendicular ſtand reſting upon its bottom, and ſupported from falling ſideways by three ſtays on the inſide. Upon the top is ſcrewed a three inch braſs globe, from which proceeds a braſs tube about one inch in diameter,

diameter, to a large brafs globe, fupported by the middle jar at a proper height, fo as to keep the inſide communication properly arranged. A view of the figure will ſhew how the four are combined, ſo as to charge and diſcharge all the 100 jars at once.

Lieutenant colonel Haldane propoſes the following method for meaſuring the force of an electrical battery, during the time of its being charged.

Let the battery be inſulated, and at a ſmall diſtance from it place an uninſulated electrical jar, and near the jar, one of Mr. Cuthbertſon's electrometers. The electrometer being adjuſted according to the degree of force which is intended to be employed as a meaſure of force to be communicated to the battery, connect the electrometer with the jar; make a metallic communication between the interior ſide of the jar and the exterior ſide of the battery, and connect the interior ſide of the battery with the conductor of an electrical machine: then, by the operation of the electrical machine, the battery receives a quantity of the electrical fluid, and becomes charged. The fluid, which departs from the exterior ſide of the battery, is received by the electrical jar, which alſo becomes charged; but this jar, being connected with the electrometer, explodes as ſoon as it acquires a force ſufficient to put the electrometer into motion. The quantity of the electrical fluid which is received by this jar, between each of the exploſions, is a meaſure of the quantity of the fluid in the battery; and the number of exploſions or diſcharges of this jar ſhews the number of meaſures which the battery contains, and conſequently the force which it is capable of exerting when diſcharged.

For the author's demonſtration of this method, and the illuſtration of it by appropriate experiments, we muſt refer to Nicholſon's Journal, vol. i. p. 156, &c.

Battery, *Galvanic*; the name uſually given to an apparatus for accumulating the electricity which is produced by the mutual agencies of certain metallic and carbonaceous ſubſtances, and peculiar fluids.

The firſt inſtrument of this kind was invented by the celebrated Volta of Pavia, in 1800, and various forms of it have been ſince adopted by different philoſophers.

The original battery, or the electrical pile, is compoſed of plates of zinc, plates of ſilver, and pieces of paſteboard, of the ſize of the plates, moiſtened in a ſolution of ſalt in water: and arranged in the order of zinc, ſilver, paſteboard, zinc, ſilver, paſteboard, and ſo on, till a ſeries ſufficiently numerous is formed. On account of the expence of ſilver, copper has been lately generally ſubſtituted for it, with but little diminution of effect; and ſolutions of muriate of ammoniac, of nitrous acid, and of muriatic acid, have been employed inſtead of the ſolution of common ſalt, with very great advantage as to the increaſe of the power of the combination. In general any two metallic ſubſtances which are perfect conductors of electricity, may be uſed, provided the interpoſed fluid is capable of oxidating at leaſt one of them.

The powers of galvanic batteries appear to be very much connected with the chemical changes going on in them, and hence plates of one metal may be made to ſupply the place of the two metals provided their different ſides be expoſed to different chemically acting fluids, as has been ſhewn by the experiments of Mr. Davy. Thus copper, ſilver, and lead, all form efficient combinations when they are arranged with two different ſets of paſteboard, one moiſtened with diluted nitric acid, and the other with ſolution of hydroſulphuret of potaſh; the order being metal, paſteboard moiſtened with acid, paſteboard moiſtened with hydroſulphuret, &c. In ſuch a caſe, if the battery is required to be of conſiderable permanency as to its effects, it is neceſſary to ſeparate the paſteboard moiſtened in the chemical agents from each other by a third ſet of paſteboards, moiſtened in common water.

In inſtances when piles are erected perpendicularly either with two metals or with one metal, in conſequence of the oxidation and the loſs of moiſture from preſſure and evaporation, the electrical action uſually ceaſes after a few days; and in order to renew it, a ſecond conſtruction of the ſeries becomes neceſſary. Several methods have been propoſed for making inſtruments more permanent in their operation than the pile, and more eaſily rendered active; but the moſt ingenious contrivance appears to be that of the trough, diſcovered by Mr. Cruickſhank. It conſiſts of a box of baked wood, in which plates of copper and zinc, or of ſilver and zinc ſoldered together at their edges, are cemented in ſuch a manner as to leave a number of water-tight cells, correſponding to the number of the ſeries: the arrangement becomes active when the cells are filled with the proper ſaline fluids; and it may at any time be eaſily freed from oxide by the uſe of muriatic acid.

In the common apparatus of Volta, that part bounded by the moſt oxidable metal, as, for inſtance, the zinc, is found in a poſitive ſtate, with regard to electricity, and the other part, as the copper, in a negative ſtate; and when a communication is made between the two ends, by means of a conducting body, a conſtant circulation of electricity is eſtabliſhed.

The electricity of the galvanic battery is capable of being partly transferred into the Leyden phial; and its effects, as has been fully ſhewn by the experiments of Meſſrs. Nicholſon, Carliſle, Woolaſton, Van Marum, and Ritter, are ſimilar to thoſe of common electricity, in a low ſtate of intenſity. It gives ſhocks to living animal organs, and excites muſcular contractions in bodies for a conſiderable time after death. It aſſumes the form of fire in paſſing from one conducting body to another in its highly concentrated ſtate; and it ignites ſmall metallic wires or leaves, and cauſes them to enter into combuſtion. It ſets fire to charcoal, ſulphur, alcohol, and other inflammable bodies; and it rapidly decompounds water and various other fluids.

The intenſity of the electricity in galvanic batteries is greater in proportion as the ſeries compoſing them are more numerous: but the quantity of it depends upon the quantity of ſurface they contain. Hence equal numbers of large and ſmall plates arranged in different batteries produce nearly the ſame effects on the human body which is an imperfect conductor, and which can admit of the paſſage only of a certain quantity of electricity of a low intenſity in a given time; but the large plates are in a determinate ratio, much more powerful in igniting the metals, and in affecting perfect conductors through which a large quantity of electricity, in any ſtate of intenſity, eaſily and inſtantly paſſes.

Many important philoſophical diſcoveries, which will be fully deſcribed in the article Galvanism, have been already made, by means of the galvanic apparatus, in different parts of Europe; and a number of enlightened experimenters have been employed in inveſtigating the principles on which its operation depends. The theory of it is, however, as yet obſcure, and the perfect developement of it will probably be connected with views more profound than any that have been as yet obtained of the nature and agencies of electricity, and its relations to chemical changes. BATTEURS *d'eſtrade*, ſcouts or horſemen, ſent out before, and on the wings of an army, two or three miles, to make-

make diſcoveries; of which they are to give an account to the general. See Scouts.

BATTEUX, Charles, in *Biography*, honorary canon of the church at Rheims, which was his native city, became profeſſor of philoſophy at the Royal College of Paris, and diſtinguiſhed himſelf by his judgment, learning, and character. He was choſen a member of the Academy of Inſcriptions in 1559, and of the French Academy in 1761. His death, which happened at Paris in 1780, is ſuppoſed to have been accelerated by the chagrin reſulting from the want of ſucceſs of the elementary works, which he drew up by order of government, for the uſe of the military ſchool. His chief publications, written in French, are the following: "A Tranſlation of the Works of Horace," 2 vols. 12mo.; "The Morals of Epictetus, extracted from his own writings," 12mo. 1758; "A Courſe of the Belles Lettres," 5 vols. 12mo. 1760; to which are annexed his treatiſes, before publiſhed; "The Fine Arts reduced to a ſingle Principle," and "On Oratorical Compoſition;" "Hiſtory of Primary Cauſes," 8vo. 1769; "The four Poetics of Ariſtotle, Horace, Vida, and Boileau, with Tranſlations and Remarks." 2 vols. 8vo. 1771; "Elements of Literature, extracted from the Courſe of Belles Lettres," 2 vols. 12mo.; "Elementary Courſe for the Uſe of the Military School," 45 vols. 12mo.; and "Tranſlations of Ocellus Lucanus, and Timæus Locrenſis." Nouv. Dict. Hiſt.

BATTIE, William, in *Biography*, born in Devonſhire, in 1704, received his education at Eton School, whence he went in 1722, to King's College in Cambridge. On the death of his father, his mother moved to Eton, and afterwards to Cambridge, that ſhe might be near her ſon, and aſſiſt in leſſening his expences. The Craven Scholarſhip becoming vacant ſoon after his admiſſion, the Doctor offered himſelf as a candidate, and had the good fortune to be ſucceſsful. Of the importance this ſmall ſtipend, only 25l. per annum, was to him, we may judge, from what he ſays on the ſubject, in a letter to a friend. "I ſhall now," he ſays, "begin to live agreeably, and have, I hope, got through the worſt part of my life." A recollection of the utility of this ſtipend to him, it is probable, Bowyer ſays, induced him, in the latter part of his life, to found a ſimilar ſcholarſhip, at the ſame univerſity. Purſuing his ſtudies, in 1726, he was made Bachelor, and in 1730, Maſter of Arts; he was alſo now one of the Fellows of the College. In 1729 he publiſhed a ſpecimen of an edition of Iſocrates, in one volume 8vo. He at firſt propoſed ſtudying the law, and his finances not being equal to the expence of taking chambers in one of the inns of court, in London, he communicated his intention to two wealthy couſins in the city, of the name of Coleman; but as they declined aſſiſting him, he turned his mind to the ſtudy of medicine, and in 1737, he took the degree of Doctor in that faculty. For a ſhort time he practiſed medicine at Cambridge. Removing thence, he went to reſide at Uxbridge, where, acquiring the confidence of ſome of the principal families in the neighbourhood, he ſoon came into conſiderable practice. About the year 1739, he married the daughter of Barnham Good, one of the maſters of Eton, having kept up an intimacy with the lady from the time of his quitting the ſchool. He was now alſo noticed by his relations, the Colemans, who were ſo much gratified by the conſequence to which they ſaw him riſing, that the ſurvivor of them left him 30,000l. Continuing a few years longer at Uxbridge, he at length removed to London. In 1745, we find him, Fellow of the College of Phyſicians. The ſame year he ſpoke the Harveian Oration, which was publiſhed the following year. About the ſame time he was elected Fellow of the Royal Society. In 1749, he completed his edition of Iſocrates, which was publiſhed in two volumes, 8vo. Though this work was not well received by the critics, it was always a great favourite with the Doctor. The year following he experienced a ſerious mortification. For taking an active part in a diſpute between the College of Phyſicians and Dr. Schomberg, and being one of the moſt ſtrenuous in oppoſing his admiſſion as a Fellow, he was held up to ridicule in a ſatyrical poem, under the name of the Battiad, in which a ludicrous account is given of the diſpute, as well as ſome ſevere ſarcaſms on his favourite work. The Battiad is ſuppoſed to have been the joint production of Moſes Mendez, Paul Whitehead, and Dr. Schomberg. It was publiſhed, at the time, in folio, and afterwards, in 1776, in a collection of humorous pieces, in 2 vols. 8vo. Another edition of this collection, much enlarged, was printed in 1792, in 4 vols. 12mo. There being at this time but one public aſylum in London, for the reception of inſane perſons, which had been long found inſufficient to contain all the indigent objects labouring under this affliction, a ſubſcription was ſet on foot by ſome wealthy and benevolent individuals, to erect another edifice for the purpoſe, on the plan of Bethlehem Hoſpital. The ſcheme was ſo much approved, and ſo largely patronized, that in 1751 the managers of the fund were enabled to take, and fit up, a large building on the north ſide of Moorfields for the purpoſe, and as Dr. Battie had been very active in promoting the ſubſcription, he was appointed phyſician to the inſtitution, which was called St. Luke's Hoſpital. It contained one hundred and ten beds, eighty of which were appropriated to recent caſes, ſuch as were ſuppoſed capable of being relieved, or cured by medical treatment, and thirty for old and incurable caſes. By the good conduct of the managers, and the character the charity thence acquired, the committee found themſelves enabled, in 1781, to take a piece of ground, in Old Street, and erect a large and magnificent building for the reception of the patients, who were removed into it in 1786. The new building contains beds for 185 recent and curable patients, and for 120 incurables. The preſent phyſician, who was elected into the office, in 1781, is Dr. Samuel F. Simmons.

In 1757 Dr. Battie publiſhed a treatiſe on Madneſs, 4to. in which, having thrown out ſome cenſures on the medical practice formerly uſed in Bethlehem Hoſpital, Dr. John Monro, whoſe father was implicated in the cenſures, replied, rebutting his charges, and having humorouſly taken for the motto to his remarks, "O major tandem parcas inſane minori." The Dr. was afterwards called by the wits, Major Battie. In 1762 he publiſhed "Aphoriſmi de cognoſcendis et curandis morbis nonnullis, ad principia animalia accomodata," taken principally from his Lumleian lectures. In February 1763 he was examined before a committee of the Houſe of Commons, on the ſtate of the private mad-houſes in the kingdom, which he ſhewed them, from inſtances that had fallen under his notice, to be ſo ill conducted, as ſometimes to be uſed as priſons for perſons whoſe relatives were intereſted in getting them out of the way. This gave riſe to a ſeries of regulations, made by the legiſlature, with a view of preventing the continuance of thoſe practices; but they were not completely ſuppreſſed until the year 1774, when the power of licenſing private mad-houſes was veſted in the college of phyſicians.

As the Doctor had for ſeveral years confined his practice to maniacal caſes, he had now leiſure to indulge his inclination for building, to which he was much attached. Beſides a large houſe, No. 88, Great Ruſſel Street, Bloomſbury, for his town reſidence, he built an elegant villa at Twickenham, lately the reſidence of the Counteſs Dowager Pawlet. He

alſo

alſo erected a more conſiderable houſe on the banks of the Thames, at Marlow, in Buckinghamſhire, where he paſſed much of his leiſure time, in the latter part of his life. Theſe houſes were built under the immediate inſpection of the Doctor, and after his own deſigns. He died of a paralytic ſtroke, at his houſe in Great Ruſſel Street, the 13th of June 1776, aged ſeventy-two years. Having no male iſſue, his great property, upwards of 90,000l. was divided between his three daughters, of whom the eldeſt was married to captain, afterwards admiral Sir George Young, who ſold the houſe at Marlow, called Court Garden, to Richard Davenport, Eſq. an eminent ſurgeon of Eſſex Street, in the Strand, London; the ſecond, to Philip Raſhleigh, Eſq. a gentleman of Cornwall; and the third, to the late Sir John Call, baronet.

BATTIFOLIUM, or BATTIFOLLUM, in *Antiquity*, a kind of tower or defence, frequently mentioned by Latin hiſtorians of the middle age. It ſeems to have been wood, and to have been erected on ſudden and haſty occaſions.

BATTLE, in *Geography*, a ſmall market town of England, in a hundred of the ſame name, in Suſſex, is ſituated 6 miles from Haſtings, and 56 ſouth-eaſt from London. It was originally called Epiton; but the deciſive victory at Haſtings, gained by William, duke of Normandy, over king Harold, induced the former, when he was fixed on the throne, and founded the abbey, to change the name of the town to that which at preſent it retains. Battle conſiſts of one principal ſtreet, indifferently built; and the pariſh church is a neat building, the incumbent of which is ſtiled dean of Battle. The inhabitants ſupport alſo a charity ſchool for forty boys. The gunpowder which is manufactured here is eſteemed the beſt in Europe, and hence called "Battle powder," though the town cannot boaſt of any other trade. The neighbourhood, however is ſo fertile, that an incredible number of large cattle are conſtantly ſent up to the London markets for ſale, eſpecially what are denominated ſtall-fed oxen, which produce the largeſt beef in England. Henry I. granted a market to be kept on every "*Lord's day*;" but Anthony, lord Montague, who, about 1600, built himſelf a beautiful ſeat here, obtained an act of parliament to change the market day to Thurſday, as it now continues. Battle is reckoned unhealthy on account of its low dirty ſituation. Its greateſt boaſt is the magnificent abbey built by William the Conqueror, on Heathfield, near the town, in 1067, to compenſate in ſome ſmall degree for the effuſion of blood the year before; the higheſt altar of the fabrick ſtanding on the very ſpot where the body of the brave but unfortunate Harold was found. This abbey was filled with Benedictine monks from Normandy, and endowed with ſuch extenſive privileges, that if a convict were paſſing to execution, it was in the abbot's power inſtantly to releaſe him, ſhould they meet on the road. At the diſſolution its revenues were valued at 880l. 14s. 7d. The ruins of the abbey are very ſtately; and what remains undeſtroyed, ſerves as a houſe for the family of Webſter, and for the purpoſes of the town, the gate-houſe being uſed as the hall in which are held ſeſſions and other meetings for this peculiar juriſdiction. From Standard and Tillman hills are very extenſive proſpects. A fact related of abbot Hamo, in 1381, is worth recording; a body of Frenchmen landing and attacking Rye and Winchelſea, Hamo raiſed whatever force he could collect, repaired to Winchelſea, and having fortified it as well as he was able, checked the progreſs of the enemy, till the force of the country was ſufficiently powerful effectually to repel them. Battle has three fairs, and two hundred and ninety-four houſes, inhabited by 2040 perſons.

BATTLE *Iſland*. See BAY of *St. Louis*.

BATTLE, a river in New South Wales, which runs N. E. into Saſkahawen river, S. E. from Mancheſter houſe.

BATTLE, or *Battel, Wager of*, in *Law*, a ſpecies of trial of great antiquity, which had its origin in the military ſpirit of our anceſtors, blended with ſuperſtition, and which conſiſted in a kind of appeal to Providence, under an apprehenſion and hope, however preſumptuous and unwarrantable, that heaven would give the victory to him who had the right. Concerning the early hiſtory and general prevalence of this mode of trial, ſee COMBAT. This trial, which had been the immemorial practice of all the northern nations, and which had been firſt reduced to regular and ſtated form among the Burgundi, about the cloſe of the fifth century, and paſſed from them to the Franks and Normans, was introduced into England, among other Norman cuſtoms, by William the Conqueror; but it was only uſed in three caſes, one military, one criminal, and the third civil: the firſt in the court martial, or court of chivalry and honour; the ſecond in appeals of felony; and the third upon iſſue joined in a writ of right. In theſe writs of right, the "jus proprietatis" could not often be aſcertained without difficulty; and this mode of determining it was allowed for the ſake of ſuch claimants as might have the true right, but yet by the death of witneſſes, or other defect of evidence, be unable to prove it to a jury. Although the writ of right itſelf, and of courſe this mode of trial, be at preſent much diſuſed, yet it is ſtill law and in force, if the parties chuſe to abide by it.

The laſt trial by battel that was waged in the court of common pleas at Weſtminſter, though one afterwards occurs in the court of chivalry in 1631, and another in the county palatine of Durham in 1638, was in the 13th year of queen Elizabeth, A. D. 1571; and was held in Tothill fields Weſtminſter, "non ſine magna juris conſultorum perturbatione," ſays ſir Henry Spelman, who was himſelf a witneſs of the ceremony. The form of it, deſcribed by judge Blackſtone, is as follows.

When the tenant in a writ of right pleads the general iſſue, viz. that he hath more right to hold, than the demandant hath to recover; and offers to prove it by the body of his champion, which tender is accepted by the demandant; the tenant in the firſt place muſt produce his champion, who, by throwing down his glove as a gage or pledge, thus wages or ſtipulates battel with the champion of the demandant; who, by taking up the gage or glove, ſtipulates on his part to accept the challenge. The reaſon why it is waged by champions, and not by the parties themſelves, in civil actions, is becauſe, if any party to the ſuit dies, the ſuit muſt abate and be at an end for the preſent; and therefore no judgment could be given for the lands in queſtion, if either of the parties were ſlain in battel: and alſo that no perſon might claim an exemption from this trial, as was allowed in criminal caſes, where the battel was waged in perſon.

A piece of ground is then in due time ſet out, of ſixty feet ſquare, encloſed with liſts, and on one ſide a court erected for the judges of the court of common pleas, who attend there in their ſcarlet robes; and alſo a bar is prepared for the learned ſerjeants at law. When the court ſits, which ought to be by ſun-riſing, proclamation is made for the parties, and their champions; who are introduced by two knights, and are dreſſed in a coat of armour, with red ſandals, barelegged from the knee downwards, bareheaded, and with bare arms to the elbows. The weapons allowed them are only batons, or ſtaves, of an ell long, and a four-cornered leather target; ſo that death very ſeldom enſued this civil combat. In the court military indeed they fought with ſword and lance, according to Spelman and Ruſhworth; as likewiſe in France only villeins fought with the buckler and baton, gentlemen armed at

all

all points. And upon this and other circumſtances, the preſident Monteſquieu hath, with great ingenuity, not only deduced the impious cuſtom of private duels upon imaginary points of honour, but hath alſo traced the heroic madneſs of knight-errantry, from the ſame original of judicial combats. But to proceed.

When the champions, thus armed with batons, arrive within the liſts, or place of combat, the champion of the tenant then takes his adverſary by the hand, and makes oath that the tenements in diſpute are not the right of the demandant; and the champion of the demandant, then taking the other by the hand, ſwears in the ſame manner that they are; ſo that each champion is, or ought to be, thoroughly perſuaded of the truth of the cauſe he fights for. Next an oath againſt ſorcery and enchantment is to be taken by both the champions, in this or a ſimilar form; "hear this, ye juſtices, that I have this day neither eat, drank, nor have upon me, neither bone, ſtone, ne graſs; nor any inchantment, ſorcery, or witchcraft, whereby the law of God may be abaſed, or the law of the devil exalted. So help me God and his ſaints."

The battel is thus begun, and the combatants are bound to fight till the ſtars appear in the evening: and, if the champion of the tenant can defend himſelf till the ſtars appear, the tenant ſhall prevail in his cauſe; for it is ſufficient for him to maintain his ground, and make it a drawn battel, he being already in poſſeſſion: but, if victory declares itſelf for either party, for him is judgment finally given. This victory may ariſe, from the death of either of the champions: which indeed hath rarely happened; the whole ceremony, to ſay the truth, bearing a near reſemblance to certain rural athletic diverſions, which are probably derived from this original. Or victory is obtained, if either champion proves *recreant*, that is, yields, and pronounces the horrible word of *craven*; a word of diſgrace and obloquy, rather than of any determinate meaning. But a horrible word it indeed is to the vanquiſhed champion: ſince as a puniſhment to him for forfeiting the land of his principal, by pronouncing that ſhameful word, he is condemned, as a recreant, "amittere liberam legem," that is, to become infamous, and not be accounted "liber et legalis homo;" being ſuppoſed by the event to be proved forſworn, and therefore never to be put upon a jury, or admitted as a witneſs in any cauſe.

This is the form of a trial by battel; a trial which the tenant, or defendant, in a writ of right, has it in his election at this day to demand; and which was the only deciſion of ſuch writ of right after the conqueſt, till Henry II. by conſent of parliament, introduced the *grand aſſiſe*, a peculiar ſpecies of trial by jury, in concurrence therewith; giving the tenant his choice of either the one or the other. Which example, of diſcountenancing theſe judicial combats, was imitated about a century afterwards in France, by an edict of Louis the Pious, A. D. 1260, and ſoon after by the reſt of Europe. The eſtabliſhment of this alternative, Glanvil, chief juſtice to Henry II., and probably his adviſer herein, conſiders as a moſt noble improvement, as in fact it was, of the law.

The trial by battel may alſo be demanded at the election of the appellee, in either an appeal or an approvement; and it is carried on with equal ſolemnity as that on a writ of right; with this difference, that there each party might hire a champion, but here they muſt fight in their proper perſons. And therefore if the appellant or approver be a woman, a prieſt, an infant, or of the age of ſixty, or lame, or blind, he or ſhe may counterplead and refuſe the wager of battel; and compel the appellee to put himſelf upon the country. Alſo peers of the realm, bringing an appeal, ſhall not be challenged to wage battel, on account of the dignity of their perſons; nor the citizens of London, by ſpecial charter, becauſe fighting ſeems foreign to their education and employment. So likewiſe if the crime be notorious; as if the thief be taken with the "mainour," or the murderer in the room with a bloody knife, the appellant may refuſe the tender of battel from the appellee; for it is unreaſonable that an innocent man ſhould ſtake his life againſt one who is already half-convicted.

The form and manner of waging battel upon appeals are much the ſame as upon a writ of right: only the oaths of the two combatants are vaſtly more ſtriking and ſolemn. The appellee, when appealed of felony, pleads *not guilty*, and throws down his glove, and declares he will defend the ſame by his body: the appellant takes up the glove, and replies that he is ready to make good the appeal, body for body. And thereupon the appellee, taking the book in his right hand, and in his left the right hand of his antagoniſt, ſwears to this effect. "Hoc audi, homo, quem per manum teneo, &c." "Hear this, O man, whom I hold by the hand, who calleſt thyſelf John, by the name of baptiſm, that I, who call myſelf Thomas, by the name of baptiſm, did not felonioufly murder thy father, William by name, nor am any way guilty of the ſaid felony. So help me God, and the ſaints; and this I will defend againſt thee by my body, as this court ſhall award." To which the appellant replies, holding the bible and his antagoniſt's hand, in the ſame manner as the other: "Hear this, O man, whom I hold by the hand, who calleſt thyſelf Thomas, by the name of baptiſm, that thou art perjured; and therefore perjured, becauſe that thou felonioufly didſt murder my father, William by name. So help me God and the ſaints; and this I will prove againſt thee by my body, as this court ſhall award." The battel is then to be fought with the ſame weapons, viz. batons, the ſame ſolemnity, and the ſame oath againſt amulets and ſorcery, that are uſed in the civil combat: and if the appellee be ſo far vanquiſhed, that he cannot or will not fight any longer, he ſhall be adjudged to be hanged immediately; and then, as well as if he be killed in battel, providence is deemed to have determined in favour of the truth, and his blood ſhall be attainted. But if he kills the appellant, or can maintain the fight from ſun-riſing till the ſtars appear in the evening, he ſhall be acquitted. So alſo if the appellant becomes recreant, and pronounces the horrible word of *craven*, he ſhall loſe his "liberam legem," and become infamous; and the appellee ſhall recover his damages, and alſo be for ever quit, not only of the appeal, but of all indictments likewiſe for the ſame offence. Blackſt. Com. vol. iii. p. 337, &c. vol. iv. p. 346, &c.

BATTLE, in the *Military Art*, ſignifies an engagement between two hoſtile armies, drawn up in regular order, in a country ſufficiently open for them to encounter in front at the ſame time; or ſhould ſome obſtacle occur to hinder the readily entering into action of the whole line, for the greater part of an army to begin the attack upon the troops oppoſed to them, the reſt remaining in fight, ready to act as occaſion may require their aſſiſtance or co-operation.

Other conflicts, when only certain points of the armies are engaged, though generally of much longer duration, and often attended with ſuperior ſlaughter, are only termed fights, or, as they are called by the French, *combats*. (Feuquiere's Memoires, chap. 80.) Under this denomination rank therefore, though as obſtinate as moſt others on record, the engagements of Senefle, of Steinkerke, of Oudenarde, and of latter days, thoſe of Zorndorff and Hochkirchen, equally celebrated on account of the carnage which attended them, and the importance of their conſequences.

The

The loſs of a battle involves almoſt always that of the artillery of the vanquiſhed, and frequently of the baggage. As all theſe loſſes muſt be repaired before the beaten army can again look their conquerors in the face, the enemy conſequently remains for a length of time maſter of the country, and at liberty to carry all his projects into execution. Theſe inconveniences are rarely ſo ſeverely felt in caſe of ill ſucceſs in a partial combat, however deſperate. Greater part of the artillery is generally preſerved, and the baggage almoſt entire, for the oppoſite armies not cloſing in front, the diviſions which have been engaged alone become the ſufferers.

But in a ſet or pitched battle, the preſent object of attention, where both parties have time and room ſufficient to arrange and extend themſelves in regular order, the caſe is widely different. The leaſt unforeſeen advantage afforded to an enemy, or the moſt trivial circumſtance unattended to, may baffle the efforts of the moſt experienced general, may ſnatch the palm of victory from the hands of numbers and valour, convert a ſucceſsful purſuit to a diſorderly flight, and lead to the irretrievable ruin of an army, poſſibly even of a ſtate.

The ancients never joined battle without a great deal of preparation and religious ceremony; as making auguries, offering up ſacrifices, haranguing to excite the courage of the ſoldiers, giving the word, or a teſſera, &c. The ſignals of battle were, among the Romans, ſounding the claſſicum, or general charge, ſtriking upon their ſhields with their javelins, and diſplaying from the prætorium a peculiar flag, called by Plutarch (in Fab. Max. and in Pomp.) a red mantle. Cæſar alſo mentions this flag in his B. Gallico, l. ii. c. 20. In the moment of onſet, a ſhout was raiſed by the whole army, for the double purpoſe of encouraging their fellows, and ſtriking terror into the enemy. Similar to this was the cuſtom which prevailed among the Greeks, of ſinging the pæan, or hymn of combat, as they moved forward to the charge.

The rigid ſuperſtition of the Jews at firſt prevented them from fighting, or even from defending themſelves, on the ſabbath-day; but fatal experience of the inconvenience of the latter precept, induced them, in their wars with the princes of the Syro-Macedonian dynaſty, to diſpenſe with its obſervance. It was, however, in conſequence of the averſion they ſtill retained to a violation of that holy day, that Pompey became maſter of Jeruſalem by aſſault, without any effectual reſiſtance. Dion. Caſſ. lib. xxxvii.

The Romans did not carry their regard for religion ſo far. They had indeed their peculiar days, called "præliares dies," wherein alone it was *lawful* to join battle; and others whereon it was unfit, called "dies atri:" but leſs ſcrupulous than the Hebrews, theſe latter were only obſerved in reſpect of attacking. No day was too ſacred for them to defend themſelves in. (Macrob. Saturn. lib. i. c. 6.) We obſerve frequent inſtances of their engaging by night. It was by night that Scipio deſtroyed near Utica the armies of Aſdrubal and Syphax (Liv. xxx. c. 5.); and the deciſive battle between Pompey and Mithridates (Plut. in Pomp.) was fought by moonlight.

The Athenians were prohibited, by the ancient laws of their country, from drawing out their forces for battle till after the 7th day of the month; and Lucian, ſpeaking of the Lacedæmonians, relates, that by the ſtatutes of Lycurgus, they were not to fight before the full moon. A ſimilar cuſtom prevailed among the ancient Germans, who reputed it an impiety to engage in the wane of the moon; and Cæſar intimates that his victory over Arioviſtus was owing to that prince's having, contrary to the religious notions of his countrymen, fought during the decreaſe of the moon. The barbarians were intimidated with the apprehenſion, and afforded Cæſar an eaſy conqueſt. To uſe his own words: "Acie commiſſa impeditos religione hoſte vicit." Cæſ. de Bel. Gal. lib. i.

An idea of the manner in which warlike operations were carried on, and battles fought, among nations in their primitive barbarous ſtate, has been given under the article ATTACK. We ſhall not here repeat what has been already ſaid on that ſubject.

Authors are fond of quoting the battle of Thymbra, between Cræſus and Cyrus (Xenoph. Cyrop. lib. vi, vii.), as the firſt general engagement ever fought. But as it is only related in the Cyropædia, a work whoſe hiſtorical veracity has been ſeverely called in queſtion, and as its recital is attended with circumſtances of the moſt romantic caſt, we ſhall content ourſelves with barely mentioning it, and paſs on to inſtances better authenticated, and leſs embelliſhed by the marvellous.

At the battle of *Marathon* (Herod. Erat. ſect. 107. 117.) the Greeks, conducted by Miltiades the Athenian, demonſtrated the poſſibility of compenſating by diſcipline, valour, and military ſkill, for any inferiority in numbers. A manœuvre not without its faults, but novel in the art of war as then underſtood, obtained for them a victory as ſplendid as extraordinary; and which we may rank as the earlieſt in profane hiſtory, of which any particular account has been tranſmitted to us.

The battle of *Platæa*, from the numerous forces engaged on either ſide, beſt deſerves the denomination of a pitched battle. (Herod. Calliope, ſect. 61—74.) It was fought upon the true ancient model. Hurry and confuſion reigned predominant. Greeks and Perſians engaged in two ſeveral places, without any attempt at co-operation, or the ſmalleſt exertion of military genius on the part of their commanders. In the true language of Homer, here "man was oppoſed to man, and ſhield met ſhield;" and the Greeks ſeem to have fairly atchieved this aſtoniſhing conqueſt by excelling their adverſaries in the vulgar qualities of bodily ſtrength and brutal courage.

After toiling through the heavy and ſanguinary period of the Peloponneſian war, where, though convinced at every page of the rapid improvement of the Greeks in tactics, we do not meet with any of thoſe general or important conteſts, the ſubject of the preſent article; and after taking a curſory examination of the maſſacre of Cynaxa; we at length arrive at the battle of *Leuctra*. (Plut. in Pelop. Xenophon. Hellen. lib. vi. Diod. Sic. lib. xv.) This brilliant engagement, between numbers comparatively trifling, deſerves from a ſcientific reader more attention than that of Platæa, as it is indiſputably the firſt occaſion on which victory was obtained merely in conſequence of an able diſpoſition. The famous column of Epaminondas, which obliged 24,000 Lacedæmonians, the braveſt troops in Greece, to yield the honor of the field to 6,000 Thebans, has been repeatedly cited with admiration by the moſt learned authors, and imitated by the firſt military geniuſes, on various occaſions.

The battle of *Mantinæa*, the next inſtance worthy of particular obſervation, was won by the ſame general (Xenoph. Hellen. lib. vii.) on the very ſame principle. The Lacedæmonians, though conducted by their king Ageſilaus, one of the ableſt leaders of his age, ſuffered themſelves to be again deſtroyed, by the preciſe diſpoſition which had already proved ſo fatal to them at Leuctra. The Spartan glory, by the loſs of this battle, ſuſtained a blow it never afterwards recovered. Epaminondas, whoſe genius had made the braveſt ſoldiers in all Greece ſhrink before weaker nerves, meaner ſpirits, and

inferior numbers, expired on the field he had immortalized no leſs by his perſonal exploits, than his able arrangements before the action. Henceforth pitched battles are more frequently diſtinguiſhed by maſterly ſtrokes of generalſhip.

The formidable phalanx, then a late invention, no leſs than his own military talents, ſecured to Philip of Macedon his important triumph at Chæronæa. (Diod. Sic. lib. xvi. ch. 86.) The three great battles of Alexander againſt Darius were gained but with little difficulty, owing to the ſuperior tactics of the Greeks. Thoſe of Iſſus and Arbela in particular (Arrian. Alex. iii. ſect. 15. Quin. Curt. lib. iv.) were only ſlaughter. When we read that in the latter, with the loſs of only 1200 of his own men, the Macedonian deſtroyed, according to the leaſt exaggerated accounts, 40,000 of the Perſians (Arrian ſays 300,000), it is pretty plain that the reſiſtance was but nominal, and that the conquerors had little more trouble than to do execution on their enemies.

The Grecian hiſtory, ſubſequent to Alexander, is replete with inſtances of pitched battles; but of which little or no particular account has been left us. We are for the moſt part in the dark with reſpect to the order obſerved in drawing up the rival armies, and the manœuvres which accelerated or retarded a victory. The abrupt termination of the hiſtory of Diodorus Siculus, deprives us of any details reſpecting the battle of Ipſus, except the brief and unſatisfactory account of Plutarch (in Dem.). The number of the ſlain alone leaves us ſometimes a little room to judge of the importance or the obſtinacy of a conflict.

Polybius, however, has left us (lib. ii.) a full and intereſting account of the deciſive engagement at *Sellaſia*, which, for a time, completely ſubjected the Grecian ſtates to the power of Macedon. Here again the phalanx determined the fortune of the day, and demonſtrated the ſuperiority of its cloſe and impenetrable order, over the more looſe and ſhallow battalions of their antagoniſts.

Among the Romans we ſhall find ſtill further occaſion to remark the rapid improvement of ancient tactics. Guided by Polybius and Livy, we peruſe with peculiar intereſt the account of battles fought for the maſtery of the world, perpetually differing in ſituation, in ſucceſs, and in conſequences. That of *Tunis* in particular, between Regulus and Xanthippus, calls ſtrongly upon the attention. We are not dazzled by a long liſt of numerous forces and barbarous auxiliaries, fatigued by a repetition of deſultory attacks and repulſes, or bewildered amidſt a ſeries of complex manœuvres. Two armies nearly equal in numbers, of ſmall ſtrength, but ſupereminent valour, headed by renowned generals, encounter on a ſpot of ground eaſily ſurveyed by the eye of imagination. We remark their ſeveral diſpoſitions. The ſimple narrative of the hiſtorian points out clearly and ſatisfactorily the faults or advantages of thoſe diſpoſitions, the miſtaken raſhneſs of the Roman, and the conſummate generalſhip of Xarthippus; and before we enter upon the viciſſitudes of the action, we are fully convinced that the errors committed by Regulus muſt ultimately lead to his total defeat. Polyb. lib. i.

The march of Hannibal into Italy furniſhes us with ſeveral inſtances of pitched battles, various in their nature, important in their conſequences, and intereſting in deſcription. Far from being fatigued with following the brave Carthaginian through a continual ſcene of ſlaughter, we conſider and admire his conduct, feel for his difficulties, eagerly accompany him in the field of carnage, and take a lively intereſt in his proceedings. The three famous engagements of the *Trebia* (Polyb. lib. iii. Liv. lib. xxi. ſect. 53—56.); of the lake *Thraſymenus* (Polyb. ib. Liv. lib. xxii. ſect. 4—7.); and of *Cannæ* (Polyb. ib. Liv. xxii. ſect. 44—52.); riſing in importance one above the other, chiefly arreſt our attention. We find that previous to every one of theſe, the arrangements made by Hannibal were ſuch as almoſt to enſure ſucceſs. A ſeries of artful movements were conſtantly employed to draw the Romans into the ſnares prepared for them; and their commanders, deſtitute of the genius it was neceſſary to oppoſe to ſo formidable an enemy, ruſhed, as it were, blindfold upon their ruin; though poſſeſſed in each of the conteſts we have juſt named of every advantage of numbers, reſources, and, we may even add, of valour. The talents of a ſingle man reduced thoſe advantages to nothing. Their numbers were converted into an hindrance to themſelves, their reſources were intercepted or rendered uſeleſs, and their valour, degenerating into deſpair, precipitated them madly upon certain deſtruction.

No action was ever more obſtinately fought, or as a pitched battle deſerves more conſideration, than that of *Zama* (Liv. lib. xxx. ſect. 32—35. Polyb. Fragm. lib. xv.), where the fortune of a Scipio finally triumphed over the Carthaginian republic. Without more than barely naming it here, we refer the reader for a more particular account of that celebrated affair, to the article Zama.

From this time, Roman diſcipline and valour reigned triumphant in every ſtruggle with foreign nations. The armies of Antiochus, Perſeus, and Mithridates, were deſtroyed, for the moſt part, with ſcarcely an effort; and the battles they ventured in defence of their dominions are only miſerable inſtances of the inferiority of mere courage, ſupported by tenfold numbers, to the cool and ſteady bravery of veteran ſoldiers, directed and managed by the talents of an experienced general.

But however cheaply the legions of Flaminius, of L. Scipio, of P. Æmilius, and of Lucullus, had earned their laurels, a harder taſk was impoſed on thoſe who, under Cornelius Sylla, and Julius Cæſar, turned their arms againſt their own countrymen. They had to engage with troops equally courageous, expert, and ſtrictly diſciplined; with men who, under Marius and the great Pompey, had exterminated the hordes of the ſavage Cimbri, and had ſubjugated the eaſtern world; in a word, with Romans. Three pitched battles, thoſe of *Pharſalia*, *Thapſus*, and *Munda*, ſignalized this bloody period, and gave ample ſcope for the exertion of the utmoſt talents of the matchleſs Cæſar. Yet in the laſt of theſe engagements, that conſummate general confeſſed, that he contended not for victory, but for his life; a ſatisfactory evidence of the deſperation with which it was fought. Plut. in Cæſ.

The two battles of *Philippi* are equally famous. Few have been more deciſive in the event, or more diſtinguiſhed for the uncommon perſeverance and obſtinacy with which they were conteſted.

In the age of Tacitus, we find the military ſcience of the Romans brought to perfection. Similar to the train of artillery which modern generals carry into the field, the army of Vitellius at *Cremona* planted its baliſtæ to play upon the enemy, and with ſhowers of immenſe ſtones, ſwept them away by whole ranks. (Tacit. Hiſt. lib. iii. ſect. 23.) This battle, and the ſubſequent ſtorming of the adverſe camp by the legions of Veſpaſian, give us a perfect inſight into the mode of warfare as then practiſed. Tacit. ibid. ſect. 21—33.

In the lower ages of the empire we meet with very few inſtances of conflicts, remarkable either for their long duration or for any celebrated manœuvres put in execution by rival generals. Nations relapſed faſt, even in this deſtructive ſcience, into their original barbariſm. Armies were no longer compoſed

compoſed of troops regularly trained and inured to ſervice, but of cowardly and undiſciplined plunderers, to whom victory or defeat was alike the ſignal for diſbanding, on whoſe exertions therefore but ſmall dependence could be placed, and from whoſe ſucceſſes little or no benefit could be derived. Numbers ſoon became, as formerly, the criterion of advantage. War teemed with ſanguinary combats, productive of trifling conſequences. Courage ſupplied the place of generalſhip; fury and carnage, of diſcipline.

Never did a ſeries of pitched battles follow each other in more rapid ſucceſſion, than during the period ſubſequent to the firſt irruption of the Arabs into the more civilized provinces of Aſia. Theſe enthuſiaſtic followers of their prophet, iſſuing from a peninſula of contemptible extent when compared to the empires they ſo madly attacked, dared to match their own puny forces againſt the united efforts of the Roman and Perſian monarchies. As we accompany them in their progreſs, the moſt incredible victories crowd upon and haraſs our reflections. It is true, that among theſe engagements, ſo general, ſo bloody, and ſo deciſive, we do not find the ſlighteſt trace of diſcipline or generalſhip. A religious fury, altogether irreſiſtible, compenſated with the Arabs the want of both theſe requiſites. Aiznadin, Kadeſia, and Yermouk, are laſting monuments of Moſlem glory; but they do not convey the leaſt information to the military reader, or recompenſe in intereſt the attention he may beſtow in peruſing them.

Alike barren, dry, and unintereſting are the details of moſt of thoſe battles fought between the time of Charlemagne and the beginning of the ſeventeenth century. Whether we peruſe the murderous annals of the Cruſades, where all Europe and Aſia ſeem mingled in reciprocal carnage; or the bloodleſs combats of the Italians in the days of Machiavel, when, after fighting a whole day, armies have ſeparated without the loſs of a man on either ſide (Machiav. Hiſt. Flor. lib. vii.); we are alike diſguſted with the want of circumſtances to excite our attention.

Creſſy, Poictiers, and Agincourt are names venerated with reaſon by every Engliſhman; but ſetting aſide any conſideration of the ſplendid carnage which attended them, and examining them in a military point of view, how little ſhall we find to extol, how much to cenſure. In all the three caſes, the Engliſh armies were brought into the moſt imminent danger by the boyiſh imprudence of their leaders, who marched them, as it were blindfold, into the heart of an enemy's country, without taking the ſmalleſt pains, either to ſecure the neceſſary ſupplies of proviſions, or to enſure a retreat. Not to be behind hand in imprudence, the French generals, although certain of ſtarving their antagoniſts into a ſurrender merely by an inconſiderable delay, had three times ſucceſſively the inſanity to march up and attack the Engliſh ſtrongly and advantageouſly poſted, and on ground too where not a fourth of their own numbers was capable of acting. Untaught by experience, they loſt the three great battles by exactly the ſame fault; and in all three (the conteſted tradition of the artillery uſed at Creſſy alone excepted), we find no reaſon to commend the military ſcience of our anceſtors. Indeed, at Poictiers, the Black prince poſſeſſed ſagacity ſufficient to line the hedges on both ſides of a narrow way with archers, for the purpoſe of annoying the French gens d'armes as they advanced through it to the attack: a ſtratagem not half ſo commendable as that of Nevil earl of Saliſbury at the petty ſkirmiſh of Bloreheath in the reign of Henry VI. (Holinſhed); an affair as much ſurpaſſing Poictiers in a tactical conſideration, as inferior in the bloody liſt of the killed, and the conſequences that enſued upon it.

In proportion as we approach nearer to modern times, we view the military ſcience making falter ſtrides towards improvement. The invention of gunpowder effected by degrees an important change in the whole art of war. The arms and order of the battalions underwent a total alteration. The cavalry, formerly the main dependence of an army, inſomuch that no perſon of family would ſerve in any other capacity than as a horſeman, became a mere appendage to the infantry, who, ſince the invention of fire-arms, have generally decided the event of battles. The muſquet and bayonet are now ſubſtituted for the pike and ſword; and armies, like fortified places, muſt be approached in form, and battered down by artillery, while the moſt complete defeat is rarely attended with worſe conſequences than the loſs of the ſurrounding territory.

About the year 1630, the entrance of Guſtavus Adolphus and his Swedes into the German empire, and the great events which ſignalized the war of thirty years, render military hiſtory more intereſting. The celebrated battles of *Leipzick* and *Lutzen*, where the firſt modern uſe was made of the column, now the chief inſtrument of the gain of victories, are remarkable epochs. On thoſe days the hard-earned laurels of Tilly and of Walſtein faded in a moment before the comprehenſive genius of Guſtavus, who by his ſkilful diſpoſitions bought, though with his life, the title of the firſt general of his age. A ſucceſſion of heroes, Weimar, Bannier, Torſtenſon, and Wrangel, adopted and improved upon his maxims. Condé and Turenne profited anew by the example; and a ſucceſſion of victories obtained under their auſpices, rendered the arms of Louis XIV. during 50 years invincible.

On entering upon the hiſtory of the war of 1690, we are ſurprized at the rapid improvements in that part of the military art, the ſubject of the preſent article. The engagement of *Steinkirk* preſents a remarkable inſtance of the recovery of an affair judged entirely deſperate. The battle of *Landen* ſhews us an army entrenched behind a number of fortified villages, driven from all its defences, and carried as it were by ſtorm. The bayonet, uſed firſt by Catinat at the action of Marſaglia, added a new and terrible weapon of offence to the infantry, and by degrees entirely ſuperſeded the uſe of the pike. The reader will now obſerve armies more numerous and more regularly ſubſiſted than formerly, plans of attack and defence more ingenious and connected, artillery more formidable and better ſerved, and a degree of method in military operations not before practiſed.

In the war of ſucceſſion, or that which took its riſe from the ſeparate claims of the houſes of Bourbon and Auſtria to the Spaniſh monarchy, the three great battles of Hochſtedt, of Ramillies, and of Turin, immortalized by the abilities and ſplendid victories of Eugene and Marlborough, claim particular attention. To enlarge upon each under the preſent article, would treſpaſs too much on the boundaries aſſigned to us; we therefore refer the ſcientific reader to the heads HOCHSTEDT, &c. where he will find a ſuccinct account of thoſe engagements, illuſtrated by the critical remarks of an excellent military judge, M. de Feuquieres.

Of all the battles fought by Charles XII. in his nine years' war with the Ruſſian empire about the ſame period, that of Pultowa alone is remarkable in a tactical point of view. Narva, Duna, Cliſſow, &c. furniſh but ſplendid and tranſitory inſtances of ſucceſsful raſhneſs in a military madman. The battle, or rather five battles, of Leſno on the Soſſa, fought by general Lewenhaupt againſt the whole forces of the Czar, are intereſting in ſo far as they diſplay the aſtoniſhing reſources of Swediſh valour.

From a tranquillity of fifty years, hardly interrupted by the ſhort conteſt for the ſucceſſion of Poland, Europe was arouzed by the war of 1740. With wonder we behold a nation, hardly before reckoned in the number of her powers, a nation of ſoldiers, ſtart into energy; and, headed by a monarch who to the moſt conſummate generalſhip joined the qualifications rarely found in military men, of love for the ſciences, and genius for their improvement, perform the moſt aſtoniſhing and romantic exploits. It would be ſuperfluous to follow the Pruſſian hero through his career of victory and glorious diſtreſs, or to enumerate the various means and manœuvres by which he triumphed at Friedberg, at Prague, at Liſſa, at Zorndorff, and at Torgaw, over the firmneſs and diſcipline of Auſtrian forces, the talents of a Daun, and the enterprize of a Laudohn. Nor have we room to enter into details of his defeats at Kolin, Hochkirchen, and Cunnersdorff; defeats which only throw additional luſtre on his tranſcendent abilities.

It ſeemed impoſſible for human genius to ſurpaſs the bounds preſcribed by the immortal Frederic to modern tactics. His hand had modelled armies into mere machines, liable to be directed with promptitude at the pleaſure of the mover. The ſyſtems practiſed in the Pruſſian and Auſtrian ſchools, ſeemed to defy alteration or improvement; and the art of drawing up armies in order of battle particularly was reduced to certain rules, adapted to all ſituations, and which enſured every preſumptive means of ſucceſs.

A revolution, the effects of which have been ſeverely felt in the moſt remote corners of the globe; a revolution, which has ſhaken the religious and political opinions of the moſt powerful nations, arrived to overturn monarchies, to change the face of Europe, and to convert it into one vaſt theatre of war. The military art did not eſcape the general influence. When the armies of Pruſſia and Auſtria, numerous, valiant, and bred up in the ſchools of Frederic and Laudohn, poured their united forces upon the French republic, oppoſed only by raw levies, undiſciplined, half armed, and conducted by generals, many of whom knew nothing of ſervice by experience; what reſources could we ſuppoſe a nation to poſſeſs, capable of counterbalancing ſuch diſadvantages. But with amazement we view the diſciplined invaders, at the end of the firſt campaign, driven back with ſhame and defeat. We view the beſt officers in Europe in a diſgraceful retreat before mere novices in the art of war. We view enthuſiaſm ſupply the place of commanders, of numbers, and of diſcipline.

One general battle had ſubjugated Belgium to the diſpoſal of France, when the treachery of a general not only occaſioned the loſs of that country, but endangered the frontier of the republic itſelf, then covered only by a diſorganized army. Nevertheleſs, during a long and bloody campaign, the forces of almoſt the whole of Europe united ſtrove in vain to break through the firſt line of the bordering fortreſſes. The ſcene was ſoon totally changed. The collected energy of a nation, overbearing all oppoſition, repelled the attack; retaliated invaſion; and by ſeven of the moſt brilliant campaigns recorded in hiſtory, atchieved ſuch important, rapid, and extenſive conqueſts as almoſt exceed credibility.

We muſt not place to the ſole account of enthuſiaſm theſe wonderful ſucceſſes. Enthuſiaſm alone, though backed by ſtill greater numbers, muſt ultimately have proved inſufficient, when oppoſed to diſciplined troops and ſkilful generals. The art of war gradually aſſumed a new face. To the maxims of the German ſchool, others ſucceeded ſtill more prompt, more energetic, and peculiarly adapted to the nation which carried them into execution. To the excellence of their artillery, their ſkill in the art of managing the bayonet, and the incredible rapidity with which they have executed the different modes of charging in column, as well as to the extraordinary talents of their ſelf-taught generals, the French owe chiefly their ſucceſſes in the late war. Under the article COLUMN, we ſhall hazard ſome obſervations on their mode of engaging.

In a war ſo productive of bloody and general engagements as the laſt, it would be ſuperfluous to dwell on particular inſtances. Never in one campaign did ſo many battles take place as in 1794, when from the beginning of April forwards hardly a day paſſed without ſome deſperate conflict. In point of conſequences, we muſt aſſign the firſt rank to Jemappe, Tirlemont, Haguenau, Fleurus, Milleſime, Arcole, Marengo, and Hohenlinden; but if we only conſider the ſlaughter on both ſides, Lodi, Verona, Stockach, Novi, and Zurich ſtand pre-eminent. A few remarks upon theſe, with ſome other affairs of principal conſequence, will be found under their proper heads.

When we conſider the immenſe reſources required to maintain a large army, and the inconvenience with which the movements of more unwieldy bodies are ſtill attended, we ſhall find room to commend the leſs extenſive ſcale on which we carry on our wars, compared to that of more ancient times. Indeed the armies, which we are aſſured have been brought forth to battle in the earlier ages, almoſt ſtagger our belief. Seſoſtris is ſaid (Diod. Sic. i.) to have led 600,000 foot, 24,000 horſe, and 27,000 armed chariots, on his famous expedition into Upper Aſia. The ſame hiſtorian ſwells the armies of Ninus and Semiramis to two and three millions of men. We are told in ſcripture that Zerah, a barbarous potentate, invaded the kingdom of Judah with a million of his ſubjects, who were totally exterminated by the Jewiſh monarch Aſa; nor are the accounts of the numbers engaged at mount Zemaraim on both ſides, and the carnage of the Iſraelites on that occaſion leſs marvellous. (II. Chron.) Darius, in his Scythian expedition marched at the head of ſeven hundred thouſand of his ſubjects (Herod. lib. iii.) Xerxes invaded Greece with a fleet of more than 1300 triremes, and a land army of 2,100,000 men. According to Herodotus (lib. vii.), the whole of his ſea and land forces numbered above five millions. Theſe numbers, immenſe as they are, will hardly appear exaggerated, when we reflect on the hoſts afterwards brought into the field by the Goths and Huns, and the formidable ſwarms of Croiſes in the middle ages. The laſt Darius, when he engaged Alexander at Iſſus, muſtered in his army ſix hundred thouſand men; and ſome hiſtorians make his forces at the battle of Arbela amount to a million.

The eaſe with which theſe immenſe hoſts were defeated by comparatively trifling numbers of Greeks, gives us the moſt mean idea of their bravery and military ſkill. We muſt except the inſtance of Platæa, where the victory was obſtinately diſputed, and the carnage conſequently dreadful. There are few inſtances upon record of a battle ſo completely deciſive. Of 300,000 men, of whom the Perſian army conſiſted at the commencement of the action, not four thouſand eſcaped the deſtruction of that fatal day. (Herod. ix.)

The Romans, although they ſometimes kept very numerous forces on foot in different parts of their dominions, ſeldom employed above forty thouſand men in the ſame army. In their war with the Ciſalpine Gauls, ſubſequent to the firſt Punic, they levied between ſeven and eight hundred thouſand troops; but theſe all acted in ſeparate corps. One of the largeſt armies they ever brought into the field, was that defeated, or rather deſtroyed, at Cannæ by Hannibal. It conſiſted of 76,000 foot and 7,200 horſe, of all whom only

only about 3000 eſcaped death or captivity. This defeat, terrible as it was, was ſome years after revenged by the ſlaughter of 60,000 Carthaginians on the banks of the Metaurus. (Polyb. lib. ii & iii. Livy.)

We ſhudder at the cruelties which ſometimes accompanied the triumphs of Rome over her more barbarous and undiſciplined enemies. L. Scipio deſtroyed 50,000 Syrians at Magneſia. Marius, in his conteſt with the Teutones, took or exterminated above 300,000 of them. In a ſecond battle, againſt the Cimbri, he ſlew 120,000, and captured half that number. In three battles againſt the generals of Mithridates, Sylla cut in pieces 200,000 men. The bloody defeats he ſuſtained from Lucullus, during the ſiege of Cyzicus, coſt the ſame Mithridates three hundred thouſand of his forces. On one occaſion, Julius Cæſar annihilated an army of 368,000 Helvetii; on another, he extirpated upwards of 430,000 Germans, who had croſſed the Rhine in queſt of new ſettlements. (Livy. Plut. in Mar., Sylla, & Lucull. Cæſ. de Bell. Gall.)

In the civil wars of the Romans themſelves, we find inſtances, conſidering the inferior numbers of the troops engaged, of ſlaughter equally dreadful. In the battle before the Colline gate of Rome, Teleſinus, a general of the Marian faction, commanded 79,000 men againſt Cornelius Sylla; 12,000 of theſe being taken, were chiefly maſſacred in cold blood after the action: all the reſt periſhed either on the field or in the flight by the ſwords of their implacable countrymen. In juſtice to Cæſar we muſt obſerve, that his triumphs over the Pompeian party were in a great meaſure exempt from theſe atrocities. (Plut. in Sylla. Eutrop.)

It is the well-founded remark of a judicious and elegant writer, that our European battles appear only as ſkirmiſhes, when compared to thoſe which have deluged the plains of Aſia with blood. (Voltaire, Eſſai ſur l'eſprit et les mœurs des nations.) In the year 1218, fatally diſtinguiſhed as being the epocha of the firſt irruption of the Moguls and Tartars into the ſouthern provinces of Aſia; the deſtroyer Ghengis-Khan marched to the ſiege of Otrar at the head of 700,000 combatants. Mohammed, the reigning ſultan of Karazm, oppoſed him with an army 400,000 ſtrong. The weaker party were defeated, and the Tartar conqueror commenced his ſanguinary career by the deſtruction of 150,000 of his enemies. This firſt chaſtiſement only paved the way for others ſtill more terrible. In following the great Khan through the dreadful ſcenes tranſcribed by De la Croix from the beſt Eaſtern authorities, we are ſhocked at the unheard of ſeverities exerciſed upon ſuch cities as moſt incurred his anger by an obſtinate reſiſtance. The particulars of ſuch tragedies would but diſguſt the reader. To ſelect a few of the moſt remarkable inſtances:—At the ſtorming of Karazm, Mohammed's capital, 200,000 perſons were maſſacred, and half that number ſold for ſlaves; 90,000 were ſhot to death with arrows in cold blood on the plains of Neſa; 1,747,000 were butchered in the two cities of Niſhabûr and Tûs, and their dependencies; 1,600,000 in the diſtrict of Herat; and in the laſt battle fought by Ghengis Khan againſt the rebels of Tangut, 300,000 are reported to have periſhed. To diſmiſs this ſubject, the Chineſe records inform us, that in the firſt fourteen years of the Mogul empire, the numbers of perſons deſtroyed by Ghengis Khan amounted to the dreadful total of eighteen millions and upwards. (Petit de la Croix, Hiſt. de Gheng. Khan, Par. 1710. Mod. Univ. Hiſt. vol. iv.)

The ſubſequent wars of the Moguls abound with examples of almoſt equal enormity. In the ſiege of the capital of the Chineſe empire by Oktay Khan, a million of people were ſlain on both ſides. Timur Bek, who carried on his expeditions upon the ſame plan as Ghengis, could bring 800,000 men at once into the field, with whom he ſo completely defeated at Aneyra 400,000 Turks under Bajazet, that not a fortieth part eſcaped the common deſtruction. In a word, it is in Aſia that war has always been waged on the moſt gigantic ſcale.

Leſs bloody in their conqueſts, and more generous in their diſputes, the armies which during the two laſt centuries have been ſet on foot by European nations, were comparatively trifling in number. The battle of Malplaquet, where 220,000 men were engaged on both ſides, is moſt remarkable for the number of the combatants; thoſe of Hochſtedt and Prague for the deſtruction of the human ſpecies. At Hochſtedt, the French and Bavarian army, which before the action muſtered 60,000 men, was reduced to one third of that number. The battle of Prague coſt the king of Pruſſia, by his own confeſſion, 18,000 of his beſt troops, while the Auſtrians loſt 24,000 men.

It is with ſorrow we are obliged to remark, that the carnage on ſeveral occaſions, during the laſt unhappy conteſt, has been unexampled in the hiſtory of modern war. Upon the Rhine, in particular, the loſs on both ſides, towards the latter end of December 1793, is computed at 80,000 men.

The following conciſe liſt of the moſt remarkable and deciſive battles which have taken place (chiefly in Europe) from the earlieſt ages, may not prove wholly unacceptable.

	B. C.
Marathon, between the Greeks and Perſians, fought	490
Himera, in Sicily, between the Greeks and Carthaginians,	480
Platæa, Greeks and Perſians,	479
Mycale, in Ionia,	479
Eurymedon,	470
In Egypt, between the Athenians and Perſians,	460
Of the Aſſinaros, in Sicily, between the Athenians and Syracuſans,	413
Cynaxa, in Perſia,	400
Coronea, between Ageſilaus and the forces of the Theban alliance,	394
Leuctra, where the Spartans were entirely defeated by Epaminondas and the Thebans,	371
Mantinæa,	363
Cheronæa,	338
Of the Granicus,	334
Iſſus,	333
Arbela, or Gaugamela, which ſubverted the Perſian empire,	331
Of the Hydaſpes, between Alexander and Porus,	327
Ipſus, in Phrygia,	301
Beneventum, in Italy, between Pyrrhus and the Romans,	274
Agrigentum, in Sicily, between the Romans and Carthaginians,	262
Tunis, in Africa, do.	255
Panormus, in Sicily, do.	251

The chief view of the great commanders of modern times has been, till of late years, rather to haraſs, or ſtarve an enemy, by frequent alarms, by cutting off his ſupplies of proviſions, carrying off his baggage, ſeizing his poſts, &c. than to ſtake their fortune and reputation on the event of a day; a battle generally deciding the fate of a campaign, and not unfrequently of the war. It is therefore a rule never to venture a general action without important reaſons, or when abſolute neceſſity leaves no other choice.

Reaſons for ſeeking and engaging the enemy are, a decided ſuperiority in number or quality of forces; diſcord among the commanders of the oppoſite army, when actuated by different intereſts; an obvious incapacity on their part, demonſtrated by a neglect of the ordinary precautions in encamping, or on a march, the neceſſity of relieving a conſiderable place beſieged by the adverſary; an apprehenſion of the total ruin and diſperſion of an army, unleſs prevented by ſucceſs in a general engagement; an intelligence of reinforcements coming to the enemy, whoſe junction would render him ſuperior, and change the ſtate of affairs; a particular advantage obtained in ſome preceding action, which, however indeciſive, has given the enemy a ſmart check, and procured an evident ſuperiority; or in fine, the obligation of putting all to the riſk of a battle.

The moſt proper reaſons for avoiding it are; the having leſs to hope for from a victory, than to fear from an overthrow; inferiority either in number or courage of the troops; an expectation of freſh ſuccours, or the junction of a conſiderable detachment; the impoſſibility of bringing the enemy, too advantageouſly poſted, to an engagement on fair terms, or of forcing him in his entrenchments; or the proſpect of ruining his army by temporiſing, and declining battle. See ACTION.

But a reſolution to engage being once taken, in conſequence of one or other of the reaſons above recited, the next object to be conſidered is the means of carrying it into execution with the ſtrongeſt preſumption of ſucceſs. Thoſe meaſures are partly preparatory to the affair; but the moſt important and eſſential chiefly take their riſe out of the different circumſtances of the action itſelf, and are thoſe which almoſt always determine its ſucceſs.

Preparatory to fighting, a general ſhould carefully obſerve the following particulars. He ſhould form the order of battle according to the ſtrength and quality of the troops of which his own army is compoſed, always having an eye towards counteracting the diſpoſition in which it is expected to find the enemy. The general officers ſhould be aſſigned their reſpective poſts, and copies of the order of battle carefully ſent to ſuch as have a ſeparate command, who muſt be reſponſible for its obſervation in every reſpect. All the troops muſt be perfectly armed and equipped; the proper number of cartridges diſtributed previouſly to the battle; waggons loaded with ammunition, and arms ſtationed in the rear of thoſe battalions, which, it is preſumed, will have the hotteſt fire to ſuſtain; and a freſh reſerve provided at the park of artillery; as well to give out before and during the action, if wanted, as after it is over, when there are generally many miſſing. Time, if poſſible, ſhould be allowed to the troops to reſt and refreſh themſelves, before the engagement. Phyſicians, ſurgeons, and medicines muſt be provided, and rather more in number than may be deemed barely ſufficient. The army muſt be totally diſencumbered of the heavy baggage, and the remainder lodged in a place of ſafety at ſome diſtance. The advantages of ſun and wind, however trivial, are not to be neglected. The ſoldiers ſhould likewiſe be inſpired with the deſire of fighting, and a certainty of victory; inflamed with the hope of plunder and good quarters; and the officers reminded of glory and of rewards.

Thoſe occaſions of conquering which commonly only preſent themſelves on the day of battle are, taking advantage of the ground; ſtrict obſervance of the diſpoſition already concerted, and, ſhould a correction prove neceſſary, the making of it without confuſion, and with the knowledge of all thoſe officers, who, from their ſituations, ſhould become appriſed of it. The artillery is to be planted along the line, according to the nature of the country; and every opportunity narrowly watched of gaining an advantage, either by extending the wings to turn, if poſſible, the flanks of the enemy; or by cloſing and protecting, to draught ſufficient troops from them for a grand attack where the enemy may appear moſt feeble. Should the march to the enemy be made by night, or little probability offer of finiſhing the conteſt before dark; the word ſhould be given to the whole line before they march. If the advance is made in line, due care ſhould be taken to preſerve the equality of the wings, and the requiſite diſtance between the lines; frequent halts ſhould be made, to give the artillery time to fire and load, and the ranks to recover their order. Frequent warnings, above all, ſhould be given the ſoldiers to receive the enemy's fire, and abſtain from returning it till they have drawn their adverſaries' ammunition from them: for troops who have parted with their fire will moſt infallibly give way on ſeeing an opponent advance, ready to pour in a heavy volley upon them. If, however, both parties purſue the ſame maxim, the only expedient is, to march up cloſe to the enemy, give in a general diſcharge upon them, and prevent its being returned by immediately having recourſe to the bayonet, under cover of the ſmoke, which ſeldom fails to produce an important effect.

If the advancing army, by reaſon of the diſtance it has to march, or the inequality and cloſe nature of the ground, or defiles, it muſt paſs, cannot come at the enemy in front, the approach muſt be made in a ſufficient number of columns, to admit the formation in order of battle, out of diſtance of be-

ing charged when in column. The general officers who conduct thefe columns ſhould alſo carefully obſerve the motions of each other, ſo that the heads of their diviſions may at leaſt preſerve a front; and that, when arrived at the ground where the army is to deploy into line, the movement may be executed with diligence and caution, and at too great a diſtance to be attacked by the enemy before all the battalions are drawn up in the pre-concerted order.

The commander in chief ſhould poſt himſelf where he may beſt and moſt conveniently remark the effect of the firſt charge, and whence he may with the leaſt difficulty diſperſe his orders, either to ſuſtain the troops who may have broken the enemy, or to replace ſuch as have themſelves been thrown into diſorder. For both theſe purpoſes he ſhould make uſe of the ſupernumerary forces ſtationed between the two lines, or of thoſe of the reſerve, as he may judge moſt adviſable. Every other general officer ſhould be at his particular ſtation, either to lead to the charge, or to remedy the diſorders which may ariſe in the brigade entruſted to his command.

If the battle becomes general and bloody, and ſucceſs inclines to neither ſide, the commander in chief ſhould direct his principal effort againſt that part of the line where the enemy's reſiſtance is moſt obſtinate; and in this caſe he ſhould himſelf haſten to the ſpot, to animate the troops by his preſence, and induce them to charge, under his eye, with greater vigour. If ſucceſs is complete throughout the firſt line, and it entirely overthrows that of the enemy, the principal attention of the general, and of the other officers, ſhould be employed to reſtrain the ſoldiers, prevent them from leaving their colours to follow up the flyers, and, committing the purſuit to ſome detached corps of cavalry and infantry, to march in good order, at a ſteady pace, to ſuſtain theſe detachments, and aſſail the ſecond line of the enemy. The artillery ſhould always accompany the firſt line, in the order already diſtributed, in caſe the nature of the ground allows of it. The remainder of the army ſhould follow the movement, always obſerving, without confuſion, the diſtance between the two lines appointed by the order of battle.

Should the firſt line give way, or be thrown into diſorder by the enemy, the battalions are to retire through the intervals left between thoſe of the ſecond line, behind which they are to halt and rally. Great care is here neceſſary to be taken by the officers, that inſtead of paſſing through the intervals, the routed troops do not directly ruſh in upon the ranks of the ſecond line, and either carry them off in the general flight, or throw them into ſuch confuſion and diſorder as it may be impoſſible to repair before the enemy are upon them.

On the firſt line's giving way, the ſecond ſhould march up briſkly to its relief, and charge furiouſly upon the enemy without giving him time to repair the diſorder into which the action and purſuit muſt of courſe have in ſome meaſure thrown him. By executing this with promptitude and determination, it is often eaſy to retrieve the ground which has been loſt, and to defeat and render uſeleſs the enemy's firſt line, already conſiderably weakened and deranged by the former attacks. It is the ſooner effected, as the enemy's fire which does moſt execution is thrown away; the ſubſequent diſcharges, from the great hurry of loading, being of little conſequence, in compariſon with the firſt. The great miſchief is, that the ſecond line, on ſeeing the firſt give way, are uſually ſtruck with a panic which magnifies the enemy, and on his nearer approach, either betake themſelves to flight, or make but a faint reſiſtance.

If, on the other hand, the victory ſtill remains conſtant, and the adverſe ſecond line is overthrown, the general in chief ſhould uſe ſtill greater care than formerly to prevent his ſoldiers from diſperſing, leſt they ſhould be charged and routed by the firſt line of the enemy, which may have retired and rallied behind their ſecond. He ſhould puſh the beaten troops, ſtill keeping his men in good order, and in line, till their confuſion is general. He muſt then progreſſively augment the number of his detached forces; without, however, once ſuffering any individual to quit his colours, unleſs commanded. It is at this moment that he ſhould employ his reſerve, and the diſtant corps which have not been engaged, to purſue the enemy, prevent them from rallying, and, *laſt of all*, to make priſoners, which the men ſhould *never* be ſuffered to do during the combat, or even to think of the booty, till the victory is abſolutely gained, and the enemy ſo ſcattered and at a diſtance, as to leave no longer any fear of their turning upon the different detachments employed in the purſuit. The general may then, for the reſt of the day, ſuffer his ſoldiers to collect the booty. If, in full purſuit, the detachments fall in among the enemies' baggage, they muſt not be ſuffered to diſband inſtead of following up their advantage. Their officers muſt with extreme attention, ſeverity, and even blows, if milder methods are of no avail, puſh them forward till they have got clear of the baggage, employ them only in taking the enemy priſoners, or cutting them down, and leave the pillage for the reſt of the troops.

The firſt care of a general after the gain of a battle, ſhould be to pay proper attention to his wounded, and viſit, or at leaſt ſend to viſit, the principals among them; to learn what valiant actions have been performed in different parts of the field; and to praiſe in general the whole army, particularly thoſe who moſt deſerve it. He ſhould collect the trophies of his conqueſt, ſuch as the priſoners, colours, ſtandards, kettle-drums, and artillery, taken from the enemy; give, without delay, a firſt account of his victory to his court, and follow it up by another and more circumſtantial detail, accompanied by the colours and ſtandards he has won. Then, after burying the dead, diſburthening his camp of the wounded of both parties, the priſoners, artillery, and other ſuperfluities, and ſuffered the army to take a little repoſe, in the execution of all which the leaſt poſſible delay ſhould be made, the victorious general may apply himſelf to derive from his ſucceſs every advantage which time or place can furniſh, in execution of the plan already concerted or reſolved on.

But as the fortune of war is changeable, and notwithſtanding every poſſible precaution taken to enſure ſucceſs, a defeat will ſometimes happen, the whole care of a general, as well as his officers, ſhould ſuch an unforeſeen event take place, muſt be exerted to prevent an entire rout. The commander ſhould have this poſſibility always preſent to his mind. His own experience and ſagacity, pointing out to him the critical moment preceding the loſs of a battle, will alſo teach him to take all thoſe meaſures proper for diminiſhing the diſorder of a flight. A laſt effort may be made with ſuch troops as yet remain unbroken, to give time to thoſe already routed to re-aſſemble and rally in the rear, and thus ſecure an orderly retreat. A poſt may be occupied impregnable to the enemy; or a defile be ſecured through which the defeated army may paſs, and re-form behind it in ſafety.

As the loſs of the battle generally involves that of the baggage, ſhould it accompany the troops, and almoſt always that of the artillery, the general ſhould only remain in the firſt poſition to which he has retired for ſafety, as long as may be neceſſary to collect the remainder of his forces, after which he may conduct them to a fortified camp, and there repair his loſſes, as well with cannon and arms brought from the adjacent garriſons, as by the ſuccours which may arrive to him. If the loſs is ſo ſerious as to threaten that of ſome conſiderable place, he ſhould throw the beſt of his infantry into the garriſon, and keep the field with the cavalry, in

order to incommode the enemy if he form the ſiege; or keep him in awe, and prevent him from dividing his forces, if his object is only to penetrate into the country, and lay it under contribution.

If the conqueror, on account of his loſs in the engagement, finds his infantry too much weakened to undertake a heavy ſiege; ſhould he be diſabled from attempting it for want of heavy artillery and ammunition; or ſhould he derive no other profit from his victory than that of diſconcerting his enemy's projects, remaining maſter of the open country during the reſt of the campaign, or procuring his men quarters upon hoſtile territory; the vanquiſhed general ought, after the firſt retreat, to occupy a defenſible poſition in the vicinity of ſome large town, whence he may procure thoſe accommodations his defeat may have deprived him of; ſuch as, cordials and medicines for the ſick, freſh baggage in lieu of that loſt, &c. He ſhould encourage his troops, without again facing the conquerors till he has repaired his loſſes by the arrival of new ſuccours, new arms, freſh ammunition, and artillery, has cured the wounded, and finds himſelf ſtrong enough to oppoſe the enemy, and prevent his eſtabliſhment in advantageous quarters.

Bland, Military Diſcipline.—Memoire de Feuquieres, c. lxxx.

Battle was alſo a term formerly uſed to denote a body of forces drawn up in order of battle, and amounts to the ſame with what is otherwiſe called Battalion.

In this ſenſe we meet with the length or depth of the *Battle;* the front, rear, and flanks of the *Battle.*

Battle, *length of the*, is the number of ſoldiers in rank, or the ſpace from the left flank to the right.

Battle, *depth of the*, is the extent of a file, or the number of men from front to rear.

Battle, *line of*. See Line.

Battle *array*, the ſame with order of Battle.

Battle, *order of*, ſignifies the diſpoſition of the ſquadrons and battalions of an army, into one or more lines, according to the nature of the ground, either for the purpoſe of engaging an enemy, or being reviewed by the general.

The Egyptians, whoſe priority in civilization and in communicating the arts to the reſt of mankind is univerſally allowed, were naturally, although they ranked many great conquerors among their firſt monarchs, a pacific nation. We have no authorities to enable us to judge of the progreſs they had made in the art of war; but from the fanciful account of the battle of Thymbra, given by Xenophon in his Cyropædia, we may fairly preſume that they uſually fought in large and deep battalions, forming a complete ſquare. On the above occaſion he mentions twelve of theſe unwieldy bodies, each conſiſting of ten thouſand men, and who formed the chief dependence of Crœſus againſt the army of Cyrus.

A people ſo particularly favoured and protected by heaven, as the ancient Jews, little needed the aſſiſtance of human invention, when, on any emergency, a new miracle was always ready to enſure them ſucceſs againſt their enemies. We find, therefore, nothing in the ſacred ſcriptures that can give us an idea of any order of battle obſerved among them; although the regular diviſion of their numerous forces under David, who diſtributed them into twelve main bodies according to their tribes, and each of theſe into thouſands, or regiments, into hundreds or companies, into tens, and even into threes, induces us to imagine, that they would not entirely forget ſuch minutiæ in the field. The Jewiſh writers, followed by the author of the "Diſſertation ſur la tactique des Hebreux," affirm, that they arranged their armies in one ſingle line, of conſiderable depth, ſometimes between twenty and thirty in file. Along the front of theſe were placed the light armed men, viz. the moſt expert archers, ſpearmen, and ſlingers, who began the onſet by a warlike ſhout, and with caſting thick ſhowers of darts and ſtones againſt the enemy's front, in order to cauſe terror and confuſion, and ſtop the ruſhing in of the chariots, which among the Canaanites were very numerous, by wounding the horſes and drivers. This is the more probable, as it is a method common to moſt of the Aſiatic nations. Anc. Univ. Hiſt. vol. iii. p. 184.

The order of battle deſcribed by Xenophon (Cyropædia) to have been uſed by Cyrus at the action of Thymbra, though perhaps a viſionary one as applied in the text, may ſerve to give an idea of the method generally uſed by the ancient Perſians in drawing up their armies, with which Xenophon muſt have been well acquainted. The cavalry, in the ſituation which it is indiſpenſibly neceſſary for them to obſerve, were poſted on the wings. The heavy armed infantry, carrying, beſides the pike, a ſword for cloſe combat, and drawn up twelve deep, formed the firſt line. The ſecond conſiſted entirely of light armed, who threw their darts over the heads of the former, and annoyed and diſordered the enemy in their approach. The third line, deſtined to the ſame purpoſe as the ſecond, was compoſed entirely of archers; their bows, which were extremely well bent and ſtrung, carrying far beyond the front ranks, ſo as to exceſſively incommode the enemy. With theſe were ſometimes intermixed ſlingers, who threw large ſtones with great effect. For this purpoſe the Rhodians afterwards ſubſtituted leaden balls. The fourth line, conſiſting of heavy armed, and ſimilar to the firſt, was intended to ſupport the preceding ones, and prevent them from giving way. It alſo ſerved as a rear-guard and a corps-de-reſerve to repulſe the enemy who ſhould penetrate ſo far. The Perſians alſo made uſe of moveable towers, erected on large carriages, each drawn by ſixteen oxen, and containing twenty men, who threw ſtones and darts. Theſe were placed in line in the rear of all the army, behind the corps de reſerve, and favored the rallying of thoſe troops which were puſhed and thrown into confuſion by the enemy. They placed likewiſe great reliance in armed chariots, which they drew up ſometimes in front of the battle, and ſometimes upon the flanks, when in fear of being enveloped.

Such was the extent of the military ſcience of thoſe nations, who under Xerxes threatened Europe and the Weſt with ſubjugation. But we ſee no occaſion on which they knew how to profit by the advantage of the ground, to carry the war, when neceſſary, into a difficult country, to make uſe of defiles and ambuſcades, either for the purpoſe of covering themſelves from the attacks of the enemy, or of annoying him on his march; or to protract an unequal campaign by avoiding a deciſive action with a ſuperior antagoniſt, and reducing him to diſtreſs for want of forage and ammunition. Neither do we obſerve that they paid the requiſite attention to the ſupporting their flanks by rivers, moraſſes, or heights, when it would have been advantageous by giving them an equal front to an army much more numerous, and putting them out of danger of being ſurrounded. Rollin, Hiſt. Ancienne; liv. iv. ch. 4.

The Perſians made ſome alterations in this ſyſtem; but they were far from being judicious. Artaxerxes Mnemon at the battle of Cunaxa, threw all his forces into one line, for the purpoſe of ſurrounding or outflanking thoſe of his brother Cyrus; but he preſerved the clumſy order of ſquare battalions, whoſe unwieldineſs rendered it impoſſible for them to take advantage of a ſucceſs with the neceſſary promptitude, to retreat with facility, or manœuvre with any effect. The diſpoſition of Mnemnon the Rhodian, in oppoſing the

paſſage of the Granicus by Alexander was leſs faulty. He formed two lines; the firſt of cavalry to aſſail and diſorder the Greeks as they attempted to gain the bank of the river; and the ſecond, at ſome diſtance, of infantry, with the intention, no doubt, of ſupporting the firſt: but, however judicious this arrangement might have been, he wanted genius or inclination to profit by it, and tamely ſuffered the Macedonians to reach the ſhore, defeat the cavalry oppoſed to them, and form their phalanx undiſturbed for the attack of his heavy-armed foot, without ſtirring from his poſition, or caſting a ſingle javelin. It is impoſſible to read, without indignation, the unſoldierlike details of the pompous march of Darius, and the extreme folly, as well as ignorance, conſpicuous in the order of battle he made his armies obſerve at Iſſus and Gaugamela. His awkward evolutions on the former occaſion, diſordered his forces before the commencement of the action. In the latter inſtance he preſerved the ruinous arrangement of his infantry by nations, in huge ſquare battalions; he intermixed them with corps of horſe no leſs unwieldy; and, not content with having committed faults ſo inexcuſable, he ſurpaſſed them both by another. The nature of the ground, not allowing his immenſe army to extend itſelf upon a ſingle front, ſeemed to point out the neceſſity of a ſecond line, or at leaſt a corps de reſerve. He indeed drew up, behind his centre, ſeveral immenſe battalions for which he had no room in front; but ſo cloſe to the firſt line, that when theſe gave way, the reſerve, inſtead of ſupporting, ſerved only to augment their diſorder. Againſt ſuch an enemy, it is by no means ſurpriſing that Alexander ſhould have been, with inferior forces, ſo completely ſucceſsful. Xenoph. Anab. lib. i. Arrian. in vit. Alex. lib. i. & iii.

We now turn to the Greeks, who, of all people of antiquity, the Romans excepted, were the beſt judges of warlike affairs and military conduct; but we cannot eaſily excuſe them for the overſight they almoſt conſtantly committed in the drawing up of their whole army on one front, and truſting to a ſingle effort the ſucceſs of the day. Their infantry conſiſted of two kinds of ſoldiers. The heavy armed, who carried large bucklers, lances, and ſwords, and in whom conſiſted the principal ſtrength of the army; and the archers and ſlingers who were generally diſtributed along the front of the line, and employed their ſtones, darts, and arrows, to diſorder the ranks of the enemy. Having made their diſcharges, they retired round the flanks into the rear of the heavy armed, whence they continued throwing their darts during the reſt of the action. As for the heavy armed, or Hoplites, we ſhall follow Thucydides in deſcribing their diſpoſition, according to the Lacedæmonian ſyſtem, that nation being then reckoned the moſt expert among the Greeks in military knowledge. Their battalions conſiſted of four leſſer diviſions, each conſiſting of 128 men, and ſubdivided into four others, each of 32 men. The effective force of every large corps thus conſiſted of 512 ſoldiers, who were uſually drawn up in ſmaller ones of four men in front, and eight in file. We find ſeven of theſe regiments engaged at the firſt battle of Mantinea, during the Peloponneſian War. The depth of the files was, however, often altered, when judged neceſſary by their commanders.

The Lacedæmonians never made uſe of cavalry before the Meſſenian war, on which occaſion they were convinced of the impracticability of carrying on their operations in a flat country without it. Even then they rarely exceeded the number of ſix hundred, and theſe were chiefly compoſed of the inhabitants of a little diſtrict in Laconia called Sciritis, a circumſtance from which they derived their appellation of Skirites. They were always drawn up on the left flank of the army, a poſt they claimed by right. So averſe were the Greeks in general to the uſe of cavalry, that in the moſt flouriſhing periods of the Athenian republic, they never muſtered above 1,200 in their army.

The Greek tacticians of the middle ages have exhauſted their imaginations in forming fanciful orders of battle, principally for the cavalry. Minute geometricians and theoretical ſoldiers, they have conſidered the art of war in a light entirely mechanical, and employing their pencils at random, have given us upon paper ſuch plans and diſpoſitions as only could exiſt in their own ideas, and could only originate in their ignorance of the practical part of the ſcience. It is hence we derive the rhomb, the wedge, the orbicular, oval, and angular manner of diſpoſing their forces, manœuvres perhaps of uſe in exerciſing a ſquadron, but not to be adopted in the field without imminent and inevitable danger. To form a proper eſtimation of ancient tactics, we ſhould conſult the writings of thoſe celebrated characters, who only recount what they have in perſon ſeen, and themſelves performed. Such are Xenophon, Polybius, Julius Cæſar, and Arrian. In reading them we trace the military art among the ancient Greeks and Romans to its higheſt pitch of perfection. The principal offenſive and defenſive operations of a campaign in the open country, or of a ſiege, are developed with order and perſpicuity, and the images they preſent to us are diſtinctly imprinted on our imagination. Thucyd. lib. iii.—Rollin, Hiſt. Anc. liv. x. ch. 2.—Potter. Archæol. tom. ii. lib. 3. ch. 9.—Ælian. tact. ch. 18.—Guiſchardt, Memoires Milit. in diſc. prelim.

Philip and Alexander put the laſt hand to improving the order of the Greek infantry in the creation and eſtabliſhment of their formidable phalanx. For a particular account of its formation and evolutions, we muſt refer the reader to the article PHALANX. For ſeveral ages, this was the order of battle which moſt prevailed among the nations of the then known world. The Carthaginians, the Syrians, the Egyptians, adopted its uſe. We find the generals of Mithridates employed it againſt Sylla, and the barbarous Helvetii and Germans in their conteſts with Julius Cæſar. But the difficulty of preſerving the neceſſary uniſon and order in ſo large and numerous a body; and the want of a ſecond line to ſupport it when obliged to give way, were glaring defects in its diſpoſition, and it was therefore eventually forced to give place to the more convenient and ſcientific arrangement of the Roman legion.

A Roman legion arranged in order of battle, conſiſted of thirty manipuli, of various ſtrength according to the eſtabliſhment of the legion. Suppoſing it of 5000 men, each manipulus of the Haſtati and Principes was compoſed of 140 ſoldiers;—thoſe of the Triarii only of 60: the remnant of the troops were Velites, or light armed. Livy, in deſcribing the war with the Latins, gives the following account of the ordonnance of the legion. The Haſtati, drawn up in ſeparate manipuli, formed the firſt line. The Principes, chiefly old experienced ſoldiers, were placed behind the former, but with intervals between their companies ſufficiently wide to receive the Haſtati in caſe they ſhould be obliged to retreat. The Triarii, all veterans, who beſides the ſhort ſword common to all the legionaries, were armed with long pikes, compoſed the third line; their intervals being ſo extended as to enable them to receive both the Principes and Haſtati within them without any diſorder, and ſtill facing the enemy. If therefore the Haſtati found themſelves unable to ſuſtain the charge, they retired gently within the Principes, and joining with them, renewed the combat. If theſe proved too weak for reſiſtance, both retired amidſt the Triarii, where rallying, they formed a new line, and charged with more vigour than ever.

ever. If again defeated, the battle was loſt: the Romans had no further reſource. Livy, lib. viii.—Macchiavel, art. di Guer. lib. iii. ch. i.

Theſe ſucceſſive retreats are no where mentioned, except in Livy as above ſtated; and prejudiced as we are in favour of the military ſcience of the Romans, we find it difficult to conceive the practicability of their execution. Livy has, in fact, much miſtaken the intention of the diſpoſition in quincunx of the ancient legion. Its ſole deſign was to enable the army to form with facility in that order of battle which the ſituation of the enemy, or nature of the ground, might render moſt applicable. At the moment which preceded the charge, the manipuli of the ſecond line, marching briſkly up into the intervals of the Haſtati, formed a continued front, ten files in depth, and equal to that of the enemy. The Triarii remained as a corps de reſerve. It was thus, as we ſhall inconteſtibly prove in our account of thoſe actions, that the Roman infantry were arranged at the *Trebia* and at *Cannæ*. It was thus, with ſome little variation, that they fought at *Zama*. Neither was it unuſual with them to diſpoſe their manipuli according to the principles of the column, as in the battle of *Tunis*, and that between Scipio and Aſdrubal the ſon of Giſco, in Spain. Where there was but little to fear from the impetus of the enemy, the intervals of the Haſtati were filled up by the Velites; the Principes remaining at their poſts in a ſecond line; but, oppoſed to the cloſe and heavy order of the Macedonian phalanx, a directly different diſpoſition was obſerved. The manipuli of each line, preſerving their intervals, and acting as ſeparate corps, haraſſed the enemy by deſultory attacks, obliged them to abandon their united order, in which ſituation only they were invincible, and penetrating the phalanx in every direction, obtained an eaſy triumph. Guiſchardt, Memoires Militaires, ch. iv.

As to the Velites, and in later times the archers and ſlingers, they were not drawn up in this regular manner; but diſpoſed of either before the front of the Haſtati, or ſcattered up and down among the void ſpaces of the firſt line, or finally, placed in two bodies on the wings. Theſe always began the battle, ſkirmiſhing in flying parties with the foremoſt troops of the enemy. If they were repulſed, which was uſually the caſe, they fell back to the flanks of the army, or retired through the intervals into the rear. When they retreated, the Haſtati advanced to the charge. The auxiliary forces generally compoſed the two points of the battle, and covered the whole body of the Roman infantry. As to the cavalry, it was poſted on the wings, fighting ſometimes on foot as well as on horſeback; and here we find ſome reaſon to arraign the judgment of the Romans, who never allotted a porportion of more than 300 cavalry to each legion whatever might be the nature of that country which was the theatre of the war. They made no difference between the plains of Lombardy and the mountains of Liguria; and in the Alps maintained the ſame number of ſquadrons, as in the fertile valleys of Apulia.

But the order of battle in quincunx was in proceſs of time abandoned by the Romans. The tactics of Cæſar widely differ from thoſe of Scipio and Æmilius Paulus; and the march and order obſerved by Metellus in his Numidian war againſt Jugurtha, tranſmitted to us by Salluſt, are the laſt traces we find in hiſtory of the diſpoſition which proved ſo fatal to Hannibal, to Philip, and to Perſeus. The manipuli with intervals; the three lines of Haſtati, Principes, and Triarii, differing in arms and in numbers, diſappear, and about the age of Marius, the legion aſſumes a new form. Inſtead of thirty companies, we then find it divided into ten cohorts, equivalent to our battalions, ſince they each conſiſted of from five to ſix hundred men, drawn up in a ſingle line, with a depth of eight or ſometimes nine in file. The legions of Veſpaſian, according to Joſephus, were drawn up ſix deep. This laſt arrangement continued to be obſerved without alteration during the flouriſhing ages of Rome; but as we advance nearer to modern times, we perceive their military art decline in its perfection, in proportion to the decay of their greatneſs. Under Leo and Mauritius it is as difficult to recognize the tactics, as the empire of the Cæſars. The difficulty of aſcertaining the period of theſe ſucceſſive alterations has deterred thoſe authors who have been moſt capable from undertaking the office; and finding it eaſier to ſuppoſe that Livy and Plutarch have furniſhed us with ſufficient information on the ſubject, they have concurred with thoſe writers to miſlead and perplex us. Salluſt. bell. Jug. —Cæſar.—Joſeph. de bell. Jud.—Guiſchardt, prel. diſc.

For further obſervations on the diſcipline and conſtitution of the Roman infantry, ſee the article LEGION.

For a long ſucceſſion of barbarous ages, we find nothing to intereſt us in military tactics. Imitating in a rude degree the order of battle pointed out to them by their anceſtors, the weſtern nations from the fifth to the fifteenth century, fought in large bodies, divided into an indefinite number of lines or *wards*, in every one of which the infantry, inferior in ſtrength and in importance of ſervice, compoſed the centre, flanked by the heavy armed cavalry, who always decided the fate of battles. It is in vain to ſearch for military ſcience in theſe periods, and we ſhall therefore paſs them over with all poſſible rapidity.

The introduction of artillery and fire arms neceſſarily introduced an alteration in this ſyſtem. The cavalry ceaſed to be the arbiters of ſucceſs, and declined rapidly in their importance. The deſtructive effect of the newly invented engines rendered it impoſſible to avoid making a material change in the order of the battalions. Their depth was gradually decreaſed. The method of engaging in wards was aboliſhed, as expoſing numbers of troops to be ſacrificed without occaſion; and two lines with a corps de reſerve were in time thought quite ſufficient for the purpoſe of action. The front of the army was proportionally extended, and embraced a greater extent of country. The advantages of ground, before judged in compariſon trivial, were now eagerly ſought after. Generals became from neceſſity tacticians, and by little and little, continually improving, ſometimes ſlowly, ſometimes with rapidity, the military art aſſumed the face it wears in our times; under the auſpices progreſſively of a Guſtavus, a Condé, an Eugene, a Marſhal Saxe, and a Frederic the Great, whoſe names will never be forgotten by the lateſt poſterity.

Under the articles COLUMN and LINE, to which they of right belong, we ſhall attempt to illuſtrate and compare the French and Pruſſian ſyſtems of the order of battle as now practiſed by both theſe nations; and accompany them with inſtances from among the number which have of late years fallen under our inſpection.

BATTLE, in a *Naval* ſenſe, denotes an engagement between two fleets, ſquadrons, or even ſingle ſhips. See ENGAGEMENT. The ancients had divers forms of ſea-battles; as the half-moon, circle, and forceps. In all theſe, not only the ſhips engaged each other, and by their beaks and prows, and ſometimes their ſterns, endeavoured to daſh in pieces, or overſet and ſink each other, but the ſoldiers alſo annoyed the enemy with darts and ſlings, and, on their nearer approach, with ſwords and ſpears, boarding each other by laying bridges between the ſhips.

By way of preparation, they took down their ſails, and lowered their maſts, and ſecured whatever might expoſe them to the wind, chooſing rather to be governed by their oars.

BATTLE, *Line of.* See LINE.

BATTLE, *Square.* See *Square* BATTALION.

BATTLE, *Attainder by.* See ATTAINDER.

BATTLE *royal*, in *Cock-fighting*, denotes a fight between three, five, or ſeven cocks all together; ſo as that the cock which ſtands longeſt gets the day.

BATTLE-AXE, an ancient military weapon, which, at different periods, formed a principal part of the offenſive armour.

Homer never aſcribes this weapon to any but the barbarians, for the battle-axe was not uſed in war by the politer nations. Euſtathius tells us, it was the favourite weapon of the Amazons. The only inſtance where Homer has placed it in the hands of a warrior occurs in the thirteenth book of the Iliad, when Piſander fights Menelaus: it is there called Αξινη, and is deſcribed with ſingular minuteneſs.

—ὁ δ' ὑπ' ἀσπιδος εἵλετο καλην
Αξινην εὐχαλκον, ελαΐνω αμφι πελέκκῳ,
Μακρῇ, εὐξεϛῳ. l. 611.

The Πελεκυς, mentioned in the fifteenth book, l. 710, was perhaps not very different:

Αλλ' οι γ' εἰϛυῖαι ιϛαμενοι, ενα θυμον εχοντες
Οξεϊ δη πελέκεσσι, καί αξινησι μάχοντο.

Something of this kind, it ſeems, was in uſe among the Bactrians, when they attended Xerxes' expedition: beſide bows and arrows, we are told they were armed with a ſort of hatchet, called Sagaris: (Herodotus, Polymnia lxiv.) The Lycians had axes and daggers: (Ibid. xcii.) and the Egyptians huge battle-axes.

At the ſiege of the Roman capitol, by the Gauls under Brennus, we find one of the moſt diſtinguiſhed warriors armed with a battle-axe (Plut. Camillus): and Ammianus Marcellinus, many centuries afterwards, deſcribing a body of Gauls, furniſhes them all with battle axes and ſwords. From Tacitus, it ſhould ſeem the ancient Germans had clubs, but no ſuch weapons as thoſe we are ſpeaking of: and the only inſtance in his writings where *ſecuris* occurs as an implement of combat, is where the Othonians are particularly deſcribed as ſtriking on the helmets of their antagoniſts with their axes. (Taciti Hiſt. II. xlii.) In ſhort, it was even then never uſed but among the Roman auxiliaries.

The introduction of the battle-axe into this country has been frequently attributed to the Danes; but proofs of its earlier uſe among us are not wanting, and there are inſtances known where it has been found even among the ſepulchres of the ancient Britons. Mr. Rooke, in the Archæologia of the Antiquary Society (vol. x. p. 113.) has deſcribed a fragment of an ancient battle-axe found among ſome Druidical remains in a barrow at Aſpatria in Cumberland, June 1789. And in the ſame volume (pl. xl.) are two repreſentations of the old Galwegian bill, or battle-axe, found in a moſs near Terreagles, the ſeat of Marmaduke Maxwell Conſtable, Eſq; of Nethdale in Ireland. Others have been found among the barrows on the downs of Wiltſhire, and in the north of Scotland.

That it was uſed in the early Saxon times, we have the authority of ſeveral manuſcripts of the ninth Century; and the French writers have recorded a particular inſtance of its uſe in France, ſo far back as the year 510. Clovis, they ſay, bribed the miniſters and captains of Ragnacharius to deliver up both him and his brother: and when the priſoners were brought before him, he firſt reproached them for ſuffering themſelves to be chained, and then diſpatched them with his battle-axe. See Greg. Turon. l. ii. c. 42.

The battle-axe, however, was more uſed by the Danes than any other of the Northern nations: and they were, in courſe, more expert with it. At the battle of Stamford, Oct. 24, 1066, between Harold king of England, and Harold Harfager of Norway, when the Norwegians were obliged to retire, and the Engliſh begun to purſue them with great eagerneſs, a total ſtop was put to their purſuit for ſeveral hours by the deſperate boldneſs of a ſingle Norwegian, who defended the paſs of Stamford-bridge with his battle-axe: he killed more than forty of the Engliſh, and was himſelf ſlain only by ſtratagem. (Hen. Hunt. l. vii. p. 211.) The battle-axe principally in uſe among the Anglo-Saxons appears to have been the *bipennis*, or double edged axe; the *giſarma* is ſuppoſed to have been the bipennis with a longer handle or halbert: and the *pole-axe*, with an edge on one ſide, and a ſharp point on the other, probably came in with the Normans.

During the middle period of our hiſtory we read but little of this weapon, though the Welſh infantry at the battle of Agincourt, 1415, found it particularly ſerviceable in diſpatching thoſe whom the archers had wounded with their arrows. One of the laſt inſtances of its effectual ſervice was at the battle of Tewkſbury, during the quarrel of the Roſes, when the Duke of Somerſet clave Lord Wenlock's head.

Toward the ſixteenth century it ſeems to have been gradually diſuſed, though one inſtance occurs where a piſtol placed in its handle beſpeaks a wiſh in the warriors of that period to improve its uſe. (See ARMS.) It was perhaps moſt ſerviceable when our Knights were completely caſed in armour; and has ſince degenerated into the halbert or partiſan.

BATTLEMENTS, in the *Military Art*, indentures, or notches in the top of a wall, parapet, or other building, in form of embraſures, for the ſake of looking through them, &c. much affected in the old fortification.

BATTOCHES, or BATTOGUES. See BATTACKS.

BATTOLOGY, from *βατος*, *battus*, *babbler*, and *λεγω*, *I ſpeak*, in *Grammar* a multiplying of words without occaſion, or a needleſs and ſuperfluous repetition of the ſame words, or things.

BATTONI, or BATONI, POMPEIO, *in Biography*, an eminent Italian painter of the Florentine ſchool, was born at Lucca in 1708. He was the ſon of a goldſmith, and brought up to that buſineſs; but diſcovering a ſtrong predilection for painting, he was ſupported in the Roman ſchool by a ſubſcription; and at Rome he employed himſelf in ſtudying the antique, and copying the works of Raphael, and likewiſe in forming a ſtyle of his own, from a diligent obſervation of nature. Having diſtinguiſhed himſelf both as a deſigner and a colouriſt, he was engaged in the execution of many important works, and painted altar-pieces and other pictures for various churches in Rome, Milan, Breſcia, Lucca, Parma, Meſſina, and other cities; as well as hiſtory-pieces for private perſons. One of his moſt admired works, is a holy family, purchaſed for a large ſum by the grand duke of Ruſſia. Battoni, however, acquired his principal fame as a portrait painter. Beſides three popes, he painted ſeveral of the Imperial families of Auſtria and Ruſſia. In recompence for a picture, which commemorated the interview of the emperor Joſeph with his brother at Rome in 1770, he received ſeveral magnificent preſents; and he, with all his male iſſue, was ennobled by the emperor. By the beautiful daughter of the ſurveyor of the Farneſe palace, whom he married in early life, he had ſeveral children; and two of his daughters were highly celebrated for their taſte and proficiency in muſic. As to his character, he was ſimple and modeſt, ſincere, friendly, and charitable; much attached to religion, and very aſſiduous in the exerciſe of his profeſſion. He ſeldom appeared in public, preferring a retired life, partly on account of the defects of his education, and partly by reaſon of the awkwardneſs of his figure, which ap-

proached to deformity. As a painter, he acquired eminence by the native force of his genius; and he had no rival but Mengs, who furpaſſed him in knowledge and learning, whilſt he was inferior to him in natural talents. Battoni, having completed his 79th year, died in 1787. Filkington. Biog. Dict.

BATTOON, or BATOON. See BASTON.

BATTORY, a name given by the *Hans Towns* to their magazines or factories abroad: the chief of which are thoſe at Archangel, Novogorod, Berghem, Liſbon, Venice, and Antwerp.

BATTOW, in *Geography*, a village on the weſt coaſt of Africa, S.E. from Cape Cavallos, on the weſt ſide of a ſmall river oppoſite to Zeno, or Swino, on the eaſt ſide. About half a league eaſt, are two rocks lying under water, and the breakers over them are ſeen at ſea at the diſtance of a league, and ſerve to point out the Cape and Road. N. lat. 5°; W. long. 8° 30′.

BATTRE LA MESURE, Fr. to beat time, in *Muſic*. There are various ways of marking the meaſure and accents in muſic: by dividing each bar into 2, 3, or 4 equal parts with the motion of the hand, the foot, a *baton*, or a roll of paper. In common time of 2 minims or 2 crotchets in a bar, called *binary* meaſure, the hand is merely moved down and up. In time of 4 crotchets in a bar, the French frequently mark each portion of it, by *beating* the hand down to the firſt crotchet, moving it to the left for the 2d, to the right for the 3d, and lifting it up for the laſt. In triple time, or *ternary* meaſure of 3 minims, 3 crotchets, or 3 quavers, it is uſually beaten, 2 down and one up, or the 1ſt down, the 2d to the left, and the 3d up.

The beating time is of great antiquity. The ancient Greeks had various ways of regulating the accents of ſong, and ſteps of the dance. See RHYTHM and GREEK MUSIC.

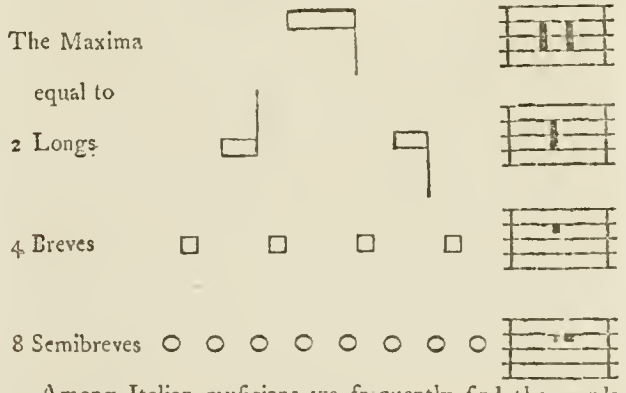
The Italians often beat the two firſt portions of a bar, and lift the hand up for the reſt, both in common and triple time.

At the Opera, concert-ſpiritual, and even at private concerts (formerly) there was a perſon at Paris, armed with a truncheon (*baton de Meſure*) like a general, whom Rouſſeau, in his Dictionary, ridicules, and ſays that he had been very aptly called the *Bucheron*, or wood-cutter; though when he wrote his muſical articles for the *Encyclopedie*, the Italians and other nations, ſtill had a *Coriſta* to regulate the meaſure in the numerous bands employed in their churches when there was a *gran Funzione* in celebration of ſome ſaint or holy time. But it was in England, at the Commemoration of Handel in Weſtminſter-abbey, that, in the moſt numerous band that ever was aſſembled in modern times, a Coryphæus was firſt diſpenſed with. See TIME, MEASURE, ARSIS & THESIS, BAR, ACCENT, & BATTUTA.

BATTUS, LIEVEN, in *Biography*, was born at Ghent, about the year 1540; but his father being obliged to remove to Roſtock, on account of the troubles about religion, when he was only ten years old, he was put under the beſt maſters that place could afford, and he ſo well profited by the inſtruction he received, that in 1559 he was appointed teacher in mathematics. In this office he continued until the year 1565, when the country being at once afflicted with war and the plague, he went firſt to Padua, and then to Venice, where he was admitted doctor in medicine. Returning to Roſtock, he practiſed medicine with ſo much ſucceſs and reputation, that he was appointed profeſſor in that ſcience, in which poſt he died, April 1591. Some ſmall medical tracts, left by him in manuſcript, were publiſhed in the Miſcellanea of Henry Suretius, at Frankf. 1611, 8vo. His ſon, Conrad Battus, following in the ſteps of his father, returning from his travels, took the degree of doctor in medicine at Baſle, in 1604, but falling down ſtairs, at his brother's houſe at Roſtock, ſoon after his return there, he received a wound in his groin, from a knife he had in his pocket, which occaſioned his death. He alſo left ſome ſhort eſſays on medical ſubjects, which were publiſhed with his father's, in the Miſcellanea.

BATTUS, CHARLES, a Flemiſh writer of ſome eminence, who flouriſhed about the end of the 16th century, publiſhed in 1598, a tranſlation of the works of Guillemæau, into his own language, folio, Dordretch, and in 1615, the works of Ambroſe Para, folio, Amſterdam, with numerous plates engraved on wood; alſo a manual for ſurgeons, with a treatiſe on wounds of the head, from Hippocrates, 12mo. Haller. Bib. Chirurg. Eloy. Dict. Hiſt.

BATTUS, an order of penitents at Avignon, and in Provence, whoſe piety carries them to exerciſe ſevere diſcipline upon themſelves, both in public and private.



BATTUSZANI, in *Geography*, a town of European Turkey, in the province of Moldavia, 44 miles N.N.W of Jaſſy.

BATTUTA, Ital. a bar in *Muſic*, or thoſe portions of a muſical compoſition, where the time is *beaten*, or marked, with the hand or foot. The Cruſca dictionary defines *battuta*; quella miſura di tempo che dà il maeſtro della muſica, in *battendo* a' cantori. Varchi, who died in 1566, and who is quoted in the Cruſca as authority for the uſe of this term, ſays; quanta noia, e faſtidio n' apportino coloro agli occhi, e agli orecchi, i quale che non ballano a tempo, o non cantano a *battuta*. What pain and uneaſy ſenſations do thoſe give us, who neither dance nor ſing in time!

Amendue parlarino in rime, canzoni, e altre ſpezie di dire con *miſura* di piede, e di tempo ſillabitati. Both pronounced in rhyme, ſongs, and other ſpecies of poetry, in meaſured feet, and poetical numbers. This paſſage is cited from a MS. of 1400.

It is not eaſy to imagine how muſic, in many parts, could be compoſed *in ſcore*, without bars or vertical lines drawn through them all, whence the term *ſcore* was derived; nor what kind of bars could contain the quantity of a *maxima*, equal to eight ſemibreves, unleſs we ſuppoſe that ſemibreves were ſung or played as quick as quavers are now. See TIME, ACCENT, ARSIS, and MEASURE.

The moſt ancient kind of time-table that has occurred in the courſe of our reſearches, conſiſted of only four ſeveral kinds of muſical characters.

Among Italian muſicians we frequently find the words *a battuta*, which import *in time* or *meaſure*, after recitative or an "ad libitum." Accordingly, *a* in the Italian muſical language, when it precedes a ſubſtantive, has the power of *in*.

BATU-PURUDAN, fluctus lapidei (*Valent.*) in *Natural Hiſtory*, one of the ſynonymes of MADREPORA LABYRINTHICA. *Gmel.*

BATUA, *Butua*, *Buthoe*, or *Buthoue*, in *Ancient Geography*, a town of Dalmatia, now BUDOA, which ſee.

BATUA,

BATUA, in *Geography*, a kingdom of Africa, in the empire of Monomatapa, extending from the mountains of the Moon to the river Magnico, whofe prince is a vaffal of the emperor. It is famous for its gold mines.

BATUDA, a method of fifhing mentioned in fome *Middle Age Writers*, wherein the fifh are driven by beating the water with poles, till flocking into one place, they are the fooner caught.

BATUECAS, LOS, in *Geography*, a people of Spain, in the kingdom of Leon, and diocefe of Coria, inhabiting a valley called "the valley of the Batuecas" encompaffed by mountains that are almoft inacceffible, between Salamanca to the north, Coria to the fouth, the river Tormez to the eaft, and the rock of France to the weft. Thefe people are fuppofed to be the remains of the ancient Goths, who took refuge in this valley among high mountains in their efcape from the Moors. Others fay, that their anceftors were ancient Spaniards or Iberians, who retired hither at the time of the invafion of the Goths. They are diftinguifhed by their barbarifm and ruflicity to fuch a degree, that the Spaniards proverbially denominate an uncivilized perfon, one who comes from the valley of Batuecas.

BATURIN, a town of the Ukraine, on the river Defna, belonging to the Ruffians, and fituate in the diftrict of Neffchin, which forms a part of Leffer Ruffia. It was deftroyed by the Ruffians in 1708; but the caftle has been twice rebuilt, and the town in fome degree repaired.

BATUS, in *Entomology*, a fpecies of CERAMBYX, found in India and South America. The thorax is wrinkled and fpinous: wing-cafes bidentated: Antennæ long, with hooked prickles. *Linn.* This is Capricornus niger. *Muf. Petrop.*

BATUSABER, in *Geography*, the capital of the kingdom of Yohor, in the fouthern extremity of the peninfula of Malacca, fituated about 6 leagues from the fea, on the river Yohor or Jor, in a marfhy fituation, fo that its fmall wooden houfes are raifed upon poles about 8 feet from the ground.

BATZ, or BATZEN, in *Commerce*, a copper coin mixed with fome filver, and current at different rates, according to the quantity of alloy, in many parts of Germany and Switzerland.

B. AV. See CHARACTER.

BAVANY, or BOWÁNY, in *Geography*, a river of Hindooftan, which runs into the Cavery, 7 miles north of Erroad in Coimbetore: N. lat. 11° 25'. E. long. 77° 50'.

BAVARIA, *Circle* of, called *Bayern* by the Germans, one of the circles of Germany, derives its name from the duchy of Bavaria, which is the moft conffiderable part of it, and is bounded on the eaft by Auftria and Bohemia, on the fouth by Carinthia and Tyrol, on the weft by Suabia and Franconia, and on the north by the Upper Palatinate, which, if conffidered as belonging to it, verges towards Upper Saxony. The dominions of the elector of Bavaria and the Palatinate, for thefe electorates are united, are computed to contain 16,176 fquare miles, and 1,934,000 inhabitants. Hoeck eftimates Bavaria at 1,339,900, and the Palatinate at 305,000. See PALATINATE. Bufching diftributes the 20 ftates of the circle of Bavaria into eccleffiaftic and laic. To the former he refers the archbifhopric of Saltzburg, the bifhoprics of Freifingen, Ratifbon, and Paffau, together with the priory of Berchtolfgaden, and the abbies of St. Emeran, Lower and Upper Munfter, all which three lie in the city of Ratifbon. The latter are compofed of the electorate of Bavaria, the duchies of Neuburg and Sulzbach, the landgravate of Leuchtenberg, the princely county of Sternftein, together with the counties of Haag and Ortenburg, and alfo the lordfhips of Ehrenfels, Sulzburg, and Pyrbaum, Hohenwaldeck, Breiteneck, and the imperial city of Ratifbon. Of this circle, the elector of Bavaria, and the archbifhop of Saltzburg, are joint fummoning princes. The diets, though ufually held at Ratifbon, are fometimes fummoned to Waffferburg, Landfhut, and Muldorf. When the military force of the empire, in time of peace, was fettled in 1681, at 40,000 men, the number required to be furnifhed by this circle was 800 cavalry, and 1494 infantry; and towards the 300,000 florins granted in 1707, it paid 18,252 florins, 9 kruitzers. The elector of Bavaria is the military commander of the forces of the circle.

Bavaria is part of the Rhætia Vindelicia and Noricum of the ancients, and is fuppofed to have derived its name from the Boii, a warlike people, that migrated from Gallia Celtica, croffed the Rhine, and firft fettled in Bohemia. About the time of the emperor Auguftus, they were expelled the country by the Marcomanni, and removed into Noricum; and their fettlement was called "Bojer" or "Bayerland;" in Latin, "Bojaria," or "Bajoaria," whence, in procefs of time, was formed Bavaria. In the 6th century, when the empire of the Franks was divided among the four fons of Clovis, Bavaria became fubject to the dominion of the Auftrafian kings, and was governed by dukes. In the 9th century, princes of the Francic family affumed the ftyle of kings of Bavaria, while Lieutpold in 889, was the firft duke; and his progeny extend to the prefent day, though interrupted in 946, when, Berthold dying without children, the emperor Otho gave Bavaria to his brother Henry of Saxony. In 1071, Welph, fon of Azo of Efte, became duke of Bavaria, which, in 1138, paffed to the houfe of Auftria; but in 1154, it reverted to the houfe of Welph, in the perfon of Henry the Lion. In 1180, it finally returned to the firft family, by the fucceffion of Otho of Wittlebach, a defcendant of Arnulph, fecond duke of Bavaria, A. D. 907. After the family had been unjuftly deprived for more than two centuries, the Palatinate and Bavaria have recently been inhabited by a branch of the family of Deux Ponts, the fon of the elector being now nominal duke of Deux Ponts.

BAVARIA, *Duchy* or *Electorate* of, comprehends the greater part of the circle, and is divided into Upper and Lower Bavaria, and the Upper Palatinate. The length from north to fouth is fomewhat interrupted, but may be about 150 Britifh miles, and the breadth about 120. The duchy is bounded on the north by Bohemia and the Upper Palatinate; on the eaft by Auftria, and the bifhopries of Saltzburg and Paffau; on the weft by the duchy of Neuburg, the marquifate of Burgau, and the bifhopric of Augfburg; and on the fouth by the county of Tyrol, and the bifhopric of Brixen. Upper Bavaria is, for the moft part, mountainous, cold, and barren, producing little corn and lefs wine; but it is covered with forefts, interfperfed with large and fmall lakes, and abounds in cattle, wild fowl, game, baths, medicinal fprings, and falt works. It is alfo enriched with mines of filver and copper, lead and iron. It has alfo many quarries of marble. Lower Bavaria, being much more level, is more fertile, and produces plenty of grain, paffurage, and fruit. The mountains of Upper Bavaria may be conffidered as branches of the Alps. The chief rivers of this duchy are the Danube, the Ifer, the Inn, the Lech, the Nab, the Atmuhl, and the Regen. Its large inland lakes are 16, and its fmaller ones 160. Render, in his "Tour through Germany," (Vol. II. p. 290) reckons 33 cities, befides Munich the capital, 80 market towns, 8000 villages and hamlets, 39,949 taxable farms, 12,000 folitary houfes, 6000 uninhabited farm-houfes, 180,000 hearths, 3,050 churches, 548 chapels, 908 parifhes, 12 collegiate foundations, and 142 convents. Upper Bavaria is divided into two governments or regencies; that of Munich, and that of Burkhaufen. The principal

principal towns of the former are Munich, Pfaffenhauſen, Abenſperg, Ingolſtadt, Donawert, Friedberg, Landeberg, Weilheim, Tolz, Waſſerburg, Traunſtein, and Reichenhall. Thoſe of the latter, are Burkhauſen, Oetting, Troſburg, Braunan, Uttendorf, Friburg, Ried, and Scharding. Lower Bavaria is alſo divided into two governments; that of Landſhut, comprehending, beſides other towns, Landſhut, Erding, Dingelſing, Teiſbach, Hals, Rottenburg, Moſburg, and Oſterhoſen; and that of Straubing, the chief places of which are Straubing, Pogen, Cham, Kelheim, Stadt-am-Hoff, and Deckendorf. The ſtates of the duchy conſiſt of the clergy, nobility, and burgeſſes, of which a committee aſſembles at Munich whenever it may be neceſſary: but before the acceſſion of the houſe of Deux Ponts, the adminiſtration had become the moſt lethargic of any in Germany; and on this account the political importance of Bavaria has, in ſome meaſure, declined; and in the dangerous conflict that has ſubſiſted, and may ſtill ſubſiſt between France and Auſtria, it may be difficult for this power to preſerve a ſhadow of independence. By the fifth ſecret article of the treaty of Campo Formio, October 17, 1797, the French republic engages to employ its influence, that his majeſty the emperor ſhall receive the archbiſhopric of Saltzburg, and that part of the circle of Bavaria which lies between the archbiſhopric of Saltzburg, the river Inn, Salza, and Tyrol; including the town of Waſſerburg, on the right bank of the Inn, with an arrondiſſement of 3000 toiſe.

The eſtabliſhed religion of Bavaria is the Roman catholic; and no other is even tolerated: and thus the ſpirit of induſtry is very materially checked and reſtrained. The clergy, both ſecular and regular, are very rich; but the peaſants are wretched in the extreme, their chief ſubſiſtence ariſing from the herds of ſwine that are fed on acorns and crabs in the woods and foreſts. The number of inhabitants in this duchy is eſtimated at 3000, and the regular military force at 12,000. The principal manufactures of the country are thoſe of coarſe woollen cloth, ſilk and woollen ſtuffs, velvet, tapeſtry, ſtockings, clocks, and watches. The principal exports are wheat, cattle, wood, ſalt, and iron. Beſides the mines of ſilver and copper near Podenmais, in the bailliage of Viechtach, and of lead at Reichenthal, the chief mineral riches of Bavaria conſiſt in the ſalt ſprings at Traunſtein, which pervade mountains of ſaline earth, like thoſe at Hallein, in the archbiſhopric of Saltzburg, and occupy many people in productive induſtry. There are other ſprings at Reichenthal. Theſe latter ſprings are 20 in number; but ſalt is only made from 4 of them: for which purpoſe part of the water proceeding from them is conveyed by pipes to the cauldrons at Traunſtein, which is about 3 leagues diſtant. The ſalt annually made from theſe ſprings amounts to 250,000 quintals.

The title of the elector is "By the grace of God, duke of Upper and Lower Bavaria, as alſo of the Upper Palatinate; Pfalſgrave of the Rhine, arch-ſteward of the holy Roman empire, and elector and landgrave of Leuchtenberg." He has 5 hereditary officers, viz. a maſter of the houſhold, a ſteward, marſhal, cup-bearer, and huntſman. The Bavarian order of St. George was revived in 1729, by the elector Albert. The knights of the order are ſtyled "defenders of the immaculate conception of the bleſſed Virgin Mary," and are required to produce unqueſtionable proofs of the nobility of their anceſtry for 8 generations in both lines. The elector is grand maſter; and its enſign is a croſs, enamelled blue, with a St. George in the middle; on the reverſe of which is the name of the reſtorer of the order in a cypher ſurmounted with the electoral cap, and bearing at the 4 angles the letters I. V. P. F. which ſignify "juſtus velut palma florebit," i. e. the righteous ſhall flouriſh like a palm-tree. The croſs is worn pendent to a broad ſky blue ribbon, with a black and white border. The elector has the fifth ſeat in the electoral college, and ſeveral votes at the diets, both of the empire and the circle, in the colleges of the princes and counts. His ordinary revenue, including the tolls on all the veſſels which paſs up and down the Danube, and other navigable rivers, with that which ariſes from the monopoly of corn, ſalt, beer, tobacco, and mines, together with his own domain, is ſuppoſed, by ſome, to amount to 700,000l. per ann. Buſching and baron Reiſbach eſtimate it at 800,000l. Render at 1,031,250l. and others at 1,166,600l.

The Bavarians are little diſtinguiſhed in literature; but they are a vigorous race, adapted to the fatigues of war. They have, however, an univerſity at Ingolſtadt, and an Academy of Sciences at Munich. Baron Reiſbach (Trav. I. 107) gives a very unfavourable account of their corporeal form and general diſpoſition and character. The characteriſtic of a Bavarian, he ſays, is a very round head, a little broad chin, a large belly, and a pale complexion; ſo that many of them appear like caricatures of men! They have large fat bellies, ſhort clubbed feet, narrow ſhoulders, a thick round head, and ſhort necks; and they are heavy and awkward in their carriage. But the women are, in general, extremely beautiful, well ſhaped, of clear tranſparent complexions, and much more lively and graceful in their geſtures than the men. The chief ornament of the men is a long broad waiſtcoat, ſtrangely embroidered, from which their breeches hang low and looſe. The women diſguiſe themſelves with ſtays in the ſhape of a funnel, covering the breaſt and ſhoulders, and hiding the whole neck. He ſays, that no pen can deſcribe the ridiculous mixture of debauchery and devotion, which is exhibited every day; and he adds, that the propenſity to feaſting, indolence, and beggary, which prevails in Bavaria, is countenanced and ſanctioned by the example of the prieſts. Indolence, he ſays, is the prevailing character of the Bavarians: and Bavaria well deſerves the character given of it by an officer of Gaſcony, of being the greateſt brothel in the world. With their indolence, intemperance, and devotion, they unite, according to his account, a certain ferocity of temper, which often occaſions quarrels, mutual abuſe, and ſcenes of blood. The Bavarian peaſant, ſays this writer, is gruff, fat, dirty, lazy, drunken, and undiſciplined; but he is brave, œconomical, patriotic, and ſuch a ſlave to his word, that when it has once been given, it is never violated. Conſiderable benefit, however, has been derived from the laudable plans for deſtroying mendicity and encouraging induſtry, propoſed and carried into effect at Munich by count Rumford. See MUNICH.

By the plan of indemnities, agreed upon between the Firſt Conſul of France and the emperor of Ruſſia, in purſuance of the 7th article of the treaty of Luneville, it was agreed to propoſe that the indemnities to the archduke, grand duke, ſhould be for Tuſcany, and its dependencies, the archbiſhopric of Saltzburg, the provoſtſhip of Berchtolſgaden, the biſhopric of Treat, that of Brixen, and part of that of Paſſau, ſituate beyond the Iltz and the Inn, on the ſide of Auſtria, except the ſuburbs of Paſſau, with a radius of 500 toiſes, and the abbeys, chapters, and convents, ſituate in the abovementioned dioceſes. Theſe principalities were to be taken out of the circle of Bavaria, and incorporated in the circle of Auſtria, and their eccleſiaſtical juriſdictions, both metropolitan and dioceſan, were to be alſo ſeparated by the limits of the two circles; Muhldorf to be united to Bavaria, and its equivalent in revenue taken from thoſe of Freiſingen. To the elector Palatine of Bavaria were to be aſſigned, for the duchy of Deux-

Deux-Ponts, the duchy of Juliers, the palatinate of the Rhine, the marquiſate of Berg-op-zoom, the ſeignory of Rauenſtein, and others ſituate in Belgium and Alſace; the biſhoprics of Paſſau, with the reſervation of the part of the archduke; of Waltzbourgh with the reſervations herein after mentioned; of Bamberg, of Anghſted, of Freiſingen, and of Augſbourgh; the provoſtſhip of Kempten; the imperial cities of Rothenbourgh, Weiſſenbourgh, Windſheim, Schweinfort, Gochſheim, Sennefelt, Allthouſen, Kempten, Kauſbeuren, Memmingen, Dinkelſbuhl, Nordingen, Ulm, Boſſingen, Buchorn, Waugen, Leutkirch, Ravenſbourgh, and Alſchſhauſen; the abbeys of St. Ulric, Itſee, Wengen, Soefſingen, Elchingen, Urſberg, Rochenbourgh, Weltenhauſen, Ottobeuren, and Kaiſerſheim.

BAVARIA, *Palatinate of.* See UPPER PALATINATE.

BAVAY, PAUL, *Ignatius De,* in *Biography,* born at Bruſſels in 1704, applied himſelf early, and excluſively, to the ſtudy of chemiſtry, in which his father had waſted a conſiderable patrimony. At length, in 1735, he went to Lovain, where, at the end of two years, he was admitted Doctor in Medicine. He now returned to Bruſſels, and acquired ſo much reputation by his ſucceſs in his practice, that, in 1746, when the French were in poſſeſſion of the city, he was made phyſician to the military hoſpital there. In 1749, the French having evacuated Bruſſels, he was appointed Demonſtrator in Anatomy, but being oppoſed by the principal phyſicians, and his practice condemned, probably on account of his profeſſing to cure ſome diſeaſes by a noſtrum of his invention, he went to Dendermond, where he continued for ſome time. Returning again to Bruſſels, he died there, Feb. 20, 1768. His works are, "Petit Recueil D'Obſervations en medecine ſur les vertus de la confection tonique, reſolutive et diuretique," Bruxelles 1753, 12mo. "Methode courte, aiſee, peu couteuſe, utile aux medecins, et abſolument neceſſaire au public indigent pour le gueriſon des pluſieurs maladies." Bruxelles, 1759, 12mo. The principal ingredients in his medicine, are ſaid to be ſquills and Florentine orris. Eloy. Dict. Hiſt.

BAVAY, in *Geography,* a town of France, in the department of the North, and chief place of a canton in the diſtrict of le Queſnoy. It was formerly a conſiderable town, but is now reduced to the condition of a village. N. lat. 50° 25'. E. long. 3° 45'.

BAUBEE, a term uſed in Scotland for a halfpenny. Johnſon.

BAUBIGNY, in *Geography,* a town of France, 1½ league from Paris.

BAUBIS, in *Zoology,* a French name of a race of running dogs, called *chiens Normans,* or dogs of Normandy.

BAUBULA, in *Geography,* a river of Spain, in the province of Arragon, which runs into the Xalon, about a league below Calataiud.

BAUCIDIAS, in *Ancient Geography,* an iſland of Greece, in the Saronic gulf. Pliny.

BAUCONICA, a town of the Vangiones, in Gallia Belgica, 9 miles from Mogontiacum, and 11 from Borbitomgum; ſuppoſed to be *Oppenheim,* which ſee.

BAUD, in *Geography,* a town of France, in the department of Morbihan, and chief place of a canton in the diſtrict of Pontivy, 3½ leagues ſouth of Pontivy.

BAUDANVILLER, a town of France, in the department of the Meurte, and chief place of a canton in the diſtrict of Blamont, 1½ league ſouth of Blamont.

BAUDEKIN. See BALDACHIN.

BAUDELOT, CHARLES-CÆSAR, in *Biography,* was born at Paris in 1648, and ſtudied firſt at Beauvais, and then at Paris. He was, againſt his inclination, bred to the law, and pleaded as counſellor of the parliament of Paris for ſome time with ſucceſs. But he afterwards devoted himſelf to the ſtudy of antiquities. Having had an opportunity, in a journey to Dijon, to viſit the libraries and cabinets of the place, he began to make a collection of books and medals; and he was thus led to write a book "On the Utility of Travelling," 2 vols. 12mo, 1686, the ſubject of which was inſcriptions, medals, ſtatues, bas reliefs, and other relics of antiquity. It paſſed through ſeveral editions in French, and was tranſlated into Engliſh. This work introduced him into an acquaintance with the moſt celebrated antiquaries of Europe, and was the means of his admiſſion into the academy of Ricoverati at Padua. In 1705, he was made a member of the academy of Belles Lettres; and he had the charge of the valuable cabinet of the ducheſs of Orleans. He was the author of ſeveral diſſertations on ſubjects of Medallic hiſtory and antiquities: and he is ſaid to have compoſed the firſt travels of Paul Lucas. He died in 1722, with the character of a mild, modeſt, and benevolent man. Nouv. Dict. Hiſt.

BAUDERON, BRICE, born at Charolles, about the middle of the 16th century, diſtinguiſhed himſelf by his knowledge in pharmacy, to which he applied with ſuch ſucceſs, that a Pharmacopœia, publiſhed by him in 1588, became the ſtandard book for many years in France. It was founded on the Pharm. Lyonenſis, and of Du Boys, with the obſervations of Catalanus on diſtilled waters. Philemon Holland tranſlated it into Latin, and publiſhed it in London, in folio, 1639, and at the Hague in 1640. It has been ſince many times reprinted, both in French and Latin. He alſo publiſhed "Praxis de febribus, et de ſymptomatibus in morbis internis," 4to, 1620, Paris. In the preface to this book, he ſays, he is now 80 years of age. He died three years after, 1623. His ſon, Gratian Bauderon, who was brought up to the ſame profeſſion as his father, died in 1615, aged 35 years. Haller Bib. Med. pract. Eloy. Dict. Hiſt.

BAUDIER, MICHAEL, hiſtoriographer of France under Lewis XIII, was born of a noble family in Languedoc He was the author of many works, containing valuable information, collected with greater induſtry than taſte or genius. The principal are "A general Hiſtory of the ſeraglio and court of the grand Signior," 8vo, Paris, 1633; "A general Hiſtory of the religion of the Turks, with the life of their prophet Mahomet, and the 4 firſt caliphs," &c. 8vo. 1636; "A Hiſtory of the Adminiſtration of Card. d' Amboiſe, miniſter of ſtate under Louis XII;" Paris, 1634, 4to; "Hiſtory of Marſhal de Thoiras," Paris, 1644, fol. and 1666, 2 vols. 12mo. He left in MS. a hiſtory of Margaret of Anjou, wife of Henry VI. of England, which is ſaid to have been tranſlated and publiſhed as an original work in England. Baudier was attached to the polite arts, and made a collection of medals and curioſities, ſuch as his fortune would allow. The time of his death is not known. Nouv. Dict. Hiſt.

BAUDIUS, DOMINIC, a learned philologiſt, was born in 1561, at Lille, in Flanders, and retired with his parents, who were of the reformed religion, from the perſecution of the duke of Alva, to Aix-la-Chapelle. After having ſtudied at Leyden, Geneva, Ghent, and other places, he ſettled at Leyden, where he applied with aſſiduity to the ſtudy of juriſprudence, and was made doctor of laws in 1585. He viſited England, and then travelled into France, where he obtained ſeveral diſtinguiſhed patrons, and reſided for 10 years. In 1602, he was nominated profeſſor of eloquence at Leyden, and he alſo delivered lectures in hiſtory and juriſprudence. In 1611, the States made him joint hiſtoriographer with Meurſius, and as ſuch he wrote in po-

liſhed

lifhed Latin, a "Hiſtory of the Truce." He alſo acquired great reputation, both as a poet and proſe-writer in that language. Towards the cloſe of his life, he incurred the diſpleaſure of prince Maurice, by his harangues in favour of peace; and he offended many perſons by his political and religious ſentiments, as well as by his moral conduct, which was not ſuch as to ſecure reſpect. His poems indicate an irritable temper, and abound with claſſical abuſe and defamation; and particularly againſt the enemies of Scaliger. Moreover, he was boaſtful, vain, importunate, and ſelfiſh: and his licentiouſneſs, both with regard to wine and women, involved him in much diſgrace. He died at Leyden in 1613. His poems, which manifeſt gravity and ſonouroufneſs of diction and elevation of ſentiment, were firſt collected and printed in 1587; and a more complete collection was printed at Leyden in 1607, and reprinted at Amſterdam, and other places. The "Letters" of Baudius, publiſhed after his death, are more eſteemed for their ſtyle, than his poems. He alſo publiſhed "Harangues," and ſome other pieces, all in Latin. Gen. Dict.

BAUDOBRICUM, or Baudobrica, in *Ancient Geography*, a place of Gallia Belgica, upon the banks of the Rhine, ſouth of Confluentes. The machines of war, called Baliſtæ, were under the conduct of a prefect reſiding in this place; and the head-quarters of the general were at Mogontiacum, or Mayence.—*Baudobrica* was alſo another place of Belgica Prima, north-eaſt of Auguſta Trevirorum, now *Boppart*.

BAUDOUIN, Francis, in Latin *Baldwinus*, in *Biography*, an eminent civilian and man of letters, was born at Arras in 1520, ſtudied at Louvain, and in his youth reſided at the court of Charles V. At Geneva he became intimate with Calvin, and embraced the reformed religion. In France he conformed to the religion of the country, and taught the law at Bourges from 1538 to 1545. In Germany he delivered lectures at Straſburg, Heidelberg, and other places, avowing himſelf a proteſtant; but by joining Caſſander in a project for bringing about a coalition of religions, he excited the laſting diſpleaſure of Calvin and Beza, and others of the reformed party. He enjoyed the favour of cardinal Lorrain, the inveterate enemy of the Calviniſts, and is ſuppoſed to have induced Antony, the weak king of Navarre, to abandon them. By that prince he was patronized, and appointed his delegate at the council of Trent. Upon the death of Antony in 1562, he was invited to Douay and Beſançon, and finally ſettled at Paris, where his reputation, acquired by ſeveral learned works which he had publiſhed, rendered his lectures popular among perſons of the firſt diſtinction. The duke of Anjou, afterwards Henry III, wiſhed to engage his pen in the juſtification of the maſſacre of St. Bartholomew's; but to this prince he delivered his ſentiments like an honeſt man, and was ſo much eſteemed by him that he appointed him one of his counſellors of ſtate. Whilſt he was preparing to follow Henry to Poland, he was ſeized with a fever, which terminated his life at the college of Arras in Paris in 1573. He was diſtinguiſhed by his extenſive knowledge, admirable memory, and perſuaſive eloquence. Notwithſtanding the juſt reproach which he incurred by his verſatility in religion, ſo that he was opprobriouſly denominated an "Hermaphrodite," he appears to have been a man of moderate and tolerating principles, and whilſt he condemned the ſeverities exerciſed againſt the Proteſtants in the Low Countries, he alſo cenſured the unjuſtifiable zeal of Calvin in the perſecution of Servetus. His Latin ſtyle was pure and elegant, and he left ſeveral works on the civil law, and alſo in eccleſiaſtical hiſtory and controverſy, which have been much eſteemed. Gen. Dict. Nouv. Dict. Hiſt.

BAUDRAND, Michael Antony, a celebrated geographer, was born at Paris in 1633. When he had finiſhed his ſtudies, he accompanied cardinal Antonio Barberini as his ſecretary to Rome; and upon his return to France, he was employed in reviſing Ferrarius's Geographical Dictionary, which he enlarged by one half, and publiſhed at Paris in 1671, fol. By his travels in Germany, and his viſit to England, he was furniſhed with a variety of obſervations that were uſeful to him in the compilation of his geography. Upon his return to France in 1677, he compoſed his Geographical Dictionary in Latin, intitled "Geographia ordine literarum diſpoſita;" Paris 1682, 2 vols. fol. After a journey to Rome in 1691, he applied himſelf at Paris to the completion of his French Geographical Dictionary, which he was prevented from publiſhing by his death in the year 1700. This work was publiſhed at Paris in 1705, in folio, but it is ſaid to be a corruption rather than a tranſlation of the Latin Dictionary, printed in 1682. Gen. Dict.

BAUDROYE, in *Ichthyology*, the name of the *angler*, or *fiſhing frog* (Lophius Piscatorius) in *Camper act. Pariſ.* &c.

BAUGE, in *Commerce*, a drugget manufactured in Burgundy, with thread, ſpun thick, and coarſe wool.

Bauge, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Mayne and Loire, ſeated on the river Coeſnon, containing about 4000 inhabitants; 6 leagues E.N.E. from Angers. N. lat. 47° 31'. E. long. 0° 10'.

Bauge, a town of Breſſe in France, pleaſantly ſituated on a fruitful hill. N. lat. 46° 40'. E. long. 4° 54'.

BAUERWITZ, or Paurwitz, a town of Sileſia, in the province of Jagerndorf, on the river Zinna, 10 miles N. W. from Ratibor. The neighbourhood is a rich corn country.

BAUHIN, John, in *Biography*, born at Amiens in 1511, was early ſent by his father to learn the practice of medicine and ſurgery, under an uncle of the ſame name at Paris. Here he had opportunity of hearing the lectures of Fernelius and Sylvius, and of ſeeing the practice of Tagault, then in high reputation. Under theſe celebrated maſters he made ſuch progreſs, that when only ſeventeen years of age, he was taken into the ſervice of Catherine Queen of Navarre, and made her phyſician. Reading about this time the tranſlation of the New Teſtament into Latin by Eraſmus, and becoming thence a proſelyte to the reformed religion, to avoid perſecution he came to England, but at the end of twelve months, being aſſured of protection, he returned to Paris. Here, however, he was ſoon laid hold of, accuſed of hereſy, and committed to priſon, whence, at the end of eighteen months, he only eſcaped with his life, through the interceſſion of his patroneſs, queen Catherine. Removing from Paris, he went to Antwerp, where for ſome time he taught and practiſed medicine and ſurgery; but the perſecution againſt the favourers of the new doctrines commencing there, he fled with his family to Baſle. Here he was at firſt employed by Frobenius, the famed printer, in correcting the preſs, until after giving the neceſſary proofs of his proficiency in medicine, he was admitted to practice, and ſoon acquired conſiderable celebrity, and in 1580, was made dean of the faculty. He died in 1582, aged 71 years. The only work left by him, is "Queſtiones tres medicæ, totidemque concluſiones;" printed at Baſle, in 1558, fol.: probably an academical exerciſe. Athenæ Bauricæ.

Bauhin, *John*, ſon of the former, born at Lyons, in 1541, ſhewing early a diſpoſition to the ſtudy of botany, after going through the preliminary exerciſes, was ſent by his father, when only twenty years of age, to accompany the celebrated Geſner in his excurſions over the greater part

of France, Germany, Italy and Switzerland. In this journey he collected a prodigious number of plants, which formed the basis of his principal work, the "Historia Plantarum," which he even then had in contemplation, as appears by his correspondence with Gesner, carried on long after his return, but which was not published until several years after his death. Having accomplished the principal object of his travels, he first settled at Basle, where in 1566 he was elected professor in rhetoric. Some time after he removed to Yverdun, and at length, on the invitation of the duke of Wirtemberg, to whom he was made principal physician, he went to Montbelliard, where he continued to reside the remaining forty years of his life. Though botany engaged the greater part of his time and attention, yet he was not unmindful of other parts of natural history, as appears by his account of the medicinal properties of the principal mineral waters of Europe, particularly of the waters at Boll, in the principality of Wirtemberg, written at the command of the duke, to which he has added descriptions of those complaints in which mineral waters are mischievous; and his "Historia memorabilis laporum aliquot rabidorum, qui circa annum 1590, apud Monpelgartum, multorum damno, publicè grassati sunt," published at Montbelliard, 1591, 8vo. He died in 1613, aged 72 years. His correspondence with Gesner, principally on botanical subjects, with his book "De plantis divis sanctisve nomen habentibus," was published by his brother Gaspard, at Basle, 8vo, 1591, parvum libellum, Haller says, et quasi specimen secuturi operis. In 1593, he published at Montbelliard also, in 8vo, "De plantis absinthii nomen habentibus." The prodromus of his great work was published at Yverdun, in one volume 4to. in 1619, under the names of J. Bauhin and Henry Cherler, his brother-in-law, who had contributed to its perfection. In this specimen, Haller says, you see the rudiments of a natural classification of plants. The "Historia plantarum nova, et absolutissima, cum auctorum consensu et dissensu, circa eas," upon which the author had bestowed above forty years' labour, was at length published at Yverdun in 1650 and 1651, in three volumes in folio, under the care of Dr. Chabré. Notwithstanding the numerous errors in this book, many of which Haller says should be imputed to the editor, who was but indifferently qualified for the task he had undertaken, it is a noble and valuable work, and deservedly places the author in the first rank among the improvers of botany. Haller's Bib. Botan. Gen. Biog.

Bauhin, Gaspard, born at Basle in 1560, twenty years later than his brother John, having the advantage of his brother's experience to guide him in his inquiries, made proportionally early advances in knowledge. After passing through the necessary preliminary studies, under Fabricius ab Aquapendente, Sev. Pinæus, and other celebrated anatomists at Padua, Montpellier, and Paris, and having collected in his travels a large number of plants, many of them unnoticed by his brother, he returned to Basle in 1580, and was admitted doctor in medicine. In 1582, he was made Greek professor, and in 1558, professor of anatomy and botany, of which he is called in his epitaph the Phœnix. He was afterwards made professor of the practice of medicine, archiater, or principal physician to the city of Basle, dean of the faculty of medicine, and rector of the university, which distinguished honours he continued to hold to the time of his death, which happened in 1624.

Indefatigable in his attention to the duties of his several offices, he discharged them with such regularity as to secure to him the affection of his pupils, who materially assisted him in collecting plants, necessary in completing his botanical works, to which also his correspondents in different parts of Europe largely contributed.

Notwithstanding the number and variety of his offices, much of his time must have been employed in composing and preparing for the press his numerous publications on anatomy and botany; and though great additions and improvements have been made in our knowledge in those sciences since his time, many of our author's works are still consulted, and held in estimation. A few of the titles to his principal works follow: for the rest, see the Bib. Anat. and Bot. of Haller. "Franc. Rousseti l. de partu cæsareo, e Gallico in Latinum transf." 4to. 1586, Basle. Two years after he republished this work with an appendix, containing additional cases of women who are said to have undergone the operation and recovered; to which is also added a description of the valve of the colon, of which he claimed the discovery. "Theatrum Anatomicum, infinitis locis auctum, Francof." 1621, 4to. including several smaller works on anatomy, published by him before at various times. "Vivæ imagines partium corporis humani æneis formis expressæ, ex theatro anatomico Casp. Bauhini desumptæ;" Basle 1620. The figures are principally from Vesalius and Eustachius: some are proper to the author. In this work also are contained other discoveries in anatomy made by the author. "De hermaphroditorum monstrorumque partium natura," Openheim, 1618, 8vo. In 1598, he published "Matthioli opera, quæ extant omnia," fol. Franc. in which there are many plants, Haller says, not before described. "Pinax theatri botanici, seu Index in Theophrasti Dioscoridis, Plinii, et botanicorum qui a seculo scripserant opera," &c. Basileæ 1623, 4to. a work extremely useful to persons consulting the older botanical writers. "Catalogus plantarum circa Basileam nascentium," Basil. 1622, 8vo; the largest catalogue extant, Haller says, of plants growing in a single district.

Bauhin, John Gaspard, son of the former, born March 12th 1606, after being well instructed in the Latin and Greek languages, and initiated in the knowledge of botany, anatomy, and other branches of medicine under his father, went to Paris in 1624, where he continued two years, attending the schools of the most celebrated masters there. He afterwards visited England, Leyden, Padua, and various other places; the fame of his ancestors procuring him an easy introduction, wherever he went, to the most distinguished persons. Returning to Basle in 1628, he was made doctor in medicine, and two years after professor in anatomy and botany, which offices he held for thirty years. In 1660, he was made professor in the practice of medicine, and was several times appointed dean of the faculty, and rector of the university. He died July 14. 1685.

Notwithstanding the numerous honours conferred upon him, he does not appear to have contributed much to the improvement of the science he professed, having only left three dissertations of little note or value. "De pesle, de morborum differentiis et causis, et de Epilepsia."

BAUHINIA, so named by Plumier in honour of the two famous botanists, John and Caspar Bauhin, in *Botany*. Lin. gen. 511. Reich. 554. Schreb. 697. Plum. 13. Juss. 351. Class and order, *decandria monogynia*. Nat. Ord. *lomentaceæ? leguminatæ* Juss. Gen. Char. *Cal.* perianth oblong, gaping longitudinally on the lower side, reclining on the other, gaping also five ways at the base, with five cohering leaflets above, deciduous. *Cor.* petals five, oblong, waved, with attenuated reflected tops, expanding; the lower ones a little larger, the upper ones more distant, all with claws placed on the calyx. *Stam.* filaments 10, declining, shorter than the corolla; the tenth much the longest; anthers ovate, always on the tenth, seldom on the rest. *Pist.* germ oblong, sitting on a pedicel; style filiform, declining; stigma obtuse, rising. *Per.* legume long, subcolumnar, one-celled. *Seeds* many, roundish, compressed, placed according to the length of the legume.

legume. Eſſ. Char. *Cal.* five-cleft, deciduous. *Pet.* expanding, oblong, with claws, the upper one more diſtant, all inſerted into the calyx. Legume. Species. 1. B. *ſcandens*, climbing mountain ebony. Folium linguæ, Rumph. Amb. 5. t. 1. Clematitis Indica, Ray Suppl. 328. n. 13 & 14. Naga-mu-valli, Rheed. Mal. 8. 57. t. 30, 31. "Stem cirrhiferous." Riſing with many ſlender ſtalks, which put out tendrils and faſten themſelves to the neighbouring trees; leaves alternate, heart-ſhaped, on long foot ſtalks, ſix inches long, three and a half broad in the middle, deeply cut into two-pointed lobes, each having three prominent longitudinal ribs; flowers at firſt whitiſh, turning to a yellowiſh colour; fruit ſlender and flat, containing ſix or eight flat bony ſeeds, black with a ſilvery border. A native of both Indies, not producing flowers in England. The ſeeds were ſent to Mr. Miller from Campeachy, probably before the year 1752.—2. B. *aculeata*, prickly, ſtalked mountain E. "Stem prickly." An erect inelegant ſhrub, about a man's height; trunk and branches prickly, leaves roundiſh, with two roundiſh blunt lobes; cloven to one-third of their depth, ſmooth with nine nerves; petiole thicker and callous at both ends, from the baſe of which proceeds on each ſide a ſharp ſhort prickle, diſtilling when young nectareous drops; flowers large, white, and having an unpleaſant ſcent; riſing, in Jamaica, to the height of ſixteen or eighteen feet, and plentiful there and in the other ſugar iſlands of America; the flowers are ſucceeded by pods, about three inches long, containing two or three ſwelling ſeeds; the pods are glutinous, and theſe, as well as the bruiſed leaves, have a ſtrong balſamic ſcent; called in America the Indian ſavin-tree, from its ſtrong odour, which ſomewhat reſembles the common ſavin. It is frequent about Carthagena in woods; cultivated by Mr. Miller in 1752.—3. B. *divaricata*, dwarf mountain E. "leaves ſmooth, lobes divaricated, acute, two-nerved; petals lanceolate." A low ſhrub, ſeldom riſing more than five or ſix feet high, dividing into ſeveral branches; corolla, white, and flowers in a ſimple upright raceme; having an agreeable ſcent, appearing during the greateſt part of ſummer, and exhibiting one of the chief beauties of the hot-houſe: the pods are taper, about four inches long, and contain four or five dark-coloured ſeeds. A native of the north ſide of Jamaica, where it grows plentifully; cultivated by R. J. Lord Petre, before 1742; flowering from June to September.—4. B. *ungulata*, "leaves ovate, lobes parallel," differing from the others in its more oblong leaves, entire at the baſe, cloven to the middle into two ſtraight parallel lobes, and having nine nerves. The calyx is long, ſtreaked, and of a grey colour; the petals are ſubulate, ſtamens alternately ſhorter; legume very long, pendulous. It riſes to the height of twenty feet, with a ſmooth ſtem, dividing into many ſmall branches, terminated by looſe bunches of white flowers, which are ſucceeded by very long, narrow, compreſſed pods, each including eight or ten ſeeds. A native of America; the ſeeds were received by Mr. Miller from Campeachy.—5. B. *variegata*, variegated mountain E. Arbor S. Thomæ, Zanon. Hiſt. 26. t. 15. Chovanna-Mandaru; 1. Rheed. Mal. 1. 57. t. 32. "Calyxes one-leaſed, burſting; petals ſeſſile, ovate; lobes of the leaves ovate obtuſe." It riſes with a ſtrong ſtem, upwards of twenty feet high, dividing into many ſtrong branches; flowers large, in looſe panicles, at the extremity of the branches, of a purpliſh red colour, marked with white, and the bottom yellow; pods about ſix inches long, and $\frac{3}{4}$ of an inch broad, each containing three or four compreſſed ſeeds. Growing naturally in both Indies, and introduced here by Mr. Bentick in 1690.—6. B. *purpurea*, purple mountain E. Chovanna-Mandaru; 2. Rheed Mal. 1. 59. t. 33. "Leaves ſubcordate, two parted, rounded, tumentoſe underneath." A tall tree, differing from the foregoing in having larger leaves, more deeply cut, and more contracted on the ſides; the calyx is yellowiſh green, and red; the corolla of a very red purple, and one petal out of the five ſtreaked with white on the claw within and without; all lanceolate and diſtant; legumes larger than thoſe of any other ſort, being one and half or two ſpans long, and an inch broad. A native of the Eaſt Indies, where it flowers through the year. Introduced here in 1778.—7. B. *tomentoſa*, downy mountain E. Mandaru Maderaſpatenſe. Pluk. Alm. 240. t. 44. f. 6. Canſchena-pou, Rheed. Mal. 1. 63. t. 35. "Leaves cordate, lobes ſemi-orbiculate tomentoſe." This grows to the height of two fathoms, with a trunk nearly ſix inches in diameter, and divides into many branches; leaves ſmaller than thoſe of the foregoing, rounded, cloven half way, ſeven-nerved and blunt, with rounded lobes; having a ſtrong ſcent if rubbed during the night, when the lobes are clapped together; the calyx of the flowers green and bell-ſhaped, the corolla yellowiſh white; one of the petals having a duſky red purple ſpot at the claw; ſtamens yellowiſh white; flowers without ſmell. A native of the Eaſt Indies. Cultivated, ſays Ray, by Compton biſhop of London, in 1687.—8. B. *acuminata*, ſharp-leaved mountain E. Velutta-Mandaru, Rheed. Mal. 1. 61. t. 34. "Leaves ovate, lobes acuminate ſemi-ovate." This riſes to a man's height, with a trunk as thick as his arm; leaves more deeply cut, longer, contracted into a cuſp or point towards the end, nine-nerved, leſs divaricated; flowers bell-ſhaped, pure white, without ſcent; petals rounded and blunt; ſtamens white; legumes ſmaller than in the others, being four or five inches long, an inch broad, ſmooth, with a round broad back. A native of the Eaſt Indies. 9. B. *emarginata*, "ſtem prickly, leaves cordate with round lobes, tomentoſe underneath;" ſeldom riſing more than ten feet high, dividing into many branches, armed with ſhort crooked ſpines; leaves alternate, heart-ſhaped, with two roundiſh lobes; flowers two or three together at the extremity of the branches, large, of a dirty white colour, and ſucceeded by flat pods, each containing two or three ſeeds.—10. B. *rotundata*, "ſtem prickly, leaves ſubcordate, two-parted, rounded, flowers ſcattered;" riſing twenty feet high, with a ſtrong upright ſtem, ſending out branches towards the top, armed with ſpines in pairs, ſtrong and crooked; leaves like the former; flowers large and white, ſucceeded by long flat pods, narrow, and each including five or ſix ſeeds. This and the preceding are natives of Carthagena in New Spain.—11. B. *aurita*, long-eared mountain E. "Leaves ſubtranſverſe at the baſe, lobes lanceolate, porrected, three-nerved; petals lanceolate." Cultivated by Mr. Miller, in 1756, and flowering in September.—12. B. *porrecta*, ſmooth broad-leaved mountain E. "Leaves cordate, lobes porrected, acute, three-nerved, petals lanceolate." A tree riſing about fifteen feet high, with ſeveral ſtraight trunks, thick as a man's leg, covered with a whitiſh bark, dividing into many branches and twigs; leaves three inches long and two broad, yellowiſh-green, ſmooth, with ſeven or more ribs, and ſome tranſverſe; the petioles an inch long; the flowers at the ends of the twigs, on pedicels half an inch long; petals long, red-white variegated or ſtriated; ſtamens long and white; legumes five or ſix inches long, brown. Growing on the hills in Jamaica. The wood very hard, and veined with black, whence the name of ebony. Cultivated by Mr. Miller, in 1739, and flowering in July.—13. B. *candida*, white-leaved mountain E. "Leaves cordate, pubeſcent underneath, lobes ovate, obtuſe; calyxes attenuated upwards and elongated." A native of the Eaſt Indies, introduced by Dr. P. Ruſſel in 1777; flowering in May and June. There are many other ſpecies both from the Eaſt and Weſt Indies, not

yet ſufficiently determined. The whole genus needs farther inveſtigation.

Propagation.—All theſe plants, being natives of hot countries, will not thrive in England out of the bark-ſtove. They are propagated by ſeeds, procured from their native countries, which ſhould be brought over in their pods. Theſe muſt be ſown in pots filled with light freſh earth, and plunged into a moderate hot bed of tanner's bark; and if the ſeeds be good, they will come up in ſix weeks, and in a month after they ſhould be carefully ſhaken out of the ſeed pot, without injuring their roots, and each of them planted in a ſeparate ſmall pot filled with light loamy earth, and plunged again into the hot-bed, ſhading them till they have taken freſh root, and then admitting freſh air to them every day in warm weather. In autumn they muſt be placed in the bark-ſtove, and treated like other tender exotics, giving them but little water in winter. As theſe plants frequently flower in winter, they deſerve a place in the ſtove. Martyn's Miller's Dict.

BAVINS, in *War*, faggots, made of birch, heath, or other ſort of bruſh-wood, that is both quickly fired and tough, 2½ or 3 feet long, with the bruſh-ends all laid one way, and the other ends tied with two bands. They are dipped and ſprinkled with ſulphur, like reeds, excepting only that the bruſh-ends only are dipped, and ſhould be cloſed together before they are ſprinkled, to keep them more cloſe, in order to give a ſtronger fire, and to keep the branches from breaking off in ſhifting and handling them. See FASCINES.

BAULA, in *Ancient Geography*, a diſtrict of Italy in Campania, between Baiæ and the Lucrine lake, formed, according to Tacitus, by the ſea; and the ſeat of many country houſes.

BAULAS, in *Geography*, a town of Syria, 50 miles eaſt of Damaſcus.

BAULEM's *Kill*, a weſtern water of Hudſon's river, 8½ miles below Albany.

BAULOT, or BEAULIEU, JAMES, in *Biography*, of mean and obſcure parentage, was born in the province of Burgundy, in 1651. Becoming acquainted with Pauloni, an Italian itinerant lithotomiſt, he travelled with him, as an aſſiſtant, for ſome years; but having at length, from obſervation, acquired the art of cutting for the ſtone, and of curing ruptures, he ſeparated from him, and ſoon became celebrated for his ſkill in both thoſe arts. Though illiterate, and totally unacquainted with anatomy, yet he is ſaid to have conſiderably improved on the method of operating uſed by his maſter; and even to have approached very near the mode now followed by the moſt celebrated ſurgeons. Following the ſteps of Pauloni, he viſited in turn all the principal cities on the continent. In 1697, he went to Paris, where he at firſt operated with ſucceſs, but failing in ſome caſes, he went to Geneva, Aix-la-Chapelle, and Amſterdam: in each of which places he was much reſorted to; for having both improved his inſtruments, and his mode of uſing them, he was now generally ſucceſsful. He next went to Straſburg, where he cut ſucceſsfully a great number of patients, then to Venice, Padua, and Rome, every where acquiring additional fame and reputation. He was of a ſingular diſpoſition, and wore a ſort of monkiſh habit, whence he became generally known by the title of Friar James. He at length ſettled in a village near Beſançon, where he died, 1720, being ſixty-nine years of age. In gratitude for the numerous cures he had performed at Amſterdam, the magiſtracy of that city cauſed his portrait to be engraved, and a medal to be ſtruck, bearing for impreſs his buſt. Haller Bib. Chirurg. Gen. Biog. Dict.

BAULTE, in *Geography*, a river of Pruſſia, which runs into the Friſch Haff, a little below Frauenburg.

BAUM, in *Botany*. See MELISSA.

BAUM, *Baſtard*. See MELITTIS.

BAUM, *Molucca*. See MOLUCCELLA.

BAUM, *Moldavian* and *Turkey*. See DRACOCEPHALUM.

BAUMA, in *Ancient Geography*, a town of Ethiopia near Egypt. Pliny.

BAUMÆ, an ancient town of Aſia, in Meſopotamia, ſeated, according to Ptolemy, on the Euphrates.

BAUMAN, a remarkable cave in Lower Saxony, about 18 miles from Goſlar; which has a narrow entrance, but within is ſpacious, and has many winding paths. The peaſants traverſe it in ſearch of bones, which they ſell for unicorn's horns. Some ſay that it extends as far as Goſlar; and ſkeletons have been found in it, ſuppoſed to be thoſe of men who have been loſt in its devious windings.

BAUMANNIANA, in *Entomology*, a ſpecies of PHALÆNA (*Tortrix*) that inhabits Auſtria. The anterior wings are yellow, with two ferruginous anaſtomiſing bands bordered with ſilver: poſterior one interrupted. *Fabricius.*

BAUME, ANTHONY, in *Biography*, chemiſt and apothecary, born at Senlis, February 26th, 1728. Applying early and diligently to the ſtudy of chemiſtry and pharmacy, he was ſoon diſtinguiſhed for his ſuperior attainments in thoſe arts. In 1752 he was received into the company of apothecaries at Paris, and in 1773 made a member of the Royal Academy of Sciences. He was alſo ſeveral years lecturer in chemiſtry, an office he filled with diſtinguiſhed credit to himſelf, and advantage to his pupils. In 1757 he publiſhed, in conjunction with doctor Macquer, "Plan d'un Cours de Chymie experimentale et raiſonnee, avec un diſcours hiſtorique ſur la Chymie;" 8vo. Paris. "Elemens de Pharmacie theorique et pratique;" Paris 1762, 8vo. "Manuel de Chymie, ou expoſé des operations," &c. Paris, 1763, 8vo. Theſe two works have paſſed through ſeveral editions. He alſo publiſhed "Memoires ſur les Argilles, ou recherches et experiences chymiques et phyſiques ſur la nature des terres les plus propres à l'agriculture, et ſur les moyens de fertiliſer celles qui ſont ſteriles," Paris, 8vo. 1770, which was well received. Eloy Dict. Hiſt.

BAUME, *St.* in *Geography*, a mountain of France in the department of Var, between Aix, Marſeilles, and Toulon. It is much frequented from a ſuperſtitious notion that Mary Magdalen died in this place.

BAUME *Bay*. See BALSAM *Bay*.

BAUMER, JOHN WILLIAM, in *Biography*, a German naturaliſt and phyſician, was born at Rheweiler in 1719, ſtudied philoſophy and medicine at Jena and Halle, and after having been ſettled as a clergyman, in 1742, at Krautheim, returned to Halle to ſtudy medicine, and in 1748, took the degree of doctor in that ſcience. He afterwards became firſt profeſſor of medicine at Erfurt, where he died Auguſt 4, 1788. His principal works are "Natural Hiſtory of the Mineral Kingdom, particularly in regard to Thuringia. Gotha, 1763, 1764, 2 vols. 8vo. "Hiſtoria Naturalis lapidum pretioſorum omnium," &c. Frankfort, 1771, 8vo. "Fundamenta politiæ medicæ," &c. "Frankfort and Lipſ. 1777, 8vo. "Fundamenta Geographiæ et Hydrographiæ Subterraneæ." Gif. 1779, 8vo. and "Hiſtoria Naturalis Regni Mineralogici, ad naturæ ductum tradita." 1780, 8vo. Gen. Biog.

BAUMES, LES DAMES, or BAUMES LES NONES, in *Geography*, a town of France, and principal place of a diſtrict in the department of Doubs, on the river Doubs, 5 leagues N. E. of Beſançon, and 8¾ N. of Pontarlier. It derives its origin from an abbey of canoneſſes, which is ſaid to have been founded in the 5th century, by St. Romain, abbot of Condat. Others aſſert that it was founded in the 7th century. About 5 miles from this town is ſhewn a remarkable

cavern, in which, after deſcending 300 paces, is found the gate of a grotto, twice as large as that of a city. The grotto is 35 paces deep, and 60 wide, and covered with a kind of vaulted roof, from which water continually drops. In this grotto is a ſmall brook, that is ſaid to be frozen in ſummer and not in winter. When the peaſants obſerve a miſt riſing from this cavern, they predict rain on the following day.

BAUMGANS, in *Ornithology*, the name of the bernacle gooſe; Anas Bernicla, in *Friſch Hiſt. Birds.*

BAUMGARTEN, Alexander Gottlieb, in *Biography*, an eminent philoſophical writer, was born at Berlin in 1714, and educated at Halle. Here he diſtinguiſhed himſelf by his private lectures in philoſophy; and after having officiated for ſome time as extraordinary profeſſor he was invited in 1740 to be profeſſor of philoſophy at Frankfort on the Oder. His conſtitution, being naturally feeble, was much impaired before the year 1751 by cloſe application to ſtudy, and his infirmities were aggravated by the loſs of a great part of his property, during the bombardment of the fortreſs of Caſtrin, whither he had fled for ſhelter. In 1760, his health being in ſome degree reſtored, he reſumed his labours with new ardour; but in 1762 he was carried off by a ſtroke of the apoplexy; having eſtabliſhed the character of an acute and found philoſopher, who united to an extenſive acquaintance with the ſciences, a diſtinguiſhed accuracy of judgment, and an agreeable chearfulneſs of temper. His principal works are "Melophyſica;" Halle, 1739, 1743, 8vo. publiſhed in German by Meyer, with many alterations, and republiſhed by profeſſor Eberhard: "Ethica Philoſophica;" Halle, 1740, 1751, 8vo. "Æſthetica." Frankf. in Oder. 1750, 1758, 8vo. and "Initia Philoſophiæ Practicæ Primæ;" Frankf. 1760, 8vo. Gen. Biog.

Baumgarten, *Siegmund Jacob*, brother of the above, was born in 1706 at Welminſtadt on the Ohra, and having ſtudied at Halle became profeſſor of theology. He died in 1757, leaving numerous writings on theological ſubjects, and many tranſlations of French and Engliſh works into German. Gen. Biog.

Baumgarten, in *Geography*, a town of Germany, in the archduchy of Auſtria, 6 miles weſt of Feltſburg.

Baumgarten, a town of Bohemia, in the circle of Chrudim, 3 miles weſt of Politzka.

BAUMHOLDER, a town of Germany, in the circle of Upper Rhine, and duchy of Deux Ponts, 10 miles weſt of Lautereck, and 25 north of Deux Ponts.

BAUMSWALDT, a foreſt of Pruſſia, on the borders of Lithuania, about 10 leagues long and 7 wide.

BAUNACH, a town of Germany, in the circle of Franconia, and biſhopric of Bamberg, near the river Mayne; 7 miles north of Bamberg. This is alſo the name of a canton of Swabia, ſo called from the river Baunach, which runs into the Mayne.

BAVOSA, in *Ichthyology*, a name given by the Italians to a ſpecies of Ray, called by modern naturaliſts *Raja Oxyrinchus*, which ſee.

BAVOTA, *Pacavita*, in *Ancient Geography*, a town of Italy in Japygia.

BAUR, BAWR, or BOUWER, John William, in *Biography*, an eminent painter of landſcapes and architecture, was born at Straſburg in 1610. After having been the diſciple of Frederick Brendel, he went to Rome for improvement; but though he poſſeſſed great genius and a fertile imagination, and reſided for a conſiderable time in and about Naples and Rome, where he devoted himſelf entirely to architecture and landſcapes, he retained the German taſte in all his figures, and neglected the ſtudy of nature or the antique; ſo that he never arrived at a grandeur of deſign. However his pencil was light, his compoſition good, and his general expreſſion beautiful, though his figures were ſomewhat heavy. His paintings in water-colours on vellum are held in the higheſt eſtimation. For the duke of Bracciano, at whoſe court he reſided for ſeveral years, he finiſhed ſome charming perſpective views of gardens, with ſtatues and fountains, and a number of elegant buildings, with many figures, coaches, cattle, and horſemen; and he generally diſtinguiſhed people of different nations by their appropriate dreſs. This artiſt alſo engraved a great number of plates from his own deſigns. His engravings from the Metamorphoſes of Ovid are generally preferred to the reſt. They are ſlightly etched, and retouched with the graver. The figures are ſmall, and incorrectly drawn. The back-grounds are dark and heavy, and the trees are deſtitute of that lightneſs and freedom, which would render the effect agreeable. His pieces of architecture are well executed, and the perſpective finely preſerved. In his ſtyle of engraving he ſeems, in ſome degree, to have imitated Callot, and the nearer he approaches it, the better are his productions. The Metamorphoſes conſiſt of 150 middling-ſized plates. Baur died at Vienna in 1640. Pilkington and Strutt.

BAURAC, an ancient name for nitre, but in ſome places uſed in a reſtrained ſenſe, as not ſignifying every thing that was called by that name, but only one of two different ſalts that were confuſedly called nitre.

The Arabians give the name *baurach* to *tincar* or *tincal*, which when refined is called *borax*, but when it is rough, in little cryſtalline maſſes like the ſmall cryſtals of *ſal gem*, mixed with earth or other impurities, it is always diſtinguiſhed by the name of *tincal*. Neumann, p. 227. See Natron.

BAURINKEL, in *Geography*, a town of Germany, in the circle of Weſtphalia, and county of Lingen, 6 miles N. E. of Lingen.

BAUSCH, Leonard, in *Biography*, a phyſician of Schweinfurd in Franconia, acquired conſiderable reputation by his commentaries on the works of Hippocrates, publiſhed 1594, folio, at Madrid. His ſon, John Laurence Bauſch, born at Schweinfurd, September 30th 1605, after the uſual ſchool education at home, viſited the principal ſeminaries in Germany, France, and Italy, and was made doctor in medicine at Altdorf in 1630. He had the merit of forming a ſociety of phyſicians, in 1652, who met at ſtated periods, and communicated ſuch obſervations in philoſophy and medicine as occurred in their practice, and ſeemed deſerving of being preſerved. This, in time, gave birth to the Academia Naturæ Curioſorum, of which he was the firſt preſident, and in 1671 they began to publiſh their memoirs, under the title of "Miſcellanea Curioſa, Medico-Phyſica, Academiæ Naturæ Curioſorum," 4to. The ſociety ſtill continue their meetings, and have publiſhed near ſeventy volumes of the Miſcellany. Haller Bib. Med. Pract. Eloy. Dict. Hiſt.

BAUSCHWITZ, in *Geography*, a town of Sileſia, in the principality of Neyſze, 8 miles E. N. E. of Neyſze.

BAUSK, or Bautko, a town of Courland, ſeated on the river Muſa, on the frontiers of Poland. It was taken by the Swedes, under Guſtavus Adolphus, in 1625, and by the Ruſſians under Czar Peter, in 1705, after a bloody battle between the Ruſſians and Swedes. N. lat. 56° 30'. E. long. 24° 44'.

BAUTSCH, a town of Moravia, in the circle of Prerau, 18 miles N. of Prerau.

BAUTZEN, or Budiszin, the capital of Upper Luſatia, in Germany, ſituate in the circle of Budiſzin, on the river Spree, ſubject to the elector of Saxony, and fortified by a citadel, called the Caſtle of Ortenburg, ſtanding on a high

high rock, and ſeparated from the town by a ditch and ramparts. This citadel was founded before the town, which had its riſe in the 9th century. This town had formerly a conſiderable manufacture of linen, hats, ſtockings, and gloves, and alſo of glazed leather, cloth, fuſtian, &c. It has frequently ſuffered much from fire. It was taken by the Pruſſians in 1757; and after their retreat, taken poſſeſſion of by the citizens. The Lutherans and Catholics are allowed the free exerciſe of their religion. N. lat. 51° 10′. E. long. 14° 42′.

BAUX, Les, or Baulx, in Latin *Baltium*, a town of France, in the department of the mouths of the Rhone, and chief place of a canton in the diſtrict of Taraſcon, ſeated on a hill having a ſtrong caſtle, formerly an independent barony, and afterwards a marquiſate. N. lat. 43° 42′. E. long. 5° 0′.

Baux *Iſland*, a name given by captain Marchand to a ſmall iſland of the Pacific ocean; being one of the group called Hergeſt's iſlands near the Marqueſas, and denominated by Hergeſt, *Sir Henry* Martin's *Iſland*; which ſee.

BAWD, a perſon who keeps a place of proſtitution, or makes a trade of debauching women, and procuring or conducting criminal intrigues. Some think the word is derived from the old French *baude*, *bold* or *impudent*; though Verſtegan has a conjecture which would carry it higher, viz. from *bathe*, anciently written *bade*. In which ſenſe, bawd originally imported no more than bath-holder, as if bagnios had anciently been the chief ſcenes of ſuch proſtitution. The Romans had their male as well as female bawds; the former denominated *lenones* and *prœgogi*, among us *panders*; the latter, *lenæ*.

By a law of Conſtantine, bawds were to be puniſhed by pouring melted lead down their throats.

BAWDER, in *Geography*, a river of England, which runs into the Tees, about 3 miles N. N. W. of Barnard-caſtle in the county of Durham.

BAWD-MONEY, in *Botany*. See Æthusa Meum.

BAWDSEY Haven, in *Geography*, a ſmall bay or anchoring place near the ſouth point of the coaſt of Suffolk, formed by the ocean, and the mouth of the ſmall river Deben, about a league to the eaſt of Languard fort.

BAWDY-House, a houſe of ill-fame, to which lewd perſons of both ſexes reſort for the purpoſe of licentious and criminal indulgence. Houſes of this kind, under the denomination of brothels and ſtews, are licenſed in ſome countries; and in England they were privileged by patent, regulated by ſtatute, and tolerated as a neceſſary drain for corruption, from the reign of Henry II. to the laſt year of Henry VIII. when they were ſuppreſſed by ſound of trumpet; and their ſuppreſſion was perhaps attended with greater ſolemnity than that of the convents. Their ſuppreſſion, however, failed to extirpate lewdneſs; and Latimer (Sermons, p. 43.), whoſe ſermons are replete with a barbarous eloquence, inveighs bitterly at its ſubſequent prevalence. In 1650, the repeated act of keeping a brothel, and alſo of committing fornication, was, upon a ſecond conviction, made felony without benefit of clergy. But at the reſtoration, when hypocriſy deviated into the extreme of licentiouſneſs, it was not thought proper to renew a law of ſuch unfaſhionable rigour. The keeping of a bawdy-houſe is cognizable by the temporal law, as a common nuiſance, not only becauſe it endangers the public peace by drawing together diſſolute and debauched perſons, and promoting quarrels, but becauſe it tends to corrupt the manners of the people by an open profeſſion of lewdneſs. (3 Inſt. 205. 1 Hawk. P. C. c. 74.) Thoſe who keep bawdy-houſes are puniſhed with fine and impriſonment, and alſo ſuch infamous puniſhment, as pillory, &c. as the court ſhall inflict; and a lodger, who keeps only a ſingle room for the uſe of bawdry, is indictable for keeping a bawdy-houſe. (1 Salk. 382.) Perſons reſorting to a bawdy-houſe are puniſhable; and they may be bound to their good behaviour. But if a perſon be indicted for keeping or frequenting a bawdy-houſe, it muſt be expreſsly alleged to be ſuch a houſe, and that the party knew it, and not by ſuſpicion only. (Poph. 208.) A man may be indicted for keeping bad women in his own houſe. (1. Hawk. P. C. c. 61. §. 2.) A conſtable, upon information that a man and woman are gone to a lewd houſe, or about to commit fornication or adultery, may, if he finds them together, carry them before a juſtice of peace without any warrant, and the juſtice may bind them over to the ſeſſions. (Dalt. 214.) Conſtables may enter bawdy-houſes, call others to their aſſiſtance, and arreſt the offenders for a breach of the peace. In London, they may carry them to priſon; and by the cuſtom of the city, whores and bawds may be carted. (3 Inſt. 206.) By ſtat. 25 Geo. II. c. 36. made perpetual by ſtat. 28 Geo. II. c. 19. if two inhabitants, paying ſcot and lot, ſhall give notice to a conſtable of any perſon keeping a bawdy-houſe, the conſtable ſhall go with them before a juſtice of peace, and ſhall, upon the oath of ſuch inhabitants, that they believe the contents of ſuch notice to be true, and their entering into a recognizance of 20l. each, to give material evidence of the offence, enter into a recognizance of 30l. to proſecute with effect ſuch perſon for ſuch offence at the next ſeſſions. The conſtable ſhall be paid his reaſonable expences by the overſeers of the poor, aſcertainable by two juſtices; and upon conviction of the offender, the overſeers ſhall pay the two inhabitants 10l. each. A conſtable, neglecting his duty, forfeits 20l. Any perſon appearing as maſter or miſtreſs, or as having the care or management of any bawdy-houſe, ſhall be deemed the keeper of it, and liable to be puniſhed as ſuch. A wife may be indicted and ſet in the pillory *with* her huſband, for keeping a brothel; for this is an offence reſpecting the domeſtic œconomy and government of the houſe, in which the wife has a principal ſhare; and it is ſuch an offence as the law preſumes to be generally conducted by the intrigues of the female ſex. 1 Hawk. P. C. 2, 3.

BAWLING, among *Hunters*, is ſpoken of the dogs, when they are too buſy before they find the ſcent good.

BAWN, or Bax, derived from the Teutonick *bawen*, to conſtruct and ſecure with branches of trees, in *Antiquity*, an area encloſed with thick ditches of earth ſquare or circular, impaled with wooden ſtakes or the branches of trees, and ſurrounded with a deep trench. This was called in Iriſh *daingeau*, a word of Celtic origin. Numerous remains of ſuch fortreſſes are found not only in various parts of Ireland, but alſo in Britain, Germany, Sweden, and almoſt every country of Europe. The Iriſh gave great trouble to the Engliſh for many centuries by fortifying paſſes between the bogs and mountains in this manner, ſo that it was a tedious work to cut through them, and make the roads paſſable. This was called *plaſhing* a paſs, from the Franco-Gallic word *plaſſer*, which, like *bawen*, ſignifies to entwine; and it conſiſted in ſecuring the top of the vallum with ſticks interlaced with branches. Before the Engliſh invaſion, each family of the Iriſh is ſuppoſed by Mr. Ledwich to have lived in a mud cabin ſurrounded by a *bawn*. The Engliſh introduced caſtles, in which they were imitated by the natives. In courſe of time, *bawn* came to ſignify an incloſure with a wall, inſtead of plaſhed ſtakes; and we find queen Elizabeth and James I. requiring thoſe to whom grants were made, to conſtruct caſtles with *bawns*, or courts round them, for the protection

of their families and tenants. When the grant was not very conſiderable, a bawn with a houſe within it was ſufficient. Of the latter kind was *Hamilton's bawn*, in the county of Armagh, which is mentioned in Dean Swift's works, and which now gives name to a village in that county. This was built of lime and ſtone, eighty feet ſquare, with two round towers for flankers, and two ſtories high, vaulted, the wall itſelf being thirteen feet high. Within the bawn was a houſe of lime and ſtone, thirty-ſix feet long and twenty feet broad. Farther particulars may be found in Ledwich's Antiquities of Ireland, p. 188—196.

BAWOROW, in *Geography*, a town of Red Ruſſia, in the palatinate of Lemberg, 64 miles eaſt of Lemberg.

BAWT, a town of Perſia, in the province of Irak-Agemi, 80 miles north of Iſpahan.

BAWTRY, a market-town in the weſt riding of Yorkſhire, and upon the confines of Nottinghamſhire, in England, is ſeated on the high road to Scotland, and conſiſts principally of one broad ſtreet, well furniſhed with inns. It is 9 miles from Doncaſter, and 152 north from London. The river Idle induces a conſiderable trade from Derbyſhire, of mill and grind-ſtones, as well as of lead and iron ware from Sheffield, which are conveyed hence to Hull and other parts of the country. The market is held on Wedneſday and Saturday; and the town has alſo three annual fairs. Its houſes are 174, inhabited by 798 perſons. N. lat. 53° 27′. W. long. 1°.

BAXA Terra, or *Barrer Bay*, lies on the weſt coaſt of Africa, 4 leagues ſouth of the river Oro, which is in N. lat. 23° 30′. It is large, and has in ſeveral places good anchorage, eſpecially on its northern ſide.

BAXAS Bahia, lies on the coaſt of Braſil, in South America, 30 leagues E. and E. by S. from the ſand bank of Tortugas, on Turtle harbour. It has good anchorage, hard ground, and deep water; and it is well ſheltered by a ſand-bank from the north wind, and by the land from all other winds.

Baxas, *Das, Punta*, denoting a cape of ſhoals, is a low point, 12 leagues from the former, and 18 from Tortugas.

BAXEADORE, Cape, is ſituated in the iſland of Luconia or Manila, in N. lat. 18° 44′. E. long. 120° 35′.

BAXIOS, Abaxos, or *Abaſſes*, are two cluſters of rocks on the ſouth-eaſt ſide of the iſland of Ceylon, called the Great and the Little Baſſes. The former is in N. lat. 6° 10′. E. long. 81° 50′; and the latter in N. lat. 6° 25′. E. long. 82° 10′.

BAXOS de Abrolhos. See Abrolhos.

Baxos *de Baabuia*. See Abrojos.

Baxos *de la Candelaria*, a ſhoal or reef of rocks, in the Pacific ocean, ſo called by Mendana in 1567, and lying, by M. Fleurieu's calculation, near S. lat. 6¾°. and E. long. from Paris 157¾°.

Baxos, *Cape*, or *Low Cape*, is the eaſt point of the entrance into the river Seſtos, on the coaſt of Africa. It lies weſt of both cape Formoſa and Palmas iſland, 2 leagues diſtant from the latter. On the eaſt of this cape are ſeveral dangerous rocks, ſome of which are under water, and ſhould therefore be carefully avoided by the trading ſhips that navigate in theſe parts.

Baxos *Cape*, lies alſo on the coaſt of Africa, eaſtward of the river Volta, 2 leagues from the Quatre Montes, or hills ſo called that are cloſe together.

BAXTER, Richard, in *Biography*, an eminent divine among the non-conformiſts of England, was born at Rowton, a ſmall village in the county of Salop, in 1615. His father was a ſmall freeholder of exemplary character, who, though belonging to the eſtabliſhed church, was charged with puritaniſm on account of his religious demeanour. Under his inſtruction and example, Baxter manifeſted early indications of that contemplative and pious diſpoſition for which he was afterwards ſo diſtinguiſhed. In his youth he enjoyed few advantages for education; the ſchoolmaſters whom he attended being men of little learning and looſe morals. But under the tuition of Mr. Wickſtead, chaplain to the council at Ludlow, he had acceſs to an excellent library, of which he availed himſelf about a year and a half very much to his improvement. At this time his views were directed to the profeſſion of a miniſter. However, in 1633, Mr. Wickſtead prevailed upon him to relinquiſh this object, and to ſeek his fortune at court. Accordingly he was recommended to ſir Hen. Herbert, maſter of the revels; but diſguſted with the mode of living which this ſituation preſented to him, he ſoon retired into the country, and reſumed his purpoſe of proſecuting his ſtudies for the miniſtry. Being appointed maſter of the free ſchool at Dudley, his health declined; and under the impreſſion produced by the immediate proſpect of diſſolution, and by the peruſal of ſeveral practical treatiſes, he acquired that deep and ſettled ſenſe of religion which formed the ruling and permanent principle of his future life. Being more than ever determined to engage in the miniſterial office, and having at this time no ſcruples againſt conformity to the church of England, he was ordained in 1638; though he afterwards condemned his precipitance in complying with the laws of ſubſcription without due examination; and he frequently preached at Dudley and in the neighbouring villages, much to the ſatisfaction of thoſe who heard him. He objected, however, to ſome of the ceremonies of the church, and he ſoon began to entertain doubts concerning the lawfulneſs of conformity. What led him and ſeveral others to ſtudy the caſe of epiſcopacy, and to think unfavourably of the eſtabliſhment, was the impoſition of the "et cætera" oath, which expreſſed an univerſal approbation of the doctrine and diſcipline of the church of England, and a determination never to attempt any alteration in its government. Mr. Baxter demurred againſt taking this oath; and though he would have ſubmitted to the eccleſiaſtical juriſdiction that was actually eſtabliſhed, he could not conſcientiouſly declare his approbation of it, and his determination to ſupport it to the extent which this oath required. In 1640, he was invited by the principal inhabitants of Kidderminſter to reſide with them as a preacher; and this place became the ſcene of his miniſterial ſervices for about ſixteen years. Such, indeed, was the ſucceſs which attended them, that he was eminently uſeful in reforming the morals of the diſſolute, and in promoting in the town and its neighbourhood a ſtrict regard to religion. About two years after his ſettlement at Kidderminſter, the civil war commenced; and on this occaſion he took part with the parliament, and recommended the proteſtation preſcribed by it, to the people. He was thus reduced to the neceſſity of leaving this town, and of repeatedly changing his reſidence, till at length he ſettled at Coventry, where he preached regularly once a week both to the ſoldiers of the garriſon and to the people of the town. After the battle of Naſeby, he became chaplain to the regiment of colonel Whalley, and attended it at ſeveral ſieges, though he was never preſent in any engagement; ſo that the ſtory of his having killed a man in cold blood, and robbed him of a medal, was an unfounded and ſcandalous fabrication. During theſe times of confuſion, Mr. Baxter was a zealous friend to regular government both in church and ſtate; and it is ſaid that he took great pains to repreſs the ſectaries. The accidental circumſtance of a profuſe bleeding at the noſe, which reduced

duced him to a ſtate of great languor, was the occaſion of his being ſeparated from the army in 1647, and of preventing that ſervice to his country, which might have been expected from a perſon of his principles and moderation. However, he reſiſted to the utmoſt of his power, the meaſures of thoſe who afterwards uſurped the government of the kingdom; he oppoſed taking the covenant, preached againſt the engagement, and diſſuaded the ſoldiers from fighting againſt the Scots troops who came into the kingdom with Charles II.; and therefore the charge alleged againſt him, of his having been a trumpeter of rebellion, is altogether without foundation. When Cromwell aſſumed the ſupreme power, he boldly and openly declared, that he diſliked his uſurpation; and in a private conference, expreſsly told him, that in his opinion the ancient monarchy was a bleſſing. To that form of government Baxter always avowed his attachment; and in a ſermon preached before the parliament on the 30th of April 1660, the day preceding that on which they voted the king's return, he maintained, that loyalty to their prince was a thing eſſential to all true proteſtants of whatever perſuaſion. About the ſame time he preached a thankſgiving ſermon at St. Paul's, on occaſion of the ſucceſs of general Monk; and this circumſtance refutes the charge of his having diſſuaded his excellency from concurring in, or bringing about that change.

After the reſtoration, Baxter was made one of the king's chaplains, and was always treated by him with peculiar reſpect. To his majeſty he ſpoke with the ſame freedom which he had uſed with the protector Cromwell. He ſtrongly repreſented the great importance of tolerating thoſe pious men who entertained doubts concerning the ceremonies and diſcipline of the church: and he obſerved, that the late uſurpers had ſo well underſtood their own intereſt, that they had found the way of doing good to be the moſt effectual means to promote it; and therefore he beſought the king that "he would never ſuffer himſelf to be tempted to undo the good which Cromwell or any other had done, becauſe they were uſurpers that did it;" and on the contrary, "that he would rather outgo them in doing good." At the Savoy conference he was one of the commiſſioners, and was employed in compiling the reformed liturgy. Having declined the preferment of the biſhopric of Hereford, which was offered him, he wiſhed to retire to his friends at Kidderminſter, and to officiate among them in the humble ſtation of a curate, but was not permitted. Diſappointed with regard to the object of his wiſhes, he preached for ſome time occaſionally in London; but the act againſt conventicles obliged him to retire firſt to Acton, and then to Totteridge. During the perſecution of the non-conformiſts, he preached, as opportunity offered, and the ſtate of the times allowed, either more openly or more privately; and he was ſometimes a ſufferer for his zeal, and ſometimes unmoleſted. After the indulgence of 1672, he chiefly reſided in London, and exerciſed his miniſtry, either occaſionally or ſtatedly, but not without interruption and moleſtation. To the ſufferings attendant on his profeſſion were added the infirmities of a feeble conſtitution and frequent bodily diſorders, together with the loſs of the greateſt part of his fortune in conſequence of the ſhutting up of the exchequer in 1671, and by the penalties inflicted upon him for the exerciſe of his miniſtry; but he bore all theſe evils with ſingular fortitude and patience. In 1684, he was treated with peculiar ſeverity. Although he was ſo ill as not to be able to ſtand, a warrant was granted againſt him in order to his being bound to his good behaviour; and the conſtables, who were entruſted with its execution, watched him ſo inceſſantly, that they prevented his paſſing from his ſtudy to his bedchamber; and by thus depriving him both of food and ſleep, at length effected their purpoſe, though they were not empowered to break open doors, and took him away to the Seſſions-houſe, where he was bound in the penalty of 400 l. to keep the peace, and he was brought up twice afterwards, though he kept his bed during the greateſt part of the time. In 1685, he was committed to priſon by a warrant from lord chief-juſtice Jeffries, for his paraphraſe on the New Teſtament, which was charged with being hoſtile to epiſcopacy, and brought to trial for ſedition. In the courſe of this trial, he was treated with all the brutal inſolence and tyranny, to the exerciſe of which that ruffian of the law, Jeffries, was accuſtomed; reviled by his judge in the groſſeſt terms, and prevented from obtaining the full defence of his council; and at laſt found guilty on the moſt frivolous grounds, and ſentenced to pay 500 marks, to lie in priſon till he paid it, and to be bound to his good behaviour for ſeven years. From this heavy penalty however, after a confinement of ſeveral months, he was releaſed, in 1686, by king James, and allowed to remain in London, notwithſtanding the proviſions of the Oxford act. From this time he lived in a retired manner, neither interfering in the concerns of his party, nor taking any part in thoſe addreſſes which ſome of his brethren preſented to James II. on his indulgence. He perſiſted, however, in the performance of his miniſterial duties, till increaſing weakneſs confined him to his chamber. The cloſe of his life correſponded to the uniform tenor of it; the approaches of diſſolution were regarded by him with pious reſignation; and he died, with the tranquillity and hope appropriate to his exemplary character, on the 8th of December 1691. Urged by extreme pain to wiſh for a releaſe, he checked himſelf by ſaying, "It is not fit for me to preſcribe; where thou wilt, when thou wilt, and how thou wilt." To one who aſked him in his ſickneſs how he did, he replied, "Almoſt well." In 1662, Mr. Baxter married the daughter of Francis Charlton, Eſq. a diſtinguiſhed magiſtrate of the county of Salop; a woman of great piety, who entered thoroughly into his views concerning religion, and cordially approved all the ſacrifices which he made from a conſcientious regard to duty. She accompanied him in priſon, and ſubmitted without repining to all the hardſhips conſequent upon the perſecution which he ſuffered. She died 10 years before him.

"Richard Baxter was a man, whoſe whole ſoul was engaged in his profeſſion. Ardent piety towards God, and zeal for the beſt intereſts of his fellow creatures, were the active ſprings of his conduct; and few men have ever devoted more time and labour to thoſe objects. He paſſed a life of much contention and obloquy; but at this cool diſtance, no candid enquirer can miſtake his true character. His early ſtudies in divinity were not, perhaps, the beſt adapted to form a theologian. They conſiſted chiefly of the ſchoolmen and metaphyſicians of a dark age, and gave him a turn to ſubtleties of diſtinction, which made him ſtand apart in ſome theoretical points from all his contemporaries. Yet in practical religion, the devotional warmth of his temper allied him to the pious of all denominations, and inſpired him with an enlargement of mind, which ſet him above the differences reſulting from petty controverſies. He was a moſt voluminous writer, and his works are ſufficient to make a library of themſelves. Above 145 diſtinct treatiſes of his compoſition have been reckoned up; of which 4 were folios, 73 quartos, and 49 octavos, beſides ſeveral others of a ſmaller ſize. They compriſe bodies of theology, practical and theoretical, beſides a vaſt number of tracts on particular topics." His practical works have been collected together in

in 4 vols. in folio. His income, it is ſaid, which was not great, was increaſed by the profit which he made of his writings, for which he ſometimes received 60 or 80l. a year of the bookſellers. But this money he ſeems to have employed in charitable purpoſes. Of his numerous works ſome of the principal were his "Methodus Theologiæ," printed in Latin in 1674, folio; his Engliſh body of practical divinity, publiſhed in 1673, folio, under the title of "The Chriſtian Directory, &c.;" "Gildas Salvianus, or the Reformed Paſtor," 8vo. 1656, much eſteemed by many divines; "Univerſal Concord," 12mo. 1658, giving an account of the terms upon which all Chriſtian churches may hold communion; "Reaſons for the Chriſtian Religion," 1667; "Catholic Theology," fol. 1675, intended to reconcile the differences between the Arminians and the Calviniſts; "A Treatiſe of Epiſcopacy," 4to. 1681; "A Treatiſe of Univerſal Redemption," 8vo. 1694. The moſt popular of his practical pieces were his "Saints Everlaſting Reſt," and his "Call to the Unconverted," of which latter 20,000 were ſold in one year, and it was tranſlated into all the European languages, and into the Indian tongue. To thoſe which we have enumerated, we may add his "Reformed Liturgy," his "Poor Man's Family Book," his "Dying Thoughts," and his "Paraphraſe on the New Teſtament." The firſt book he publiſhed was his "Aphoriſms of Juſtification" and the "Covenants," printed in 1649; and the laſt in his life-time, "The Certainty of the World of Spirits," printed in 1691; ſo that he was an author 42 years. One of his works is "A Narrative of his own Life and Times;" which, though a rhapſody," ſays Mr. Granger, "compoſed in the manner of a diary, contains a great variety of memorable things, and is itſelf, as far as it goes, a hiſtory of non-conformity." Mr. Baxter was diſtinguiſhed not only as a practical, but alſo as a controverſial writer; and under this latter character, he particularly oppoſed the Antinomians. Few perſons have ſuffered more rancorous abuſe than Mr. Baxter; and few have been more highly reſpected both by his cotemporaries and poſterity. Among his friends and admirers we may reckon ſome of the moſt diſtinguiſhed characters of the age in which he lived, of whom many were members of the eſtabliſhment, ſuch as chief juſtice Hale, ſir John Maynard, Dr. Barrow, biſhop Wilkins, biſhop Patrick, and biſhop Burnet. The great chief juſtice Hale honoured him with an intimate friendſhip, gave a high encomium of his piety and learning to all the judges, and when he was in priſon, on the Oxford act, left him a legacy in his will, and ſeveral large books, in his own hand-writing, on the matter of their converſations. Dr. Barrow has teſtified concerning his works, that "his practical writings were never mended, his controverſial ſeldom confuted." Biſhop Wilkins affirms, "that he has cultivated every ſubject which he has handled;" and he uſed to ſay of him, "that if he had lived in the primitive times, he had been one of the fathers of the church. Biſhop Burnet's teſtimony is ſomewhat qualified. "Baxter," ſays he, "was a man of great piety, and, if he had not meddled in too many things, would have been eſteemed one of the learned men of the age. He had a very moving and pathetical way of writing, and was his whole life long a man of great zeal and much ſimplicity; but was moſt unhappily ſubtle and metaphyſical in every thing." Baxter was one of the laſt divines, whoſe name has diſtinguiſhed a particular denomination or deſcription of perſons. See BAXTERIANS. Calamy's Life of Baxter. Biog. Brit. Gen. Biog.

BAXTER, *William*, an eminent philologiſt and antiquarian, was the nephew and heir of Richard Baxter, and born of parents in mean circumſtances at Llanlugany, an obſcure village of Shropſhire, in 1650. He derived his pedigree, like a true Cambro-Briton, through a long ſeries of anceſtors from John Baxter, who, in the reign of Henry VI., ſettled at Shrewſbury; and he ſhews, that the name Baxter ſignifies originally a baker, in Saxon "Bæceſter," and that it was given to that family, becauſe they were bakers to the ancient princes of Wales, in which poſt, according to the cuſtom of the ancient Celtes and Greeks, the nobleſt perſons were employed.

In his infancy and youth, his education was ſo much neglected, that when he was ſent to Harrow ſchool in Middleſex at the age of 18, he knew not one letter, nor underſtood one word of any language but Welſh. But ſuch were his talents and application, that he ſoon became diſtinguiſhed by his extenſive knowledge. In 1679 he publiſhed a Latin grammar, entitled "De Analogia, ſeu arte Latinæ linguæ commentariolus," &c. 12mo. Thus qualified for the profeſſion of a ſchoolmaſter, to which he devoted himſelf, he employed the greateſt part of his life in this occupation. For ſome years he kept a boarding ſchool at Tottenham High-croſs in Middleſex; and he was afterwards elected maſter of the Mercers' ſchool in London. Having acquired great celebrity as a ſcholar, and in the proſecution of antiquarian reſearches, and diſtinguiſhed, perhaps, more by his learning than his judgment, he died in 1723. In 1695 he publiſhed a new and correct edition of "Anacreon," with notes, which was reprinted with conſiderable additions and improvements in 1710. His abuſe of Tanaquil Faber, a former editor of Anacreon, was amply retorted upon himſelf by J. Cornelius de Pauw, in his 4to. edition of the ſame poet, publiſhed at Utrecht in 1732, who held his comments in great contempt. His edition of "Horace," printed in 1701, and reprinted with improvements in 1725, has obtained a more laſting reputation. Dr. Harwood pronounces this the beſt edition ever publiſhed, and the learned Geſner has teſtified his approbation of it, by making it the ground-work of his excellent edition. Bentley, famed for the ſeverity of his criticiſms, in ſpeaking of it, calls Baxter "Vir reconditæ eruditionis." In 1719 Baxter publiſhed his dictionary of Britiſh antiquities, under the title of "Gloſſarium Antiquitatum Britannicarum ſive ſyllabus etymologicus antiquitatum veteris Britanniæ atque Iberniæ, temporibus Romanorum," 8vo. By his ſkill in the Britiſh or Welſh tongue, and by means of etymology, he profeſſes to correct Camden, and to add about 200 names of ancient places and rivers omitted in his Britannia; of this work, a ſecond edition was publiſhed, after the author's deceaſe, in 1733. His gloſſary of Roman antiquities, proceeding no farther than the letter A, was publiſhed in 1726 by Mr. Moſes Williams, under the title of "Reliquiæ Baxterianæ, &c." and republiſhed in 1731, with the title "Gloſſarium Antiquitatum Romanorum, &c." Lond. 8vo. Baxter alſo wrote four letters on ſubjects of antiquity, inſerted in the firſt volume of the "Archæologia." He left behind him notes on Perſius and Juvenal, and was the tranſlator of ſome of Plutarch's lives "done into Engliſh" by ſeveral hands. Biog. Brit.

BAXTER, *Andrew*, an ingenious metaphyſician and philoſopher, was the ſon of a merchant at Aberdeen, and born there in 1686 or 1687. He was educated in King's college in that city, and afterwards undertook the care of private pupils, ſome of whom were perſons of rank and fortune. About the year 1730, he publiſhed in 4to. his celebrated work, entitled, "An Enquiry into the Nature of the Human Soul; wherein the Immateriality of the

Soul is evinced, from the principles of Reaſon and Philoſophy." This work, which was reprinted in 2 vols. 8vo. in 1737 and in 1745, was much applauded by ſeveral perſons of eminence, and particularly by biſhop Warburton, who, in his "Divine Legation," ſpeaks of it as containing "the juſteſt and preciſeſt notions of God and the Soul," and "as one of the moſt finiſhed of the kind, that the preſent times, greatly advanced in true philoſophy, have produced." Of the author's ſentiments, ſee ſome account under the articles DREAM, SOUL, and VIS *Inertiæ*. In 1741 Mr. Baxter went abroad with one of his pupils, and ſettled for ſome time at Utrecht, where he became acquainted with ſeveral literary perſons, and whence he made ſeveral excurſions into Flanders, France, and Germany. Upon his return to Scotland in 1747, he reſided till his death at Whittingham, in the ſhire of Eaſt Lothian. His work, entitled "Matho, ſive Coſmotheoria Puerilis," was drawn up for the uſe of his pupils, and firſt printed in Latin, and afterwards greatly enlarged, and publiſhed in Engliſh, in 2 vols. 8vo. The ſecond edition of this work was publiſhed in 1745, and the third in 2 vols. 12mo. in 1765. The deſign of this work was to deduce the principles of natural religion from the phenomena of the material world. A miſtake in the aſtronomical theory, which the author did not live to rectify, as he had intended, had diſguſted ſome readers; and therefore, in the third edition, the conference that was chiefly affected by that error, was ſuppreſſed, and the vacancy ſupplied by another. In 1750 the author publiſhed "an Appendix to the firſt part of his Enquiry into the Nature of the Soul," vindicating it from ſome objections, which was dedicated to Mr. Wilkes, with whom he formed an intimate acquaintance abroad. In this year Mr. Baxter, after having endured great ſufferings from the gout, and a complication of diſorders, with exemplary patience, cloſed his life about the ſixty-third year of his age. He left behind him ſeveral unfiniſhed MSS. on philoſophical ſubjects, and one in a complete ſtate, concerning the controverſy between the Engliſh and foreign philoſophers on the ſubject of the force of bodies moving in free ſpaces, which however was never publiſhed.

Mr. Baxter's learning and talents are ſufficiently diſplayed in his writings. His application was ſuch, that he ſometimes ſat up whole nights reading and writing: and yet his diſpoſition was cheerful and ſociable. In converſation he was modeſt and unaſſuming; and in the diſcharge of the ſocial and relative duties of life, his conduct was exemplary. His mind was poſſeſſed with the moſt reverential ſentiments of the Deity, and the general tenor of his life was conformable to the rules of virtue. He was economical without parſimony. Such was his diſintereſtedneſs, that he declined conſiderable offers of preferment, which he might have obtained if he had taken orders in the church of England. His knowledge of the modern languages was extenſive; ſo that he could write and ſpeak in French, German, Dutch, Italian, and Spaniſh. By his wife, whom he married in 1724, and who ſurvived him ten years, he had one ſon and three daughters. Biog. Brit.

BAXTERIANS, in *Eccleſiaſtical Hiſtory*, derive their appellation from Mr. Richard Baxter, a nonconformiſt miniſter; of whom we have already given an account. His theological ſyſtem has been called Baxterianiſm; and thoſe, who embrace his ſentiments in divinity, are called Baxterians. The Baxterians have endeavoured to ſtrike into a middle path between Calviniſm and Arminianiſm; and to unite both theſe ſchemes. They profeſs to believe in the doctrines of election, effectual calling, and other tenets of Calviniſm; and conſequently, ſuppoſe, that a certain number, determined upon in the divine counſels, will infallibly be ſaved. This they think neceſſary to ſecure the ends of Chriſt's interpoſition. But then, on the other hand, they reject the doctrine of reprobation, and admit that our bleſſed Lord, in a certain ſenſe, died for all; and that ſuch a portion of grace is allotted to every man, as renders it his own fault, if he doth not attain to eternal happineſs. If he improves the common grace given to all mankind, this will be followed by that ſpecial grace which will terminate in his final acceptance and ſalvation. Whether the Baxterians are of opinion, that any beſides the elect, will *actually* make ſuch a right uſe of common grace as to obtain the other, and, at length, come to heaven, we cannot aſſuredly ſay, there may poſſibly be a difference of opinion upon the ſubject, as they approach nearer to Calviniſm or to Arminianiſm. Mr. Baxter appears, likewiſe, to have modelled the doctrines of juſtification, and the perſeverance of the ſaints, in a manner which was not agreeable to the rigid Calviniſts. Some foreign divines in the 17th century ſtruck nearly into the ſame path; and, particularly, in France, M. le Blanc, Mr. Cameron, and the celebrated Monſ. Amyrault. For a conſiderable time the non conformiſt clergy in England were divided into ſcarcely any but two doctrinal parties, the Calviniſts and the Baxterians. Of late the Baxterians have been leſs numerous. However, they are ſtill a conſiderable body; and ſeveral perſons are fond of the name as a creditable one, who probably go farther than Mr. Baxter did. The name, however, like other theological diſtinctions, will probably, in a courſe of time, ſink into diſuſe, till it is either wholly forgotten, or preſerved merely in the records of hiſtory. Biog. Brit. Art. BAXTER.

BAY, in *Botany*. See LAURUS.

BAY, *Loblolly*. See GORGONIA.

BAY, *Roſe*. See NERIUM.

BAY, *Dwarf Roſe*, and *Mountain Roſe*. See RHODODENDRUM.

BAY, *Sweet Flowering*. See MAGNOLIA.

BAY *Plum*. See PSIDIUM.

BAY, in *Building*, denotes any kind of opening in walls; as a door, window, or even chimney.

BAY *windows* are the ſame with what we otherwiſe call *bow windows*.

BAY, in *Geography*, denotes a little gulf, or an arm of the ſea, ſtretching up into the land; being larger in the middle within, than at its entrance, which is called the *mouth of the bay*. The largeſt and moſt remarkable bays are thoſe of Biſcay. Bengal, Hudſon's, Panama, &c.

BAY of *All Saints*. See ALL SAINTS.

BAY of *Antongil*. See ANTONGIL.

BAY, *Baffin's*. See BAFFIN.

BAY of *Cancale*. See CANCALE.

BAY, *Chequitan*. See CHEQUITAN.

BAY of *Cheſapeak*. See CHESAPEAK.

BAY of *Fires* lies on the eaſt coaſt of New South Wales or New Holland, in the Pacific ocean, to the north of St. Patrick's Head. The north point of the bay is called Edyſtone, and the ſouth point St. Helen's. A ſmall rocky iſland is near the middle of its entrance, on each ſide of which is an open paſſage.

BAY of *Freſh Water*, lies ſouth of Aſcenſion bay in the north part of the gulf of Mexico. N. lat. 30°. W. long. 93°.

BAY of *Fundy*. See FUNDY.

BAY of *Good Fortune*, lies on the north coaſt of Chaleur bay, which is a large bay of the gulf of St. Lawrence, and on the north eaſt coaſt of Nova Scotia in North America.

BAY, *Hudſon's*. See HUDSON'S.

BAY of *Inlets*, a bay on the ſouth eaſt coaſt of New Holland,

land, between cape Palmerſton and cape Townſhend. S. lat. 21° 30′. to 22° 30′. W. long. 209° 36′. to 210° 40′.

Bay of *Iſlands* lies on the coaſt of Nova Scotia, on the continent of North America, about 6 leagues ſouth-weſt from cape St. Mary.

Bay of *Iſlands* is alſo a bay on the northern iſland of New Zealand in the ſouth Pacific ocean, lying on the north-eaſt coaſt between cape Brett and cape Pococke. This bay is large and deep, and has many ſmall iſlands in it. The beſt entrance into the bay is on the weſt ſide; within it are ſeveral leſſer bays. S. lat. 35° 12′. E. long. 174° 57′.

Bay of *Iſlands* is alſo a bay on the ſouth coaſt of the ſtraits of Magellan, towards the weſtern entrance, W. by N. from Upright bay, and E. by S. from the bay of Diſappointment. A cluſter of ſmall iſlands lies in the entrance, and in the eaſt part of the bay: but the beſt entrance is between the weſternmoſt of the two iſlands off the point of cape Upright, and a ſmall iſland farther weſt, where a ſhip may have ſafe paſſage, and anchor in 20 fathoms in ſoft mud, near the weſt coaſt of the cape, in S. lat. 53° 9′. W. long. 75° 32′.

Bay of *Iſles* is an extenſive bay of the gulf of St. Lawrence, on the weſt coaſt of Newfoundland, about 8 or 9 leagues to the S. W. from la Belle bay, and 14 or 15 leagues to N. N. E. from Porta port. The centre of the bay lies in about N. lat. 49° 5′. W. long. 58° 15′.

Bay of *Iſles* is alſo a bay ſituate towards the weſt end of the north coaſt of South Georgia iſland, in the ſouth Atlantic ocean.

Bay of *St. Louis*, lies on the Labrador coaſt, and has cape St. Louis on the north, and cape Charles on the ſouth. It has many ſmall iſlands; the largeſt of which is Battle iſland, in the mouth of the bay. The middle of the bay is in N. lat. 52° 23′. W. long. 55° 23′.

Bay, *de Roche Fende* lies on the weſt ſide of Lake Champlain, and the ſtate of New York, 17 miles above Crown-point.

Bay of *Rocks* is a ſpacious bay of the Arabian ſea, which forms a part of the Indian ocean, and lies on the ſouth-eaſt coaſt of Arabia, with good anchorage for ſhips.

Bay of *Seven Iſlands* lies W. N. W. from Moiſie river, and about 18 leagues to N. N. E. from Trinity point, on the north ſhore of the gulf of St. Lawrence.

Bay of *Shoals*. See Baxas *Bahia*.

Bay of *St. Spirit*, is a large bay of the Indian ocean, on the ſouth-eaſt coaſt of Africa, on the north of the iſland and cape of Unhaſa. It is ſufficiently ſpacious to receive a fleet of ſhips, and is ſo called from the river St. Spirit, or Manica, which falls into this bay.

Bay, among *Farmers*, is that part of the barn where the mow is placed.

Bay, in *Hydraulics*, ſignifies a pen, or pond-head, made up a great height, to keep in a ſtore of water for driving the wheels of a forge or furnace of an iron-mill, by the ſtream that comes thence through a paſſage, or flood-gate, called the *pen-ſtock*.

Bay *colour*, in *Manege*. The word *bay* is formed from the Latin *baius*, or *badius*, and that from the Greek βαιος, *a palm-branch*, ſo that *badius* or *bay* properly denotes *color phœniceus*. Hence alſo, among the ancients, thoſe now called *bay* horſes, were denominated *equi palmati*.

The bay is the moſt uſual colour among horſes. It is a ſtrong and perhaps invariable character in this colour to be attended with a black mane and tail, which the cheſnut or any other colour that approaches it never is. The bay is alſo moſt frequently attended with black legs and feet up to the knees and hocks: the feet, however, are often varying to the white in horſes of this colour, which is not with us eſteemed ſo handſome as when entirely black. There are ſeveral kinds of bays, as light bay, dark bay, brown bay, golden bay, dappled bay, &c.

Bay *à mirroir*, the ſame as dapple *bay*.

Bay, among *Sportſmen*, is applied to ſtags, boars, foxes, &c. and alſo to dogs when they turn head againſt one another. Thus when a ſtag has been ſo long purſued, that he is almoſt exhauſted, he turns round, and facing the hounds, defends himſelf with his antlers, and keeps the hounds at *bay*, till the ſportſmen come up, draw off the dogs, and ſave his life. When a ſtag takes *ſoil*, that is, takes to the water, he will defend himſelf, and keep the hounds for a long time at *bay*, provided that he fathoms the lake or river ſo well as to keep the hounds ſwimming, without going out of his own depth, but if he is obliged to ſwim at the time, he *is up* or quite tired, and being ſurrounded by the dogs, he is inevitably drowned. In fox hunting, when the fox is ſuppoſed to have entered the earth, the place of his retreat is ſoon diſcovered by the terriers, "laying well at him," provided he has not *turned* in the earth; but if he has, the terrier and the fox are face to face, and are both baying, or keeping each other at *bay*; and the conteſt terminates with *digging out* the fox.

Bay *ſalt*. See Salt.

Bay *yard*, is a denomination ſometimes uſed promiſcuouſly with *woollen yarn*. 10 and 11 W. III. c. 10. 5 G. II. c. 21. See Yarn, &c.

BAYA, in *Geography*. See Baia, and Bayja.

Baya, low, marſhy land on the Gold coaſt of Africa, without any towns or people near the ſhore; 4 leagues W. S. W. from the river Volta, and 8 leagues E. and E. N. E. from Ningo ground.

Baya, in *Ornithology*, Indian groſbeak, or *Loxia Indica*, is rather larger than a ſparrow, with yellow brown plumage, a yelloviſh head and feet, a light-coloured breaſt, and a conic beak, very thick in proportion to his body. This bird is very common in Hindoſtan; and is deſcribed as ſurpriſingly ſenſible, faithful, and docile; never voluntarily deſerting the place where its young are hatched, not averſe from the ſociety of mankind, and eaſily taught to perch on the hand of his maſter. In a ſtate of nature the baya builds his neſt on the higheſt tree which he can find; generally on the palmyra or Indian fig-tree, preferring that which overhangs a well or rivulet, forming it of graſs in the ſhape of a large bottle, ſuſpending it on the branches ſo as to be firm and yet to rock with the wind, and placing it with its entrance downwards, to ſecure it from birds of prey. This bird is taught with eaſe to fetch a piece of paper, or any ſmall thing which his maſter wants. If a ring be dropped into a deep well, and a ſignal given to the bird, he will fly down with aſtoniſhing celerity, and bring it up to his maſter with apparent exultation; and it is confidently aſſerted, that if a houſe or any other place be ſhewn to him once or twice, he will carry a note thither immediately, on obſerving a proper ſignal. They are alſo trained by the youthful libertines of Benares to pluck off the pieces of gold called ticas, placed by way of ornament between the eye-brows of their miſtreſſes, which they bring in triumph to their lovers. The baya's natural food is graſshoppers and other inſects; but it ſubſiſts, when tame, on pulſe macerated in water. The female lays many beautiful eggs, reſembling large pearls: their white, when boiled, is tranſparent, and the flavour of them is exquiſitely delicate. Aſiatic Reſearches, vol. ii. p. 109.

BAYAGARAS, in *Geography*, a town on the iſland of St. Domingo.

BAYAMO, called alſo *St. Salvador*, a town in the eaſtern part of the iſland of Cuba, having the town of Almo to the weſt, and St. Barbara to the ſouth. It lies on the eaſt ſide

of Edero river, about 20 miles from the ſea; and it gives name to a channel, that runs between the numerous ſmall iſlands and rocks, called "Jardin de la Reyna, or Queen's gardens," on the north-weſt, and the ſhoals and rocks that line the coaſt on the ſouth-eaſt ſide of it, from the bold point called Cabo de Cruz.

BAYARD, or Baiard, in ſome *Old Writers*, is an appellative for a horſe. Hence the phraſes, blind bayard, bayard's watering, bayard's green, &c.

BAYDER, in *Geography*, a ſmall town of the Crimea or Taurida, which gives name to the delightful valley, called by the natives the "Tauric Arcadia," the "Crimean Tempe," &c. which is watered by two gentle murmuring ſtreams. It is of an oval form, about 20 miles long, and ſurrounded by high mountains, covered with beautiful woods, intermixed with odoriferous flowering ſhrubs. It contains a number of Tartar villages, romantically ſituated and inhabited by the families of ſhepherds and huſbandmen.

Bayder, *Cape*. See Bajador.

BAYEN, Peter, in *Biography*, a French chemiſt, was born at Chalons in 1725. In 1749, he ſerved under Charas in pharmacy. He gave analyſes of the mineral waters of France; and he wrote memoirs on marbles, ſerpentine ſtones, porphyries, granites, jaſpers, ſchiſts, and iron ſpar. He doubted the exiſtence of the phlogiſton of Stahl; and by operating on mercurial precipitates, he found that what are called metallic oxides owe their ſtate, when obtained by calcining metals, to the abſorption of one of the conſtituent ingredients of atmoſpheric air. This chemiſt alſo diſcovered the fulminating property of metals, when mixed with a very little ſulphur; and he ſhewed that tin was not neceſſarily contaminated by arſenic; that what is uſed by potters contains copper and antimony, by which it is rendered hard; zinc, by which it is whitened; biſmuth, by which it is rendered ſonorous; and lead, in order to diminiſh the price. Bayen died at the age of 72 years. Mem. de l'Inſtitut. National, &c. vol. ii.

BAYER, Gottlieb Siegfried, a celebrated philologiſt, was born at Konigſberg, in Pruſſia, in 1694, and ſtudied, chiefly, the languages, firſt in his native city, and afterwards at Dantzig, Berlin, and Leipſic; at which latter place he took the degree of maſter of arts in 1717. On his return to Konigſberg in the following year, he was appointed librarian of the public library. In 1726 he removed to Peterſburgh, became profeſſor of the Greek and Roman antiquities in the Academy of Sciences, and acquired an extenſive knowledge of the Chineſe and other Aſiatic languages. In 1730 he was choſen member of the Academy of Sciences at Berlin; and in 1731 invited to be profeſſor of eloquence at Halle; which he was not allowed to accept, but continued in Ruſſia with a conſiderable increaſe of ſalary. He died at Peterſburgh in 1738. His numerous diſſertations on different ſubjects are inſerted in Lilienthal's "Select. Hiſtor. & Liter," the "Acta Eruditorum," and the "Comment. Acad. Petropol." &c. His "Muſeum Sinicum," publiſhed in 1732, in 2 vols. 8vo. is a work of great learning and ingenuity. Gen. Biog.

BAYER, John, a German aſtronomer, flouriſhed at the cloſe of the 16th and commencement of the 17th centuries; but the time and place of his birth are not aſcertained. Some have ſuppoſed that he was the grandfather of the ſubject of the preceding article, and that he was born at Augſburg. It was at Augſburg, however, that he publiſhed, in 1603, his excellent and uſeful work, entitled "Uranometria." This is a large celeſtial atlas, conſiſting of folio charts of all the conſtellations, with a nomenclature, collected from all the tables of aſtronomy, ancient and modern, improved by his own uſeful invention of denoting the ſtars in each conſtellation by Greek letters, in alphabetical order according to the magnitude of each. The ſtars are thus as eaſily diſtinguiſhed as if each of them had an appropriate name; and the utility of this mode of claſſification has been ſo much approved, that it has been retained, ſince Bayer's time, in all the atlaſſes, catalogues, and celeſtial globes through the ſcientific world. This valuable work was gradually improved and augmented by the author himſelf. In the year 1627 Julius Schiller, a civilian, projected by the ſuggeſtion of Bayer, and publiſhed his Uranographia, under the title of "Cœlum Stellatum Chriſtianum;" in which he rejected the heathen names, characters, and figures of the conſtellations, and inſerted in their ſtead others taken from the ſcriptures. Accordingly he placed the twelve apoſtles in the zodiac; and he deduced the ſouthern conſtellations from the Old Teſtament, and the northern ones from the New Teſtament. This innovation, however, tended to embarraſs aſtronomers, and was never adopted. The ancient names were therefore reſtored in the later editions of the Uranometria of 1654 and 1661. Montucla, Hiſt. des Math. tom. ii. p. 333. See Catalogue.

BAYERSDORF, in *Geography*, a town of Germany, in the circle of Franconia, and principality of Bayreuth, ſeated on the Rednitz, with a tribunal of juſtice and a large ſynagogue; 4 miles north of Erlang.

BAYETTE, in *Ichthyology*, a French name of the ſpecies of *Silurus* obſerved by Sonnini in the Nile, and figured pl. 27 of his "Voyage en Egypte." It is the ſame kind which Forſkal calls Silurus bajad. It grows to a large ſize, but its fleſh is not much eſteemed.

BAYEUX, in *Geography*, a town of France, and principal place of a diſtrict, in the department of Calvados. Before the revolution it was the capital of Beſſin, in the province of Normandy, the ſeat of a governor and the ſee of a biſhop, whoſe dioceſe included 611 pariſhes. The cathedral is much admired. The number of inhabitants is computed at 8000, and the principal commerce is leather. It is ſeated on the river Aure, about 4 miles from the ſea. N. lat. 49° 16′ 30″. W. long. 0° 42′ 51″.

The celebrated tapeſtry of Bayeux, which ſtill exiſts, and is publicly exhibited at ſtated periods in the cathedral of the city, is a very curious monument of the ſtate of the art of embroidering at the time of the Norman conqueſt. It is a web of linen, nearly two feet in breadth, and 442 in length, embroidered with the hiſtory of that memorable expedition, from the embaſſy of Harold to the Norman court in 1065, till his death in the following year. The ſcenes of this buſy period are ſucceſſively exhibited, and conſiſt of many hundred figures of men, horſes, beaſts, birds, trees, houſes, caſtles, and churches, with inſcriptions over them explanatory of their meaning and hiſtory. This work is underſtood to have been performed under the direction of Matilda, conſort to William I. and was not improbably executed by the hands of Engliſh women, whoſe ſuperiority in performances of this kind was then univerſally acknowledged. The entire contents of this tapeſtry are repreſented in a ſeries of engravings, which may be ſeen in Montfaucon, tom. 1 & 2; and Ducarel, Anglo-Norman Antiquities, App. No. 1.

BAYF, or Baif, Lazare De, in *Biography*, was the ſon of a gentleman of Anjou, and having ſtudied under Budæus and others, he purſued the profeſſion of the law at Paris; and afterwards travelled into Italy, and learned Greek under Muſurus, a Candiot, at Rome. Upon his return he devoted himſelf to literature, and retired to his own eſtate at Anjou. In 1531 he was ſent by Francis I. as ambaſſador to Venice; in 1539 he was deputed on public buſineſs to Germany; and after

after his return was made maſter of requeſts, and had alſo the abbacies of Grenetiere and Charroux. The preciſe time of his birth and death is unknown. As a writer he ſeems to have been the firſt who introduced the Greek tragedy among his countrymen, by his tranſlations of the "Electra," of Sophocles, and the "Hecuba," of Euripides, into French verſe. He was alſo the author of two learned treatiſes, "De re veſtiaria, et de vaſculis," Baſil, 1526, 4to. and "De re Navali," Par. 1536, 4to.; and he tranſlated ſome Lives of Plutarch. Moreri.

Bayf, John Anthony. See Baif.

BAYJA, Baja or Baia, in *Geography*, a town of Africa, in the kingdom of Tunis, not far from the frontiers of the Algerines, is ſuppoſed to be the ancient "Vacca" of Salluſt, the "Oppidum Vagenſe" of Pliny, and the "BAΓA" of Plutarch; and it is at this day, as it was formerly, a place of great trade, being the chief mart of the whole kingdom, particularly for corn, which is ſupplied in ſuch abundance by the plains of Buſdera, along the banks of the Mejerda, that the Tuniſians ſay proverbially concerning it, that if there was another ſuch town for plenty of corn, it would become as common and cheap as ſand. It has alſo every ſummer a public fair, to which the moſt diſtant Arabian tribes reſort with their flocks, their manufactures, and their families. However, the inhabitants, ſubject to the oppreſſive exactions of government, and the frequent incurſions of the Arabs, who are numerous and powerful in its vicinity, are extremely poor, and a great part of their ground remains uncultivated. It is ſeated on the declivity of a hill in the road to Conſtantina, about 10 leagues from the northern coaſt, and 36 W. S. W. from Tunis; and has the convenience of being well watered. On the ſummit of the hill is a citadel of no great ſtrength. The walls, which are raiſed out of the materials of the old Roman Vacca, are ſtill entire and have ſome ancient inſcriptions. N. lat. 36° 42′. E. long. 9° 25′. Shaw's Travels, p. 92.

BAYLE, Peter, in *Biography*, an eminent critic and philoſopher, was the ſon of a proteſtant miniſter at Carla, in the county of Foix in France, where he was born in 1647. Whilſt he purſued his ſtudies, firſt under his father, and afterwards in the proteſtant academy at Puylaurens, whither he was ſent in 1666, his application was ſo intenſe and unintermitting as to injure his health. His reading was very extenſive; but his favourite authors were Plutarch and Montagne. From Puylaurens he removed in 1669 to the univerſity of Toulouſe, with the hope of enjoying ſuperior advantages for improvement, and of making more rapid progreſs. Here he attended the philoſophical lectures that were read in the college of the Jeſuits; and his diſputes with a popiſh prieſt, who lodged in the ſame houſe with him, ſerved to increaſe the ſcruples which he had already begun to entertain againſt the proteſtant religion, and at length to induce him to avow himſelf a Roman catholic. This change of opinion, which ſeemed to be on his part the reſult of inquiry and of conviction, although produced by arguments which maturer examination would diſcover to be inadequate, manifeſted an ingenuity of mind. However, it ſo grieved and offended his father, that he withdrew from him the neceſſary means of ſubſiſtence. In theſe deſtitute circumſtances, he was generouſly relieved by the biſhop of Rieux, who muſt unqueſtionably have been gratified by the acceſſion of ſuch a convert. Upon further inquiry Bayle found, that he had been too precipitate in abandoning his religion; and he therefore determined to leave Toulouſe after having continued there about eighteen months, and to renounce the errors into which he had been betrayed. Having made his abjuration in the preſence of his eldeſt brother and ſome other miniſters, he immediately ſet out for Geneva, in order to proſecute his ſtudies. Here he ſoon found reaſon for relinquiſhing the philoſophy of Ariſtotle, to which he had been zealouſly attached, and to adopt that of Deſcartes. His reputation introduced him to an acquaintance with ſeveral perſons of eminence at Geneva, and particularly with Mr. James Baſnage; between whom and Bayle an intimate friendſhip ſubſiſted as long as they both lived. At this time Bayle acquired the means of ſupport by private tuition; but diſſatisfied with this mode of life, which did not ſuit the independence of his ſpirit, nor correſpond to his deſire of further improvement, he wiſhed to exchange it for ſome ſituation better adapted to his genius and views. After a few years employed in this way, an opportunity offered for gratifying his wiſhes. In the ſpring of 1675 he removed to Paris, and undertook the tuition of Meſſrs. de Beringhen, brothers to a counſellor in the parliament of Paris. From this city, however, to which his wiſhes had been directed, he ſoon removed, at the deſire of his friend Mr. Baſnage, in order to offer himſelf as a candidate for the vacant profeſſorſhip of philoſophy in the proteſtant univerſity of Sedan. His views were favoured by Mr. Jurieu, the profeſſor of divinity, who favoured Bayle, partly becauſe he was anxious to exclude another candidate. Bayle evinced a decided ſuperiority to the other competitors in a public diſputation, and having ſecured his election, began his lectures, Nov. 11, 1675. By the aſſiduity with which he diſcharged the duties of his public office, and by the amiable temper which he manifeſted in private life, he gained great reputation, and many friends, at Sedan; and he devoted his hours of leiſure to compoſitions of the critical kind, which habituated him to that accuracy and depth of reaſoning, that afterwards conſtituted his diſtinguiſhing excellence. The firſt work, which he committed to the preſs, was his Obſervations on the comet that made its appearance in December 1680; the firſt edition of which was printed at Rotterdam in 1682, without a name, and under the aſſumed character of a Roman catholic, under the title of "Lettre a M. L. A. D. C. docteur de Sorbonne," &c. and Cologne was the pretended place of publication. In this treatiſe, afterwards called "Penſées ſur la Comete," &c. many delicate queſtions are diſcuſſed, relative to ſuppoſed miracles wrought, and preſages given among the heathens, to the compariſon of the miſchiefs of atheiſm with thoſe of idolatry, and to other points which afforded a range to the author's ſpirit of free enquiry. In 1681 the univerſity of Sedan was ſuppreſſed by an arbitrary edict of Lewis XIV.; and M. Bayle, deprived of his profeſſorſhip, was reduced to the neceſſity of ſeeking ſome new employment. At this time, the magiſtrates of Rotterdam eſtabliſhed a "Schola Illuſtris;" and Bayle was appointed profeſſor of philoſophy and hiſtory; and at his recommendation Jurieu was engaged as profeſſor of divinity. In December 1681, Bayle entered on his new office. In the next year he publiſhed a criticiſm on Maimbourg's "Hiſtory of Calviniſm," in the form of letters, under the title of "Critique Générale de l'Hiſtoire du Calviniſme de M. Maimbourg." This work, written in a lively manner, and with a vein of raillery, was read with pleaſure by perſons of the reformed religion, and it was particularly agreeable to the prince of Condé, who was no friend to Maimbourg. Although it was publicly condemned at Paris, it became popular in Holland, and a new edition of it, with enlargements, was ſpeedily publiſhed. Jurieu had alſo publiſhed a refutation of Maimbourg; but being much leſs popular than Bayle's, the author began to regard his brother profeſſor with a conſiderable degree of jealouſy.

jealouſy. In 1684 Mr. Bayle was induced, by the freedom of the preſs in Holland, to print ſeveral controverſial works, that were ſent him from France; and particularly "A collection of ſome curious pieces relative to the philoſophy of Deſcartes," with a preface, giving an account of theſe pieces, and containing ſome reflections on the inquiſitorial power exerciſed in France over books on ſcientific topics. In this year he began his monthly literary journal, entitled "Nouvelles de la Republique des Lettres," which was written in a manner that ſerved not only to ſupport, but to increaſe the reputation which he had already gained. About this time he declined an offer of the profeſſorſhip of philoſophy at Franeker, though it was propoſed very much to augment the ſalary which he received at Rotterdam. His "Nouvelles Lettres de l'Auteur de la Critique generale de l'Hiſtoire du Calviniſme de M. Maimbourg," which was a continuation or ſecond part of his former work, and printed in 1685, excited much leſs attention than the firſt. Having given an opinion in favour of M. Malebranche in his account of Arnauld's book written againſt him, he was engaged in a diſpute with the latter; and in 1686 he had a correſpondence with Chriſtina, queen of Sweden, concerning a letter of her majeſty's, which he had mentioned in his journal, and which condemned the perſecution ſuffered by the proteſtants in France. This letter, he had ſaid, was "the remainder of the Proteſtant religion in her." This expreſſion had given ſome ſlight offence to the queen, and Bayle addreſſed to her a letter of apology. In an ample reply the queen declared her ſatisfaction with his excuſes; and adds, "I will lay a penance upon you, which is, that for the future you ſend me all the curious books, in French, Latin, or Italian, upon all kinds of ſciences and all ſorts of ſubjects, provided they be worth reading." Her majeſty made no exception of romances or ſatires, and particularly requeſted books of chemiſtry, and the author's journal. Bayle was much affected by the revocation of the edict of Nantes, and the cruelties exerciſed againſt the proteſtants in France for the purpoſe of inducing them to abjure their religion. Upon this conduct he made ſome juſt and pointed reflections in his journal; and in 1686, he publiſhed a pamphlet, entitled, "Ce que c'eſt que la France toute Catholique ſous le regne de Louis le grand," or, a character of France, become entirely catholic under Louis the great. It was publiſhed without his name; and contained very ſevere cenſures on the treatment which the proteſtants received, as well as on the iniquity and folly of all attempts to procure converſion by force. This was ſoon followed by his famous work, intitled, "Commentaire Philoſophique, &c.;" or, a Philoſophical Commentary on the words "Compel them to come in." This work was an elaborate defence of toleration, which formed the firſt part of it; and in the ſecond the author anſwers all the objections againſt it. It was followed in the next year by a third part, containing a confutation of St. Auguſtin's apology for perſecution. The free ſentiments expreſſed in this work gave offence to Jurieu; and though he was ignorant of the author, who had taken pains to conceal his name, he wrote a treatiſe againſt it. Bayle's health was ſo much impaired by the application devoted to the compoſition of his commentary, and probably alſo by the vexation occaſioned by his controverſy relating to queen Chriſtina, that he found it neceſſary to diſcontinue his literary journal, in the conduct of which he had obtained numerous teſtimonies of approbation, not only from private perſons, but from ſeveral ſocieties of learned men, and particularly from the French Academy and the Royal Society of England. His ſituation alſo at Rotterdam became unpleaſant to him, on account of the quarrelſome diſpoſition of Jurieu and ſome other circumſtances; and he wiſhed to leave it: but diſappointed in his views of a removal to Berlin, he was under a neceſſity of continuing at Rotterdam. In 1688, Bayle publiſhed a fourth part of his philoſophical commentary, in which he examined and confuted the perſecuting principles maintained by Jurieu in his two treatiſes intitled "Vrai Syſteme de l'Egliſe," and "Droits des deux Souverains." Another circumſtance alſo occurred which ſerved to widen the breach between them. Jurieu, in his interpretation of ſome of the ſcripture prophecies, had preſaged the approaching triumph of the proteſtants in France, and he had publiſhed ſome free opinions, with a view of preparing the people for this great revolution, on the right of ſubjects to reſiſt by force of arms the tyranny of ſovereigns over their conſciences. Among other books that were written in order to counteract the effect of Jurieu's publication, the moſt remarkable was a treatiſe, intitled, "Avis aux Refugiez," or Important Advice to the Refugees, concerning their approaching return into France, and printed in 1690. The author perſonated a catholic, and his name was concealed; but Jurieu, attributing it to Bayle, was much incenſed, and took occaſion to attack his religious and political character, publicly accuſed him before the magiſtrates of Rotterdam, and attempted to get him diſmiſſed from his profeſſorſhip. Bayle made a ſpirited defence, and his cauſe was eſpouſed by ſeveral able writers. The magiſtrates conducted themſelves with impartiality and moderation; and the diſpute ſubſided. Although Mr. Bayle denied his having been the author of the above mentioned treatiſe, there is reaſon to believe that the ſuſpicions and charges of Jurieu and others were not unfounded. Bayle had been accuſtomed to write under fictitious characters, and on oppoſite ſides of the ſame queſtion; and this is a circumſtance which has been alleged, and not without reaſon, againſt his character. Beſides, it is not unlikely that national prejudice and early attachment might have induced him to vindicate the rights and intereſts of the French monarchy. However this be, he was afterwards ſuſpected of being concerned in an intrigue to bring about a ſeparate peace between France and the United States; and king William, dreading the conſequences of this project of peace, gave orders to the magiſtrates of Rotterdam to deprive him of his profeſſorſhip and of his penſion. This event took place in November 1693; and Mr. Bayle, declining offers that were made him of entering into new engagements, lived in retirement.

The project of his "Critical Dictionary" had been announced in 1690; and in 1692, his plan, under the title of "Projet et Fragmens d'un Dictionaire Critique;" but as it was diſapproved by the public, he commenced the work, as it has ſince appeared, on a new plan. Accordingly the firſt volume appeared in Auguſt 1695. Such was the favourable expectation entertained concerning this work, that the duke of Shrewſbury, an Engliſh nobleman, diſtinguiſhed by his talents as well as by his high rank and employments, expreſſed a wiſh to have it dedicated to him, and by means of Mr. Baſnage offered Bayle 200 guineas as an acknowledgment for this diſtinction. Mr. Bayle declined the offer, and maintained his independence. The ſecond volume, which completed the firſt edition, though it has ſince appeared in a more enlarged form, was printed in 1697; and the ſale of the whole was uncommonly rapid and extenſive. Whilſt Bayle profeſſed to ſupply the numerous defects of Moreri's dictionary, and to correct its errors, it ſeems to have been his real purpoſe "to make his dictionary a kind of common place for all the critical and philoſophical knowledge, all the curious information as to fact, and all the ſubtlety of argu-

argumentation he had ſpent his life in acquiring." The text is conciſe; but the notes, which contain much valuable information, are ſpun out to a tireſome and unintereſting length. This dictionary, generally ſo well received, and containing a variety of unexceptionable matter, diſplayed freedoms of ſeveral kinds, both as to ſentiment and diction, which were not likely to eſcape cenſure. Jurieu, the avowed and implacable antagoniſt of Bayle, attacked it from the preſs, and endeavoured to procure its condemnation from the eccleſiaſtical aſſemblies. The conſiſtory of the Walloon church of Rotterdam contented itſelf with the detail of ſeveral objections againſt particular articles, for which indeed no ſatisfactory apology can be offered; but ſatisfied with Mr. Bayle's promiſe of amendment in a ſecond edition, they proceeded no further. In 1702, Mr. Bayle publiſhed a ſecond edition, with many additions. In the following year he wrote a volume entitled, "Réponſe aux Queſtions d'un Provincial," containing an entertaining and inſtructive variety of hiſtorical, critical, and literary obſervations, to which he added a ſecond and third volume in 1705, and a fourth in 1706. In 1704, he publiſhed "A Vindication of his Thoughts on Comets," which involved him in new diſputes, particularly with the ingenious and learned Le Clerc. With his fame his adverſaries multiplied; and attempts were made to prejudice lord Sunderland, the Engliſh miniſter of ſtate, againſt him, and to procure his excluſion from the United States, as a man who was not only an enemy to religion, but chargeable with treaſon againſt the government. The ſtorm, however, was diverted by the influence of lord Shafteſbury. He was offered at this time a liberal proviſion and hoſpitable refuge by ſeveral perſons of diſtinction in England; but he declined all theſe generous propoſals. The decline of his health made him averſe from changing his ſituation; and towards the cloſe of the year 1706, he was reduced by a pulmonary diſorder, which was hereditary, to a very weak ſtate. The approaches of death were regarded by him with philoſophical firmneſs, nor did he intermit his literary labours to the laſt period of his life. In the morning of December 28, 1706, when his landlady entered his chamber, he aſked her in a faint voice if his fire was kindled, and immediately expired; having attained the age of ſomewhat more than 59 years.

By his panegyriſts, Mr. Bayle's talents, learning, and powers of reaſoning have been unduly extolled; by his adverſaries they have been no leſs unjuſtly degraded. M. le Clerc, who belongs to the latter claſs, and whoſe judgment is evidently biaſſed by prejudice, has not allowed him the merit to which he is unqueſtionably entitled. He repreſents him as ſo ignorant of geometry, that, according to his own confeſſion, he could never underſtand the demonſtration of Euclid's firſt problem, and as having written in the latter period of his life againſt the evidence of mathematical demonſtration. As a reaſoner, he ſays, he had no ſettled principles, and he argued only with a deſign to puzzle the unlearned readers. His arguments, he adds, contain much more froth and empty words than ſound reaſoning. He was unacquainted with the books written in England upon experimental philoſophy, and underſtood only a little of the philoſophy of Des Cartes. He had peruſed only a few tranſlations of Engliſh books upon metaphyſical ſubjects. His knowledge of divinity was derived from his catechiſm, from ſermons, or from a few French books. In eccleſiaſtical antiquity, and in that of Greece and Rome, he was indifferently ſkilled; law and phyſic were to him hidden treaſures; and his knowledge of modern hiſtory was partial and imperfect. He had collected with great labour a thouſand literary trifles and inconſiderable circumſtances; and though he wrote in a very agreeable manner, it was only when he was not in a paſſion. Saurin ſays of him, that he was one of thoſe extraordinary men, whoſe oppoſite qualities leave room to doubt whether we ought to look upon him as the beſt or the worſt of men. On the one hand, he was a great philoſopher, knowing how to diſtinguiſh truth from falſehood, and perceiving at one view all the conſequences of a principle and their connection; and on the other hand, a great ſophiſt, confounding truth with falſehood, and deducing falſe inferences from his aſſumed principles. On the one hand, a man of learning and knowledge, who had read all that can be read, and remembered all that can be remembered; and on the other, ignorant, or feigning ignorance, with regard to the moſt common ſubjects, propoſing difficulties which have been a thouſand times ſolved, and urging objections which a ſchool-boy could not make without bluſhing. On the one hand, attacking the moſt eminent men, opening a large field for their labours, and giving them a great deal of trouble to vanquiſh him; and on the other, uſing the worſt authors, to whom he was laviſh of his praiſes, and diſgracing his works by ſuch names (meaning probably Brantome and Rabelais) as a learned mouth never pronounced. On the one hand, free, at leaſt in appearance, from all the paſſions which are inconſiſtent with the ſpirit of Chriſtianity, grave in his diſcourſes, temperate in his diet, auſtere in his manner of living; and on the other, employing all the ſtrength of his genius to overthrow the foundations of moral virtue, and attacking as much as lay in his power, chaſtity, modeſty, and all the Chriſtian virtues. On the one hand, appealing to the throne of the moſt ſevere orthodoxy, going to the pureſt ſprings, and borrowing his arguments from the leaſt ſuſpected writers; and on the other, following the paths of heretics, propoſing again the objections of the ancient hereſiarchs, lending them new arms, and collecting together in one age all the errors of paſt ages. The eloquent preacher cloſes this detail with the following benevolent wiſhes: "May that man, who had been endowed with ſo many talents, be acquitted before God of the ill uſe he made of them! May that Jeſus, whom he ſo often attacked, have expiated his ſins!"

Voltaire, ſpeaking of his Critical Dictionary, ſays, "It is the firſt work of the kind in which a man may learn to think." He cenſures, however, thoſe articles which contain only a detail of minute facts, as unworthy either of Bayle, an intelligent reader, or poſterity. "In placing him," adds this author, "among the writers who do honour to the age of Louis XIV. although a refugee in Holland, I only conform to the decree of the parliament of Toulouſe; which, when it declared his will valid in France, notwithſtanding the rigour of the laws, expreſsly ſaid, "that ſuch a man could not be conſidered as a foreigner." "Without a country, or a patron, or a prejudice," ſays Gibbon in his "Miſcellaneous Works," Bayle claimed the liberty, and ſubſiſted by the labours of his pen. The inequality of his voluminous works is explained and excuſed by his alternately writing for himſelf, for the bookſellers, and for poſterity; and if a ſevere critic would reduce him to a ſingle folio, that relic, like the books of the Sibyl, would become ſtill more valuable. The ancient paradox of Plutarch, continues this writer, that atheiſm is leſs pernicious than ſuperſtition, acquires a tenfold vigour when it is adorned with the colours of his wit, and pointed with the acuteneſs of his logic. His "Critical Dictionary" is a vaſt repoſitory of facts and opinions, and he balances the falſe religions in his ſceptical ſcales, till the oppoſite quantities, adopting the language of algebra, annihilate each other. The wonderful power which he ſo boldly exerciſed of aſſembling doubts and objections had tempted him jocoſely to aſſume the title of the νεφελαγερετα Ζευς, *the cloud-compelling Jove;* and in a converſation with the

the ingenious abbé, afterwards cardinal, de Polignac, he freely diſcloſed his univerſal Pyrrhoniſm. "I am truly (ſaid Bayle) a proteſtant, for I proteſt indifferently againſt all ſyſtems and all ſects."

Upon the whole we may obſerve, that in private life Mr. Bayle was ſober and temperate, modeſt and unaſſuming, diſintereſted and ſincere. As a writer, his ſentiments were fluctuating and ſceptical, and he is not unjuſtly placed at the head of modern ſceptics. Although he often takes pleaſure in propagating his doubts, and perplexing his readers with a contrariety of opinions, yet he frequently combats hurtful prejudice and unwarrantable dogmatiſm. In many articles of his Dictionary, it does not appear to what country, ſect, or perſuaſion he belongs; and this circumſtance has been regarded by ſome perſons as conſtituting a qualification for hiſtorical diſcuſſion. For the pruriency of his ideas, for his notorious want of delicacy, and for his diſpoſition to introduce offenſive topics, his moſt partial advocates will find it difficult to deviſe an apology. The pernicious tendency of his ſceptical ſyſtem, with regard to religion and ſociety, is well expoſed by lord Lyttleton in his "Dialogues of the Dead," Dial. 24. Works, vol. ii. p. 315. "You have endeavoured," ſays this excellent writer, perſonating Locke, "and with ſome degree of ſucceſs, to ſhake thoſe foundations, on which the whole moral world, and the great fabric of ſocial happineſs, entirely reſt; how could you, as a philoſopher, in the ſober hours of reflection, anſwer for this to your conſcience, even ſuppoſing you had doubts of the truth of a ſyſtem, which gives to virtue its ſweeteſt hope, to impenitent vice its greateſt fears, and to true penitence its beſt conſolations; which reſtrains even the leaſt approaches to guilt, and yet makes thoſe allowances for the infirmities of our nature, which the ſtoic pride denied to it, but which its real imperfection, and the goodneſs of its infinitely benevolent Creator, ſo evidently require?" As to his ſtyle of writing, it is natural and lively, but not always correct, and inclining to prolixity; and his manner is rather ſatirical and humourous, than inflammatory. The beſt editions of his Dictionary are thoſe of 1720 and 1740. The Engliſh tranſlation of Mr. de Maizeaux is reckoned a good one. A new and accurate tranſlation of Bayle's dictionary is incorporated in the "General Dictionary, Hiſtorical and Critical," with reflections on ſuch paſſages of Mr. Bayle, as ſeem to favour ſcepticiſm and the Manichee ſyſtem. Maizeaux's Life of Bayle. Gen. Dict. Gen. Biog.

Bayle, Francis, many years profeſſor in medicine and philoſophy at Toulouſe, and author of numerous learned and ingenious works, died September 24th, 1709, aged 87 years. The moſt eſteemed of his productions are, "De Menſtruis Mulierum," "Sympathia partium corporis humani cum utero, uſu lactis ad tabidos, &c." Toloſ. 1670, 4to. He attributes the menſtrual flux to a fermentation occurring periodically in the mucous ſinuſes in the uterus, diſtending and opening their mouths, which collapſe and cloſe as ſoon as the fermentation ſubſides; a notion as philoſophical as the periodical plethora of Friend. "Diſſertationes phyſicæ ſex," Toloſ. 1677, 12mo. The third diſſertation is on phyſiognomy, in which the author had faith, as well as in the power of the imagination of the mother, in marking and mutilating the fœtus in utero. "Diſcours ſur l'experience et la raiſon," Paris, 1675, 12mo. He here aſſerts the ſuperiority of experience over theory in medicine. "Hiſtoire d'un enfant qui a demeuré 25 ans dans le ventre de ſa mère," Toloſ. 1678, 12mo. The fœtus was found uncorrupted, ſurrounded by a firm cruſt or ſhell. For the titles of the remainder of this author's works, which were collected and publiſhed in four volumes, 4to. in the year 1701, at Toulouſe, ſee Hall. Bib. Anat. & Eloy's Dict. Hiſt.

Bayle, in *Fortification*, the ſpace outſide the ditch of our ancient fortreſſes, commonly ſurrounded by ſtrong paliſades, and ſometimes by a low embattled wall.

Bayly, Lewis, in *Biography*, an Engliſh biſhop in the reign of James I., was born at Carmarthen, in South Wales, and educated at Oxford. Being an eminent preacher, he was appointed one of the king's chaplains, and promoted to the ſee of Bangor in 1616. In 1621 he was committed to the Fleet, probably on account of his concern in prince Henry's match with the Infanta of Spain. He died in 1632, and was buried in the church of Bangor. This prelate was the author of a famous piece called "The Practice of Piety," which has been ſo popular, that the edition of 1734 was the 59th. It was tranſlated into Welſh and alſo into French in 1733; and a complaint was alleged againſt it, that the common people regarded its authority as equal to that of the Bible. Biog. Brit.

BAYNA, in *Geography*, a town of Hungary, in the Bodok diſtrict, the inhabitants of which are principally farmers and huſbandmen.

BAYNES, a town of France, in the department of the Calvados, and chief place of a canton, in the diſtrict of Bayeux, 3¾ leagues W.S.W. of Bayeux.

BAYNET, a town and bay on the ſouth ſide of the iſland of St. Domingo, 4½ leagues from Petit Guave, on the north ſide of the iſland, and about 8 leagues weſt of Jackmel. N. lat. 18° 17'.

BAYON, a town of France, in the department of the Meurte, and chief place of a canton in the diſtrict of Luneville, ſeated on the Moſelle. N. lat. 48° 30'. E. long. 14° 42'.

BAYONA, a ſea-port town of Spain in Gallicia, ſituated in a ſmall gulf, near the mouth of the Minho, with a convenient harbour. The coaſt near it abounds with excellent fiſh; and the land, watered by many ſprings, is fertile. N. lat. 42° 15'. W. long. 9° 30'.

Bayona *Bay* and *Iſlands*, lie on the ſouth part of the great bay of Vigo, and to the eaſt of cape Paſſelis, on the weſt coaſt of Spain, in the Atlantic ocean. The bay forms the harbour of the town of Bayona. The two iſlands are ſituated a little to the weſt of north from the town. They were anciently called "Inſulæ Deorum," or the iſles of the Gods. A large rock, with many ſmall ones about it, lies at the ſouth end of Bayona iſlands.

BAYONET, in the *Military Art*, ſignifies a ſhort broad dagger, uſed by all modern armies, ſince the ſword has been laid aſide, as a neceſſary appendage to the infantry. The origin of the term is not correctly known; but is moſt probably derived from having been firſt manufactured at the city of Bayonne, or originally invented by an engineer of that place.

Bayonets were formerly made with a round handle, adapted to the bore of a firelock, ſo as to be fixed there after the ſoldier had diſcharged his piece. They are now conſtructed with iron handles and rings which go over the muzzle of the firelock, and are ſcrewed faſt; thus enabling the ſoldier to fire and load with his bayonet fixed, and ready to act, if neceſſary, againſt horſe. This is particularly of ſervice to dragoons and fuſileers, after they have expended all their powder and ball.

The uſe of the bayonet faſtened on the muzzle of the firelock was a great improvement, firſt introduced by the French, and to which, according to the chevalier de Folard (Comm. ſur Polyb. vol. i. p. 135. edit. Paris, 1727), they owed in a great meaſure their victories obtained in the war of 1689. To its neglect in the next war, the ſame writer attributes moſt of the loſſes they ſuſtained. It is to marſhal Catinat, the French are indebted for the great ſuperiority they

they poſſeſs in the management of this weapon. During greater part of the ſeventeenth century, one half of a battalion was armed with pikes, the other carried muſquets; but the feeble effect of theſe laſt, and the frequent miſſing fire from the aukward uſe of matchlocks, ſuggeſted the improvement of firelocks with bayonets, which unite the two arms in the moſt effectual manner.

The battle of Marſaglia, in 1693, was the firſt occaſion on which Catinat put this improvement in practice, againſt the Spaniards and Savoyards. The French infantry marched boldly up to the enemy, received their fire, and without returning a ſhot, charged furiouſly with their bayonets. The ſlaughter was horrible, and the rout of the allies complete. The ſame method was adopted by marſhal Tallard at the battle of Spires in 1703; and by the duc de Vendôme at the battle of Calcinato in Italy, in 1705. On both occaſions ſucceſs was the ſame as in the former inſtances. Of late the bayonet has come into very general uſe; and battles of importance have been gained by it without the diſcharge of a muſquet. The late king of Pruſſia, although he relied greatly on the running fire which he taught his troops to practiſe with ſuch terrible effect, yet highly recommended the charge with the bayonet as the moſt effectual means of throwing a wavering enemy into irreparable diſorder.

But the French, whoſe natural genius ſeems particularly adapted to the uſe of this weapon, have not only invented, but have alſo employed it with the moſt aſtoniſhing ſucceſs. In the laſt war, the favourite maxim of their generals, inſtead of loſing time by cannonading and firing on the enemy with muſquetry, has been to bring the iſſue of the affair as early as poſſible to the point of the bayonet. The battles of Jemappe, Haguenau, and Ettingen, in particular, not to mention many others, were almoſt excluſively gained by it; and the Spaniards, throughout the dreadful conteſts between their own and the French forces, at the concluſion of the campaign of 1794, were uniformly defeated by the uſe of the bayonet alone.

BAYONNE, in *Geography*, a pleaſant ſea-port town, on the weſtern coaſt of France, in a corner of the bay of Biſcay. It is ſituated in the diſtrict of Uſtaritz, and department of the lower Pyrenées, at the conflux of the rivers Adour and Nive, about a league from the ſea, with a good harbour, and having a narrow and dangerous entrance. The Adour divides the ſuburb from the citadel, and through the town itſelf flows the river Nive. A wooden drawbridge, which admits veſſels to paſs, connects the ſuburb with the town. The ſtyle of the buildings at Bayonne is principally Spaniſh, with balconies at every window, and arcades before the houſes. From the "place de la Liberté", which is ſurrounded by very neat houſes, and appears very gay, a gate leads to a pleaſant promenade on the Adour. The trade of this town is very conſiderable, on account of its vicinity to Spain, and of the great quantity of wines which are brought hither from the adjacent country, and which the Dutch have been accuſtomed to take in exchange for ſpices and other commodities. Maſts are alſo brought from the Pyrenées by means of the Nive, the Gave of Oleron, and the Adour, to Bayonne, whence they are ſhipped to Breſt, and other ports. The common people generally ſpeak the old biſcayan or baſque language. At Bayonne, and in the neighbouring country, the young women are very beautiful, combining with a tall ſlender ſhape great ſymmetry of features, a fair complexion, and black lively eyes. Before the revolution, Bayonne was the ſee of a biſhop, ſuffragan of Auch. In 1784, it was declared a free port. N. lat. 43° 29′ 21″. W. long. 1° 30′ 6″.

BAYS, in *Commerce*, a kind of coarſe, open, woollen ſtuff, having a long knap; ſometimes friſzed on one ſide, and ſometimes not friſzed, according to the uſes for which it is intended.

This ſtuff is without wale, being wrought on a loom with two treddles like flannel.—It is chiefly manufactured about Colcheſter, and Bocking in Eſſex; and in Flanders, about Liſle and Tournay, &c.

This manufacture was firſt brought into England, together with that of ſays, ſerges, &c. by the Flemings, who fled hither from the perſecution of the duke of Alva, about the fifth year of the reign of queen Elizabeth, and had afterwards peculiar privileges granted them by the 12 Car. II. in 1660. The exportation of bays was formerly much more conſiderable than it is now, as the French manufacturers have learned to imitate them, and have ſet up manufactures of their own at Niſmes, Montpelier, &c. However a conſiderable quantity of bays is ſtill exported to Spain, Portugal, and Italy. Their chief uſe is for the religious, and for linings in the army; the looking-glaſs makers alſo uſe them behind their glaſſes, to preſerve the tin or quickſilver; and the cafe makers to line their caſes.

The breadth of bays is commonly a yard and half, yard and three quarters, or two yards; by forty-two, or forty-eight in length: thoſe of a yard and three quarters are moſt proper for the Spaniſh trade.

BAYS, in *Geography*, a town of France, in the department of the Mayenne, and chief place of a canton, in the diſtrict of Mayenne, 3½ leagues E.S.E. of Mayenne.

BAZA, or BAZAT, in *Commerce*, fine ſpun cotton, which comes from Jeruſalem, whence it is alſo called Jeruſalem cotton.

BAZA, in *Geography*, a town of Germany, in the duchy of Carniola, 7 miles S.S.W. of Feldes.

BAZA, or *Baça*, a town of Spain, in the province of Granada, between Guadix and Hueſcar, ſuppoſed to be the ancient Baſti. N. lat. 37° 31′. W. long. 2° 31′.

BAZADOIS, a diſtrict of the province of Guyenne, before the revolution, ſituated between Agenois, Condomois, and Guyenne. The ſoil is ſandy and unproductive. The capital is Bazas.

BAZAR, or BASAR, in *Commerce*, a denomination among the Turks and Perſians, given to a kind of exchanges or places where their fineſt ſtuffs and other wares are ſold. They are alſo called *bezeſtins*.

The word bazar ſeems of Arabic, or rather of Perſian and Turkiſh origin, where it denotes *ſale*, or exchange of goods.

Some of the eaſtern bazars are open, like the market-places in Europe, and ſerve for the ſame uſes, more particularly for the ſale of the more bulky and leſs valuable commodities. Others are covered with lofty ceilings, or even domes pierced to give light; and it is in theſe the jewellers, goldſmiths, and other dealers in the richer wares, have their ſhops.

The bazar or maidan of Iſpahan is one of the fineſt places in all Perſia, and even ſurpaſſes all the exchanges in Europe; yet, notwithſtanding its magnificence, it is excelled by the bazar of Tauris, which is the largeſt that is known, having ſeveral times held thirty thouſand men ranged in order of battle.

At Conſtantinople there are the old and the new bazar, which are large, ſquare buildings, covered with domes, and ſuſtained by arches and pilaſters; the former chiefly for arms, harneſſes, and the like; the latter for goldſmiths, jewellers, furriers, and all ſorts of manufactures. For an account of the bazars of Aleppo, ſee ALEPPO.

BAZAR, or *Bazaar*, a town of Hindooſtan, 20 miles N.E. of Attock, ſeated near the Indus, Nilab or Sinde river. N. lat. 33° 45′. E. long. 71° 18′.

BAZARUTO, or BOCICA *iſlands*, lie off the South-eaſt coaſt of Africa, in the Indian ocean, oppoſite to ASUCA bay. S. lat. 21° 55′. E. long. 34° 30′.

BAZAS, a city of France, and principal place of a diſtrict,

trict, in the department of the Gironde, before the revolution the capital of Bazadois, and fee of a bifhop. It is feated on a rock, and the number of inhabitants is computed at 2000. N. lat. 44° 26'. W. long. 0° 30'.

BAZEILLE, St., a town of France, in the department of the Lot and Garonne, in the diftrict of Marmande, ½ league N. W. of Marmande.

BAZGENDGES, in *Natural Hiftory*, the name of a fubftance ufed by the Turks, and other eaftern nations, in their fcarlet dying: they mix it for this purpofe with cochineal and tartar, the proportions being two ounces of the bazgendges to one ounce of cochineal.

The bazgendges feem to be no other than the horns of the turpentine tree in the eaftern parts of the world; and it is not only in Syria that they are found, but China alfo affords them. Many things of this kind were fent over to M. Geoffroy at Paris from China, as the fubftances ufed in the fcarlet dying of that country, and they all proved wholly the fame with the Syrian and Turkifh bazgendges, and with the common turpentine horns. The lentifk or maftic tree is alfo frequently found producing many horns, of a like kind with thefe, and of the fame origin, all being owing to the *pucerons*, which make their way into the leaves, and breed their young there. Reaumur's Hift. of Infects, vol. vi. p. 37.

BAZIEGE, in *Geography*, a town of France, in the department of the upper Garonne, and chief place of a canton, in the diftrict of Villefranche, 4 leagues S.E. of Touloufe.

BAZIN, Niccolas, in *Biography*, a French phyfician and correfponding Member of the academy of Sciences at Paris, graduated at Strafbourg, where he afterwards refided, and acquired conficerable reputation as a practitioner in medicine, though his attention was principally turned to the ftudy of natural hiftory, which he enriched with the following valuable productions. "Obfervations fur les plantes, et fur leur analogie avec les infectes." Strafbourg, 1741, 8vo. He believed that plants refpired, and that the juices abforbed by them for their nourifhment were digefted, or concocted in the root, prior to their diftribution. "Hiftoire des Abeilles," 2 vol. 12mo. Paris, 1744. "Lettre au fujet des animaux, appellés polypes," 1745, 12mo. He died in March 1754. Hall. Bib. Bot. Eloy. Dict. Hift.

BAZIRA, in *Ancient Geography*, now *Bijore*, a diftrict of a territory adjoining to the country of the Affaceni, or Affacani, correfponding to the prefent Sewad or Sowhad, between the rivers Bijore and Penjekoreh in Hindooftan. When Alexander had taken Maffaga, the capital of the Affaceni, by affault, he fummoned Bazira, the capital of the next adjacent territory; and the modern diftrict of Bijore prefents itfelf in a pofition that anfwers moft unequivocally to that of Bazira; and the fimilarity of their names is no lefs ftriking. See Bijore.

BAZIRGION, a town of Perfia, in the province of Lariftan, 57 miles eaft of Lar.

BAZIUM, a promontory of Egypt, on the weftern coaft of the Red Sea. Ptolemy.

BAZOCHE, or Basoche, in *Law*, formerly a royal kind of jurifdiction exercifed among the clerks of the palais, or courts of juftice at Paris. It was adminiftered in the name and by the authority of the king of *Bazoche, roi de la Bazoche*, by virtue of an ancient grant of the kings of France; the elder among the clerks were the officers; and he who prefided was the chancellor. This court only took cognizance of caufes among the clerks, or between clerks and artificers for goods bought, or work done. The freedom they exercifed with regard to private characters in their inquifition and remonftrances, occafioned feveral arrets to reftrain their power, and prohibit their holding pleas without leave.

A collection of ftatutes, ordonnances, regulations, monuments, and prerogatives of the kingdom of Bazoche, was publifhed at Paris in 1654, 8vo.

Bazoche, La, in *Geography*, a town of France, in the department of the Eure and Loire, and chief place of a canton, in the diftrict of Nogent le Rotron, 5 miles S.E. of Anthion.

BAZOCHES, a town of France, in the department of the Orne, and chief place of a canton, in the diftrict of Argentan, 9 miles N.W. of Argentan.—Alfo, a town of France, in the department of the Loiret, and chief place of a canton, in the diftrict of Neuville-Aux-Bois, 6 miles N. of Neuville.—Alfo, a town of France, in the department of the Aifne, and chief place of a canton, in the diftrict of Soiffons, 4 leagues E. of Soiffons.

BAZOGE, La, a town of France, in the department of the Sarte, and chief place of a canton, in the diftrict of le Mans, fix miles N. of le Mans.

BAZOUGERS, a town of France, in the department of the Mayenne, and chief place of a canton, in the diftrict of Laval, 2½ leagues S. E. of Laval.

BAZOUGES la Perouse, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the diftrict of Dol, 3¼ leagues S. S. E. of Dol.

BDELLIUM, βδέλλιον, an aromatic gum, brought from the Levant, of fome ufe, both as a medicine and a perfume.

The word is fuppofed to have been formed of the Hebrew בדלח. *bedollach*, which the Engliih tranflators render by the appellation *bdellium*. It is alfo written *bedellium*, *bedello*, *ptellium*, *petallium*, *megalium*, and *telinum*.

There is much uncertainty concerning both the plant and the place of its production, which is fuppofed to be in Africa. We find mention of the name both among the ancient naturalifts, and in Scripture; but it is doubtful whether any of thefe be the fame with the modern kind. As for the Scripture bdellium, we know very little of it. Mofes defcribes manna as of the colour of bdellium; and Jofephus explains the paffage, by faying it is the gum of a tree refembling the olive tree; and that the manna wherewith the Jews were fed in the defart refembled this drug.—But Scaliger and others fet afide this explication, and own they do not know what the bdellium mentioned in Scripture is.

The bdellium of the moderns is a gum refin in irregular brittle maffes, of a deep brown when broken, interfperfed with more tranfparent parts; and mixed with fmall twigs and other accidental impurities. Its external appearance a good deal refembles myrrh. The fmell of this gum-refin is fomewhat fragrant, and its tafte fomewhat bitter and pungent. It grows foft and tenacious when chewed. It burns with eafe, giving a fragrant fmoke and a crackling noife. It is partly foluble in alcohol, and partly in water, or completely (the impurities excepted) in diluted fpirit. By Neuman's experiments only about one fixth is pure refin. The watery folution is fea-green, the fpirituous red. Diftilled with water it impregnates the liquid with its flavour, but it does not yield any fenfible quantity of effential oil, when only a moderate quantity is ufed.

Bdellium was formerly employed as a ftimulating remedy, chiefly for external application, and is ftill retained in fome of the warm plafters of the Paris difpenfatories. It is entirely difufed here, and feldom to be feen in the fhops. It refembles myrrh in its properties, but lefs in degree, and is very defervedly neglected. Murray. Lewis. Le Grange Elem. de Pharm.

BEACH Fork, in *Geography*, a branch of Salt river, which rifes in Nelfon county, Kentucky, in America. On this river is found a fine clay, which it is thought might be manufactured into good porcelain.

BEACHY-HEAD, is a bold promontory which projects into the Engliſh channel on the Suſſex coaſt, between Haſtings and Shoreham. This commanding headland conſiſts of alternate ſtrata of chalk and flint; though the latter is only ſeen in thin layers or veins. "It is eſteemed," ſays Camden, "the higheſt cliff of all the ſouth coaſt of England;" and on its ſouth ſide is a large ſemicircular intrenchment. It is divided into ſeven cliffs, and ſo called by ſeamen. The coaſt round this head is very dangerous in ſtormy weather, particularly when the wind ſets in from S. S. E. or S.W. From this promontory to Arundel, the country along the coaſt riſes into high hills, which are known by the name of South-downs, and celebrated for their ſheep walks. Beachy-head is memorable for the defeat of the Engliſh and Dutch fleets near it by a ſuperior force of the French, June 30th 1690. N. lat. 50° 44′ 30″. E. long. 0° 19′ 40″. See EASTBOURNE.

BEACHY-HEAD, lies alſo on the eaſtern coaſt of South America, in Patagonia, about S.S.W. from Port Julian, and N.N.E. from cape Fairweather. S. lat. 50° 21′. W. long. 67° 40′.

BEACON, a ſignal for the better ſecuring the kingdom againſt foreign invaſion.

Different methods have been taken in different countries, both anciently and of later ages, to convey the notice of any impending danger to diſtant places with the greateſt expedition. But no kind of ſignals has more generally prevailed than that of fires in the night. That this was practiſed among the Jews we learn from the ſacred writers. Hence the prophet Iſaiah, in alluſion to that cuſtom, threatens them that they ſhould be left "as a Beacon upon the top of a mountain, and as an enſign on a hill." (chap. xxx. 17.) And in the like manner Jeremiah alarms them by ſaying, "Set up a ſign of fire in Beth-haccerem, for evil appeareth out of the north, and great deſtruction;" (chap. vi. 1.) And as to other countries, Ariſtotle (de Mundo) informs us, that theſe ſignals were ſo diſpoſed on towers through all the territories of the king of Perſia, that in the ſpace of twenty-four hours he could receive advice at Suſa and Ecbatana, his two capital cities, of any commotions or diſturbances that might be raiſed in the moſt diſtant parts of his dominions. But the Greeks, as Thucydides relates, made uſe of torches for ſignals, which by a different management ſerved either to give notice of the approach of an enemy or the arrival of a friend to their aſſiſtance. For as the ſcholiaſt ſays, in the former caſe "the torches were ſhook by thoſe who held them, and in the latter they were kept ſteady." (lib. xi. c. xciv. lib. iii. c. xxii.) Among the Greeks they were called Φρυκτοι; and their uſe is particularly deſcribed in the Agamemnon of Æſchylus. The like cuſtom of nocturnal fires obtained alſo among the Romans, as appears from Cicero, where ſpeaking of the miſconduct of Verres, when governor of Sicily, he ſays, "Non enim ſicut antea conſuetudo erat predonum adventum ſignificabat ignis e ſpecula ſublatus; ſed flamma ex ipſo incendio navium, et calamitatem acceptam et periculum reliquum nuntiabat: (lib. v. in Verrem, § 91.) Wherefore ſignals of this ſort are called by Pliny "ignes prænuntiativi" (Nat. Hiſt. lib. xi. § 73.) which he diſtinguiſhes from the Phari, or light houſes that were placed upon the coaſts for the direction of ſhips; the latter of which were conſtant, but the former only occaſional.

Eſtabliſhed ſignals were repeated, ſays Charnock, in his "Marine Architecture", by means of beacons or light-houſes erected in proper poſitions, from mountain to mountain, through a chain of ſtations, which are ſaid to have commanded an extent of more than 500 miles; ſo that even the inhabitants of Conſtantinople were capable of being informed, within the ſhort ſpace of a few hours, of any motions that might be attempted by their Saracen enemies in Tarſus.

In our own country, the name of beacon is derived from the Anglo-Saxon *becnian*, to ſhew by ſign or beckon. It was uſually placed upon a high ground, and ſometimes on a tumulus. From Lord Coke we learn (Fourth Inſtit. c. xxv. p. 184.) that before the reign of Edward the third, beacons were but ſtacks of wood ſet up on high places, which were fired when the coming of an enemy was deſcried; but in his reign pitched boxes were ſet up inſtead of them. In time of danger a watch was kept at them, and horſemen called hobbelars were ſtationed by moſt of them to give notice of an enemy's approach.

BEACONS are alſo marks and ſigns erected on the coaſts, for the guidance and preſervation of mariners at ſea by night as well as by day. The erection of beacons, light houſes, and ſea-marks, both for alarming the country in caſe of the approach of an enemy, and for the direction and ſafety of ſhips, is a branch of the royal prerogative. For this purpoſe the king hath the excluſive power, by commiſſion under his great ſeal, to cauſe them to be erected in fit and convenient places, as well as upon the lands of the ſubject as upon the demeſnes of the crown; which power is uſually veſted by letters patent in the office of lord high admiral.

Nevertheleſs it muſt be underſtood that the power of erecting beacons was occaſionally given to individuals, and limited by grants from the crown, whence, or for ſome atchievements performed in times of danger, the beacon is worn as a creſt in the arms of ſeveral families, as Belknap, Butler, Mountford, Sudley, and Shelly of Michell Grove, one or two of whom obtained eſpecial grants which empowered them to erect and maintain beacons at their own expence.

The care of theſe when erected by the crown, was committed to one or more of the adjacent hundreds; and the money due or payable for their maintenanee, called *beconagium*, was levied by the Sheriff of the county upon each hundred. (Archæologia, vol. i. part 1. Hutchin's, Hiſt. of Dorſet, vol. i. p. lix. Camd. Brit. Edit. 1609. p. 196.)

By ſtat. 8 Eliz. c. 13. the corporation of the Trinity houſe are empowered to ſet up any beacons or ſea-marks wherever they ſhall think them neceſſary: and if the owner of the land or any other perſon ſhall deſtroy them, or ſhall take down any ſteeple, tree, or other known ſea mark, he ſhall forfeit 100 *l.* or in caſe of inability to pay it, ſhall be ipſo facto outlawed.

BEACONAGE, money paid towards the maintenance of a *beacon*. A ſuit for beaconage of a beacon ſtanding on a rock in the ſea may be brought in the court of admiralty, the admiral having an original juriſdiction over beacons. 1 Sid. 158.

BEACON HILL, in *Geography*. See HARWICH.

BEACONSFIELD, a ſmall market town of Buckinghamſhire, in England, at the diſtance of 23 miles N. W. from London. The town is built on high ground, whence ſome antiquaries have inferred, that it derived its name from a beacon formerly occupying this ſpot. The ſubſtratum on which it ſtands is chiefly gravel, and the houſes are built with flints or brick, there being no ſtone quarries in this part of the county. Beaconsfield has little claim to popular attention, there being no particular hiſtorical events or antiquities attached to it. Here are a ſmall weekly market on Wedneſdays, and two annual fairs. Seated on the great public road between London and Oxford, it derives ſome advantages from travellers; but it has been particularly noted in the literary annals of this country, by the contiguous reſidences of Edmund Waller the poet, and Edmund

Burke the politician, both of whom poſſeſſed eſtates near Beaconsfield, and the memories of both are commemorated by inſcriptions at the pariſh church. See WALLER, and BURKE.

About three miles eaſt of Beaconsfield is *Bulſtrode*, a ſeat of the duke of Portland. This ducal reſidence was formerly in the poſſeſſion of the Bulſtrode family, but reverting to the crown, was given by king William III. to William Bentinck, who had long been the conſtant attendant and faithful ſervant of that monarch, and who was created by him earl of Portland in 1689. From him it deſcended to the preſent nobleman, who has made conſiderable additions and improvements to the houſe and grounds. The former is a large irregular brick building, ſeated on a high knoll, in the centre of a fine park which abounds with venerable trees, and is diverſified with that variety of ſurface, which conſtitutes the foundation of the picturesque. This park contains about 800 acres, and in the eaſtern part of it is a large circular entrenchment encloſing an area of twenty acres. See Beauties of England and Wales, vol. i. 1801.

BEAD, BAGUETTE, Fr. in *Architecture*, a little round moulding, the diminutive, or rather the vulgar name of aſtragal. This moulding is generally found in the cornices of antique buildings, where it is uniformly carved with ornaments, ſometimes in the ſhape of a ſtring of beads, ſometimes a twiſted ribbon or a rope. See *Plate* XXI. of *Architecture*. Plain beads are very much uſed in modern joiners' and plaiſterers' work, as the mouldings of doors, ſhutters, ſkirtings, impoſts, and cornices.

BEAD, in *Aſſaying*, the ſmall lump or maſs of pure metal ſeparated from the *ſcoriæ*, and ſeen diſtinct and pure in the middle of the coppel while in the fire.

Thus, in ſeparating ſilver from its ore by means of lead, the ſilver remains in form of a bead, when the lead, that had before aſſiſted in the operation, is reduced to *ſcoriæ*. In this proceſs, the bead of ſilver muſt be taken out of the coppel as ſoon as it is ſeen pure and fine, leſt growing cold, it ſhould be conglutinated to the coppel or litharge. This bead, when rightly made, is always porous underneath. Cramer.

BEADS are more particularly uſed among us for a ſort of glaſs necklace, made in imitation of the colour and figure of pearl.

BEADS are alſo uſed in ſpeaking of thoſe glaſs globules vended to the ſavages on the coaſt of Africa, thus denominated, becauſe they are ſtrung together for the convenience of traffic.

The common black glaſs of which beads are made for necklaces, &c. is coloured with manganeſe only; one part of manganeſe is ſufficient to give a black colour to near twenty of glaſs. Lewis's Comm. Phil. p. 422. See ARTIFICIAL PEARLS.

BEADS, in a religious ſenſe. See CHAPLET.

BEAD-*Roll*, among the Romiſh prieſts, a liſt or catalogue of ſuch perſons, for the reſt of whoſe ſouls they are obliged to rehearſe a certain number of prayers, &c. which are told by means of their beads.

BEAD-*Makers*, called by the French *paternoſtriers*, are thoſe employed in the making, ſtringing, and ſelling of beads. At Paris there are three companies of *paternoſtriers*, or *bead-makers*; one who make them of glaſs or cryſtal; another in wood and horn; and a third in amber, coral, jet, &c.

BEAD *Proof*, or *Double Proof*, terms uſed by our diſtillers, to expreſs that ſort of proof of the ſtandard ſtrength of ſpirituous liquors, which conſiſts in their having, when ſhaken in a phial, or poured from on high into a glaſs, a crown of bubbles, which ſtand on the ſurface ſome time after. This is eſteemed a proof that the ſpirit conſiſts of equal parts of rectified ſpirits and phlegm.

This is a fallacious rule as to the degree of ſtrength in the liquor; becauſe any thing that will increaſe the tenacity of the ſpirit, will give it this proof though it be under the due ſtrength. Our malt diſtillers ſpoil the greater part of their goods, by leaving too much of the ſtinking oil of the malt in their ſpirit, in order to give it this proof, when ſomewhat under the ſtandard ſtrength. But this is a great deceit on the purchaſers of malt ſpirits, as they have them by this means not only weaker than they ought to be, but ſtinking with an oil, which they are not eaſily cleared of afterwards.

On the other hand, the dealers in brandy, who uſually have the art of ſophiſticating it to a great nicety, are in the right when they buy it by the ſtrongeſt bead proof, as the grand mark of the beſt; for being a proof of the brandy containing a large quantity of its oil, it is, at the ſame time, a token of its high flavour, and of its being capable of bearing a very large addition of the common ſpirits of our own produce, without betraying their flavour or loſing its own.

We value the French brandy for the quantity of this eſſential oil of the grape which it contains, and that with good reaſon; as it is with us principally uſed for drinking as an agreeably flavoured cordial: but the French themſelves, when they want it for any curious purpoſes, are as careful in the rectification of it, and take as much pains to clear it from this oil, as we do to free our malt ſpirit from that naufeous and fœtid oil, which it originally contains.

No judgment can be formed of brandies by the bead proof as to their mixed or adulterated, or their pure ſtate, farther than that they are likely to be moſt pure when they have the greateſt proportion of this oil, in regard to mixtures of other ſpirits. There are many occaſions where we want ſpirit, merely as ſpirit, and where any oil, whether ſweet or ſtinking, muſt be equally improper. Shaw's Eſſ. on Diſtillery.

BEAD *Tree*, in *Botany*. See MELIA.

BEADLE or BEDELL, *Bedellus*, ſignifies a meſſenger or apparitor of a court, who cites men to appear and anſwer in the court to what is alledged againſt them.

BEADLE is alſo uſed for an officer in univerſities, whoſe place it is to walk before the maſters at all public proceſſions, &c. with a mace. The office of church and pariſh beadles is well known.

Spelman, Veſſius, and Somner, derive *beadle* from the Saxon *bidel, a public crier*; in which ſenſe biſhops, in ſome ancient Saxon manuſcripts, are called *beadles of God, Dei bedelli*. The tranſlator of the Saxon New Teſtament renders *exactor* by *bidele*; and the word is uſed in the ſame ſenſe in the laws of Scotland.

BEADLE *of the Foreſt*, is an officer, that warns all the courts of the foreſts, and executes proceſs, makes all proclamations, &c. 4 Inſt. 313.

BEAGLE, in *Zoology*. See CANIS FAMILIARIS, and DOG.

Beagles are of divers kinds; as the *ſouthern beagle*, ſomething leſs and ſhorter, but thicker than the deep-mouthed hound; the *fleet northern*, or *eat beagle*, ſmall, and of a finer ſhape than the ſouthern, and a harder runner. From the two, by croſſing the ſtrains, is bred a third ſort held preferable to either.

To theſe may be added a ſtill ſmaller ſort of beagles ſcarce bigger than lap-dogs, which make pretty diverſion in hunting the coney, or even ſmall hare in dry weather: but otherwiſe unſerviceable, by reaſon of their ſize. Beagles, both rough and ſmooth, have their admirers among ſportſmen: their tongues are muſical, and they go faſter than the ſouthern hounds; they run ſo cloſe to the ground,

as

as to enjoy the ſcent better than taller dogs, eſpecially when the atmoſphere is low. In an incloſed country they are ſaid to do beſt, as they are good at trailing or default, and for hedge-rows; but they require a clever huntſman, for out of eighty couple in the field, during a winter's ſport, ſcarcely four couple are to be depended upon. Of the two ſorts, the wire-haired, as having good ſhoulders and being well filletted, are preferred. Smooth-haired beagles are commonly deep hung, thick-lipped, with large noſtrils, but often ſo ſoft and bad quartered, as to be ſhoulder-ſhook and crippled the firſt ſeaſon they hunt; among them are frequently ſeen crooked legs, like the Bath turnſpit; and after two hours running many of them are diſabled. Their form and ſhape ſufficiently denote them not deſigned for hard exerciſe. Daniel's Rural Sports, vol. i. p. 378.

BEAK, *Roſtrum*, in *Ornithology*, the bill of a bird; from the form and ſtructure of which, Linnæus divides this whole family or general claſs of animals into ſix orders. See Bird, and Ornithology.

Beak, in *Architecture*, a little fillet left on the edge of a larmier, which forms a canal, and makes a kind of pendant chin, anſwering to what Vitruvius calls the *mentum*.

Beak, or *Beak-Head of a Ship*, is that part without the ſhip before the forecaſtle, which is faſtened to the ſtem, and is ſupported by the main knee: this is uſually carved and painted, and, beſides its uſe, makes the becoming part, or grace of a ſhip.

The beak was anciently made of wood, but fortified with braſs, and faſtened to the prow, ſerving to annoy the enemies' veſſels. Its invention is attributed to Piſæus, an Italian. The firſt beaks were made long and high; but afterwards a Corinthian, named Ariſto, contrived to make them ſhort and ſtrong, and placed ſo low as to pierce the enemies' veſſels under water. By the help of theſe, great havoc was made by the Syracuſans in the Athenian fleet. Pott. Archæol. lib. iii. c. 17.

Beak was alſo uſed for one of the ancient battalia, or forms of ranging an army for battle, particularly uſed by the Macedonians.

Beak is alſo applied to the ſlender crooked prominences of divers bodies, bearing ſome analogy or reſemblance to the beaks of birds.

In this ſenſe we meet with beaks of ſhoes, *roſtra calceorum*, for long peaked toes, in uſe of old. Du Cange.

Among *Farriers* beak denotes a little horſe-ſhoe, turned up, and faſtened in upon the forepart of the hoof.

It is uſed to keep the ſhoes faſt, and not liable to be ſtruck off by the horſe, when by reaſon of any itch, or being much diſturbed by the flies in hot weather, he ſtamps his feet violently on the ground.

BEAKED, *Becqué*, in *Heraldry*, is uſed when the beak or bill of a fowl is of a different tincture from the body.

In this caſe, they ſay *beaked* and membered of ſuch a tincture.

BEAKING, in *Cock-Fighting*, expreſſes the fighting of theſe birds with their bills, or holding with the bill, and ſtriking with the heels.

BEAL, in *Geography*, a river of Ireland, which runs into the Shannon near Aſkeaton, in the county of Limerick.

BEALE, Mary, in *Biography*, a female portrait painter in the reign of king Charles II., was the daughter of Mr. Cradock, miniſter of Walton upon Thames, and was born in Suffolk in 1632. Although ſhe was not inſtructed in the rudiments of painting by ſir Peter Lely, as ſome have ſuppoſed, ſhe diligently copied the works of that great maſter, as well as thoſe of Vandyke. She painted in oil, water-colours, and crayons; and by copying ſome pictures of Italian maſters, improved her taſte and pencil, and acquired much of their air and ſtyle, which appear in her portraits. She was little inferior to any of her contemporaries with reſpect to colouring, ſtrength, force, or life; and ſhe worked with a great body of colours. Her performances were held in high eſtimation by ſir Peter Lely. Amiable in her conduct, and aſſiduous in her profeſſion, ſhe was very much encouraged and employed, both by the clergy and by ſeveral perſons of rank, whoſe portraits ſhe painted. It appears, that in one year ſhe received for pictures 429l., and that ſhe and her huſband devoted about two ſhillings in the pound of their income to charitable purpoſes. In the MSS. of Mr. Oldys, Mrs. Beale is celebrated for her poetry as well as her painting. She died Dec. 28, 1697; and left two ſons, Charles and Bartholomew, both of whom exerciſed the art of painting; but the latter relinquiſhed painting, and ſtudied phyſic under Dr. Sydenham, and practiſed at Coventry, where he and his father died. Walpole's Anecdotes of Painting, vol. iii. Biog. Brit. Pilkington.

BEALNABRUCH, in *Geography*, the name of a river in the county of Galway, province of Connaught, Ireland, which riſes in Joyces country near the Killeries, north of the mountain of Beannebeola or the twelve pins, and flows through a mountainous country into Lough Corrib, near the baſe of the ſtupendous Ben Levagh. The valley through which it runs is pretty well peopled. A great error is committed in Roque's and all the old maps, in repreſenting this river as flowing into Roundſtone bay, and affording a ſecond outlet to Lough Corrib, inſtead of carrying into it a large ſupply of water. Dr. Beaufort's Map and Memoirs.

BEALSBURG, a ſmall town of America in Nelſon county, Kentucky, on the eaſt bank of Rolling fork, containing twenty houſes, and alſo a tobacco warehouſe; 15 miles W. S. W. from Bairdſtown, and 890 from Philadelphia. N. lat 37° 42′. W. long. 85° 50′.

BEALT. See Builth.

BEAM, in *Architecture*, is any piece of timber of a rectangular ſection of equal depth and thickneſs throughout its length, applied in an horizontal poſition in various ſituations in a building, for the purpoſe of reſiſting ſome ſtrain either in a longitudinal or tranſverſe direction, ſuch as to prevent the rafters of roofs from puſhing out adjacent walls upon which they reſt, or to ſuſtain a ſuperincumbent part of a wall inſtead of an arch. This word, however, is not much uſed technically, and only in combination with other words, which denote its poſition or uſe. When a beam is placed at the bottom of a pair of rafters it is called "a Tie-beam;" but if placed in a higher ſituation it is called "a Collar-beam." When a beam is placed over piers of maſonry or wooden poſts to ſupport a ſuperincumbent wall, it is called a "breaſt-ſummer," or "ſummer-beam." When a beam is placed acroſs a floor to ſupport the ends of joiſts and ſhorten their bearings, it is called a "girder," or girding-beam." See Carpentry.

Some of the beſt authors have conſidered the force or ſtrength of beams, and brought their reſiſtance to a preciſe calculation; particularly M. Varignon and M. Parent. See Strength of Timber.

Beam *of a Plough*, in *Agriculture*, a name given by our farmers to the great timber of the plough, in which all the other parts of the plough-tail are fixed.

This is uſually made of aſh, and is ſtraight, and eight feet long in the common plough: but in the four-coulteredplough, it is ten feet long, and its upper part arched. The head of this beam lies on the pillow of the plough, and is raiſed.

raiſed higher, or ſunk lower, as that pillow is elevated or depreſſed by being ſlipped along the crow-ſtaves. Near the middle, it has an iron collar, which receives the tow-chain from the box, and the bridle-chain from the ſtake or gallows of the plough is fixed in it a little below the collar. Some inches below this, there is a hole, which lets through the coulter; and below that there are two other ſmall ones, through which the heads of the reteches paſs. Theſe are the irons which ſupport the ſheat, and with it the ſhare. Farther backward ſtill is a larger perforation, through which the body of the ſheat paſſes; and behind that, very near the extremity, is another hole through which the piece called the hinder-ſheat paſſes. See PLOUGH.

BEAMS of a ſhip, are the large, main, croſs timbers, ſtretching from ſide to ſide, which hold the ſides of a ſhip from falling together, and which alſo ſupport the decks and orlops of the ſhip.

The main beam is that next the main maſt; and from it they are reckoned by *firſt*, *ſecond*, and *third beam*. The great beam of all is called the *midſhip beam*.

There are uſually twenty-four beams on the lower deck of a ſhip of 74 guns, and on the other decks additional ones in proportion, as the ſhip lengthens above.

BEAM, *on the*, in *Sea-Language*, denotes any diſtance from the ſhip on a line with the beams, or at right angles with the keel. Any object that lies eaſt or weſt, when the ſhip ſteers northward, is ſaid to be on the ſtarboard or larboard beam.

BEAM, *before the*, ſignifies an arch of the horizon comprehended between the line of the beam, and that point of the compaſs which ſhe ſtems. See ABAFT.

BEAM, *on the Weather*, ſignifies on the weather ſide of the ſhip.

BEAM, *Camber*. See CAMBER-BEAM.

BEAM *of an anchor*. See ANCHOR.

BEAM *of a balance*, is that piece of iron or wood, ſomewhat bigger toward the middle than at the ends, where there are holes through which run the ropes or ſtrings which hold the ſcales: the beam is divided into two equal parts, by a needle placed over it perpendicularly: and the centre of motion muſt be placed a little above the centre of gravity, that the beam may reſt exactly in an horizontal poſition. See BALANCE.

BEAM, or *Roller*, among *Weavers*, is a long and thick wooden cylinder placed lengthways on the back part of the loom of thoſe who work with the ſhuttle. The threads of the warp, of linen or woollen cloth, ſerges, or other woollen ſtuffs, are rolled upon the beam, and unrolled as the work goes on. That cylinder on which the ſtuff is rolled as it is weaved is alſo called the beam or roller, and is placed on the fore-part of the loom.

BEAM, in *Heraldry*, is uſed to expreſs the main horn of a hart or buck.

BEAM, among *Hunters*, denotes the main ſtem of a deer's head; or that part which bears the antlers, royals, and tops; the little ſtreaks of which are called circles.

BEAM is alſo uſed for a fiery meteor in the ſhape of a pillar; and for a ray of the ſun.

BEAM *compaſſes*. See COMPASSES.

BEAM *feathers*, in *Falconry*, the longeſt feathers of a hawk's wing.

BEAM-*filling*, in *Building*, the filling up the vacant ſpace between the riſing plate and roof, with ſtones, or bricks, laid between the raſters on the raiſing plate, and plaiſtered on with loom; this is frequent where the garrets are not pargeted, or plaiſtered.

BEAM *tree*. See CRATÆGUS *Aria*.

BEAMINSTER. See BEMINSTER.

BEAN, in *Botany*. See VICIA *Faba*.

BEAN, *faba*. The medicinal and dietetic qualities of beans are ſaid to be nutritive, but flatulent: the pods yield a water held good againſt the gripes in children. Some have uſed the horſe bean as a ſuccedaneum to coffee; which in principles it much reſembles; only that it contains but half the quantity of oil. Mr. Boyle has ſeveral experiments of beans treated pneumatically to ſhew the great plenty of air they afford, on which their flatulency depends. This air, which beans contain in a fixed ſtate, is extricated during their digeſtion in the ſtomach, in greater quantity than can be again abſorbed; and upon that account theſe, and other legumina, have been at all times noted for occaſioning flatulency, and ſometimes colic pains. The expanſion of beans in growing, Mr. Boyle alſo found ſo conſiderable that it would raiſe a plug clogged with above a hundred pounds weight. Boyle's Works abr. tom. i. p. 285. tom. ii. p. 615, &c.

Beans with proper management make one of the fineſt of all baits for fiſh. The method of preparing them for this purpoſe is this: take a new earthen pot glazed on the inſide; boil ſome beans in it, ſuppoſe a quarter of a peck: they muſt be boiled in river water, and ſhould be previouſly ſteeped in ſome warm water for ſix or ſeven hours. When they are about half boiled, put in three or four ounces of honey, and two or three grains of muſk: let them boil a little on, then take them off the fire, and uſe them in this manner: ſeek out a clean place, where there are no weeds, that the fiſh may ſee and take the beans at the bottom of the water. Throw in ſome beans at five or ſix in the morning, and in the evening for ſome days. This will draw them together, and they may be taken in a caſting net in great numbers.

The ancients made uſe of beans in gathering the votes of the people, and for the election of magiſtrates. A white bean ſignified abſolution, and a black one condemnation. Beans had a myſterious uſe in the *lemuralia* and *parentalia*; where the maſter of the family, after waſhing, was to throw a ſort of *black beans* over his head, ſtill repeating the words, "I redeem myſelf and family by theſe beans." Ovid gives a lively deſcription of the whole ceremony in his Faſti, lib. v. ver. 435. Abſtinence from beans is ſaid to have been enjoined by Pythagoras, for which prohibition various reaſons have been aſſigned. Some have ſuppoſed that it was intended to reſtrain his diſciples from intermeddling in trials and verdicts which were decided by throwing beans into an urn. Others founding their opinion on the double ſenſe of the word κυαμος, which ſignified both a bean and the common teſticle, explain it by abſtaining from venery. Clemens Alexandrinus grounds the abſtinence from beans on their tendency to render women barren; which property is confirmed by Theophraſtus, who extends the ſame effect even to plants. Cicero ſuggeſts another reaſon; viz. that beans are very injurious to mental tranquility. Hence Amphiaraus is ſaid to have forborne the uſe of beans, before Pythagoras, that he might be better prepared for divining by dreams. The Egyptian prieſts held it a crime to look at beans, judging the very ſight unclean. The *flamen dialis* was not permitted even to mention the name. Lucian introduces the ſame philoſopher in hell, ſaying, that to eat beans, and to eat our father's head, were equal crimes. After all, both the genuineneſs of the precept, and the reality of any ſuch abſtinence among the ancient Pythagoreans have been diſputed. Some attribute the precept to Empedocles, a diſciple of Pythagoras. Ariſtoxenus, an ancient writer cited by A. Gellius, (l. iv. c. 11.) introduces Pythagoras ſaying, that he eat more frequently

of

of beans than of any other pulſe, on account of their gentle looſening the belly. Accordingly he is ſaid to have permitted the uſe of them, becauſe he believed them to be wholeſome, but his diſciples have forbidden them, becauſe they thought them, as Hippocrates alſo did, productive of flatulency, and otherwiſe prejudicial to health. Thus, a prohibition, which was at firſt a civil regulation, or ſalutary advice, aſſumed the authority of a ſacred law.

Bean, *Bog*. See Menyanthes.

Bean-*caper*. See Zygophyllum.

Bean-*cod*, in *Navigation*, a ſmall fiſhing veſſel or pilot boat, uſed by the Portugueſe, which rigs with one maſt, ſimilar to the *Tartan*; which ſee.

Bean-*flour*, in *Antiquity*, called by the Romans *lomentum*, was of ſome repute among the ancient ladies as a coſmetic, wherewith to ſmooth the ſkin, and take away wrinkles.

Bean-*fly*, in *Natural Hiſtory*, the name given by authors to a very beautiful fly, of a very beautiful purple colour, frequently found on *bean*-flowers. It is produced from the worm or maggot called by authors *mida*.

Bean, in *Agriculture*, a ſort of pulſe, of which there are ſeveral kinds: but thoſe beſt adapted to field culture are the ſmall ſorts, ſuch as the common *horſe-bean*, and the *tick-bean*. The large ſorts, or garden-beans, as the *Windſor*, *Long-pod*, and *Mazagon*, have alſo been occaſionally employed in the field, with ſucceſs, in ſome of the ſouthern diſtricts.

Beans conſtantly prefer a ſtrong moiſt ſoil, and on ſuch, where proper culture is given, they moſtly afford an abundant produce. Tick-beans are ſuppoſed by ſome farmers to be more productive than horſe beans; but the latter grow higher in the ſtem, and produce a more ſtagnated ſtate of the air, or ſmother the land more, conſequently are the moſt ſuitable for the ſtronger ſorts of ſoil.

The author of the Agricultural Survey of Middleſex obſerves, that beans are a crop which thrive well in almoſt any ſoil that is rather ſtrong, ſuch as medium-loams, ſandy-loams, clayey-loams, and chalky-loams; on clay. marl, chalk, and ſuch like cool ſubſoils. And the author of the Synopſis of Huſbandry remarks that the proper time for planting beans is towards the latter end of January, or early in the following month; though this buſineſs may be continued to advantage till the middle or latter end of March, if the weather had prevented their being got in at an earlier ſeaſon; but in general it is beſt to embrace the firſt opportunity of ſowing them after Candlemas, as they often miſcarry if the ſeaſon be procraſtinated beyond that time, eſpecially if a dry ſummer ſhould ſucceed. In purchaſing beans for ſeed, care ſhould be taken to chooſe ſuch as are hard and bright, without being ſhrivelled in their appearance.

Mr. Donaldſon, in his view of the preſent ſtate of huſbandry obſerves, that the ordinary mode of preparing land for a crop of beans, is to give one ploughing only, which is generally performed in the ſpring, immediately before the ſeed is ſown.

Beans are for the moſt part ſown broad-caſt, either on the ſtubble, before ploughing, or on the new turned-up furrows. Sometimes beans are ſown or planted in the bottom of every ſecond or third furrow, and afterwards horſe and hand hoed. In a few diſtricts they are ſown with a drill-machine, and at ſuch diſtances in the rows as to leave ſufficient ſpace, either for hand-hoeing, when that only is intended, or for horſe and hand hoeing, when it is purpoſed that both theſe operations ſhould be performed. It will at once appear obvious, he thinks, that either of theſe laſt-mentioned methods is preferable to ſowing the ſeeds broad-caſt, as a better opportunity is not only afforded of cleaning the ground properly, but a more abundant return, and a produce of ſuperior quality inſured.

The ſpring ſeed time in general commences with the ſowing of beans. In the ſouthern diſtricts, they are ſown in ordinary ſeaſons ſo early as the middle or towards the end of February; and in the northern parts of Scotland ſo late as the beginning of April. The month of March may, however, as has been obſerved, be conſidered as the general bean ſeed ſeaſon.

The firſt of the above writers thinks, that on land which is inclined to moiſture the preparation for this crop ſhould be as follows: Early in autumn lay on the manure, and immediately plough the land into ridglets of two feet ſix inches wide; in which ſtate let it lie until the ſeaſon for planting, when the ſeed may be dibbled in, one row of beans into the middle of each ridglet, at the diſtance of about three inches from bean to bean. They ſhould be immediately covered; which may be done by children, with a garden rake or hoe, or, ſhould the ſurface of the land be dry and crumbly, a horſe and a buſh harrow would do as well. In moſt places, he obſerves, it is adviſeable to ſet a boy with a rattle to frighten away the rooks until the beans have attained ſome growth. The diſtance between the rows will not prevent the crop from completely covering the ground, eſpecially if the land was manured for them, as they will branch out ſideways, three or four ſtout ſtems from each root. They ſhould be early planted, in order to their getting ſufficient root-hold of the land, and procuring ſhade againſt the hot weather ſets in. It is alſo ſome ſecurity againſt the *black dolphin*, which is the greateſt enemy the bean is ever attacked by. They require a ſoil that can ſeldom be worked without damage during the winter and ſpring; conſequently it ought to be manured and gathered into one bout ridges in the autumn. The ſhape of theſe ridges keeps the land more dry through the winter than any other, and prevents exceſſive rains from waſhing away the manure, which had been previouſly folded by the plough into the centre of ſuch ridges; in which ſtate it ſhould lie, as has been already obſerved, until the ſeaſon for ſowing; when the land thus prepared will be ſo dry as to admit of dibbling every fair day; which ſecures to the farmer the advantage of chooſing his ſeaſon. He dunged, he ſays, about ten acres in September 1793, and ploughed the land into ridges of two feet and a half wide, burying the dung in the middle of them. The land lay dry through the winter, and he dibbled one row of beans into the middle of each ridge during the firſt week of February 1794. My neighbours, ſays he, on a ſimilar ſoil, who ploughed into flat ridges of about fifteen feet wide, could not get their ſeed in till March. The enſuing ſummer was uncommonly dry: my beans being ſo unuſually wide apart, admitted the plough and hoe to work as freely between the rows as a ſtubborn ſoil would allow. The plants tillered or branched till they completely covered the intervals, and the field appeared as completely cropped as though it had been ſown broad-caſt. When my neighbour's plants, ſays he, were beginning to pod, mine were half ſet. The whole were alike attacked by the black-fly, which reduced their crops to a buſhel or two per acre, while I had twenty.

Mr. Young, however, remarks in the Survey of Suffolk, that it is there uncommon to give more than one earth for beans, and generally improper, as they love a whole firm furrow, and never thrive better than on a layer.

There are many different methods, Mr. Banniſter ſays, of raiſing crops of beans. In ſome counties they ſow this pulſe by broad-caſt, which is by no means an eligible way, ſince much of the ſeed will be left above ground, and a great part of that which is covered by the harrow will not be covered

to a proper depth; and many other objections might, he thinks, be urged againſt this method of ſowing beans at random, of which it is not one of the leaſt, that ſuch irregular ſown crops are in great danger of being injured by weeds, which cannot ſo eaſily be extricated when the beans are ſown at random as when they are planted regularly in drills.

In ſome diſtricts, as Middleſex, Surrey, &c. the method is, to plant this pulſe in rows ſtricken out by a line, by which a great ſaving is made in the article of ſeed, a circumſtance which is thought to compenſate for the extraordinary charge of this mode of huſbandry; and thus far it may be fairly acknowleged, that the method of planting beans by the dibble is greatly to be preferred to that of ſowing the ſeed at random. The œconomy of this agricultural proceſs he thus explains: the rows are marked out one foot aſunder, and the ſeed planted in holes made two inches apart; the lines are ſtretched acroſs the lands, which are formed about ſix feet over, ſo that when one row is planted, the ſticks to which the line is faſtened are moved by a regular meaſurement to the diſtance required, and the ſame method purſued till the field is completed. The uſual price for this work is 9d. per peck, and the allowance two buſhels per acre. Great confidence muſt neceſſarily be repoſed in the people who tranſact the buſineſs of planting beans by the dibble, who, if inclined to fraud, have it in their power to deceive their employer by throwing great part of the ſeed into the hedge, from which their daily profits are conſiderably enhanced, their own labour ſpared, and every diſcovery effectually precluded, till the appearance of the crop, when the frequent chaſms in the rows will give ſufficient indications of the fraud; and by this time perhaps the villainous authors of the miſchief may have eſcaped all poſſibility of detection, by having conveyed themſelves from the ſcene of their iniquity. Such is the method of planting beans by the dibbler; but the neateſt and moſt expeditious way of ſowing this pulſe, eſpecially the field bean, is, he obſerves, that purſued by the Kentiſh farmers. The uſual courſe in that county, is to plough up the oat or barley grattens, which are deſigned for beans, ſoon after the wheat ſeaſon is finiſhed, in which condition the fallows are to lie till towards Candlemas, or later, as the ſtate of the weather, or the farmer's occaſion may require, and then to ſtrike out the furrows.

About eleven furrows to a row's breadth is the uſual width of ſetting out the rows, though ſome prefer a wider ſpace, whilſt others ſtrike them ſtill narrower; and this difference in the width of the rows is the cauſe why the farmers vary ſo eſſentially in reſpect to the quantity of ſeed to be ſown on the ſame given ſpace of ground; for, whilſt ſome will content themſelves with an allowance of two buſhels per acre, others will throw a ſack of beans upon the ſame compaſs of land. When the furrows are ſtruck at the diſtance mentioned before, two buſhels and a half of middle-ſized tick-beans are ſufficient to ſeed an acre, and on good land (for if the ground be not either rich in itſelf, or rendered fertile by art, it is of little conſequence to attempt the cultivation of this crop,) a perſon, in his opinion, ſtands a much fairer chance for a crop when the beans are thinly planted, than when a more liberal quantity of ſeed is allowed; for, when beans ſtand ſo very thick in the rows, they never pod ſo kindly as when the ſtalks are leſs crowded; and although the crop of haulm may be more abundant, the increaſe will not be adequate to the large bulk of ſtraw.

In Suffolk, according to Mr. Young, beans have been dibbled by ſome a row on every ſlag; by others, on every other ſlag. He has found it more advantageous to plant in cluſters four or five beans in every hole; and eight or nine inches from hole to hole, which admits of much better hoeing than when more thickly ſet. Dibbling, ſays he, is the beſt and moſt effective method of cultivating beans. In the Synopſis of Huſbandry it is further obſerved, that in Kent ſome people make uſe of a drill plough at bean ſeed time; but as theſe pulſe, eſpecially the larger ticks, are very unequal in ſize, they cannot be let out of the hopper with ſufficient regularity; for by this inequality in ſize, many yards of ground in the length of a furrow will be left vacant from the caſual obſtruction of a large bean, and when this is removed, numbers of a ſmaller ſize crowd to the chaſm, and ſhoot out of the hopper for a conſiderable ſpace, till another large bean intervenes to obſtruct the paſſage, and thus the crop makes a very unſightly appearance in the rows, and at the time of harveſt is very unequal; the injury in large fields being not inconſiderable: for, in thoſe parts of the furrows, where no beans had been ſown, an increaſe cannot be expected; and thoſe which are huddled together by a quart or more in a ſpot, will, from the thickneſs of their growth, in courſe come to little. Some farmers are ſo nice as to pick and cull their ſeed before it goes into the hopper, in order to render the beans more even, and prevent the injury above mentioned; but this is a very tedious practice, and after all, he believes, very ſeldom anſwers the expence. The beſt method of ſowing this crop, according to this writer, is from an inſtrument called a box, which is held by a man who follows the ſtriking plough, and who, by ſhaking the box filled with beans, drops them with regularity in the furrow, keeping even pace with it; ſo that by two men, and two or three horſes to the ſtriking plough, a man to box, and a boy and two horſes to harrow down the ground after the plough, three acres may be finiſhed off in a day, and the whole conducted with regularity.

The writer of the Agricultural Survey of Middleſex thinks that beans ſhould be manured for, and kept perfectly clean while growing, by ploughing, horſe or hand-hoeing, and hand-weeding; and that where they are ſo managed, they are an excellent preparation for either wheat or oats. They have a tap root, and hence they are more likely to ſucceed after crops that have fibrous roots; though he never heard that they would not grow after any crop. They are generally ſown after wheat, barley, or oats; and ought, as has been already obſerved, to be planted on ridglets, eſpecially on wet thin-ſkinned ſoils.

In the Synopſis of Huſbandry it is recommended as a good method to roll and harrow beans in the latter end of March. By the roll, ſays this writer, the clods are broken ſo as to afford freſh nouriſhment to the roots; and the harrows following this operation pulverize and looſen the ſurface, which had been flattened and baked down by the rains in the preceding month, by which the beans are conſiderably aſſiſted in the future progreſs of their growth. Soon after this the crop ſhould be edge-hoed, and afterwards braked; which method of braking is a piece of huſbandry peculiar to the county of Kent, and in every reſpect claims the preference to that of hoeing the whole ſpace between the rows; not only becauſe the braking is performed at an inferior expence, but it is likewiſe more efficacious, as well for extirpating the weeds that may have ſprung up between the rows, as in furthering the advances of the beans in growth, by looſening the foil, and conveying freſh earth to the ſtalks. This operation of braking may be continued at the interval of three weeks or a month, from the beginning of May till the crop becomes in bloom. When it is propoſed to earth up the beans, this may be effected with great facility by fixing a ſmall block of wood on the *ſtrig* of the brake; the manner of doing which is familiar to every Kentiſh ploughman; and according to the diameter of this block, the earth may be

thrown to different heights on the bean ſtalks, as they advance in growth.

In dry ſummers, when eaſterly winds prevail, beans are very apt to be ſtricken with the *dolphin* fly, an inſect which in a very ſhort ſpace of time will deſtroy the produce of a whole field. In this caſe it has been found very beneficial to take off the tops with the ſcythe, as the dolphin generally effects its firſt lodgment in the upper part of the ſtalk. Where this pulſe is ſown broad-caſt, there remains no other way of cleanſing the field, than by cutting up the weeds with a hook, or by turning in a flock of ſheep in May, where the ground is very foul, as this animal will devour the weeds, and leave the beans untouched. From this very partial method of weeding, it may fairly be concluded little benefit can accrue, and that the gratten will be abundantly ſtocked with weeds at harveſt, and the ground be totally unfit for ſowing with wheat: and, indeed, the practice of ſowing bean grattens with wheat is never attempted in thoſe countries where this method of ſowing beans at random prevails; and here, therefore, the bean and pea grattens generally come in courſe the next year for a fallow. This is a practice that cannot be recommended.

It is remarked in the Survey of Middleſex, that beans are ſeldom ripe enough to cut till the latter end of Auguſt, and the proper time is when the *kids* are turning black, about ten days before they would begin to open at the ends. Though in ſome parts of the field the kids may not be ſo black as in others, this ſhould not prevent their being cut; for they will ripen and harden after that is done, by ſetting the ſheaves upright, and leaving them in the field for a week or ten days. If they are cut long before they are ripe, they will ſhrink and ſhrivel; and if too ripe, they will ſhed conſiderably; though there is much leſs danger in reaping them too early, than in letting them ſtand too long. Thoſe that are over-ripe ſhould be cut with the dew on them, and carried to the barn in the ſame ſtate; the green parts of the crop being cut in the middle of the day. When the intention is to ſow wheat or tares after beans, they ought to be ſet up ſo as to occupy as little ſpace as poſſible, that the vacant ground may be immediately prepared for the next crop. The writer of the Synopſis of Huſbandry aſſerts, that after a growing ſummer, and on land which is in good heart, there will be many green-pods when the crop is upon the whole fit for the hook; for the ſtalks having run to a great length, and being very replete with moiſture, the upper part of the leaves, pods, and ſtalks, will appear to be in a growing ſtate long after the pods on the lower part of the ſtalk are fully ripened. To wait the ripening of theſe upper pods would be very ill-judged, as by this delay great part of the crop would be loſt, from the ſhedding of thoſe which were already come to maturity. The beſt method, therefore, is to cut the beans when the major part have ripened, and by ſuffering the ſhocks to remain ſome time in the field, the upper part of the ſtalks will be ſufficiently withered, ſo as to prevent any ill effects from their humidity, when laid in the barn or ſtack; nor will the beans from thoſe unripened pods be of any injury to the ſample. At harveſt time, the ſame author informs us, that in Kent thoſe beans which were ſown broad-caſt are mown with a ſcythe, and carried looſe into the barn; a practice which is fraught with many inconveniencies; but that in Middleſex, where the beans are planted in rows with a dibbler, as before mentioned, the intervals are carefully cleanſed during their growth by means of the hoe; and to this purpoſe the farmers are under the neceſſity of employing a number of hands; the Kentiſh method of cleaning the intervals by the brake not having yet been introduced into that county; ſince the whole ground between the rows muſt be ſtat-hoed. At harveſt, the ſtalks are cut with a hook, bound into ſheaves, and ſet up four together; and as a ſubſtitute for ſtrings, it is uſual to ſow the headlands with peaſe, the haulm of which anſwers the purpoſe of bands to tie up the ſheaves. The Kentiſh mode of huſbandry is greatly to be preferred, he thinks, to that of the Middleſex farmers, as is evident from the conſideration of the comparative diſadvantages which attend a crop raiſed and managed according to the latter method, with the ſuperior benefits of the former. At ſeed-time the planting by a dibbler is infinitely more tedious and expenſive than that of dropping the ſeed into the furrow after the ſtriking plough; and in the courſe of huſbandry required to cleanſe the intervals, the ſeveral ſtat-hoeings cauſe a far heavier charge than what attends the braking and edge-hoeing; and after all, the ground is not ſo well prepared for a wheat ſeaſon at Michaelmas, a method of huſbandry generally purſued by the Middleſex farmers. One reaſon may be aſſigned, he ſays, why the Kentiſh huſbandry has not yet been adopted by the Middleſex farmers; and this is from the nature of the land in that county, which in many parts is a deep heavy clay, ſo that on theſe adheſive ſoils the *ſwing-plough* is generally uſed, and the ground divided into partitions, or (as they are termed) lands, to guard againſt the contingency of a wet ſeaſon. But ſurely, ſays he, this ſoil might be worked with a turn-reſt-foot plough, and by proper drains be ſecured from the ill effects of a moiſt time; and the field being thus laid on a level, the rows might eaſily be ſtruck out, and the ſubſequent brakings be executed to advantage during the ſummer, as uſual with the Kentiſh farmers. It is added, that in thoſe parts of Kent where the round tilth huſbandry is purſued, the farmers are particularly attentive to the ſeveral operations of hoeing and braking the ground during the growth of the beans; for, as the land in that county is of a nature ſo fertile as not to require the intervention of a ſummer fallow, they ſpare no pains in the cultivation of their bean and pea grounds, in order to render it as clean and well pulverized as poſſible by means of the hoe and brake, ſo that this latter inſtrument is ſcarcely ever out of the field, from the beginning of May till the time when the beans are advanced to that height, as to obſtruct the working of it; by which the ground becomes ſo intimately divided, that every particle of ſoil in the interſpace is expoſed to the beneficial influence of the ſun and air, and at harveſt ſcarcely a weed is perceptible throughout the crop. In order to deſtroy what few weeds may remain in the rows, and to give that part of the ground its due ſhare of pulverization, and to cleanſe it from the bean haulm, a plough is ſet to work ſoon after harveſt to ſpuddle the gratten; and for this purpoſe a plate of iron is fixed acroſs the ſhare at about four or five inches from the point, and the ſame axle-tree and wheels are made uſe of that were before employed for ſtriking out the furrows; and with this plough and two horſes three acres of ground may be ſpuddled in a day, by ſetting the ſhare point in the interval, ſo that the iron or ſin may embrace a row on each ſide; and when the whole field is thus ſpuddled, the harrows and roller are to ſucceed, by which the haulm and weeds will be completely extricated at a trifling charge, and the ground be laid in readineſs for ploughing the ſeed furrows, at which time thoſe beans or peaſe which may have been ſhed will have vegetated, and are deſtroyed by the plough; ſo that the farmer may, from this mode of huſbandry, be not leſs confident of growing a clean ſample of wheat, than if his ground had been ſummer fallowed.

On thin, chalky, or gravelly grounds, notwithſtanding what has juſt been urged of the good effects of ſpuddling, he

obſerves that it would perhaps be more prudent to omit that work, leſt it might contribute towards looſening the ſoil beyond a due medium; for on theſe ſoils the chief aim ſhould be to cloſe them as much as poſſible, that at wheat ſeed-time the ſurface may be perfectly tight; and therefore to roll and harrow the bean and pea ground on ſuch ſoils, in order to rid the field of the haulm, &c. and when it has lain ſome time, to plough the ſeed furrows, are the whole proceſs neceſſary to prepare it for the ſucceeding crop of wheat: and this ſhows, he thinks, the neceſſity of ſowing with this grain or with peaſe that part of the farm which is moſt free from weeds, and in the beſt heart; not only that theſe pulſe, both of them (eſpecially beans) require to be ſown on good land, and on ſuch as has been improved by art, but likewiſe that the grattens may be ſo perfectly clean, as not to require the operation of ſpuddling. In Kent, they cut their beans with a hook, and bind them into ſheaves with rope-yarns. Theſe ſheaves are ſet up in ſhocks of various forms, either five on each ſide, in the manner of wheat ſhocks, or in a circular form, four ſheaves to the ſhock. The expence of cutting, binding, and ſetting up is from 4s. to 6s. or 7s. per acre, according to the degree of goodneſs in the crop. Some farmers, in ſuch years when the hops have failed, cut up the bind, and reſerve it as a ſubſtitute for rope yarns to tie their bean ſheaves. But though this practice may at firſt ſight bear the appearance of frugality, it will be found eventually to be the moſt expenſive; as the cutting the hop-vines at that ſeaſon will be apt to cauſe them to bleed, to the infinite prejudice of the ſtocks; and thus the future crops may be hazarded by a premature removal of the binding thoſe years when, from the failure of the hops, it ſhould ſeem to be of no further uſe. Mr. Marſhall, however, recommends the pulling beans in preference to cutting; for, he ſays, the benefit the ſoil receives will more than pay for the extra labour in clearing. Another advantage ariſing from their being pulled, is the ſtubbornneſs of the roots keeping the mow open, and admitting a circulation of air. And he ſays in another place, that by experience he found pulling up by hand far preferable to cutting with ſickles; as they may be pulled up not only much faſter, but much cleaner from weeds and graſs than when cut, beſides leaving the land in a ſtate greatly ſuperior. The waſte is alſo leſs, ſo much ſo as to loſe ſcarcely a bean; and the bean ſtalks are immediately ready to bind and ſet up; and by the roots lifting them from the ground, the air acquires a free circulation. The work is alſo eaſier to the labourer, who ſtands more upright, and the power required is much leſs, eſpecially in dry weather. By ſtriking the roots of each handful againſt the foot, the mould is almoſt wholly diſengaged from the fibres. The ſoil in the drills, inſtead of being bound by the roots, and encumbered by the ſtubble, is left as looſe as a garden, and the ſurface free from obſtructions; and if thoroughly hoed, is as fit as a fallow to be ſowed with wheat on one ploughing.

Beans are every where an uncertain crop, conſequently the average produce difficult to eſtimate. In Kent, Mr. Young thinks, they probably exceed four quarters; but in Suffolk he ſhould not eſtimate them at more than three: yet five or ſix are not uncommon. According to Mr. Donaldſon, a crop of beans, taking the iſland at large, may be ſuppoſed to vary from ſixteen to forty buſhels; but that a good average crop cannot be reckoned to exceed twenty. And in Middleſex, Mr. Middleton tells us, that bean crops vary from ten to eighty buſhels per acre. They are rendered a very precarious crop by the ravages of myriads of ſmall black inſects of the ſame ſpecies. The *lady-birds* are ſuppoſed either to generate or feed on them, as they are obſerved to be much among them. Mr. Foot ſays, the average produce is from three and a half to four quarters per acre.

It is aſſerted, by the author of the Synopſis of Huſbandry, that bean ſtraw, if well harveſted, forms a very hearty and nutritious diet for cattle in the winter-time; and that both oxen and horſes, when not worked, will thrive on it. Sheep are alſo very fond of browſing on the pods; and the *cavings* are very nutritious manger meat for horſes. But in Middleſex the ſtraw is generally employed in bedding the farmer's horſes and other cattle, and in littering the farm yards, where it is picked over by young ſtock; though ſometimes a load is ſold for 20s. or 25s. delivered in. When the bean-ſtraw and the *caving-chaff* are made uſe of as a fodder for cattle, they ſhould always be newly threſhed, as in that ſtate they are much more nutritious than when they have been kept ſome length of time.

Crops of this kind are for the moſt part applied to the purpoſe of feeding horſes, hogs, and other domeſtic animals. In the county of Middleſex all are given to horſes, except what are preſerved for ſeed, and ſuch as are podded while green, and ſent to the London markets. When pigs are fed with beans, it is obſerved that the meat becomes ſo hard as to make very ordinary pork, but good bacon. It is alſo ſuppoſed that the mealmen grind many horſe-beans among wheat, to be manufactured into bread. And Dr. Darwin remarks in his Phytologia, that a ſtrike or buſhel of oats weighs perhaps forty pounds, and a ſtrike or buſhel of peas and beans ſixty pounds; and that as the ſkin of peas and beans is much leſs in quantity than that of oats, he ſuppoſes there may be at leaſt fifteen pounds of flour more in a ſtrike of peas and beans than in a ſtrike of oats. There is alſo reaſon to believe, he ſays, that the flour of beans is more nutritive than that of oats, as appears in the fattening of hogs; whence, according to the reſpective prices of theſe two articles, he ſuſpects that peas and beans generally ſupply a cheaper provender for horſes than oats, as well as for other domeſtic animals. But as the flour of peas and beans is more oily, he believes, than that of oats, it may in general be ſomewhat more difficult of digeſtion; hence, when a horſe has taken a ſtomach full of peaſe and beans alone, he will be leſs active for an hour or two, as his ſtrength will be more employed in the digeſtion of them, than when he has taken a ſtomach full of oats. Hence it may be found adviſable to mix the bran of wheat with the peans and beans, a food of leſs nutriment but of eaſier digeſtion; or to let the horſes eat before or after them the coarſe tuſſocks of ſour graſs, which remain in moiſt paſtures in the winter; or laſtly, to mix finely cut ſtraw with them.

BEAN, in *Gardening*. See VICIA.

BEAN-*Gooſe*. See ANAS.

BEAN, *Ignatius's*. See IGNATIUS's *Bean*.

BEAN, *Kidney*, or *French*, in *Botany*. See PHASEOLUS.

BEAN, *Kidney*, *Tree*. See GLYCINE.

BEAN, *Malacca*, the *anacardium orientale*, is a fruit of a ſhining black colour, of the ſhape of a heart flattened, with a very thick pedicle occupying almoſt the whole baſis. For the characters of the plant that produces it, ſee AVICENNIA *Tomentoſa*; and for its qualities, ſee ANACARDIUM.

BEAN, *Molucca*, a name given by ſir Robert Sibbald in his *Prodromus*, and by Mr. Wallace in his deſcription of the Orkney iſlands to a ſort of fruit frequently caſt on ſhore in the north-weſt iſlands of Scotland, eſpecially on the coaſts moſt expoſed to the waves of the great ocean. They are called by ſome Orkney beans, and are not the produce of that iſland, or indeed of any other part of Europe, but of America. Sir Hans Sloane procured four ſpecies of them little

little injured by the ſea, and found on examination that three of them were the common produce of the iſland of Jamaica; where he had himſelf gathered them, and deſcribed them in his catalogue and hiſtory.

The firſt ſort was a kind of kidney bean, and the plant which produces it is deſcribed by ſir Hans under the name of the great perennial kidney bean, with a great crooked lobe. It is alſo figured in the Hortus Malabaricus by the name of *perim kakavali*, and ſir Robert Sibbald alſo calls it *nux Indica ex qua pyxides pro pulvere ſternutario parant*. This is a native of the Eaſt and Weſt Indies, and is ſometimes found thrown on ſhore in the county of Kerry in Ireland, and in ſome other places. A ſecond kind of fruit thrown on ſhore in the Orkneys, is a very common fruit in Jamaica, known there by the name of the horſe-eye bean; it has this name from its reſembling the eye of ſome large animal, by reaſon of a *hilus* or welt which ſurrounds it. This is deſcribed by many authors, and among the reſt by ſir Hans Sloane, in his catalogue of Jamaica plants; and is found in many other of the hotter parts, both of the Eaſt and Weſt Indies. A third kind of fruit found on theſe ſhores, is that called by the people of Jamaica the aſh-coloured nickar nut; it has this name from its colour, and from its being perfectly round, of the ſhape of a nickar, or marble, ſuch as boys play with. This is alſo common in the Eaſt and Weſt Indies. A fourth kind is alſo a Jamaica fruit, with the hiſtory of which we are not yet well acquainted; nobody has ſeen it growing, but the fruit itſelf is preſerved in many of the collections of the curious, and has been figured and deſcribed by Cluſius and others under the name of a round exotic fruit rigid with four riſing nerves.

Theſe are the principal kinds of fruits thus toſſed on ſhore with us; but how the products of Jamaica, or other parts of America, ſhould be brought to the ſhores of Scotland and Ireland, ſeems difficult to determine on any certain foundation. It is eaſy to conceive, that when they grow by the ſides of rivers, they may fall off from the trees into them, and be thence conveyed into the ſea. It is likewiſe eaſy to ſee, that when they are thus floating on the ſurface of the ſea, they may be carried about by the winds and currents to a conſiderable diſtance; but their motion this way muſt naturally be ſtopped by the main continent of America, and they muſt be forced through the gulf of Florida, or the canal of Bahama, going thence conſtantly eaſt, and into the north American ſea. This is eaſily conceived by a ſimilar fact which happens every day; which is, that a kind of ſea lentil, called *ſargaſſo*, which grows very plentifully on the rocks about Jamaica, is waſhed off from thence, and carried by the winds and currents, which for the moſt part go impetuouſly the ſame way, toward the coaſt of Florida, and thence into the North American ocean, and is there found floating on the ſurface. Thus far it is eaſy to trace our fruits from their native ſoil: but how after this they ſhould be forwarded to us is unaccountable, unleſs we ſuppoſe, that as ſhips when they go ſouth expect a trade eaſterly wind, and when they come north expect and generally find a weſterly wind, for at leaſt two parts in three of the year; ſo theſe fruits being brought north by the current from the gulf of Florida, are put into the way of theſe weſterly winds, and by them conveyed to the coaſts of Scotland and Ireland. Philoſoph. Tranſact. N° 222. p. 300.

By the ſame means that theſe beans came to Scotland, it is reaſonable to believe that the ſame winds and currents brought from America thoſe ſeveral things towards the Azores and Porto Santo, which are recorded by Ferdinand Columbus in the life of his father; which gave this bold adventurer the firſt notion that there was ſuch a place as America. Among the things he mentions as waſhed aſhore in this manner, was a piece of wood very ingeniouſly wrought, but evidently without the help of iron tools. This was taken up by a Portugueſe pilot, four hundred and fifty leagues from ſhore, off cape St. Vincent, after a weſt wind which had blown violently for many days: after this ſuch another piece of wood was taken up on the ſhore of Porto Santo, after ſuch another long and violent weſt wind. Large canes, vaſtly ſuperior to any of the growth of the then known parts of the world, were alſo found thrown on the ſame ſhores, and the fruits of pines which did not grow in any known part of the world; and finally the bodies of two men appearing to be of a different nation from any of the known people, and two of the canoes, were driven on ſhore on the iſland Flores, one of the Azores. All theſe things having been found only after ſtrong and continued weſt winds, it appeared very evident, that there muſt be land ſomewhere to the weſt, where fruits and men were to be found; and that theſe men had no knowledge of our arts, by their want of iron. From theſe conjectural concluſions ſprung the greateſt diſcovery of modern times.

Bean *Stalks*. The aſhes of bean ſtalks make good and clear glaſs.

Bean *Tree, Erythrina*. See Corallodendron.

Bean *Tree, binding*. See Mimosa.

Bean *Trefoil*. See Anagyris, and Cytisus.

Bean is alſo uſed by ſome *Anatomiſts* to denote the *glans of the penis*, on account of its figure and reſemblance to that pulſe.

Bean is alſo improperly uſed for a weight, containing the third part of a ſcruple.

BEANA, in *Ancient Geography*, a town of Aſia, placed by Ptolemy in Babylonia.

BEAR, in *Aſtronomy*, a name given to two conſtellations called *the Greater* and the *Leſſer Bear*, or *Urſa major* and *minor*.

The pole ſtar is ſaid to be in the tail of the *Leſſer Bear*; this ſtar is never above two degrees diſtant from the north pole of the world. See Ursa.

Bear, or Bere, in *Agriculture*, is a ſpecies of barley cultivated in Scotland and Ireland, and the northern parts of England. It yields a large return, but is not eſteemed ſo good for malting as the common barley.

Bear, in *Zoology*. See Ursus.

Bear, *Ant*. See Tapir, and Ant-eater.

Bear, *Polar*. See Polar *Bear*.

Bear, *Sand*, is ſuppoſed to be a variety of the badger, or Ursus *Meles*, and the ſame animal which naturaliſts have deſcribed under the name of the "ſow-badger." Its colour is a yellowiſh white; its eyes are ſmall, and its head thicker than that of the common badger; its legs are ſhort, and on each foot are four toes, armed with ſharp white claws. It is almoſt without hair, very ſenſible of cold, and burrows in the ground. Bewicke's Quadrupeds, p. 284.

Bear, *Sea*. See Sea-*Bear*.

Bear's *Fleſh* was much eſteemed by the ancients: even at this day the paw of a bear ſalted and ſmoaked is ſerved up at the tables of princes.

Bear's fleſh is reckoned one of the greateſt rarities among the Chineſe; inſomuch that, as Du-Halde informs us, the emperor will ſend fifty or a hundred leagues into Tartary, to procure them for a great entertainment. The fleſh is reckoned ſuch a dainty among the inhabitants of Kamtſchatka, that they ſeldom eat it alone, but uſually invite a number of gueſts to partake of the delicious repaſt. The inteſtines alſo, when cleanſed and properly ſcraped, are worn by the fair ſex as maſks to guard their faces from the ſun-beams,

which being reflected from the ſnow, are generally found to blacken the ſkin; by which means the Kamtſhadale ladies preſerve a fine complexion. The Ruſſians of Kamtſhatka make window-panes of theſe inteſtines, which are as clear and tranſparent as thoſe made of Muſcovy glaſs. Of the ſhoulder blades of the bear are made ſickles for cutting graſs; and the heads and the haunches are hung up by the Kamtſhadales, as ornaments or trophies, on the trees about their dwellings.

Bear's *Greaſe*, is eſteemed by ſome a ſovereign remedy againſt cold diſorders, eſpecially rheumatiſms. Some have alſo employed it with ſucceſs in the gout, and againſt tumors and ulcers. To be good, it muſt be newly melted, greyiſh, glutinous, of a ſtrong diſagreeable ſmell, and a moderate conſiſtence. That which is too white is adulterated with common tallow. It is now much uſed by hair-dreſſers, and is ſaid to be of ſervice in thickening the hair, and for other purpoſes.

The inhabitants of Kamtſhatka hold in high eſtimation the fat of the bear, as a very ſavoury and wholeſome nouriſhment; and when melted, and thus rendered fluid, it ſupplies the uſe of oil.

Bear's *Skin* makes a fur in great eſteem, and on which depends a conſiderable article of commerce, being uſed in houſings, on coach-boxes, &c. In ſome countries, cloaths are made of it, more eſpecially bags wherein to keep the feet warm in ſevere colds. Of the ſkins of bears-cubs are made gloves, muffs, and the like. It is uſed in Ruſſia for beds, covertures, caps, gloves, and collars for their ſledge-dogs. Thoſe who traverſe the ice for the capture of marine animals make their ſhoe-ſoles of bears' ſkin, which prevents the danger of ſlipping. A light black bear ſkin is one of the moſt comfortable and coſtly articles of the winter wardrobe of a man of faſhion at Peterſburg or Moſcow; and even the ſmall white hand of a belle is ſlipt into the large bear muff which covers the half of her elegant ſhape. The exportation of bear-ſkins forms a very conſiderable article of Ruſſian commerce, independently of thoſe that are uſed for home conſumption.

Bear *Garden*, a place where bears and other beaſts are expoſed as a public ſpectacle to be baited. See Baiting.

Bear, *hunting and killing of the*. The bear is in a variety of reſpects ſo uſeful an animal in Ruſſia and northern countries, that the inhabitants have deviſed ſeveral ingenious methods of taking and deſtroying them. The moſt uſual way of killing this animal is with fire-arms, and ſpears or darts. The Laplanders knock them down with clubs, as they can eaſily overtake them in running with their ſnow-ſhoes; but they are generally firſt ſhot, and then diſpatched with ſpears. In ſome parts of Siberia, the hunters erect a ſcaffold of ſeveral balks laid on one another, which falling down, cruſhes the bear, on his ſlipping upon the trap placed under it. Another method is to dig pits, in which is fixed a ſmooth, ſolid, and very ſharp-pointed poſt, which riſes about a foot above the bottom. The pit is carefully covered with ſods, and acroſs the track of the bear is ſtretched a thin rope with an elaſtic bug bear. As ſoon as the bear touches the rope, the wooden bug-bear ſtarts looſe; and the ſcared animal, endeavouring to ſave himſelf by flight, falls with violence into the pit, and is killed by the pointed poſt. If he eſcape this ſnare, at a ſmall diſtance, perhaps, ſeveral caltrops (ſee Caltrop) and other inſtruments of annoyance await him, amongſt which a ſimilar terrific log is erected, and where the perſecuted beaſt, the more he ſtrives to get free, fixes himſelf more firmly to the ſpot at which the blood-thirſty hunter lies in ambuſh for him. The Koriaks find out a crooked tree, which is grown up in the form of a gibbet, and at the bent ſummit of it they attach a nooſe, with a bait ſuſpended to it. The hungry bear, thus allured, eagerly climbs up the tree, and on his moving the branch, the nooſe draws together, and the animal remains ſuſpended to the tree. But the method adopted by the inhabitants of the mountainous parts of Siberia to make this ferocious animal kill himſelf is more ſingular and ingenious. They faſten a very heavy block to a rope, terminating at the other end with a loop. This is laid near a ſteep precipice on the path which the bear uſually takes. On having his neck in the nooſe, and finding that he cannot proceed on account of the clog, he takes it up in a rage, and to free himſelf from it, throws it down the precipice, which of courſe pulls him after it, and he is commonly killed by the fall. Should this accidentally not be the caſe, he drags the block again up the acclivity, and renews his efforts, till with increaſing fury he either ſinks to the ground, or kills himſelf by a deciſive plunge.

The white or polar bear (Ursus *Maritimus*) lives on the coaſt of the Frozen ocean, and in ſome of the eaſtern and northern iſles, where the chace of him is a collateral occupation of the mariners who viſit theſe coaſts for the capture of the morſe. Black bears are ſo numerous in Kamtſhatka, that they are ſeen roaming about the plains in troops, and muſt long ſince have been exterminated, if they were not here more tame and gentle than in any other part of the world. In ſpring, they deſcend from the mountains where they have wintered, to the mouths of the rivers for catching fiſh, which ſwarm in all the ſtreams of that peninſula. If the fiſh are plentiful, they eat only the heads; and when they find nets laid in any place, they dexterouſly drag them out of the water, and empty them of the fiſh. Towards autumn, when the fiſh go up the rivers, they advance with them gradually to the mountains. When a Kamtſhadale eſpies a bear, he endeavours to conciliate his friendſhip at a diſtance, accompanying his geſtures by courteous words. Indeed they are ſo familiar, that the women and girls, when they are gathering roots and herbs, or turf for fuel, are never diſturbed in their employment, even in the midſt of a whole drove of bears; and if one of theſe animals comes up to one of them, it is merely to take ſomething out of their hands. They have never been known to attack a man, except when they are roufed from their ſleep, and they ſeldom turn upon the markſmen whether they be hit or not. Notwithſtanding this gentleneſs of the bear, its utility renders it a valuable object of prey. When the hunter and the bear meet, the conteſt is generally bloody, but it generally terminates to the advantage of the artful huntſman. Armed with ſpears and clubs, the Kamtſhadale goes in queſt of the peaceful bear in his calm retreat, who, thinking only of his defence, takes the faggots brought by his purſuer, and choaks with them the entrance into his den. The mouth of the cavern being cloſed, the hunter bores a hole through the top, and then with the greateſt ſecurity ſpears his defenceleſs foe. Tooke's View of Ruſſia, vol. ii. p. 442, &c.

Dr. Barton, in his "Fragments of the Natural Hiſtory of Pennſylvania," informs us, that the bears migrate in great numbers, every autumn, acroſs the Miſſiſippi, proceeding ſouth, perhaps to the mountains of New Mexico, in ſearch of a milder climate. In the ſpring they return again by the ſame route. This migration of the bears is particularly obſerved at Manchar, on the Miſſiſippi.

Bear *leading*, to ſhew tricks, is an ancient practice, which we find prohibited in the canons of the church. Du-Cange.

Bear *wards*, *urſarii*, were a kind of ſervants in great families among the Romans, who had the care of breeding and feeding thoſe animals. Pitiſc. Lex. Ant. tom. ii. p. 1110.

p. 1110. Our nobility had formerly officers of this kind. The annual falary of one of them belonging to the fifth earl of Northumberland was twenty fhillings. Northumb. Houfehold Book.

Bear-*Tribe*, in *Geography*, one of the tribes into which the American Indians of the Six-Nations are diftributed. See Six-Nations.

Bear, *Order of the*, was a military order in Swifferland, erected by the emperor Frederic II. in 1213, by way of acknowledgment for the fervice the Swifs had done him, and in favour of the abbey of St. Gal. To the collar of the order, which was a gold chain interlaced with a chaplet of oak-leaves, hung a medal of gold, on which was repreſented a bear raiſed on an eminence of earth; or a bear fable on a ground vert.

Bear-*berry*, in *Botany*. See Arbutus.

Bear-*bind*. See Convolvulus.

Bear's *breech*. See Acanthus.

Bear's *ears*. See Primula *Auricula*.

Bear's *ears fanicle*. See Verbascum.

Bear's *foot*. See Helleborus.

Bear-*a-hand*, a naval term, fynonymous with make haſte, or diſpatch. See Bearing.

Bear's *Bay*, in *Geography*, or *Little Port*, lies at the eaſt end of Anticoſti iſland, at the mouth of the river St. Lawrence, in North America.

Bear's *Bay*, or *White Bear Bay*, is a very deep bay on the ſouth coaſt of the iſland of Newfoundland, towards its weſt end.

Bear's *Cape*, the ſouth-eaſt point of St. John's iſland, near Nova Scotia, in North America. N. lat. 45° 53'. W. long. 62° 40'.

Bear *Cove*, lies on the eaſt ſide of the ſouth-eaſtern corner of the iſland of Newfoundland, at the head of which is the ſettlement of Formoſe. It is a good fiſhing-place for boats. Reneau's rocks are ſituated between Bear-Cove and Freſh-water bay on the ſouth, 32 miles northerly from cape Race.

Bear *Creek*, a water of Tenneſſee river. See Occochappo.

Bear's *Graſs Creek*, a ſmall creek on the eaſtern ſide of Ohio river, north of the town of Louiſville, in Kentucky, and near it. A canal is propoſed to be cut from this creek to the rapids of the Ohio, which would render the navigation of this river ſafe and eaſy. The country on the ſide of this creek, between Salt river and Kentucky river, is rich and beautiful.

Bear *Iſland*, an iſland near the entrance of Bantry bay, in the county of Cork, Ireland. It is about ſix miles long, and is very coarſe, mountainous, and rugged, but is of great uſe in defending this noble bay from the fury of the ſouth-weſt winds, ſo that veſſels within the iſland may ride ſecure. N. lat. 51° 35'. W. long. 9° 45'. The whole bay was formerly called *Bearhaven*; but this name is now confined to that part between the iſland and the peninſula of *Bear*, on which is the ſmall town of Caſtleton. Smith's Cork. Beaufort. See Bantry.

Bear, *and* Bantry, the name of a barony in the weſtern part of the county of Cork, Ireland, which is very mountainous, and with the adjoining parts of Carbery and Muſkerry, is the pooreſt and leaſt improved part of the county.

Bear, *North*, a ſmall iſland in St. James's bay, Hudſon's bay. N. lat. 54° 40'. W. long. 80°.—Another ſmall iſland in the ſame bay is called *South Bear*. N. lat. 54° 35'. W. long. 80°.

Bear, or *Cherry*, *Iſland*, lies on the coaſt of Greenland. N. lat. 74° 28'. E. long. 17° 58'.

Bear *Lake*, *Great*, is ſituated in the north-weſt part of North America, near the Arctic circle, in N. lat. 65°, and W. long. 121°; and a river flows from it in a W.N.W. courſe, called Great Bear river, which runs into Mackenzie's river.

Bear *Lake*, *Black*, lies in New South Wales, north-weſt from Cumberland houſe. N. lat. 53° 30'. W. long. 107° 30'.

Bear *Lake*, *White*, lies due weſt from another ſmall lake called Bear lake, both in N. lat. 48° 15'; and the former in W. long. 98° 30'. Theſe lakes are ſaid to give riſe to the river Miſſiſippi.

Bears, *White*, *Point of*, the eaſt point of St. Peter's river, on the coaſt of Labrador, in North America, ſo called from the great number of bears that were ſeen there. N. lat. 51° 55'. W. long. 55° 30'.

Bear's *Port*, one of the ports on the coaſt of Nova Scotia, in North America, between port and cape de l'Heve to the north-eaſt, and cape Sable, the ſouth-weſt point of Nova Scotia.

Bear *River*, a river of the north-weſt part of North America, which runs into the Unjigah, or Peace river, in N. lat. 56° 12'. W. long. 119° 28'.

Great Bear *River*. See Bear *Lake*.

Bear *Rocks*, *New*, are ſituated about ſouth by weſt from the extreme weſt point of the iſland of Jamaica. N. lat. 16° 20'. W. long. 78° 55'.

Bear *Sound*, or *Barſund*, lies on the weſt coaſt of Weſt Greenland. N. lat. 62° 20'. W. long. 49°.

Bear *Town*, a town of America, in Caroline county, Maryland, about 7 miles north of Greenſburg, and about 15 ſouth-eaſt from Cheſter-town.

Bear, *to*, denotes to bring forth young, or to produce fruit.

BEARALSTON, in *Geography*. See Beeralston.

BEARD, John, in *Biography*, an energetic Engliſh ſinger, and an excellent actor, was brought up in the king's chapel. He knew as much of muſic as was neceſſary to ſing a ſingle part at ſight, and with a voice that was more powerful than ſweet, he became the moſt uſeful and favourite ſinger of his time, on the ſtage, at Ranelagh, at all concerts; and in Handel's oratorios, he had always a capital part; being by his knowledge of muſic the moſt ſteady ſupport of the choruſes, not only of Handel, but in the odes of Green and Boyce. Having married for his ſecond wife a daughter of Rich, the patentee of Covent-garden theatre, upon the death of his father-in-law, he became manager of that play-houſe, and diſcontinued all public ſinging; which a deafneſs that had been long encreaſing rendered neceſſary. His firſt marriage was with a lady of quality, a ſiſter of the late Earl of Walgrave, to whom he was a very indulgent and tender huſband; and he proved himſelf to be a man of honour and principle in every tranſaction of his life. There were ſo much intelligence and humour in his acting and ſinging comic parts on the ſtage, and Scots and Iriſh ballads in private, as well compenſated for deficiencies of voice. He was cloſely united by friendſhip to Dr. Boyce, in the performance of whoſe muſic he manifeſted a zeal and even a partiality which were not diſcoverable for that of any other compoſer. He died in 1791.

Beard, in *Geography*, a town of France, in the department of Nievre, and chief place of a canton in the diſtrict of Decize, on the Loire; 10 miles S. E. of Nevers.

Beard, in *Phyſiology*, the hair growing on the chin, and adjacent parts of the face; chiefly of adults and males.

Various have been and ſtill are the ceremonies and cuſtoms of different nations with regard to the beard: Kingſon aſſures us, that a conſiderable branch of the religion of the Tartars conſiſts in the management of their beards; and that they waged

waged a long and bloody war with the Perſians, and declared them infidels, though, in other reſpects, of the ſame faith with themſelves, merely becauſe they would not cut their whiſkers after the mode or rite of the Tartars. The Spartans from the age of 20 years, ſuffered their hair and beards to grow: the hair being deemed an ornament, which became the free man and warrior. A Spartan being once aſked why he wore ſo long a beard, replied, "Since it is grown white it inceſſantly reminds me not to diſhonour my old age." Nevertheleſs, as they were accuſtomed to obedience, even in things the moſt indifferent, the ephori, when they entered on office, proclaimed, by ſound of trumpet, a decree, commanding the people to ſhave their upper lips, and to ſubmit to the laws. The Egyptian prieſts ſhaved the head, chin, and whole body. Accordingly, moſt of the Egyptian figures are without beard. However, Herodotus informs us, that in time of calamity, they ſuffered their beard and hair to grow. The Aſſyrians had long beards; and Chryſoſtom obſerves, that the kings of Perſia had their beards woven or matted together with gold thread; and ſome of the firſt kings of France had, in the ſame manner, their beards matted and knotted with gold. The Africans wore long beards, as may be ſeen on the medals of Juba. The Greeks, if tradition may be credited, wore long beards from their heroic times. Cedrenus informs us, that at Conſtantinople, in the thermæ of Zeuxippus, there was a ſtatue of Homer with a long beard.

Athenæus, from Chryſippus, obſerves, that the Greeks always wore their beards till the time of Alexander; and that the firſt who cut it at Athens ever after bore the addition of κοσσης, *ſhaven*, on medals. Plutarch adds, that Alexander commanded the Macedonians to be ſhaven, leaſt the length of their beards ſhould give a handle to their enemies: however this be, we find Philip, his father, as well as Amyntas and Archelaus, his predeceſſors, repreſented on medals without beards. The Greeks continued to ſhave the beard till the time of Juſtinian, under whoſe empire long beards came again into faſhion, and ſo continued till Conſtantinople was taken by the Turks. The Greek philoſophers diſtinguiſhed themſelves from the vulgar by their long beards. According to Laertius (l. vi.) Antiſthenes was the firſt of the philoſophers who ſuffered his beard to grow. This cuſtom, however, among the philoſophers, was not invariable, for the ſcholiaſt of Ariſtophanes (Nub. 120.) pretends, that the ancient philoſophers ſhaved their beards. The Roman philoſophers affected to preſerve the ſame diſtinctive characters of the mantle and long beard.

Thus Horace deſcribes them:

——— "Tempore quo me
Solatus juſſit ſapientem paſcere barbam."
Sermon. l. ii. ſat. iii. v. 34.

Aulus Gellius and Lucian expreſs themſelves in a ſimilar manner. Perſius ſeems to have been ſo convinced of the beard's being the ſymbol of wiſdom that he thought he could not beſtow a greater encomium on Socrates than calling him "Magiſtrum barbatum." The Sicilians, and the Etruſcans adopted the cuſtoms of the Greeks. The latter exhibited all their deities with a beard, except Vulcan, but on the medals of the former their kings appear without a beard.

The Romans for a long time wore beards and long hair. Cicero, in his oration for Cœlius, (c. 14.) mentions the "barba horrida, quam in ſtatuis antiquis & imaginibus videmus." Liv. (v. 51.) ſpeaking of the ſenators, who remained in Rome, after the entrance of the Gauls, ſays that they wore a very long beard: "barbam, ut tum omnibus promiſſa erat." Scipio Africanus appeared with a long beard in his interview with Maſiniſſa. Hence Ovid calls the ancient Romans "intonſi;" thus,

"Hoc apud intonſos nomen habebat avos." Faſt. ii. 26.

Juvenal alſo (Sat. xvi.) deſcribes them in the ſame manner:

"Et credam dignum barbâ, dignumque capillis
Majorum."

Pliny obſerves, that the Romans did not begin to ſhave till the year of Rome 454, when P. Ticinius brought over a number of barbers from Sicily; he adds, that Scipio Africanus was the firſt who introduced the mode of ſhaving every day. The philoſophers, however, retained the beard; and the military men wore it ſhort and frizzled, as we ſee it upon the triumphal archs, and other monuments. In time of grief and affliction they ſuffered their beard and hair to grow, as was the caſe with M. Livius in his retirement from Rome, and with Auguſtus after the defeat of Varus. The Greeks, on the contrary, in time of grief, cut their hair and ſhaved their beards, (Seneca Benef. v. 6.) which was alſo the cuſtom among ſome barbarian nations. Accordingly, the cuſtom of letting the beard grow is a token of mourning in ſome countries, and of ſhaving it in others. The firſt fourteen Roman emperors ſhaved, till the time of the emperor Adrian, who retained the mode of wearing the beard. Plutarch tells us he did it to hide the ſcars in his face.

Antoninus Pius and Marcus Aurelius wore a beard under the character of philoſophers. The ſucceſſors of Juſtinian reſumed the habit of wearing beards, and the latter Greek emperors had them of an extraordinary length. The ancient Britons in the time of Cæſar ſhaved the reſt of the body, except the head and upper lip: "Capillos ac barbam radere præter caput, et labrum ſuperius." Bell. Gall. l. v. c. 14. Diodorus Siculus and Tacitus inform us, that the ancient Germans ſhaved the beard, except that on the upper lips; and, among the Catti, a nation of Germany, a young man was not allowed to ſhave or cut his hair till he had ſlain an enemy. Tac. de Mem. Germ. 31. Among the Jews it was reckoned ignominious to ſhave a perſon's beard. 2 Sam. x. 4. Strabo relates, that the Indian philoſophers, the Gymnoſophiſts, took great pains to attract the veneration of the people by the length of their beards. The Goths and Franks wore only a muſtache, called by Plutarch μυσακα, and by the Latins "criſta." While the Gauls were under their ſovereignty, none but the nobles and Chriſtian prieſts were allowed to wear long beards. When the Franks made themſelves maſters of Gaul, they aſſumed the ſame authority as the Romans; the bondſmen were expreſsly ordered to ſhave their chins; and this law continued in force till the entire abolition of ſervitude in France. In the time of the firſt race of kings, a long beard was a ſign of nobility and freedom; and the kings were emulous to have the largeſt beards. Eginard, ſecretary to Charlemagne, ſpeaking to the laſt kings of the firſt race, ſays, they came to the aſſemblies in the field of Mars in a carriage drawn by oxen, and ſat on the throne with their hair diſhevelled, and a very long beard.

It is not eaſy to fix with preciſion the time when the beard was firſt ſhaven among the young Romans. It was ſometimes when the toga virilis was aſſumed, according to Suetonius (Calig. 10.) Macrobius (Somn. Scip. i. 6.) ſays, it was about the age of 21. Auguſtus did not ſhave before the age of 25. Hence young men with a long down, or "lanugo," upon the chin, were called "juvenes barbatuli," or "benè barbati." The firſt growth of the beard was conſecrated to ſome god, uſually to the Lares. Nero conſecrated his in a golden box, ſet with pearls, to Jupiter Capitolinus. The day on which the young men, among the Greeks and Romans, firſt ſhaved the beard, was a feſtival; viſits of ceremony were paid them; and they received preſents from their friends. To this purpoſe, Juvenal ſays, Sat. iii. 186.

"Ille

" Ille metit barbam, crinem hic deponit amati ;
" Plena domus libis genialibus."

Slaves, among the Romans, wore their beard and hair long; when manumitted they ſhaved the head in the temple of Feronia, and put on a cap, or "pileus," as a badge of liberty. Thoſe who eſcaped from ſhipwreck, ſhaved their heads ; and perſons acquitted of a capital crime, cut their hair and ſhaved, and went to the capitol to return thanks to Jupiter.

Perſons of quality had their children ſhaved the firſt time by others of the ſame, or greater quality, who by this means became godfathers, or adoptive fathers of the children. Anciently, indeed, a perſon became god-father of the child by barely touching his beard; thus hiſtorians relate, that one of the articles of the treaty between Alaric and Clovis was, that Alaric ſhould touch the beard of Clovis to become his godfather.

As to eccleſiaſtics, the diſcipline has been very different on the article of beards : ſometimes they have been enjoined to wear them, from a notion of too much effeminacy in ſhaving, and that a long beard was more ſuitable to the eccleſiaſtic gravity ; and ſometimes again they were forbid it, as imagining pride to lurk beneath a venerable beard. The Greek and Romiſh churches have long diſputed together about their beards ; ſince the time of their ſeparation, the Romaniſts ſeem to have given more into the practice of ſhaving, by way of oppoſition to the Greeks; and have even made ſome expreſs conſtitutions "de radendis barbis." The Greeks, on the contrary, eſpouſe very zealouſly the cauſe of long beards, and are extremely ſcandalized at the beardleſs images of ſaints in the Roman churches.

By the ſtatutes of ſome monaſteries, it appears, that the lay-monks were to let their beards grow, and the prieſts among them to ſhave ; and that the beards of all that were received into the monaſteries were bleſſed with a great deal of ceremony ; and there are ſtill extant the prayers uſed in the ſolemnity of conſecrating the beard to God, when an eccleſiaſtic was ſhaven.

Le Comte obſerves, that the Chineſe affect long beards extravagantly ; but nature has balked them, and only given them very little ones, which, however, they cultivate with great care : the Europeans are ſtrangely envied by them on this account.

The Ruſſians wore their beards till within theſe few years, when the czar Peter enjoined them all to ſhave ; but, notwithſtanding his injunction, he was obliged to keep on foot a number of officers to cut off by violence the beards of ſuch as would not otherwiſe part with them. For enforcing his regulation, which was violently oppoſed, he laid a tax on long beards, and many ſubmitted to it rather than part with their beard, which was univerſally held to be an ornament to the perſon. Superſtitious Ruſſians even thought it to be an external characteriſtic of the orthodox faith ; and thoſe who were too poor, or too parſimonious, to pay the tax for retaining the beard, religiouſly preſerved the beard that was ſhorn off, and had it depoſited in the coffin with them on their deceaſe, that they might preſent it to St. Nicholas, on his refuſing to admit them, as beardleſs chriſtians, into the kingdom of heaven. As a proof of the high eſtimation in which the beard was held in Ruſſia in early times, it is a law in the Novgorodian code, that whoever plucks hair from another's beard ſhall be mulcted four times as much as for cutting off a finger.

In the 10th century, king Robert of France, the rival of Charles the ſimple, was not more famous for his exploits than for his long white beard, which he ſuffered to hang down on the outſide of his cuiraſs, to encourage the troops in battle, and to rally them when defeated. Upon the death of the great Henry IV. of France, who was ſucceeded by a beardleſs youth, the beard was proſcribed. Louis XIII. aſcended the throne of his glorious anceſtor without a beard ; and his courtiers immediately reduced their beards to whiſkers, and a ſmall tuft of hair under the lower lip. The duke of Sully, however, though he encountered ridicule, would never adopt this effeminate cuſtom. Whiſkers continued in faſhion in the commencement of the reign of Louis XIV. who, as well as his courtiers, were proud of wearing them ; ſo that they were the ornament of Turenne, Condé, Colbert, Corneille, Moliere, &c.

In Spain, Philip V. aſcended the throne with a ſhaved chin ; and the courtiers imitated the prince, and their example was followed by the people. The change, however, produced lamentations and murmur. Hence aroſe the Spaniſh proverb, denoting, "Since we have loſt our beards, we have loſt our ſouls." The Portugueſe, whoſe national character is much the ſame, have imitated them in this reſpect. Accordingly we read, that in the reign of Catherine, queen of Portugal, when the brave John de Caſtro had taken the caſtle of Diu in India, he was under the neceſſity of borrowing from the inhabitants of Goa a thouſand piſtoles for the maintenance of his fleet ; and that as a ſecurity for the loan, he ſent them one of his whiſkers, telling them "all the gold in the world cannot equal the value of this national ornament of my valour ; and I depoſit it in your hands as a ſecurity for the money." The inhabitants of Goa, it is ſaid, generouſly returned both the money and his whiſkers.

We have already obſerved, that the ancient Britons, in the time of Cæſar, ſhaved the body, except the head and the upper lip ; the hair of which they, as well as the Gauls, allowed to grow to a very inconvenient length. The Anglo-Saxons, on their arrival in Britain, and for a conſiderable time after, allowed their beards to grow, as well as their near neighbours the Longobards, to whom in every reſpect they bore a near reſemblance. After the introduction of Chriſtianity, their clergy were obliged to ſhave their beards, in obedience to the laws, and in imitation of all the weſtern churches. This diſtinction between the clergy and the laity ſubſiſted for ſome time ; and a writer of the ſeventh century complains, that the manners of the clergy were ſo corrupted, that they could not be diſtinguiſhed from the laity by their actions, but only by their want of beards. By degrees the Engliſh laity began to imitate the clergy ſo far as to ſhave all their beards except their upper lips, on each of which they left a lock of hair ; by which they were diſtinguiſhed from the French and Normans, who ſhaved their whole beards. The Normans had as great an averſion to beards as they had a fondneſs for long hair. Among them, to allow the beard to grow, was an indication of the deepeſt diſtreſs and miſery. They not only ſhaved their beards themſelves, but when they had authority, they obliged others to imitate their example. It is mentioned by ſome of our ancient hiſtorians, as one of the moſt wanton acts of tyranny in William the Conqueror, that he compelled the Engliſh, who had been accuſtomed to allow the hair of their upper lips to grow, to ſhave their whole beards. This was ſo diſagreeable to ſome of that people, that they choſe rather to abandon their country than reſign their whiſkers. In the fourteenth century long beards were in faſhion, and continued to the ſixteenth century ; ſo that in the reign of Mary I. the beards of biſhop Gardiner and cardinal Pole, appear in their portraits to be of a moſt uncommon ſize. The lawyers, however, had a regulation impoſed upon this important feature. Towards the cloſe of the ſixteenth century, the beard was much leſſened, and gradually dwindled into muſtachios or whiſkers : and in proceſs of time the practice of ſhaving the whole face became univerſal.

Among the Turks, it is more infamous for any one to have his beard cut off, than among us to be publickly whipt, or branded with a hot iron. They who ſerve in the ſeraglio have their beards ſhaven as a token of ſervitude; and when they are ſet at liberty, they permit it to grow. With them and the Perſians the beard is a mark of authority and liberty; and the want of muſtachios and beards diſcriminates ſlaves and women. Hence, it is ſaid, ariſes the unfavourable idea which they form on the firſt ſight of an European. There are many in that country who would prefer death to this kind of puniſhment. The Arabs make the preſervation of the beard a capital article of religion, becauſe Mahomet never cut his. The Moors of Africa hold by their beards while they ſwear, in order to give validity to their oath, which after this formality they rarely violate.

The Turkiſh wives kiſs their huſbands beards, and children their fathers, as often as they come to ſalute them. The men kiſs one another's beards reciprocally on both ſides, when they ſalute one another in the ſtreets, or come off from a journey.

The Jews wear a beard on the chin, but not on the upper lip or cheeks. Moſes forbids them to cut off entirely the angle or extremity of their beard; that is to imitate the Egyptian faſhion, who left only a ſmall tuft at the extremity of the chin; whence the Jews to this day ſuffer a little fillet of hair to grow from the lower end of their ears to their chins, where, as well on as their lower lips, their beards form a pretty long bunch. In time of mourning the Jews neglected to trim their beards, that is, to cut off what was ſuperfluous on the upper lips and cheeks. In time of great affliction they alſo plucked off the hair of their beards.

It has been advanced by ſeveral hiſtorians and travellers, that the Indians of America differed from other males of the human ſpecies in the want of one very characteriſtic mark of the ſex, viz. that of a beard. From this general obſervation, the Eſquimaux have been excepted; and hence it has been ſuppoſed, that they had an origin different from that of the other natives of America. Mr. Cauſland, after ten years reſidence at Niagara, in the midſt of the Six Nations, with frequent opportunities of ſeeing other nations of Indians, affirms, that they do not differ from the reſt of men in this particular more than one European differs from another; and as this imperfection has been attributed to the Indians of North America, equally with thoſe of the reſt of the continent, he inclines to think, that the aſſertion is as void of foundation in one region as it is in the other. All the Indians of North America, ſays this writer, except a very ſmall number, who, from living among white people, have adopted their cuſtom, pluck out the hairs of the beard; and as they addict themſelves to this practice from its firſt appearance, it may be ſuppoſed, that to a ſuperficial obſerver, their faces will ſeem ſmooth and beardleſs. As farther proofs that they have beards, he alleges that all of them have an inſtrument which they uſe for plucking out the hairs; that when they neglect this for ſome time, hairs ſprout up, and are ſeen upon the chin and face; that many Indians allow tufts of hair to grow upon their chins or upper lip; and that ſeveral of the Mohocks, Delawares, and others, who live among white people, ſometimes ſhave with razors, and ſometimes pluck their beards out. Accordingly, colonel Butler affirms, that the men of the Six-Nation Indians have all beards naturally, which is alſo the caſe with reſpect to all other nations of North America, which he has had an opportunity of ſeeing: but that it is the general practice of the Indians to pluck out the beard by the roots from its earlieſt appearance; and hence their faces appear ſmooth. The ſame fact is confirmed by Captain Brent. Phil. Tranſ. vol. lxxxvi. p. 229. &c.

Beard, *anointing the*, with unguents, is an ancient practice both among the Jews and Romans, and ſtill continues in uſe among the Turks; where one of the principal ceremonies obſerved in ſerious viſits, is to throw ſweet ſcented water on the beard of the viſitant, and to perfume it afterwards with aloes wood, which ſticks to this moiſture, and gives it an agreeable ſmell, &c.

In *Middle age Writers* we meet with *adlentare barbam*, uſed for ſtroking and combing it to render it ſoft and flexible.

The Turks, when they comb their beards, hold a handkerchief on their knees, and gather very carefully the hairs that fall; and when they have got together a certain quantity, they fold them up in a paper, and carry them to the place where they bury the dead.

Beard, *plucking the*, was practiſed to Cynics by way of contempt. The Stoics, as well as Cynics, affected to be inſenſible to injury, and their patience was tried by this practice. Socrates was not exempt from this ſpecies of inſult and perſecution, as we are informed by Diogenes Laertius. Horace ſays to a perſon of this deſcription:

"————Vellunt tibi barbam
Laſcivi pueri." Sermon. Sat. 3, 133.

And Perſius (Sat. i. 133.)

"Si Cynico barbam petulans Nonaria vellat."

The ſame ſatyriſt repreſents Jupiter as offering his beard to be plucked by Dionyſius the tyrant:

"Ideirco ſtolidam præbet tibi vellere barbam
Jupiter."

Some authors alſo ſpeak of *mortgaging the beard, barbam hypothecare*. Du-Cange.

Beard, *touching the*, was an action anciently uſed by ſupplicants, and by thoſe who made vows. An inſtance of this is found in Homer (Il. K. 454.): and Pliny (ii. 45.) ſays, that the ancient Greeks had a cuſtom of touching the chin of a perſon, whoſe compaſſion they wiſhed to excite; the chin being ſubſtituted for the beard. Inſtances of a ſingular kind occur in the Oreſtes and Hecuba of Euripides. To touch any one's beard, or cut off a ſmall part of it, was, among the ancient French, the moſt ſacred pledge of protection and confidence. For a long time all letters, iſſuing from the ſovereign, had, for greater ſatisfaction, three hairs of his beard in the ſeal. A charter of 1121, ſtill extant, concludes with the following words: "Quod ut ratum et ſtabile perſeveret in poſterum, præſentis ſcripto ſigilli mei robur appoſui cum tribus pilis barbæ meæ."

Beard, *barba falſa*, was an artificial one. In a general court of Catalonia, held in 1351, it is expreſsly enjoined, "Ne quis barbam falſam ſeu fictam audeat deferre vel fabricare." Du-Cange.

Hottoman has given an elegant dialogue *de barba*, firſt printed by Plantin in 1586.

Beard, or *under-beard*, called alſo *chuck*, of a horſe, is that part under the lower mandible on the outſide, and above the chin, which bears the curb of the bridle.

Beard, *old-man's*, in *Botany*. See Clematis.

Beard *of a Comet*, denotes the rays which the comet emits towards that part of the heavens to which its proper motion ſeems to direct it. Thus, the beard of the comet is diſtinguiſhed from the *tail*, which is underſtood of the rays emitted towards that part from which its motion ſeems to carry it. It is called beard from ſome fancied reſemblance it bears to the beard of a man; or becauſe it is projected before the comet.

Beard, in *Conchology*, the byſſus of the *pinna*, the *muſcle*, &c. an aſſemblage of threads or hairs of a ſtout texture that hangs from the body of the animal, and by means of which

it faſtens itſelf to ſtones, or any other heavy ſubſtance; the hairs of the beard terminating in a ſpungy ſubſtance, that adheres very tenaciouſly to the ſmootheſt ſurfaces. The thread of this kind of byſſus is ſometimes woven as an object of curioſity into gloves, ſtockings, &c. and in point of durability at leaſt, cannot be inferior to any other material that could be employed for that purpoſe. Some notice is taken of this among ancient writers, who ſpeak of it as a kind of ſilk. See SILK.

BEARDED, *barbatus*, denotes a perſon or thing with a beard, or ſome reſemblance thereof.

In *Middle Age Writers*, this is ſometimes expreſſed by *malibarbis*, q. d. *barba in malis ſeu genis*.

The faces on ancient Greek and Roman medals are generally bearded. Some are denominated *pogonati*, as having long beards, e. gr. the Parthian kings. Others have only a *lanugo* about the chin, as the Seleucid family. Adrian was the firſt of the Roman emperors who nouriſhed his beard; hence all imperial medals before him are beardleſs; after him, bearded.

The medals of gods, and heroes, in vigorous youth, repreſent them beardleſs, except Jupiter, and a few others.

The Romans paid their worſhip to a bearded Venus, *Veneri barbatæ*, ſuppoſed to have been of both ſexes; a ſtatue of whom was alſo found in the iſle of Cyprus. The reaſon of repreſenting the goddeſs of beauty with a beard is variouſly gueſſed at by the learned.

BEARDED *women* have been all obſerved to want the menſtrual diſcharge; and ſeveral inſtances are given by Hippocrates, and other phyſicians, of grown women, eſpecially widows, in whom, the menſes being ſtopped, beards appeared. Euſebius Nieurembergius mentions a woman, who had a beard reaching to her navel. Bartholin ſpeaks of a bearded woman at Copenhagen, who partly, in virtue thereof, paſſed for an hermaphrodite.

BEARDED *brothers*, *fratres barbati*, in *Eccleſiaſtical Writers*, are thoſe otherwiſe called *fratres converſi* in the order of Grammont and the Ciſtercians. They took this denomination becauſe they were allowed to wear their beards contrary to the rule of the profeſſed monks.

BEARDED *huſk*, among *Floriſts*, a huſk which is hairy on the edges, as is that of the roſe, &c.

BEARDING, in *Carpentry*, denotes diminiſhing any piece of timber from a given line on its ſurface, to make the thickneſs leſs on the edge.

BEARDING *of Wool*, in the *Manufactures*. See WOOL.

BEARDSTOWN, in *Geography*. See BAIRDSTOWN.

BEARER, in *Architecture*, any ſubſidiary or intermediate ſupport in aid of the principal ſupports, as the ſmall joiſts or brackets which bear a gutter or the covering board of a cornice, the piers and blockings under the joints of a ground floor; or the joiſts, &c. which bear any thing independent of or unconnected with the building, as the bearers of a ciſtern, of a vat, of a platform.

BEARERS, *geſtantes*, in *Middle Age Writers*, are ſometimes uſed for a child's goſſips, becauſe they hold the infant in their arms, and preſent him to the prieſts in the ceremony of baptiſm. Du-Cange.

BEARERS *of a bill of exchange*, denote the perſons in whoſe hands it is, and in favour of whom the laſt order or indorſement was made. See BILL *of* EXCHANGE.

When a bill is ſaid to be payable to bearer, it is underſtood to be payable to him who firſt offers himſelf after it becomes due. To be paid a bill of this kind, there needs neither order nor transfer; yet it is good to know to whom it is paid.

BEARERS are more particularly uſed for thoſe who carry the dead to their graves.

In a ſenſe ſomewhat different from this, we alſo ſay *pall-bearers*, &c.

The ancients had peculiar orders or officers of bearers, called by the Greeks κοπιάλαι; by the Romans, *lecticarii*. The *veſpillones*, or *bajuli*, were a lower ſort of bearers, appointed for perſons of inferior rank.

BEARERS, in *Horticulture*, denote the fruit branches, or ſuch as bear fruit.

The bearers, or bearing branches of an apple-tree, and the like, are found to be rougher, and fuller of aſperities in their bark, than the other branches.

BEARERS, in *Heraldry*, ſee SUPPORTERS.

BEARER, *Croſs*, ſee CROSS.

BEARERS, in *Law*, denote ſuch as bear down and oppreſs others, and are ſaid to be the ſame with maintainers. By ſtat. 4 Edw. III. c. 11. juſtices of aſſize ſhall enquire of, hear, and determine maintainers, bearers, and conſpirators, &c.

BEAR-HAVEN, in *Geography*, a commodious harbour formed by the iſland of Bear, near the mouth of Bantry bay in the county of Cork, Ireland, into which ſhips of war and merchantmen often put for ſhelter; but the adjoining village of Caſtletown affords them few reſources, and no accommodation. Beaufort's Memoir.

BEARING, in *Geography*, and *Navigation*, the ſituation of one place from another, with regard to the points of the compaſs; or the arc of the horizon, that lies between the meridian of a place and a line paſſing from that place to another; or the angle which a line drawn through the two places makes with the meridians of each.

In other words, the bearing of an object in navigation, is the rhumb on which it is ſeen; and the bearing of one place from another is reckoned by the name of the rhumb paſſing through thoſe two places. In every figure relating to any caſe of plain ſailing, the bearing of the line not proceeding from the centre of the circle or horizon, is found by drawing a line parallel to it from the centre and towards the ſame quarter.

To find the bearing of any two places, e. g. cape Clear, and the iſland of Saint Michael's, one of the Azores, by the plain chart; lay a ruler by the two places, take the neareſt diſtance between the centre of the compaſs, and the edge of the ruler; and in this poſition, ſlide one point of the compaſſes along the ruler, and the other point will run along the point of the compaſs, ſhewing the bearing, which in this caſe is S. W. that is, St. Michael's lies to the S. W. of cape Clear, or cape Clear to the N. E. of St. Michael's. See SAILING.

To find the bearing of any two given places on the globe; lay the graduated edge of the quadrant of altitude over both places, the beginning, or 0°, being on one of them, and obſerve, while the quadrant lies in this poſition, what rhumb of the neareſt fly, or compaſs, runs moſtly parallel to the edge of the quadrant, and that rhumb ſhews the bearing ſought, nearly.

The bearings of places on the ground are uſually determined from the magnetic needle: in the managing of theſe lies the principal part of ſurveying; ſince the bearing and diſtance of a ſecond point from the firſt being found, the place of that ſecond is determined; or the bearings of a third point from two others, whoſe diſtance from each other is known, being found, the place of the third is determined: inſtrumentally we mean; for to calculate trigonometrically, there muſt be more data. Mr. Collins gives the ſolution of a problem in the Philoſophical Tranſactions, where the diſtances of three objects on the ſame plane being given, and the bearings from a fourth place in the ſame plane obſerved,

ſerved, the diſtances from the place of obſervation to the reſpective objects are required. See SURVEYING.

BEARING, in the *Sea Language*.—When a ſhip ſails towards the ſhore, ſhe is ſaid to *bear in with the land*.—When a ſhip that was to windward, comes under another ſhip's ſtern, and ſo gives her the wind, ſhe is ſaid to *bear under her lee*.—If a ſhip ſails into a harbour with the wind large, or before the wind, ſhe is ſaid to *bear in with the harbour*, &c.

In conding they ſay, *bear up the helm*, that is, let the ſhip go more large before the wind—*bear up round*, that is, let the ſhip go between her two ſheets, directly before the wind—*bear a hand*, i. e. make haſte.

They alſo ſay a ſhip *bears* when, having two ſlender a quarter, ſhe will ſink too deep into the water with an over light freight, and therefore can carry but a ſmall quantity of goods.

BEAR *ſail well, to*, is ſaid of a ſhip when ſhe is a ſtiff-guided ſhip, and will not couch down on a ſide, with a great deal of ſail.

When a ſhip is ſaid to *bear out her ordnance*, it is meant, that her ordnance lies ſo high, and ſhe will go ſo upright, that in reaſonable fighting weather, ſhe will be able to keep out her lower tier, and not be forced to ſhut in her ports.

A ſhip is ſaid to *overbear* another, when it is able, in a great gale of wind, to carry out more ſails, viz. a top-ſail more, or the like.

BEARING *off* is alſo uſed by *Seamen* generally in buſineſs belonging to ſhipping, for *thruſt off*.

Thus, in hoiſting any thing into the ſhip, if it hath hold by any part of the ſhip or ordnance, or the like, they ſay, *bear it off from the ſhip's ſide*.—So if they would have the breech or mouth of a piece of ordnance, or the like, put from one, they ſay, *bear off* or *bear about* the breech.

BEARING *up*, or *bearing away*, is improperly uſed to denote the act of changing the courſe of a ſhip, in order to make her ſail before the wind, after ſhe had ſailed ſome time with a ſide wind or cloſe-hauled.

BEARING alſo expreſſes the ſituation of any diſtant object, eſtimated from ſome part of the ſhip, according to her poſition. In this ſenſe, the object muſt be either a-head, a-ſtern, on the beam, before the beam, abaft the beam, on the lee or weather bow, and on the lee or weather quarters.

BEARING *of a piece of timber*, in *Carpentry*, denotes the ſpace either between the two fixed extremes thereof, when it has no other ſupport; which is called *bearing at length*: or between one extreme, and a poſt, brick wall, or the like, trimmed up between the ends to ſhorten its bearing.

Joiſts are not to bear above ten feet length; nor ſingle rafters more than nine feet. 19 Car. II. c. 3.

BEARING *of an arch* or *vault*, denotes the effort which the ſtones make to burſt open the piers, or *piedroits*.

This amounts to the ſame with what the French call *pouſſée*.

BEARINGS, in *Heraldry*, a term uſed to expreſs a coat of arms, or the figures of armories, by which the nobility and gentry are diſtinguiſhed from the vulgar, and from one another. See ARMS.

BEARING *of an organ pipe*, denotes an error or variation from the juſt ſound it ought to yield. See TEMPERATURE.

BEARING *pains*, in *Midwifery*. The pains in labour or child birth are ſaid to be bearing pains, when they force the child downward.

BEARING *down of the womb, vagina* or *anus*. When the uterus deſcends from the upper part of the pelvis, and preſſes upon or paſſes through the os externum, it is called a bearing down (procidentia) of the womb. In this caſe the uterus is included in a duplicature of the vagina, to the upper part of which it is attached. Women who are troubled with the whites (fluor albus) or who have borne children, particularly if the perinæum was injured, or torn, at the time of the birth of any of them, are moſt ſubject to this complaint. It manifeſts itſelf at firſt by a ſenſe of dragging or bearing down of the part; ſome time after, there is a difficulty in making water, the uterus lying on, and covering the meatus urinarius. In this ſtage of the complaint, on paſſing a finger into the vagina, it meets the os uteri, immediately on getting through the os externum. If not now remedied, the uterus continues deſcending, until it frees the os externum, and hangs down between the thighs; and if ſtill neglected, the part protruded goes on increaſing, from the ſize of a nut to that of a large pear, and in ſome caſes the uterus, covered with the vagina, has been found hanging down beyond the middle of the thighs, and of the ſize of the body of a Florence flaſk. When a fold of the vagina only deſcends, and paſſes through the os externum, it is called a bearing down (procidentia) of the vagina. A ſimilar indiſpoſition affects the rectum, a fold of the gut being forced through the ſphincter ani, whenever the fæces are voided. This complaint is particularly incident to weakly children, though adults are not unfrequently affected with it. As in all theſe caſes there is a relaxed tone of the fibres, the cure is to be effected by the exhibition of ſuch things as ſtrengthen and increaſe the tone and elaſticity of them, by the peruvian bark and chalybeats, the uſe of the cold bath, exerciſe, air, aſtringent applications to the parts, as decoctions of oak bark, pomgranate ſhells, ballauſtine flowers, red roſe leaves, &c. to which a portion of red port wine is to be added, and the medicine ſo prepared is to be injected into the vagina or rectum, and compreſſes ſoaked in it, applied to the parts externally, taking care in the mean while that the body be kept moderately open. When the womb is the part bearing down, in addition to theſe remedies, after returning the womb to its proper ſituation, a peſſary is to be introduced into the vagina and worn there to prevent its deſcending again. See PESSARY; ſee alſo PROCIDENTIA *Uteri, Vaginæ, et Ani*.

BEARING *claws*, among *cock-fighters*, denote the foremoſt toes, on which the bird goes; and if they be hurt or gravelled, he cannot fight.

BEARING *of a ſtag*, is uſed in reſpect of the ſtate of his head, or the croches which he bears on his horns.

If you be aſked what a ſtag *bears*, you are only to reckon the croches, and never to expreſs an odd number: as, if he have four croches on his near-horn, and five on his far, you muſt ſay he bears ten; a falſe right on his near horn: if but four on the near horn, and ſix on the far horn, you may ſay he bears twelve; a double falſe right on the near horn.

BEARN STONE, ſee PHOSPHORUS.

BEARN, in *Geography*, was a province of France, before the revolution, at the foot of the Pyrenées, about 16 leagues long and 12 broad; bounded on the eaſt by Bigorre, on the north by Armagnac, Turſan, and Chaloſſe, on the weſt by Dax, a part of Soule, and lower Navarre, and on the ſouth by the Pyrenées. The plain country is very fertile, producing flax and Indian corn, and the mountains are covered with fir-trees, and within them are mines of copper, lead, and iron, and the leſſer hills are planted with vines, which yield good wine. The Spaniards are ſupplied from hence with horſes and cattle, and alſo with linen, of which there is in this province a conſiderable manufactory. The principal rivers which bear the name of Gaves, are the Gave-Bearnais, and the Gave d' Oleron. Bearn forms now the department of the Lower Pyrenées; and its capital is Pau.

BEAST, in *Zoology*, an appellation given to all four-footed

footed animals, fit for food, labour, or ſport. See Brute, and Zoology.

Authors make this difference between "beaſts of the foreſt" and "of chaſe," that the firſt are "ſilveſtres tantum," the latter "campeſtres tantum." "Beaſts of the foreſt" make their abode all the day time in the great coverts and ſecret places of the woods; and in the night ſeaſon they repair into the lawns, meadows, paſtures, and pleaſant feeding-places: whence their denomination "ſilveſtres," q. d. beaſts of the wood.

"Beaſts of the chaſe" reſide all the day time in the fields, and on the mountains afar off, to prevent ſurpriſe; but on night's approach, they feed, as the reſt, in meadows, &c. whence their appellation "campeſtres," q. d. beaſts of the field.

In our Statute books, "beaſts of chaſe" are five; the buck, doe, fox, martin, and roe. "Beaſts of the foreſt," called beaſts of venery, are the buck, hind, boar, and wolf: and "beaſts and fowls of the warren" are, the hare, coney, pheaſant, and partridge. See Game.

No other, according to Manwood, are accounted beaſts or fowls of warren, than hares, coneys, pheaſants, and partridges. Lord Coke is of another opinion, diſtinguiſhing beaſts of the warren, from fowls of the warren. Under the former he includes hares, coneys, and roes: the latter he divides into *ſilveſtres*, *campeſtres*, and *aquatiles*. To the firſt belong the pheaſant, woodcock, &c. to the ſecond the partridge, quail, rail, &c. to the third the mallard, hern, &c. Coke on Littleton, p. 233.

Beast *of burden* is underſtood of all quadrupeds employed in carrying goods on their backs. To this claſs belong elephants, dromedaries, camels, horſes, mules, aſſes, and the ſheep of Mexico and Peru.

Beast, in *Games of Chance*, a game at cards, played thus; the beſt cards are the king, queen, &c. of which are formed three heaps, denominated the king, the play, and the troilet. Three, four, or five may play; and to every one are dealt five cards. Before the play every one ſtakes to the three heaps. He that wins moſt tricks takes up the heap called the play: he that has the king takes up the heap, ſo called; and he that has three of any ſort, as three fours, three ſives, three ſixes, &c. takes up the troilet heap.

Beast *at ombre* is where the player or perſon that undertakes the game, loſes it to the other two; the penalty of which is a forfeiture equal to the ſtake played for.

BEASTAN, in *Geography*, a town of Perſia, in the province of Segeſtan, 80 miles S. W. of Kin.

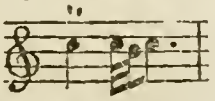
Beasts, *rother*, ſee Rother.

BEAT, in *Fencing*, denotes a blow or ſtroke given with the ſword. There are two kinds of beats, the firſt performed with the foible of a man's ſword on the foible of his adverſary's, which in the ſchools is commonly called baterie, from the French batre, and is chiefly uſed in a purſuit, to make an open upon the adverſary. The ſecond and beſt kind of beat is performed with the fort of a man's ſword upon the foible of his adverſary's, not with a ſpring, as in binding, but with a jerk, or dry beat; and is therefore moſt proper for the parades without or within the ſword, becauſe of the rebound a man's ſword has thereby from his adverſary's, whereby he procures to himſelf the better and ſurer opportunity of riſpoſting.

Beat, St., in *Geography*, a town of France, in the department of the upper Garonne, and chief place of a canton, in the diſtrict of St. Gaudens, on the Garonne. All the houſes are built of marble, the neighbourhood ſupplying no other materials. It is ſeated between two mountains, cloſe to the town on each ſide. N. lat. 42° 50'. W. long. 1° 6'.

Beat, St., *mountains of*, are mountains of Switzerland in the canton of Berne, near the lake Thun; the rocks of which are calcareous and rugged, and containing in a few places broken petrifactions. Some of theſe rocks are perpendicular, and even impending, and are marked at different elevations with furrows, occaſioned by the waters of the lake, which in former periods was probably ſeveral hundred feet above its preſent level.

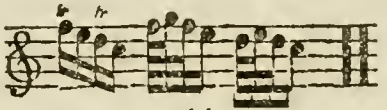
Beat, in *Horology*. See Beats.



Beat, in the *Manege*. A horſe is ſaid to beat the duſt, when, at each ſtroke or motion, he does not take in ground or way enough with his fore-legs. He is more particularly ſaid to beat the duſt at *terra à terra*, when he does not take in ground enough with his ſhoulders, making his ſtrokes or motions too ſhort, as if he made them all in one place. He beats the duſt at curvets, when he does them too precipitantly and too low. He beats upon a walk, when he walks too ſhort, and thus rides but little ground, whether it be in ſtraight lines, rounds, or paſſings.

Beat *upon the hand*, ſee Chack.

Beat *of the Drum*, in the *Military Art*, is differently performed, according to the purpoſes deſigned by it. Notice is hereby given of any ſudden change; ſoldiers are ſummoned to repair to their arms and quarters; and the various movements before and after, and during the engagement, are denoted by different beats of the drum.



The chief beats or beatings on the drum are, the *general*, the *aſſembly*, the *chamade*, the *march*, the *reveille*, the *retreat*, &c. See Drum.

Beat, in *Muſic*, is a grace marked thus: " or thus ⁊. Its effect is juſt the contrary of a tranſient ſhake in rapid movements, where it can neither be prepared nor turned. It conſiſts merely of three notes:

Beat. Effect.

tranſient ſhakes:

explained.

BEATA, in *Church Hiſtory*. See Mass *of the Beata*.

Beata, *Cape*, is at the ſouth point of the iſland of St. Domingo or Hiſpaniola. N. lat. 17° 42'. W. long. 72° 2'.

Beata *Iſland*, is about 14 leagues S.W. by W. from the cape.

BEATER is applied, in *Matters of Commerce*, to divers ſorts of workmen, whoſe buſineſs is to hammer or flatten certain matters, particularly metals. In this ſenſe we meet with *plaſter-beater*, *cement-beater*, *mortar-beater*, &c.

Beaters, *gold*, are artiſans, who, by beating gold and ſilver with a hammer on a marble, in moulds of vellum and bullocks guts, reduce them to thin leaves fit for gilding or ſilvering of copper, iron, ſteel, wood, &c.

Gold-beaters differ from flatters of gold and ſilver, as the former bring their metals into leaves by the hammer; whereas the latter only flatten it by preſſing it through a mill, preparatory to beating. See Gold-*beating*.

There are alſo tin-beaters employed in the looking-glaſs trade, whoſe buſineſs it is to beat tin on large blocks of marble, till it be reduced to thin leaves, fit to be applied with quickſilver behind looking-glaſſes. See Foliating.

Beater is alſo uſed for an inſtrument wherewith to gravel walks and alleys in gardens even. It is a piece of wood half a yard long, ſix inches thick, and eight or nine broad, having a handle fixed obliquely in the middle.

BEATIA, in *Ancient Geography*, a town of Spain, in Bætica, south-east of Caſtulo, and near it.

BEATIFIC VISION. See VISION.

BEATIFICATION, in *Electricity*, a term uſed by profeſſor Boze to denote an electrical experiment, by which he incircled the head of a perſon ſtrongly electrified, and ſtanding on a large cake of pitch, with a luminous glory, reſembling that with which painters ornament the heads of ſaints. The ſecret of this experiment, which occaſioned many fruitleſs and expenſive trials to the firſt electricians in Europe, conſiſted in the uſe of a ſuit of armour decked with ſteel, in various figures; and the glory was produced by rays iſſuing from the edges of the helmet.

BEATIFICATION, in the Romiſh *Church*, the act by which the pope declares a perſon happy after death.

Beatification differs from canonization; in the former, the pope does not act as a judge in determining the ſtate of the beatified, but only grants a privilege to certain perſons to honour him by a particular religious worſhip, without incurring the penalty of ſuperſtitious worſhippers; but in canonization, the pope ſpeaks as a judge, and determines "*ex cathedra*" upon the ſtate of the canonized.

Beatification was introduced when it was thought proper to delay the canonization of ſaints, for the greater aſſurance of the truth and manifeſtation of the rigorous ſteps taken in the procedure.

The ceremony of beatification is a previous one to that of canonization; and cannot be performed till 50 years after the death of the perſon thus honoured. On this occaſion, certificates or atteſtations of the character and miracles of the perſon for whom this honour is intended, are produced and examined by the congregation of rites. An advocate, called by the people the devil's advocate, is employed to conteſt the claims of the candidate; and it is the buſineſs of an advocate, engaged on the other ſide, to obviate and refute the cavils of the adverſary. As ſoon as the ſaint's claim is confirmed, he is admitted into all the privileges of beatification by the pope's decree. His relics, if any ſuch are found, become henceforth entitled to the veneration of all good Chriſtians; his images are crowned with rays, and a particular office is ſet apart for him; and the day of his beatification is diſtinguiſhed by the grant of indulgences and remiſſion of ſins.

It is remarkable, that particular orders of monks aſſume to themſelves the power of beatification. Thus Octavia Melchiorica was beatified with extraordinary ceremonies by the Dominicans, for a legacy of 7000 dollars to the order.

BEATING, among *Sportſmen*, denotes the noiſe which hares make in *Rutting-time*.

The hare is ſaid to *beat*, the hart to bell, &c.

BEATING, PULSATION, in *Medicine*, is applied to the reciprocal agitation or palpitation of the heart and pulſe. See PULSATION.

BEATING *of the Heart*. See PALPITATION.

BEATING *Flax*, or *Hemp*, is an operation in the dreſſing of theſe matters, contrived to render them more ſoft and pliant.

When hemp has been ſwingled a ſecond time, and the hurds laid by, they take the ſtrikes, and dividing them into dozens and half dozens, make them up into large thick rolls, which being broached on long ſtrikes, are ſet in the chimney corner to dry; after which they lay them in a round trough made for the purpoſe, and there with beetles, beat them well, till they handle, both without and within, as pliant as poſſible, without any hardneſs or roughneſs to be felt: that done, they take them from the trough, open and divide the ſtrikes as before, and if any be found not ſufficiently beaten, they roll them up, and beat them over as before.

Beating hemp is a puniſhment inflicted on looſe and diſorderly perſons.

BEATING, in *Book-Binding*, denotes the knocking a book in quires on a marble block, with a heavy broad-faced hammer, after folding, and before binding or ſtitching. On the beating of it properly, the elegance and excellence of the binding, and the eaſy opening of the book principally depend.

BEATING, in the *Paper Works*, ſignifies the beating of paper on a ſtone with a heavy hammer with a large ſmooth head and ſhort handle, in order to render it more ſmooth and uniform, and fit for writing.

BEATING *the Wind*, was a practice in uſe in the ancient method of trial by combat. If either of the combatants did not appear in the field at the time appointed, the other was to beat the wind, or to make ſo many flouriſhes with his weapon; by which he was intitled to all the advantages of a conqueror. Du Cange.

BEATING *the Hands or Feet*, by way of praiſe or approbation. See APPLAUSE.

BEATING *Time*, in *Muſic*. See BATTRE LA MESURE.

BEATING, in *Navigation*, the operation of making a progreſs at ſea againſt the wind, in a zigzag line or traverſe, by ſteering alternately cloſe-hauled on the larboard and ſtarboard tacks. See TACKING.

BEATING, *Drubbing*, or *Stripes*, make one of the moſt ancient as well as univerſal ſpecies of puniſhment. Among the Romans it obtained, under the denomination of *verberare*, *fuſtigare*, *flagellare*, *pulſare*, &c. In the Eaſt it ſtill prevails under the name of *baſtonado*.

Some diſtinguiſh between *pulſation* and *verberation*, as if the latter imported a beating with pain, the former without; but this diſtinction is not always obſerved.

BEATING, in the Engliſh *Law*. See BATTERY.

BEATING *in the Flanks*, a diſtemper to which black cattle are ſubject, and is an indication of a great inflammation in the bowels.

BEATING, in *Huſbandry*. See BURNING *of Land*.

BEATITUDE, imports the ſupreme good, or the higheſt degree of happineſs human nature is ſuſceptible of.

In which ſenſe, it amounts to the ſame with what we otherwiſe called *bleſſedneſs* and *ſovereign felicity*; by the Greeks called μακαριότης; and by the Latins *ſummum bonum*, *beatitudo*, and *beatitas*.

BEATITUDE, among *Divines*, denotes the beatific viſion, or the fruition of God in a future life to all eternity.

BEATITUDE is alſo uſed in ſpeaking of the *theſes* contained in Chriſt's ſermon on the mount, whereby he pronounces *bleſſed* the poor in ſpirit, thoſe that mourn, the meek, &c.

BEATITUDE was alſo a title anciently given to all biſhops; but of later days reſtrained to the pope.

It appears to have been ſometimes alſo given to laymen.

BEATON, BETON, or BETHUNE, DAVID, in *Biography*, primate of Scotland, and cardinal of Rome, was deſcended from a family originally of France, and the nephew of archbiſhop James Beaton, his predeceſſor in the primacy. He was born in 1494; and having paſſed through the ordinary diſcipline of the ſchools, and of the univerſity of St. Andrew's, he was ſent to France by his uncle, for the completion of his education. In the univerſity of Paris he applied with diligence to the ſtudy of the civil and canon laws, and alſo of divinity, in order to qualify himſelf for the ſervice

ſervice of the church. At the proper age, he entered into holy orders; but, notwithſtanding his clerical character, he was employed in ſeveral affairs of importance by John duke of Albany, regent of Scotland, and appointed reſident at the court of France in 1519. In 1523 his uncle, being promoted to the archbiſhopric of St. Andrew's, reſigned the rich abbacy of Arbroath in his favour, and having obtained from the pope a diſpenſation for holding it two years without taking the habit, he returned to Scotland in 1525, and took his ſeat in parliament as abbot. Having ingratiated himſelf with the young king, whom he had ſerved in France during his minority, he was promoted in 1528 to the high office of lord privy-ſeal. In this capacity he obtained the king's confidence; and in 1533 he was entruſted with an important commiſſion which required his return to France, where he was eminently inſtrumental in maintaining the attachment of James to the French intereſt, and where he was employed in negociating ſeveral important concerns between the two courts, and in demanding for his maſter, Magdalen, the king's daughter, in marriage. During his ſtay at the French court, he gained the eſteem of king Francis I. to ſuch a degree, that he granted him ſeveral ſingular favours; inveſting him, in 1537, with all the privileges of a native of France, and conferring upon him, in the ſame year, the valuable biſhopric of Mirepoix. King James having eſpouſed the princeſs Magdalen at Paris in 1537, the abbot of Arbroath accompanied them to Scotland; and after her death, in the ſame year, he was deputed to negociate a ſecond marriage for the king with Mary, daughter of the duke of Guiſe, whom he conducted to Scotland in 1538, where their nuptials were celebrated at St. Andrew's. In this year he was advanced by pope Paul III., who wiſhed to attach the clergy of Scotland and England to the ſee of Rome, to the dignity of cardinal. Upon the death of his uncle ſoon after, he ſucceeded to the primacy, and exerciſed the ſingular powers with which he was inveſted, in evincing his attachment to the religion and intereſts of Rome, in conducting a very ſevere inquiſition into heretical doctrines, and in cauſing proſecutions to be inſtituted againſt ſeveral perſons, of whom ſome were men of family and diſtinction. It is ſaid, that he had preſented to the king a roll of 360 of the chief nobility and barons, as ſuſpected of hereſy, and if the king's death had not prevented the execution of his ſanguinary purpoſes, theſe, and perhaps many more, muſt have fallen ſacrifices to his perſecuting power, which his majeſty did not ſeem diſpoſed to controul. At the inſtigation of the cardinal, James undertook the invaſion of England, and at Solway Moſs the royal army was totally defeated in 1542; but this unexpected diſaſter proved fatal to the king, and he died ſoon afterwards. The cardinal was the only perſon of authority who was preſent with him in his laſt moments; and he is accuſed of having forged a will, in which the king appointed him, together with three other noblemen, to the regency of the kingdom, during the minority of queen Mary. This fact is conſidered as unqueſtionable by the generality of modern, as well as the more early hiſtorians. But the Engliſh intereſt prevailed, and the earl of Arran was declared to be regent. Upon this cardinal Beaton was apprehended and confined; but in a little while, he contrived by his political ability and influence not only to be liberated, but to be appointed high-chancellor of the kingdom. The commiſſion of legate "á latere," which he ſoon afterwards obtained from the court of Rome, empowered him to proceed in his favourite deſign of extirpating heretics. In the execution of this deſign, he cauſed ſeveral perſons to be condemned and executed; and among the reſt, Mr. George Wiſhart, the moſt famous proteſtant preacher in Scotland, who was burnt at St. Andrew's in 1646; the cardinal himſelf, as it has been aſſerted on the authority of Buchanan, being ſeated at a window as a ſpectator of the tragedy. This execution produced great diſcontent and murmur amongſt the adherents of the proteſtant religion; and as the forms of law had not been duly regarded, they meditated a revenge. The cardinal, himſelf, however, apprehended no danger; and ſo prevalent was his intereſt at this time, that the earl of Crawford was gratified by marrying his eldeſt ſon to the cardinal's natural daughter; for notwithſtanding his profeſſion and high rank in the church, Beaton, without diſguiſe, kept a concubine, by whom he had ſeveral children. In leſs than three months after the death of Wiſhart, the event which this good man denounced, and as ſome have ſaid, without ſufficient reaſons, predicted, happened to the cardinal. A conſpiracy was formed againſt his life by ſome perſons whom he had diſobliged; and they, accompanied by a ſmall number of attendants, ſurpriſed the caſtle of St. Andrew's, in which the cardinal lodged, ruſhed into his chamber, and diſpatched him with their ſwords. One of the conſpirators, James Melville, expreſsly imputed his revenge to the cardinal's perſecution of Wiſhart. This event happened in the latter end of May 1646, and proved fatal to the ancient religion, and to the French intereſt in Scotland.

Beaton's character is ſufficiently marked in the hiſtory of his life. Poſſeſſed of talents, which qualified him for the high rank to which his ambition aſpired, and which he occupied both in the church and the ſtate, he eſpouſed and promoted the intereſt of Rome, as the moſt effectual method of ſecuring his advancement. Dr. Robertſon, indeed, aſcribes his ſupport of the Romiſh ſuperſtition and his enmity to the reformers, merely to political motives; but there is reaſon to imagine, more eſpecially when we conſider the period in which he lived, that a real bigotry in favour of popery might blend itſelf with the principles and views of ambition and policy. It is certain, however, that his ambition was unbounded, that he was haughty and violent in his temper, that his inſolence was carried to the higheſt pitch, and that his character, upon the whole, was extremely deteſtable. His violence, as a perſecutor, muſt ever cauſe his memory to be held in abhorrence, by thoſe who have any feelings of humanity, or any regard for religious liberty. He appears to have had little learning, being prevented from acquiring it by his early and continued application to public buſineſs; and his morals were unbecoming his ſtation. Biog. Brit. Robertſon's Hiſt. of Scotland, vol. i. p. 97, &c.

BEATORUM, Insula, in *Ancient Geography*, a name given to one of the Oaſes (See Oasis) of Africa, called an *iſland*, becauſe it was ſurrounded with ſand, like an iſland in the ſea, and denominated "inſula Beatorum," becauſe, according to Strabo, it abounded with water, wine, and other neceſſaries of life, though encompaſſed by vaſt ſandy deſerts. Some have ſuppoſed that this Oaſis was a diſtrict of the "Oaſitæ nomi," abut ſeven days journey weſt of Thebes. Others ſuppoſe that it was ſituated in the "Regio Ammoniaca," and that it was the ſite of the temple of Ammon, which was amply ſupplied with fountains and vegetation, and afforded a very pleaſant habitation. Ulpian ſays, that it was a place of baniſhment for real or pretended criminals, whence, as it was ſurrounded by ſand, there was no probability of eſcape.

BEATS, in *Horology*, are the audible ſtrokes which a tooth of the laſt wheel in a clock or watch movement makes againſt its pallet, to maintain the vibration of a pendulum, or oſcillation of a balance. The interval between two ſucceſſive beats, in a clock or watch with an ordinary eſcapement,

ment, is equal to one vibration or oſcillation, but is not exactly contemporary with it, becauſe the latter is counted as commencing at one of the extremities of its arc; whereas the former begins at ſuch other degree of it, as the nature of the eſcapement determines: a vibration here implies either one direct or one retrograde paſſage through the whole arc of a pendulum, and an oſcillation one direct or one retrograde motion of a balance through its whole arc. Hence, in a common clock or watch, the words beat, vibration, and oſcillation, are ſynonimous terms, when applied as the meaſure of the ſmalleſt ſubdiviſion of time; there being a ſtroke of the laſt wheel at ſome part of every vibration or oſcillation: but in thoſe aſtronomical and marine time-pieces which have detached eſcapements, there is but one beat in two vibrations or oſcillations, the alternate ſtroke of the piece which unlocks the detent being uſually ſilent; in theſe machines, therefore, the beats are ſlower by one half than in ordinary ones, notwithſtanding the movements, or mechaniſm of wheels and pinions, may be the ſame in both, and the vibrations or oſcillations ſimilar. In any horological machine, the number of vibrations or oſcillations which it makes in an hour, is the value of its train, which may be thus determined, viz. "Divide double the product of all the wheels, by the exact product of all the pinions, and the quotient will be the train univerſally;" the great wheel and its pinion, however, being uſed only to regulate the period of going after winding up, and to communicate motion, are left out of the calculation. The reaſon why the product of all the wheels is required to be *doubled*, is, that one tooth of the laſt wheel does not completely eſcape its pallet in leſs than two ſucceſſive vibrations or oſcillations in any eſcapement. The beats of a pocket watch are a very convenient meaſure of ſmall portions of time, and might be applied to many uſeful purpoſes with advantage, particularly if they were each an exact fraction, ſuch as $\frac{1}{4}$ or $\frac{1}{5}$ of the ſecond, which they might as eaſily be as otherwiſe. (Vid. Nicholſon's Journal, vol. iii. p. 49— and 189. and vol. v. p. 46, 4to. Series.) In the beſt time-pieces or chronometers for determining the longitude, this circumſtance is attended to, and the trains are uſually either 14,400 or 18,000, namely, either four or five oſcillations; i. e. either two, or two and a half beats per ſecond, by reaſon of their eſcapements being detached. If the ſame attention were paid to the trains of common pocket watches, the frequency of their beats would fit them for nice obſervations in ſome of the departments of philoſophy, and give them, in this reſpect, a preference even over more accurate inſtruments with leſs frequent beats: but at preſent, the only attention that is paid by the makers to the value of the train of a common watch is, that, for a ſmall balance, it may be a quick one, and for a large balance a ſlow one; or, in other words, that the momentum of the balance ſhall not be too much controlled by the maintaining power, which neceſſary proviſion might be equally attended to, if the beat were made an exact fractional portion of a ſecond. In any watch the whole train or vibrations in an hour divided by 3600, the ſeconds in an hour, will give the vibrations per ſecond of that watch. See CLOCK-MOVEMENT, DEAD-BEAT, ESCAPEMENT, &c.

BEATS, in *Muſic*, are certain pulſations of two continued ſounds, as in an organ, that are out of tune, occaſioned by warring vibrations that prevent coincidence in any two concords. This phenomenon, which was firſt diſcovered by M. Sauveur, has not only been deſcribed by Dr. Smith in his "Harmonics" but made the foundation of a ſyſtem of temperament. "In tuning muſical inſtruments, (ſays he, Sect. IV. Prop. X.) eſpecially organs, it is a known thing, that while a conſonance is imperfect, it is not ſmooth and uniform as when perfect, but interrupted with very ſenſible undulations or *beats;* which, while the two ſounds continue at the ſame pitch, ſucceed one another in equal times, and in longer and longer times, while either of the ſounds approaches gradually to a perfect conſonance with the other; till at laſt the undulations vaniſh, and have a ſmooth, uniform, conſonance."

Theſe beats, the ſame author obſerves, are of uſe in tuning an organ to any deſired degree of exactneſs.

The work of Dr. Smith, though excellent, is far too profound for the perſons moſt in want of it: the organ and harpſichord tuners are ſeldom mathematicians, and to comprehend the doctrines laid down in this book, would require as much ſcience as Newton's "Principia".

The beats of two diſſonant organ pipes, reſemble the beating of the pulſe to the touch: and, like the human pulſe in a fever, the more diſſonant are the ſounds, the quicker they beat, and the ſlower as they become better in tune; till at length they are loſt in the coincident vibrations of the two ſounds. See VIBRATION, TEMPERAMENT, and TUNING.

BEATTIE, JAMES, L. L. D., in *Biography*, a celebrated moral philoſopher and poet, was born about 1735, in the county of Kincardine, in North-Britain. His father was in a ſtation of life no higher than that of a little farmer, a claſs of men ſubject to much hardſhip and indigence in Scotland. He was, however, poſſeſſed with that laudable ſpirit which ſo frequently in that country raiſes native genius from obſcurity; and he beſtowed upon his ſon a literary education, firſt in the parochial ſchool of his neighbourhood, and then in the college of New Aberdeen. The youth was aſſiſted in his progreſs through the ſtudies of the latter, by one of thoſe ſmall exhibitions which have been annexed to it for the encouragement of learning; and it is ſuppoſed that he ſupported himſelf in the intervals of the ſeſſions by teaching at a country ſchool. For ſome conſiderable portion of his early life, it is known that he acted as a ſchoolmaſter at Alloa and in Kincardineſhire. At length he removed to Aberdeen, and engaged as aſſiſtant to the maſter of the principal grammar ſchool, whoſe daughter he married.

The talent which firſt made him known to the world was that of poetry, which he had cultivated from his youth. In 1760, he publiſhed a volume of "Original Poems and Tranſlations," which in 1765 was followed by "The Judgment of Paris." Theſe performances were characteriſed by richneſs and elegance of language and melody of verſification; but rather denoted a refined taſte in poetry, than a powerful and inventive genius. They probably brought the author into notice at the place of his reſidence, but ſeem to have excited little attention among readers in general.

One of the fruits of his riſing reputation was to obtain for him the patronage of the earl of Errol, who reſided in the neighbourhood of Aberdeen. Beſides other benefits, the influence of this nobleman acquired for Mr. Beattie the honourable ſituation of profeſſor of moral philoſophy and logic in the mariſchal college of Aberdeen. In this capacity he next appeared before the public as the author of a philoſophical work, entitled "An Eſſay on the Nature and Immutability of Truth, in Oppoſition to Sophiſtry and Scepticiſm," 8vo. 1760. The progreſs made about this time by Mr. Hume's principles, eſpecially among his countrymen, could not fail of exciting alarm among the friends of revealed religion. How long Beattie had ranked among theſe, does not clearly appear. An admired poem of his, "The Hermit," in its firſt form ſtrongly expreſſes that doubt of a future exiſtence which could not be baniſhed from heathen philoſo-

phy; and in a poem hereafter to be mentioned, he warmly congratulates himſelf on having *eſcaped* "From Pyrrho's maze and Epicurus' ſty." There is a vein of acrimony and exaſperation in all his alluſions to the ſceptical philoſophy, which renders not improbable the report of a perſonal offence received by him from Hume; though there is no reaſon to doubt that when he wrote his book, he was very ſincerely impreſſed with the danger of the tenets he oppoſed, and that he ever after remained zealouſly attached to the cauſe of revelation. The author in this work is regarded as a philoſophical diſciple of Dr. Reid, admitting an inſtinctive principle of the perception of truth, and founding it upon that faculty of *common ſenſe*, which acts in a ſimilar manner upon all, or a great majority, of mankind. As he wrote with more eloquence and a more popular manner than Dr. Reid, his performance was much read, and gained him a number of very reſpectable friends and admirers. It is allowed, that he has ſucceſsfully detected many of the ſophiſms of Hume, and has brought together many ingenious and uſeful thoughts on this ſubject; but the foundation of its philoſophy has by ſome, eſpecially by Dr. Prieſtley, been treated as ſhallow and ſuperficial: and he has been cenſured for the arrogance which he has diſplayed towards thoſe of oppoſite opinions, and for the readineſs with which he has imputed to them conſequences ſubverſive of morality. Indeed, many parts of his book favour more of the rhetorician than the philoſopher. Theſe defects, however, did not render leſs acceptable an attempt from a layman to ſerve the cauſe of religion; and among the friends Beattie acquired on the occaſion, were lords Mansfield and Lyttelton, biſhops Hurd and Porteus, Dr. Johnſon, and Mrs. Montague. The influence of lord Mansfield obtained for him a penſion of 200l. from his majeſty's privy-purſe.

In the following year, 1771, his fame as a poet was extended throughout the kingdom by the publication of the firſt part of "The Minſtrel." The ſubject of this piece, is the feigned birth and education of a poet. The term *minſtrel* is not very happily applied to the character deſcribed; nor are the famed "Gothic days" in which he is placed to be recognized in real hiſtory: but there is great beauty in the delineation of the native poetical diſpoſition aſſigned to him, and in the invention of circumſtances by which it is nouriſhed. The ſtanza is that of Spenſer, which is managed with ſingular dexterity, and made to produce a melody of verſification ſcarcely exceeded in the range of Engliſh poetry. The ſecond part of this poem, which appeared in 1774, contains the maturer education of the young bard, and enlightens his mind with the leſſons of hiſtory, philoſophy, and ſcience. There are many fine ſtrains in this part, which, however, deviates from the original conception; and the work is left a fragment, probably becauſe its plan was found to involve unavoidable incongruities. The "Minſtrel," whatever be its defects, is probably the performance on which Beattie's future fame will chiefly depend; and it may be regarded as having taken ſecure poſſeſſion of a place amid the moſt approved poetry in the language.

Mr. Beattie viſited London in 1771, and was received with great cordiality by his admirers. The degree of L.L.D. was conferred upon him by his college at Aberdeen not long afterwards, and he repeated his London journey in 1773. A new edition in 4to. of the "Eſſay on Truth" was publiſhed in 1777, by a private ſubſcription among his friends, conducted on the moſt liberal principles, and to the volume were added three eſſays on ſubjects appertaining to polite literature, which had been read before a private ſociety at Aberdeen. In the Eſſay on Truth, ſome corrections were made, and ſome harſh reflections were ſoftened and modified. The other pieces diſplayed much refined taſte, ſound judgment, and acquaintance with the beſt authors, ancient and modern.

Dr. Beattie, in 1783, publiſhed a quarto volume conſiſting of "Diſſertations, Moral and Critical." Theſe are detached eſſays on various ſubjects, which formed a part of a courſe of lectures read by the author in his profeſſional capacity. Many uſeful and curious topics are diſcuſſed in them, without any pretenſions to extraordinary ſubtlety and acuteneſs, but in a mode calculated to improve the heart as well as the underſtanding. The work is not free from ſomewhat of the warm and dogmatical manner which characteriſes the Eſſay on Truth; and though not unworthy of the writer's fame, it appears to have made little addition to it. The applauſe given by the biſhop of London to a ſketch of manuſcript lectures to young perſons on the evidence of Chriſtianity, induced Dr. Beattie to draw up and publiſh in 1786, a work entitled "Evidences of the Chriſtian Religion, briefly and plainly ſtated," 2 vols. 8vo. This was eſteemed a plain, elegant, and popular view of the ſubject, well calculated for its intended purpoſe. It was the laſt publication of the author, whoſe time was much occupied with the duties of his ſtation, and with ſocial and domeſtic concerns; of which one of the deareſt to his heart was the education of his eldeſt ſon, James Hay Beattie, a youth of very extraordinary endowments and uncommon moral excellence. He was ſo ſucceſsfully trained by his father, as to be made his aſſiſtant in the profeſſorial chair at the age of nineteen; and he was become the moſt intimate friend and beloved companion of his revered parent, when he fell into a decline, which carried him off in 1790, at the age of 22. Dr. Beattie had fortitude enough to be the editor of a ſmall volume of the youth's compoſitions, in verſe and proſe, to which he prefixed a memoir on his life and character, highly intereſting and unaffectedly pathetic. This grievous loſs was followed in 1796 by that of his younger ſon, Montague Beattie, in his eighteenth year. The unhappy father was unable, with all his reſources, to bear up under this accumulated ſorrow. The latter years of his life were a blank of exiſtence, which terminated at Aberdeen, on Auguſt 18, 1803, in the 68th year of his age. Dr. Beattie was amiable and exemplary in every department of private life, and fulfilled the duties of his public ſtation in ſuch a manner as to confer honour and credit upon the univerſity of which he was a profeſſor. He was a fellow of the Royal Society of Edinburgh.

BEATUS RHENANUS, a learned man of the 16th century, whoſe father Anthony Bilde, aſſumed the name of Rhenanus from Rheinach, the place of his birth, was born at Schletſtad in Alſace, in 1485. He purſued his ſtudies at Paris and Straſburg, and from thence proceeded to Baſil, where, in 1514, he formed an intimate acquaintance with Eraſmus, and applied to the Greek language under J. Conon of Nuremberg, and became a corrector of the preſs to the celebrated Frobenius. At the age of 35 he returned to Schletſtad. He firſt publiſhed the two books of the "Hiſtory of Velleius Paterculus," and firſt cauſed the works of Tertullian to be printed from two MSS. which he borrowed from two monaſteries in Germany. His notes to Tertullian were cenſured by the Spaniſh inquiſition, and placed in the Index of prohibited books, becauſe they contained ſome free reflections on the ſenſuality of the clergy in his time. Rhenanus was a man of extenſive learning, particularly in the Greek language, church hiſtory, and the antiquities of Germany. Scaliger ſays, that he contributed greatly

greatly to revive ancient literature, and Scioppius bears very honourable teſtimony to his talents as a critic. Towards the cloſe of his life he was afflicted with a diabetes, and obtaining no relief from the baths of Baden in Switzerland, he died at Straſburg in 1547. He was no leſs diſtinguiſhed by his integrity and modeſty, and his mild and conciliating temper, than by his great learning. He profeſſed great regard for Luther, and deteſted the tyranny which the clergy exerciſed at that period; but he never openly declared in favour either of Luther or of any other reformer. Although he was no leſs diſpleaſed than Eraſmus with the errors that had blended themſelves with religion, he was an enemy to ſchiſm, and wiſhed, by prudent reformation, to preſerve the unity of the Chriſtian church. Of his works, written in Latin, which were numerous, we ſhall only mention his "Obſervations on Pliny's Natural Hiſtory," his "Notes on Livy," his "Preface and Annotations to Tacitus," his "Epiſtle prefixed to Eraſmus's edition of the Works of Origen," his "Preface to the Works of Eraſmus," and his "Origines Gothicæ:" to which we may add his beſt work, entitled "De rebus Germaniæ libri tres," printed at Ulm in 1693, with the annotations of James Otto. Jortin's Life of Eraſmus. Gen. Biog.

BEAU, Charles Le, was born at Paris in 1701, and became profeſſor of rhetoric in the college des Graſſins, then profeſſor in the college-royal, ſecretary to the duke of Orleans, and perpetual ſecretary and penſionary of the academy of inſcriptions. Like Rollin, he united the charms of eloquence with profound erudition, and was no leſs, than this eminent profeſſor, beloved by his pupils. His moſt conſiderable work was his "Hiſtory of the Lower Empire," in French, 22 vols. 12mo., which is written in a correct and elegant ſtyle. He alſo wrote ſeveral learned diſſertations in the "Memoirs of the Academy of Belles Lettres," and ſome "Hiſtorical Eulogies," on the academicians. His private character was amiable, and he was much eſteemed for his worth and generoſity. He died at Paris in 1778. His younger brother, John Lewis Le Beau, was profeſſor of rhetoric in the college des Graſſins, and member of the academy. He publiſhed a diſcourſe on the condition of fortune moſt ſuitable to a man of letters; and an edition of "Homer, Greek and Latin," 2 vols. 1746, and of "Cicero's Orations," 3 vols. 1750; both with notes. Nouv. Dict. Hiſt.

Beau *Port*, in *Geography*, a ſpacious and commodious harbour on the S. E. part of the Falkland iſlands, capable of accommodating a large fleet of ſhips in perfect ſafety. It is almoſt ſurrounded by the land, has good anchorage, and ſufficient depth of water.

BEAUBASSIN Bay. See Chignecto.

Beaubassin *Bay*, is alſo a bay on the ſouth coaſt of the ſtrait of Maghellan, at the S. E. angle of the ſtrait, where it extends to the W. It is nearly oppoſite to Wallis's harbour on the north coaſt, is a ſpacious bay, and has an open entrance.

BEAUCAIRE, a town of France, and principal place of a diſtrict in the department of the Gard, on the right bank of the Rhone, oppoſite to Taraſcon, with which it has a communication by a bridge of boats. This town carries on a conſiderable commerce in wool, ſilk, ſtuffs, ſpices, drugs, leather, cotton, &c.; and it has an annual fair which laſts for ſix days. The part of the Rhine is well conſtructed. The principal building is the collegiate church. N. lat. 43° 48′. E. long. 4° 30′.

Beaucaire de Peguilon, Francis, in *Biography*, a polite ſcholar of the ſixteenth century, was deſcended from an ancient family of the Bourbonnois, and born in 1514. In conſequence of his literary reputation, he was appointed preceptor to cardinal Lorrain, the ſecond ſon of the firſt duke of Guiſe, and attended him to Rome. On his return, he was promoted to the biſhopric of Metz, and attended his patron to the council of Trent, where he diſtinguiſhed himſelf by his eloquence. He was likewiſe of ſingular ſervice in reſcuing the fathers of the council from the perplexity occaſioned by different opinions concerning marriage; for he drew up a decree, framed in terms ſo ambiguous as to be accommodated to the variety of opinions that were held, and by the different ſenſes in which it might be interpreted to ſatisfy all parties. However, he gave offence to the votaries of the papal power by maintaining the independence of the epiſcopal order, and his opinion on this point was diſavowed by the cardinal of Lorrain. In 1568 he reſigned his biſhopric to Lewis, cardinal of Lorrain, and retired to his caſtle of La Chrete in the Bourbonnois. Here he employed himſelf in compoſing a "Hiſtory of his own Times," which was written in Latin, and compriſed the events from the year 1462 to 1567. This work was diſcontinued about three years before his death, which happened in 1591. It remained in MS. for ſeveral years, the author having declined the publication of it for fear of giving offence; but being found in his library by Philip Dinet, he printed it at Lyons in 1625, in folio. It is deemed a well-written, and upon the whole, a faithful hiſtory; though too favourable to the houſe of Guiſe, and very hoſtile to the Hugonot party. Beaucaire, ſome time after he had taken poſſeſſion of his ſee, engaged in a controverſy with the Calviniſts upon the future ſtate of children dying unborn. Gen. Dict.

BEAUCE, or Beausse, in *Geography*, the name given before the revolution to a country of France, part of Orleannois, now the department of Eure and Loire, which was ſo fertile in every part, as to be called the granary of France. Its capital was Chartres.

BEAUCHENES Island, in *Geography*, a ſmall iſland to the S. of Falkland iſlands, in S. lat. 53°, and W. long. about 58° 30′.

BEAUCHASTEL, a town of France, in the department of the Ardeche, 2½ leagues S.S.W. of Valence.

BEAUCHIEF Abbey, in *Geography*, was ſituated in a pleaſant valley, on the north ſide of Derbyſhire, in England, within a ſhort diſtance of the town of Sheffield. This celebrated religious houſe was founded by Robert Fitz-Ranulph, lord of Alfreton, between the years 1172 and 1176, for regular canons of the premonſtratenſian order. Since the diſſolution of monaſteries, 26th of Henry VIII. this abbey has continued to crumble by the decay of time, and only a part of the chapel remains to mark the character of this once proud pile. See Pegge's Hiſtory of Beauchief Abbey. 4to.

BEAUDUN, a town of France, in the department of the Var, and chief place of a canton, in the diſtrict of Barjols; 12 miles N. E. from Barjols.

BEAVER, in *Zoology*, the Engliſh name of Castor Fiber, *Linnæus*, which ſee. Pennant calls Sorex Moschatus of *Pallas*, the *Long noſed beaver*.

Beaver, Bever, and in Latin *Fiber*, *Caſtor* & *Caſtorius*, John, in *Biography*, a benedictine monk, in Weſtminſter Abbey, flouriſhed about the beginning of the 14th century. He is repreſented as a perſon of ingenuity and induſtry, and a great maſter of the hiſtory and antiquities of England, to the ſtudy of which he particularly devoted himſelf. He wrote, "a Chronicle of the Britiſh and Engliſh Affairs," from the coming in of Brute to his own time, which remains in MS. in the Cottonian library; and alſo a book "De Rebus

Cænobii Weſtmoranienſis." He is commended by Leland and Bale, and cited with reſpect by Stow in his Survey of London and Weſtminſter. Biog. Brit.

Beaver *Creek*, in *Geography*, a creek of North America, which runs into lake Erie, at the eaſt end, about 7 miles S. E. from Fort Erie.

Beaver *Creek, Big*, falls into the Allegany river, after having received ſeveral branches from the north-eaſt, about 28 miles N. W. from Pittſburg. It riſes in the ſouth, runs north about 6 miles, thence 12 more north-eaſt to the Salt Lick town; then by the Mahoning town and Salt Springs, 34 miles ſouth-eaſterly to the Kiſh-kuſh town, from which to its mouth are 22 miles ſoutherly. Its whole courſe is about 74 miles.

Beaver *Dam*, a townſhip in Pennſylvania, on the weſt ſide of Suſquehannah river.

Beaver *Eater*, in *Zoology*. See Glutton.

Beaver *Iſland*, in *Geography*, an iſland in the lake Michigan. N. lat. 45° 20′. W. long. 85° 20′.

Beaver *Indians*, nations of North America, ſituate north of Slave lake, in N. lat. about 62°, and W. long. about 120°.

Beaver *Kill*, is a ſouth-eaſt arm of the Popachton branch of the Delaware. Its mouth is 17½ miles eaſt from the Cook Houſe, and 24¼ N. W. from Kuſhichtun Falls.

Beaver *Lake*, a lake of North America, forming a part of the Saſkaſhawin river, in N. lat. 54° 40′. W. long. 102° 50′. To the north of it at a little diſtance is the ſource of Churchill river; to the ſouth is Cumberland-houſe; and not far from it are a number of houſes belonging to the Hudſon's bay company.

Beaver *River*, a river of North America, which riſes in a lake called Beaver lake and the adjoining hills, in about N. lat. 54° 40′. W. long. 111° 15′, and diſcharges itſelf into la Cros lake, in N. lat. 55° 15′. and W. long. 108° 30′.

Beaver-rat, in *Zoology*. See Mus Coypus.

Beaver *ſkin*, the fur or ſkin of an amphibious animal called the *caſtor*, or *beaver*, ſometimes found in France, Germany, and Poland, but moſt abundantly in the province of Canada in North America, and the uninhabited wilds of Siberia. The ſkin of the beaver has hair of two kinds: the lower hairs immediately next to the ſkin are ſhort, implicated together, and as fine as down; the upper grow more ſparingly, and are thicker and longer. The latter is of little value; but the flix or down is wrought into hats, ſtockings, and caps.

"The beaver's flix
Gives kindlieſt warmth to weak enervate limbs,
When the pale blood ſlow riſes through the veins."
Dyer's Fleece.

The merchants diſtinguiſh three kinds of caſtor, though all equally the ſkins of the ſame animal; theſe are *new caſtor*, *dry caſtor*, and *fat caſtor*. The *new caſtor*, called alſo *winter caſtor*, and *Muſcovite caſtor*, becauſe ordinarily reſerved to ſend into Muſcovy, is that taken in the winter huntings. This is the beſt, and moſt eſteemed for rich furs, as having loſt none of its hair by moulting. In the year 1794 the importation of beaver ſkins into the port of St. Peterſburg amounted to the value of 332,350 rubles; a circumſtance, which, as Mr. Tooke obſerves, ought to be a matter of concern to every true Ruſſian, as it naturally ſtrikes us with ſurpriſe, that a country ſo richly ſtocked with wild animals of every kind ſhould be dependent on foreign induſtry in this claſs of its neceſſaries. *Dry caſtor*, or *lean caſtor*, is the reſult of the ſummer huntings, when the beaſt is moulted, and has loſt part of its hair; this being much inferior to the former, is little uſed in furs, but moſtly in hats. *Fat caſtor*, uſually called *old-coat*, or coat-*beaver*, is that which has contracted a certain fat, unctuous humour, by ſweat exhaled from the bodies of the ſavages, who have worn it for ſome time; this, though better than the dry, is yet only uſed for hats.

Its chief uſe is in the compoſition of hats, furs, &c. Beſides this, in 1669, an attempt was made to employ it in other merchandizes; accordingly, a manufactory was ſettled in the Fauxbourg S. Antoine near Paris, where they made cloths, flannels, ſtockings, &c. of *caſtor*, with a mixture of wool. The manufacture flouriſhed for a while, but ſoon decayed, it being found by experience that the ſtuffs loſt their dye when wet, and that when dry again they were harſh and ſtiff as felts.

After the hair is cut off the ſkin to be uſed in hats, the pelt or ſkin itſelf is uſed in various works, viz. for the covering of mails and trunks, in ſlippers, &c.

Beaver is chiefly imported by the Hudſon's-bay company, from the northern parts of America, where the animal abounds. Beaver ſkins are alſo procured in conſiderable abundance on the weſtern coaſts of North America. See Fur.

Beaver's *Town*, in *Geography*, lies bewteen Margaret's creek, an upper N. W. branch of Muſkingum river, and the north branch of that river; at the head of which north branch there is only a mile's portage to Cayahoga river. Beaver's town is diſtant about 85 miles N. W. from Pittſburg.

BEAUFET. See Buffet.

BEAUFORT, Henry, in *Biography*, cardinal and biſhop of Wincheſter, was the natural ſon, legitimated by parliament, of John of Gaunt, by Catherine Swineford, who afterwards became his third wife. Having been educated at Oxford and Aix la Chapelle, he was advanced, at an early period of his life, to high ſtations both in the church and the ſtate. In 1397 he became biſhop of Lincoln, in 1399 chancellor of the univerſity of Oxford, and dean of Wells, in 1404 lord high chancellor of England, and in 1405 biſhop of Wincheſter. During the reigns of his brother, Henry IV. and of his nephew, Henry V. he does not ſeem to have poſſeſſed much political importance: but he lived in great ſplendour, and acquired immenſe wealth, ſo that he was able to lend Henry V. 20,000l. to aid his expedition into France, and thus to divert him from his deſign of attacking the revenues of the church. Upon the death of Henry V. he was appointed one of the guardians of his ſon Henry VI. during his minority; and in 1424 he was again made lord chancellor of England. In 1425, the diſſenſions that ſubſiſted between him and the protector, Humphry duke of Glouceſter, roſe to ſuch a height, that Beaufort thought it neceſſary to appeal to his nephew, the duke of Bedford, then regent of France, and to requeſt his preſence for bringing about an accommodation. Upon the arrival of the regent an aſſembly of the nobility was convened at St. Alban's; but their interpoſition proving ineffectual, the deciſion of the conteſt was referred to the parliament held at Leiceſter in 1426. The duke of Glouceſter produced ſix articles of accuſation againſt the biſhop, of which he was acquitted; and the diſputants being enjoined to cultivate mutual friendſhip, departed with outward appearances of perfect amity. The regent, however, in order to gratify his brother, the protector, took away the great ſeal from the biſhop. In 1428 the duke of Bedford returned to France, and was accompanied by Beaufort to Calais, where he was inveſted with the dignity of cardinal, with the title of St. Euſebius, conferred upon him by pope Martin V. He was alſo honoured by the ſame pope with the character of legate; but on his return to England, he was forbidden the exerciſe of it by royal proclamation.

As he was likewiſe appointed the pope's legate in Germany, and general of the cruſade againſt the Huſſites, or heretics of Bohemia, he obtained from parliament the grant of a ſum of money, and a body of forces, for the more ſucceſsful execution of his office. Having embarked with his troops for France, he was obliged, for ſome time, with reluctance on his own part, to employ them under the duke of Bedford; and he then proceeded with them to Bohemia, where he remained for ſome months, till he was recalled by the pope. In 1430 he accompanied king Henry into France, under the title of the king's "principal counſellor," and performed the ceremony of crowning the young monarch in the church of Notre Dame, at Paris. The honours, however, which he received during his abſence, were, in his eſtimation, an inadequate compenſation for the mortification reſulting from the duke of Glouceſter's ſucceſsful attempts for humbling his pride, and reſtraining his power. He not only procured an order of council, prohibiting any of the king's ſubjects from accompanying the cardinal, if he ſhould leave the king without his permiſſion; but he attempted to deprive him of his biſhopric, as inconſiſtent with the dignity of a cardinal. On his return, and for his more effectual ſecurity againſt theſe hoſtile attempts, he obtained, by the interceſſion of the houſe of commons, letters of pardon for all offences committed by him contrary to the ſtatute of "proviſors," and other acts of "præmunire." This pardon was renewed five years after, viz. in 1437, for all crimes whatſoever. Notwithſtanding theſe precautions, the duke of Glouceſter, in 1442, drew up fourteen articles of impeachment againſt him, and preſented them with his own hands to the king, who referred the matter to his council. The examination of theſe articles was attended with ſuch delay, that the protector dropped the proſecution, and the cardinal eſcaped. The cauſe of the protector's inveterate enmity againſt the cardinal is ſaid to have been the part which he had taken in inſtigating certain perſons to accuſe and perſecute his dutcheſs for treaſon, witchcraft, and other notorious crimes.

Cardinal Beaufort died in 1447, about a month after the duke of Glouceſter, in whoſe murder, it is ſuppoſed, he was concerned. The remorſe and horror occaſioned by the reflection on this event, in the near approaches of his own death, were "more," ſays Hume, "than could naturally be expected from a man hardened, during the courſe of a long life, in falſehood and politics;" and they are exhibited in very impreſſive characters in the repreſentation of his laſt ſcene, by Shakeſpeare, in the laſt ſcene of the third act of the "Second Part of King Henry VI."

"If thou be'eſt death, I'll give thee England's treaſure,
Enough to purchaſe ſuch another iſland,
So thou wilt let me live, and feel no pain."

Again,

"Bring me unto my trial when you will.
Dy'd he not in his bed? where ſhould he die?
Can I make men live, whether they will or no?
Oh! torture me no more: I will confeſs——
Alive again? Then, ſhew me where he is;
I'll give a thouſand pounds to look upon him—
He hath no eyes, the duſt hath blinded them:
Comb down his hair; look! look! it ſtands upright,
Like lime-twigs ſet to catch my winged ſoul.
Give me ſome drink, and bid th' apothecary
Bring the ſtrong poiſon that I bought of him."

The cardinal was buried at Wincheſter. He died rich, and left large ſums for pious and charitable purpoſes, in various parts of the kingdom: and he ordered 10,000 maſſes to be ſaid for his ſoul. Haughty and turbulent, and fond of pomp and power, he is allowed to have been a faithful and able ſervant of the crown. Mr. Hume deſcribes him as a prelate of great capacity and experience, but of an intriguing and dangerous character. Hume's Hiſt. vol. iii. p. 135. 173. Biog. Brit.

Beaufort, Margaret, diſtinguiſhed by her muniſicent encouragement of literature, was the daughter of John Beaufort, duke of Somerſet, and grandſon of John of Gaunt; ſhe was born at Bletſhoe, in Bedfordſhire, in 1441. Her firſt huſband was Edmund earl of Richmond, by whom ſhe had one ſon, Henry VII. king of England. Her ſecond huſband was Sir Henry Stafford, ſecond ſon of Henry duke of Buckingham; and her third, Thomas lord Stanley, afterwards earl of Derby, by neither of whom ſhe had any iſſue. Waving all pretenſions to the crown in favour of her ſon, ſhe devoted her life to exerciſes of piety and charity, and derived her chief pleaſure from relieving the indigent and diſtreſſed. She kept conſtantly in her houſe twelve poor people, whom ſhe lodged, fed, and clothed. She extended her patronage to the ſtudents of both univerſities, and to men of learning throughout England. In 1502 ſhe inſtituted two perpetual public lectures in divinity, one at Oxford, and the other at Cambridge, which ſtill ſubſiſt under the name of Margaret profeſſorſhips. At Cambridge ſhe eſtabliſhed a perpetual public preacher, whoſe duty it ſhould be to preach, at leaſt, ſix ſermons every year, at certain churches in the dioceſes of London, Ely, and Lincoln; and ſhe alſo founded a perpetual chantry at Winbourn minſter, in Dorſetſhire, for teaching grammar. But her nobleſt inſtitutions were the colleges of Chriſt and St. John in Cambridge, the former founded in 1505, for one maſter, twelve fellows, and forty-ſeven ſcholars, and the latter in 1508, for a maſter and fifty fellows and ſcholars, which being begun juſt before her death, was finiſhed by her executors. It is, therefore, with juſtice, that Gray has made this lady the principal object of his eulogy, in his ode on the inſtallation of the duke of Grafton as chancellor of Cambridge.

"Foremoſt, and leaning from her golden cloud,
The venerable Margaret ſee!
"Welcome, my noble ſon," ſhe cries aloud,
"To this, thy kindred train, and me:
"Pleaſed in thy lineaments we trace
"A Tudor's fire, and a Beaufort's grace."

Her piety and devotion were no leſs exemplary, though partaking in a great degree of the ſuperſtition of the times, than her charity. She died in June 1509, and was interred in the chapel of her ſon Henry VII. in Weſtminſter Abbey. She is the reputed author of the tranſlation of two devotional pieces from the French; and alſo of rules and orders for the prudence and attire of noble ladies at funerals. Biog. Brit.

Beaufort, in *Geography*, a town of France, in the department of the Mayenne and Loire, and chief place of a canton, in the diſtrict of Baugé. The caſtle of Beaufort gives the title of duke to the noble family of Somerſet, lineally deſcended from John of Gaunt, duke of Lancaſter, and the houſe of Lancaſter obtained this caſtle from Blanche of Artois, queen of Navarre, wife to Edmund Crouchback, ſecond ſon of king Henry III., and firſt earl of Lancaſter. N. lat. 47° 26'. W. long. 0° 3'.

Beaufort, a town of France in the department of the Drome, 2 leagues N. E. of Creſt.

Beaufort, a town of Italy in Savoy, on the river Oron, 30 miles E. N. E. of Chambery. N. lat. 45° 40'. E. long. 6° 48'.

Beaufort, a diſtrict of the lower country of South Carolina, lying on the ſea-coaſt, between Combahee and Savannah rivers. It is 69 miles long and 37 broad, and divided into four pariſhes, containing 18,753 inhabitants, of whom only

4346 are whites. The northern part of this diſtrict abounds with large foreſts of cypreſs; but the lands are fit for raiſing rice, indigo, &c. It ſends twelve repreſentatives and four ſenators to the legiſlature of the ſtate. The amount of taxes is 3,022l. 2s. 11d. ſterling.

Beaufort is the chief town of the above-mentioned diſtrict, ſituated in the iſland of Port Royal, at the mouth of Cooſawhatchie river. It is a pleaſant though ſmall town, having ſixty houſes, and about 200 inhabitants, diſtinguiſhed by their hoſpitality and politeneſs. It has a fine harbour, and is likely to become a conſiderable town. Its ſituation is healthy, and it is diſtant about 73 miles S. W. from Charleſton. N. lat. 32° 26′. W. long. 80° 55′.

Beaufort, a ſea-port town of North Carolina, in the county of Carteret, and diſtrict of Newbern, on the N. E. ſide of Core ſound. It contains about 20 houſes, a court-houſe, and gaol; and the county-courts are held here. It is diſtant 55 miles S. E. from Newbern, and about 27 from Cape Look-out. N. lat. 34° 47′. W. long. 77° 20′.

Beaufort *Iſland*. See Port-Royal.

BEAUGENCY, or Baugency, a town of France, and principal place of a diſtrict in the department of the Loiret, ſeated on the Loire, over which is a bridge of 22 arches, and trading in wine and brandy; 4½ leagues S.W. from Orleans. N. lat. 47° 48′. E. long. 1° 46′.

BEAUJEU, a town of France, in the department of the Rhone and Loire, and chief place of a canton in the diſtrict of Villefranche, ſituate at the foot of a mountain on the Ardiere, formerly the capital of the Beaujolois; 4 leagues N.N.W. of Villefranche, and 7 E.N.E. of Roanne. N. lat. 46° 10′. E. long. 4° 40′.

BEAUJOLOIS, a ſmall but fertile province of France before the revolution, now forming part of the department of Iſére, 10 leagues long, and 8 wide, ſituated between the Lyonnois, Burgundy, the Saone, and Loire.

BEAULIEU, a pleaſant village in the New Foreſt, Hampſhire, is diſtinguiſhed in the monaſtic hiſtory of England, for a large abbey, which was founded and endowed here by king John, in 1204, for monks of the Ciſtercian order. The remains of this abbey are now conſiderable; and the walls, which formerly incloſed an area of nearly twenty acres, are moſtly ſtanding. The abbot's houſe, now called the Palace, has been fitted up and much modernized by the predeceſſor of the late duke of Montagu. This abbey poſſeſſed the privilege of *ſanctuary*, and conſequently gave reception and protection to many villains and felons. Among others, Perkin Warbeck, in the year 1498, having raiſed the ſiege of Exeter, and retired with his army to Taunton, fled by night to this monaſtery, where he and ſeveral of his companions regiſtered themſelves ſanctuary-men. Henry VII. was prevailed on from ſeizing him by force, but offered his life, if he would ſurrender himſelf. This he complied with, and was brought to London, where he was confined in the Tower, and afterwards hung at Tyburn for ſeditious practices. Rapin's England, vol. i. Tour round Southampton, 12mo.

Beaulieu, a town of France, in the department of the Correze, and chief place of a canton in the diſtrict of Brive, on the Dordogne, 17 miles ſouth-eaſt of Brive.—Alſo, a town of France, in the department of the Indre and Loire, ſeated on the Indre, oppoſite Loches, and containing about 1500 inhabitants.—Alſo, a town of France, in the department of the Loiret, 4 leagues S. E. of Gien.

Beaulieu *ſous la Roche*, a town of France, in the department of the Vendée, and chief place of a canton in the diſtrict of Sables d'Olonne, 4¼ leagues N.N.E. of Sables d'Olonne.

BEAULON, a town of France, in the department of the Ill and Vilaine, and chief place of a canton in the diſtrict of Redon, 4 leagues S.W. of Rennes.

BEAULY, is the name of a river in Inverneſsſhire, Scotland. It is formed by the junction of three ſmall ſtreams, which concentrate near Erkleſs caſtle, whence the united waters flow eaſterly, and after forming the falls of Kilmorack and other fine caſcades, they are diſcharged into an arm of the ſea. The frith, or mouth of the river, is ſix miles in length and two in breadth. The banks of this river are richly diverſified with ſome fine natural woods, and various combinations of bold rocky ſcenery. At one place, the river divides, forming the little iſland of Agaiſh, which is of an oval figure, about one mile and a half in circumference, and riſes gradually about 100 feet above the level of the water. The Beauly is noted for its ſalmon fiſhery, whoſe rents have lately produced ſix hundred and thirty-one pounds per annum.

BEAUMAN'S, or Bauman's, *Iſlands*, a cluſter of three iſlands, ſo called from the name of the captain who diſcovered them, part of Roggewein's archipelago, ſituated in the great Equinoctial or Pacific ocean, in about S. lat. 12° W. long. 155° 10′. The diſcovery of theſe iſlands has been aſcribed by ſeveral geographers to Roggewein; and he named them, in 1721, Beauman's iſlands. His own words are theſe: "we diſcovered three iſlands at the ſame time in the 12th degree of latitude, of a very agreeable appearance; we found them ſtocked with fine fruit-trees, herbs, vegetables, and plants of every deſcription. The iſlanders, who came to meet our veſſels, offered us all ſorts of fiſh, cocoa-nuts, bananas, and other excellent fruit. Theſe iſlands muſt be well-peopled, the beach being on our arrival covered with many thouſands of men and women, the greater part of the former carrying bows and arrows. All the inhabitants are white, and only diſſer from Europeans by ſome of them being much ſun-burnt. They ſeemed good kind of people, lively and gay in converſation, kind and humane towards each other, and nothing of the ſavage in their manners. Their bodies were not painted like thoſe we had before ſeen; they were clothed from the waiſt to the ancle with fringes of ſilken ſtuff artfully wrought; their heads were covered with hats of the ſame kind, very fine and broad, to protect them from the heat of the ſun. Some of theſe iſlands were ten, fourteen, and even twenty miles in circumference. We called them Beauman's iſlands, from the name of the captain of the ſhip Tinhoven, who firſt ſaw them. It muſt be confeſſed (adds the author), that this is the moſt civilized and honeſt nation we have met with in the iſlands of the South ſea. All the coaſts of theſe iſlands have good anchorage, in from 13 to 20 fathoms water." See the extract from the hiſtorical account of Roggewein's voyage, written in French, in 1739, by a German of Mecklenburgh, who was on board Roggewein's fleet, in La Peroufe's Voyage round the World, vol. ii. p. 192. Eng. ed. The other cluſters of iſlands of Roggewein's archipelago, marked in the hydrographical charts annexed to Marchand's Voyage, are Roggewein and Groning, ſituated a little to the north of Beauman's iſlands, and nearly in the ſame longitude. Some have ſuppoſed Beauman's iſlands to be the ſame with thoſe which Bougainville has called "Navigator's iſlands;" but neither the hiſtory of the inhabitants, nor the geographical poſition of the iſlands, warrant this ſuppoſition.

BEAUMARCHEZ, a town of France, in the department of the Gers, 7 leagues weſt of Auch. N. lat. 43° 35′. W. long. 0° 1′.

BEAUMARIS, or Beaumarsh, the principal and county town of the iſle of Angleſea, North Wales, is ſitu-

ated on the weſtern bank of the river Menai, which forms a fine ſpacious bay oppoſite the town. The caſtle, intimately connected with the early hiſtory and foundation of this town, owes its origin to Edward I. who, having erected two magnificent fortreſſes at Caernarvon and Conway, deemed it neceſſary to raiſe another at this place, for the purpoſe of enforcing obedience and ſubjection among the conquered Britons of Angleſea. The foundation of this ſtructure was laid in 1275, in a place called Bonover Marſh, which afterwards aſſumed the compound French terms *beau*, *fair*, and *marais*, *marſh*. The favourable ſituation of the caſtle enabled the engineers to make ſuch a foſſe or ditch round it, as might be conſtantly filled with water from the bay, and a canal was alſo cut between the river and caſtle, that ſmall veſſels might carry their freightage immediately to the walls of the latter. This fortreſs being complete, the royal founder appointed ſir William Pickmore, a Gaſcon, the firſt governor, who was alſo nominated captain of the town. The ſame perſon (one inſtance excepted) was always appointed to theſe two offices; and his annual ſalary was forty pounds as conſtable, and twelve pounds three ſhillings and four-pence as captain. The caſtle and town were guarded by 24 ſoldiers, at four-pence a day each. Other perſons had proportionable pay, yet from every man's ſalary a certain ſum was deducted monthly towards the payment of itinerant preachers and teachers, and for letters and intelligence. The caſtle becoming very burthenſome to the people, occaſioned many contentions between the inhabitants of the town and thoſe of the fortreſs. Battles ſometimes enſued. One of them, called the black fray, happened on a market-day, in the time of Henry VI. and it produced great ſlaughter. The hiſtory of theſe fortreſſes preſents a continued ſeries of oppreſſion and irritation; and it ſeemed a grand policy of the Engliſh governors to exclude the Welſh from thoſe ſtrong holds, and their dependent towns, which they had wreſted from the ſubjugated Cambrians. By a rental of the borough property of Beaumaris, taken even ſo late as 1608, there appear only ſeven Welſh names, and one burgage in the tenure of a Welſhman. The caſtle was given by Henry IV. to Percy, earl of Northumberland, for life; and Richard III. granted the conſtableſhip and captainſhip of the caſtle and town to ſir Richard Huddleſtone, knight. From the time of ſir Rowland Villeville, alias Brittayne, the reputed baſe ſon of Henry VII., and conſtable of the caſtle, the garriſon was withdrawn till 1642, when Thomas Cheadle, then conſtable, repleniſhed it with men and ammunition. It was then held for Charles I. whoſe throne was in danger. The gentlemen of this town and iſland being warm partiſans for the monarchy, determined to oppoſe the parliamentary forces which had aſſembled at Conway, and had deputed five commiſſioners to manage their buſineſs. The iſlanders refuſing to ſurrender on ſummons, were invaded by about 1500 men, horſe and foot, whoſe ſuperior diſcipline and courage ſoon routed and conquered the royaliſts. On the 2d of October 1648, the town and caſtle ſurrendered to general Mytton: colonels Bulkeley and Whitely were made priſoners; and the inhabitants agreed to pay to their conquerors 7000l. within fourteen days. The caſtle is now the property of the crown. It ſtands in the grounds of lord Bulkeley, attached to the eaſt end of the town, and covers a conſiderable ſpace of ground. Though partly in ruins, yet its outer walls, ſeveral towers, and many parts remain, to characteriſe its dimenſions and architecture. It is ſurrounded by a foſſe, with an entrance to the eaſt between two embattled round and ſquare towers. Within theſe is the principal body of the caſtle, which is nearly of a ſquare form, having a round tower at each angle, and another in the centre of each face. The area is an irregular octagon, about 37 yards from north to ſouth, and 60 from eaſt to weſt. In the middle of the north ſide is the hall, twenty yards long and twelve wide. What was formerly the porter's lodge is now uſed as the bridewell. A gallery of communication extended round the buildings of the inner court; and in different receſſes of this were ſquare holes, which ſeemed to have opened into dungeons beneath. The two eaſtern towers ſerved alſo as dungeons, the deſcent to which was dark and narrow. On the eaſtern ſide of the caſtle was a ſmall chapel, ſome of which remains.

The town of Beaumaris is not very ancient; nor do we find any particular records of it previous to the erection of the caſtle, ſoon after which it aſſumed ſome conſequence, and Edward I. ſurrounded it with a wall, made it a corporation, and endowed it with certain privileges. In the 27th of Henry VIII. Angleſea, with eleven other counties of Wales, were impriviledged and ſummoned to ſend members to parliament, but no return was made from this county till the 33d of Henry VIII. when Newborough, now a poor decayed village, ſent one member. Since the 2d of Edward VI. Beaumaris has been regularly repreſented by one member, and the right of voting was veſted, in 1729, in a mayor, two bailiffs, and twenty-one capital burgeſſes. Though this town has not an extenſive trade, yet it has a cuſtom houſe for the caſual reception of goods, a large town hall with aſſembly room, a free ſchool, alms-houſe, and a handſome church or chapel with a lofty ſquare tower. The free ſchool and alms-houſe were founded by David Hughes; the firſt in 1603, and the latter in 1613. Here are a weekly market on Saturday, and four annual fairs. It is ſituated 59 miles W. by N. from Cheſter, and 252 N.W. of London. N. lat. 53° 14'. W. long. 4° 15'.

The *Bay* of Beaumaris forms a fine expanſe of water before the town, and ſhips can ride ſafe at anchor in ſix or ſeven fathom water, even when the tide is out. From this to the oppoſite ſhore at Aber is a diſtance of about four miles, yet the channel at low water does not occupy above one mile. The remainder is a uniform bed of ſand, called Traeth-Telavan, or the Levan ſands. Theſe, the Welſh ſuppoſe, were anciently quite free from water, and formed a habitable part of Carnarvonſhire; which Mr. Pennant admits, and endeavours to prove, by ſhowing that the ſea has made great encroachments at Abergeley, and that ſeveral bodies and roots of oak trees have been found in a tract of hard loam at a conſiderable diſtance from the preſent ſhores.

About one mile from Beaumaris ſtand ſome ſhattered remains of *Llanfaes*, which Camden called "a famous religious houſe in times paſt," and belonged "to the friars minors, unto whom the kings of England ſhewed themſelves very bountiful patrons, as well in regard of the friar's holineſs, as alſo becauſe (that I may ſpeak out of the public records of the kingdom) were buried a daughter of king John, a ſon of a king of the Danes, the bodies alſo of the lord Clifford, and other knights and ſquires, who in the time of the noble and renowned kings of England were ſlain in the wars againſt the Welſh." This monaſtery, erected by Llewelyn ap Jorwerth, was conſecrated, in 1240, by Howel, biſhop of Bangor; and in a few years afterwards burnt in the inſurrection of Madoc. At the diſſolution, Henry VIII. ſold the convent and its poſſeſſions to one of his courtiers. The family of Whyte (now extinct) afterwards became poſſeſſed of it, and built a reſpectable houſe, which has ſince been enlarged, modernized, and the grounds much improved. It is now one of the ſeats of ſir Robert Williams, Bart. Near this place a ſevere battle was fought, in 819, between the Welſh and the Saxons under their leader Egbert, who had invaded the iſland, and given it then, for the firſt time, the name of Angle-ſea. The Saxons at firſt proved victorious, but

but were ſtrongly oppoſed by Merfyn Frych, the Welſh prince, who after ſome ſevere battles expelled the invaders from this iſland.

Two miles north of Friars are the remains of the priory of *Penmon*, conſiſting of little more than the ruinous refectory and part of the church. This priory for Benedictine monks was endowed, if not founded, by prince Llewelyn ap Jorwerth before 1221.

Near Penmon is a *well* ſurrounded with a wall and ſtone ſeats, having two doors or entrances. This was a ſacred, baptiſmal, or holy well. About a quarter of a mile diſtant is an ancient croſs, ſix feet high, the ſhaft of which is curiouſly ornamented with ſculptured checquered work. At the diſtance of about one mile from the ſhore is *Ynis Seiriol*, or Seiriol's iſland, now called Prieſt-holme. This was once appendant to the monaſtery of Penmon; and the remains of a ſquare tower ſtill mark its religious appropriation. This iſland is ſometimes called Puffin iſland, from its being much frequented by birds of that name. From the beginning of April to the beginning of Auguſt, immenſe numbers of theſe and other ſea-fowl reſort to this ſpot. To the weſt of Prieſt-holme are three ſmaller iſlands, called Ynis Llygod, or the Mouſe iſlands.

In the channel which waters theſe iſlands, the large oyſters called the *Penmon* are taken by the dredge, and great quantities are pickled, packed in ſmall caſks, and ſent to different parts of the kingdom.

Baron-hill, the ſeat of lord Bulkeley, is finely ſeated on an eminence overlooking the town, caſtle, &c. The original manſion of this family in Wales was *Court mawr*, in Caſtle-ſtreet, Beaumaris. The preſent manſion was built by ſir Richard Bulkeley, for prince Henry, ſon of James I. The houſe has ſince been enlarged and greatly improved by its preſent poſſeſſor, under the direction of Mr. S. Wyatt. The grounds of this domain are ſingularly fine and beautiful, and the various proſpects of ſea, mountain, and ſylvan ſcenery, are highly grand and intereſting.

About ſeven miles ſouthweſt of Beaumaris is *Plas-Newydd* an elegant modern manſion, built in a caſtellated ſtyle, belonging to the earl of Uxbridge. The houſe is large, commodious, and handſome, and the ancient woods around it give it a venerable character. Cloſe behind the houſe are two Cromlechs, the largeſt of which has been long deſignated by the name of "Cromlech of Mona." See Cromlech. See an intereſting poem called "Beaumaris Bay," with notes; "A Tour round North Wales," by the Rev. W. Bingley; and "Mr. Pennant's Tours in North Wales."

BEAU-MASS. See Mass.

BEAUME Cave. See Baume.

BEAUMEILLE, Laurent-Angliviel de la, in *Biography*, a modern French writer, was born in 1727, at Vallcraugues, in the dioceſe of Allais. Having been invited to Denmark to undertake a profeſſorſhip of French Belles Lettres, he opened his courſe by a "Diſcourſe," printed in 1751. But the climate being too ſevere for his conſtitution, he quitted Denmark with a penſion and the title of counſellor. In his return by way of Berlin, he wiſhed to form an acquaintance with Voltaire, of whoſe writings he was a paſſionate admirer; but their irritable diſpoſitions produced a quarrel, which admitted of no reconciliation, and which produced perſonalities equally diſreputable to both. On his arrival at Paris, in 1753, his publication, entitled "Mes Penſées," cauſed him to be confined in the Baſtile; and ſoon after his liberation he was committed to the ſame priſon on account of his "Memoirs of Maintenon." After his ſecond liberation, he retired into the country; but in 1772, he was called back to Paris to occupy the poſt of king's librarian, from which death removed him in conſequence of a diſorder of his breaſt, in November 1773. The principal of his works are "A Defence of the Spirit of Laws;" "Mes Penſées," a ſatirical work; "Mem. of Mad. Maintenon," 6 vols. 12mo. ſoon followed by 9 vols. of her "Letters;" "Letters to M. de Voltaire," 1761, 12mo. upon the peruſal of which Voltaire acknowledged, "the rascal has a great deal of wit;" "Thoughts of Seneca," Latin and French; and "Commentary on the Henriade," 1775, 2 vols. 8vo. He left ſome MSS. He is ſaid to have been of an open and frank temper, but haſty, captious, and addicted to ſatire. Nouv. Dict. Hiſt.

BEAUMENIL, in *Geography*, a town of France, in the department of the Eure, and chief place of a canton, in the diſtrict of Bernay; 2 leagues S.S.E. of Bernay.

BEAUMETZ-LES-LOGES, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the diſtrict of Arras; 2 leagues S.W. of Arras.

BEAUMONT, Elie de, in *Biography*, was born at Charenton, in Normandy, in 1732, and admitted an advocate in 1752, in which profeſſion he did not ſucceed for want of voice. Upon his retirement from the bar, he became a writer, and addreſſed a variety of eloquent pieces to the magiſtrates and to the public. His memoir in behalf of the unfortunate Calas family produced a permanent effect. This was ſucceeded by many others, no leſs intereſting and pathetic. Beaumont's imagination was lively, but like other perſons of the ſame caſt, he was liable to dejection. He was lord of Caen, in Normandy, where he inſtituted an intereſting feſtival, called "Fête des bons gens," or the good folks' feaſt. He died at Paris, in 1785.

The wife of the preceding, Madame Elie du Beaumont, was born at Caen in 1730, and is known with reputation by her "Letters of the Marquis de Roſelle," 12mo. a novel, which exhibits a faithful picture of the manners and characters of the courtiers of the day, and of their ſycophants and dependants. In ſociety ſhe was beloved and reſpected by reaſon of the amiableneſs of her diſpoſition, the polite eaſe of her manners, the ſoundneſs of her underſtanding, and the extent of her knowledge. She died at Paris in 1783. Nouv. Dict. Hiſt.

Beaumont, Francis, an eminent dramatic poet, was the ſon of Francis Beaumont, one of the judges of the common pleas, and born at Grace-Dieu, in Leiceſterſhire, an ancient ſeat of the family, in 1585 or 1586. He was educated at Cambridge, and afterwards admitted a ſtudent in the Inner Temple, where his devotion to the Muſes diverted his attention from the ſtudy of the law. Beaumont and Fletcher were ſo intimately connected, and wrote ſo much in concert, that it is difficult at this diſtance of time to aſſign to each his appropriate part in the numerous compoſitions, tragic and comic, which have been publiſhed under their common names. Tradition reports, and probably with truth, that Beaumont was peculiarly diſtinguiſhed by judgment, which was commonly employed in correcting and retrenching the ſuperfluities of Fletcher's wit. It appears, however, from an examination of Beaumont's diſtinct productions, and particularly his little Maſque of the Inner Temple and Gray's Inn, and alſo a poem entitled the "Hermaphrodite," that he was by no means deſtitute of poetic imagination and invention, and that his verſification is elegant and harmonious. Beaumont was eſteemed ſo accurate a judge of plays, that Ben Jonſon, who expreſſed his affectionate regard for him in a copy of verſes, ſubmitted all his writings to his cenſure, and is thought to have availed himſelf of his judgment in correcting, if not in contriving, all his plots. He died before

fore he had attained the age of 30 years, in March, 1615; and left a daughter, who was in poſſeſſion of ſeveral poems of her father's writings, but they were all loſt at ſea in a voyage from Ireland, where ſhe had lived for ſome time in the duke of Ormond's family. Beſides the plays in which he was jointly concerned with Mr. Fletcher (for an account of which ſee FLETCHER), he wrote the dramatic piece above mentioned, entitled, "A Maſque, &c." "A Poetical Epiſtle to Ben Jonſon," "Verſes to his Friend Maſter John Fletcher upon his Faithful Shepherdeſs," and other poems, printed together in 1653, 8vo. The elder brother of the preceding, ſir John Beaumont, was diſtinguiſhed by his poetical talents, and was the author of ſeveral pieces which had conſiderable merit. A volume of his miſcellaneous poems was publiſhed by his ſon in 1629. Gen. Dict. Biog. Brit.

BEAUMONT, in *Geography*, a town of France, in the department of the Calvados, and chief place of a canton, in the diſtrict of Pont l'Evêque, 6 leagues E.N.E. of Caen. —Alſo, a town of France, in the department of the Côte d'Or, and chief place of a canton, in the diſtrict of Is-ſur-Tille, 16 miles N.E. of Dijon.—Alſo, a town of France, in the department of the Channel, and chief place of a canton, in the diſtrict of Cherburg, 8 miles weſt of Cherburg. —Alſo, a town of France, in the department of Puy de Dôme, and chief place of a canton, in the diſtrict of Clermont-Ferrand, 2 miles ſouth of Clermont.—Alſo, a town of France, in the department of the Seine and Oiſe, and chief place of a canton, in the diſtrict of Pontoiſe, on the Oiſe, 33 miles north of Paris.—Alſo, a town of France, in the department of the Dordogne, and chief place of a canton, in the diſtrict of Belvez, 3½ leagues weſt of Belvez.—Alſo, a town of France, in the department of the Sarte, and chief place of a canton, in the diſtrict of Frenay-le-Vicomte, 5 leagues N.E. of Le Mans.

BEAUMONT *en Argonne*, a town of France, in the department of the Ardennes, and chief place of a canton, in the diſtrict of Sedan, 3½ leagues S.S.E. of Sedan.

BEAUMONT-*Les-Forges*, a town of France, in the department of the Nyevre, and chief place of a canton, in the diſtrict of La Charité, on the Nyevre, 13 miles north of Nevers.

BEAUMONT *on Gatinois*, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the diſtrict of Nemours, 4 leagues S.W. of Nemours.

BEAUMONT *de Lomagne*, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the diſtrict of Grenade, 5 leagues N.W. of Grenade.

BEAUMONT *Le Roger*, a town of France, in the department of the Eure, and chief place of a canton, in the diſtrict of Bernay, 2½ leagues eaſt of Bernay. N. lat. 49° 5'. E. long. 0° 41'.

BEAUMONT *ſur Veſle*, a town of France, in the department of the Marne, and chief place of a canton, in the diſtrict of Reims, ſeated on the Veſle, 8 miles S.E. of Reims.

BEAUNE, a town of France, in the department of the Mayne and Loire, and chief place of a canton, in the diſtrict of Baugé, 3 leagues eaſt of Angers, and 3 weſt of Baugé. —Alſo, a town of France, and principal place of a diſtrict, in the department of the Côte d'Or, 7 leagues ſouth of Dijon. N. lat. 47°. E. long. 4° 50'.—Alſo, a town of France, in the department of the Loiret, and chief place of a canton, in the diſtrict of Bois-Commun, 1 league north of Bois-Commun.

BEAU-PLEADER, or BEW-PLEADER, in *Law*, a writ on the ſtatute of Marlbridge, 52 Hen. III. c. 11. whereby it is provided, that no fine ſhall be taken of any man in any court for *fair-pleading*, i. e. for not pleading aptly and to the purpoſe. And beau-pleader is as well in reſpect of vicious pleadings, as of the fair-pleading, by way of amendment. 2 Inſt. 122.

BEAUPRE', in *Geography*, an iſland in the Pacific ocean, ſo called after the name of Beaupré, engineer-geographer to the expedition fitted out for ſearch of La Perouſe, lying weſt of the New Hebrides, in S. lat. 20° 14', E. long. 161° 27'. It is very low, and about 1500 toiſes long.

BEAUPREAU, a town of France, in the department of the Mayne and Loire, and chief place of a canton, in the diſtrict of St. Florent, 3 leagues S. of St. Florent.

BEAUQUESNE, a town of France, in the department of the Somme, and chief place of a canton, in the diſtrict of Doulens, 2 leagues S.E. of Doulens.

BEAUREGARD, a town of France, in the department of the Dordogne. 4 leagues ſouth of Perigueux.—Alſo, a town of France, in the department of Puy de Dôme, 3 leagues eaſt of Clermont-Ferrand.—Alſo, a town of France, in the department of Lot, 5 leagues E.S.E. of Cahors.

BEAUREPAIR, a town of France, in the department of the Saone and Loire, and chief place of a canton, in the diſtrict of Louhans, 2½ leagues eaſt of Louhans.

BEAUSOBRE, ISAAC DE, in *Biography*, a learned French Calviniſt miniſter, was born at Niort in Swiſſerland, in 1659, and deſcended from a family of Provence, originally named Boſſart, and changed into Beauſobre on their retreat into Swiſſerland from the maſſacre of St. Bartholomew's. Having completed his education at the proteſtant college of Saumur, he declined the profeſſion of the law, in which he was tempted to engage by flattering proſpects, and determined to devote himſelf to the Chriſtian miniſtry. Accordingly he was ordained at the age of 22 years, and ſerved a church in France for 3 or 4 years; but when his place of worſhip was ſhut up, his zeal prompted him to break the king's ſeal, which was affixed to the doors; and on this account being condemned to an "amende honorable," he left his country, and took refuge in Holland. Under the patronage of the princeſs of Orange, he was appointed chaplain to her daughter, the princeſs of Anhalt Deſſau; and in 1686, ſettled at Deſſau, where he had leiſure to proſecute his ſtudies. In 1693, he publiſhed the firſt reſult of his theological acquiſitions, under the title of "A Defence of the Reformed," which was very favourably received by his party. In 1694, he obtained a very advantageous ſettlement among the French refugees at Berlin, which was the place of his reſidence for the remainder of his life. Here he ſuſtained ſeveral offices of diſtinction among his brethren, and diſcharged the duties connected with them in a manner honourable to himſelf and ſatisfactory to them. At the ſame time he was aſſiduous in his application to his ſtudies, and thus acquired that extenſive erudition, for which he was ſo eminent. The firſt work which he undertook, and which occupied many years of his life, was "A Hiſtory of the Reformation." This work, which he left in manuſcript for the preſs, was publiſhed at Berlin in 2 vols. large 8vo. in 1784, 1785, under the title of "Hiſtoire de la Reformation, ou Origin et Progrés du Lutheraniſme dans l'Empire, &c." i. e. A Hiſtory of the Reformation, or an Account of the Origin and Progreſs of Lutheraniſm in the

Empire, and in the States where the Confeſſion of Augſburg was received, from the year 1517 to 1530. Although the origin and progreſs of Lutheraniſm be the principal objects of this work, in the diſcuſſion of which the author has availed himſelf of the materials contained in the excellent hiſtory of Seckendorff, it contains alſo details and illuſtrations of ſeveral politico-eccleſiaſtical tranſactions, that are not to be found in Seckendorff, or in any other writer known to us. It alſo comprehends very curious and ample details relative to the progreſs of the reformation in France and Swiſſerland, and the characters, learning, and writings of thoſe who ſtood foremoſt in maintaining or oppoſing the doctrines and remonſtrances of the reformers. Beauſobre was alſo employed with his colleague the learned l'Enfant by the court of Berlin in a French verſion of the New Teſtament. This work, of which St. Paul's epiſtles fell to the ſhare of Beauſobre, was publiſhed in 1718, in 2 vols. 4to. with an ample preface and notes, and was well received. Beauſobre was one of the principal members of the new ſociety, denominated "Anonymous," and contributed ſeveral pieces to the "Bibliothéque Germanique," of which journal he was the director as long as he lived. His papers are "A Diſſertation on the Adamites of Bohemia;" "A Diſſertation on the ſtatue of Paneades;" "On the Virgin Queen of Poland;" and "Converſations on Images." But the moſt elaborate and eſteemed of his works is his "Hiſtory of Manicheans and of Manicheiſm," in 2 vols. 4to. French; the firſt, publiſhed at Amſterdam, in 1734, and the ſecond, after his death, in 1739, to which is annexed a poſthumous diſſertation ſur les Nazarenes, Lauſanne, 1745. To the character of this work, very generally applauded by the learned for the extent of its erudition and the ſingularity of its candour, we ſhall ſubjoin the following teſtimonies. The celebrated hiſtorian Gibbon ſays of it (Hiſt. Decl. &c. vol. viii. p. 260, note): "This is a treaſure of ancient philoſophy and theology. The learned hiſtorian ſpins with incomparable art the ſyſtematic thread of opinion, and transforms himſelf by turns into the perſon of a ſaint, a ſage, or an heretic. Yet his refinement is ſometimes exceſſive: he betrays an amiable partiality in favour of the weaker ſide, and while he guards againſt calumny, he does not allow ſufficient ſcope for ſuperſtition and fanaticiſm." The candid and impartial Lardner (Works, vol. iii. p. 539.), after acknowledging his obligations to Beauſobre, from whom however he occaſionally differs, ſays of this work, that "it contains not only a laboured hiſtory of the Manichees, but likewiſe ſeveral entertaining and uſeful digreſſions concerning the opinions of the heathen philoſophers, and the moſt early Chriſtian ſects;" and he cloſes with expreſſing a wiſh, "that ſome learned man might have ſufficient leiſure and encouragement to give us a handſome edition of it in Engliſh." "As for me," ſays Beauſobre himſelf (Hiſt. Man. t. ii. p. 730.) "whom heaven has preſerved from the ſpirit of the church, who knew no greater good than freedom of thought, nor any more delightful employment than the ſearch of truth, nor greater pleaſure than that of finding and ſpeaking it, I have ſtudied eccleſiaſtical hiſtory with as little prejudice as poſſible."

In the compoſition of his ſermons, Beauſobre employed much time and care, and they contained much original matter, moral and theological, and a fund of the moſt ſtriking oratory. His talents for preaching, and his powers for converſation, continued unimpaired to his ſeventy-ninth year. He was eminently a poliſhed ſcholar, and adorned a perſon, naturally agreeable and prepoſſeſſing, with all the acquired graces of good company. The qualities of his heart were no leſs diſtinguiſhed than the faculties of his underſtanding. He was kind, generous, chearful, and diſintereſted, always ready to perform acts of friendſhip, and deteſting every degree of malevolence and ſlander. He enjoyed life without interruption from the weakneſſes of advanced age to his 80th year, and died on June 5th, 1738. Beauſobre was twice married, and left children by both wives, of whom Charles Lewis was paſtor of a church in Berlin, and made himſelf known by ſome learned works; and Leopold was colonel of a regiment in the Ruſſian ſervice. Four volumes of poſthumous ſermons were printed at Lauſanne, in 1755. Mem. ſur la Vie, &c. de Beauſobre, prefixed to the ſecond volume of his Hiſt. du Manicheiſm.

BEAUSSET, Le, in *Geography*, a town of France, in the department of the Var, and chief place of a canton, in the diſtrict of Toulon, 7 miles N. W. of Toulon.

BEAUTY, in a general and popular ſenſe, denotes that quality, or aſſemblage and union of qualities in the objects of our perception, whether they be material, intellectual, or moral, which we contemplate with emotions of complacence and pleaſure; and it is referred by many writers to a principle or faculty, called by ſome an "internal ſenſe," and by others "taſte." (See theſe articles.) In a more ſtrict and philoſophical ſenſe, beauty may denote that ſentiment or feeling which is excited in the mind by objects of perception, that are adapted to inſpire love, or ſome ſimilar paſſion, or to give pleaſure.

The word Beauty, according to Dr. Hutcheſon, (Enquiry concerning Beauty, &c. p. 7.) ſignifies the idea raiſed in us; and a ſenſe of beauty denotes our power of receiving this idea, which he denominates an internal ſenſe. This ingenious writer conſiders beauty as original or abſolute, and comparative or relative. By the former, however, he does not underſtand any quality ſuppoſed to exiſt in the object, which ſhould of itſelf be beautiful, without relation to any mind which perceives it; for beauty, he ſays, like other names of ſenſible ideas, properly denotes the perception of ſome mind; and, therefore, by abſolute beauty he means only that beauty which we perceive in objects without compariſon to any thing external, of which the object is ſuppoſed to be an imitation or picture; ſuch as that beauty perceived from the works of nature, artificial forms, figures, and theorems. Whereas comparative or relative beauty is that which we perceive in objects, commonly conſidered as imitations or reſemblances of ſomething elſe. The general ſource of our ideas of beauty, according to this writer, is uniformity amidſt variety; and what we call beautiful in objects ſeems to be in a compound ratio of uniformity and variety, ſo that where the uniformity of bodies is equal, the beauty is as the variety, and vice verſâ. This poſition he illuſtrates by a number of examples deduced from different figures, from the works of nature, from the inward ſtructure and outward form of animals, and the proportion of their parts to each other, from the harmony of ſound, from theorems or univerſal truths, and from the works of art. Relative beauty is founded, as he conceives, on a conformity, or a kind of unity between the original and the copy; and for obtaining this ſort of beauty it is not neceſſary that there ſhould be any beauty in the original; for an exact imitation may ſtill be beautiful, though the original is altogether deſtitute of beauty. A ſenſe of beauty from uniformity amidſt variety is, in his opinion, univerſally prevalent among mankind; and for the truth of the fact, he appeals to experience. The ſame ingenious writer deduces all our ideas of virtue from an implanted ſenſe, called "Moral ſenſe;" (which ſee); and he deſcribes moral good and evil by the effects accompanying the perception of them.

Dr. Price, in his inquiry into the origin of our ideas of beauty

beauty and deformity of actions, (ſee "Review of the principal Queſtions in Morals," ch. i. and ii.) diſtinguiſhes between our perception of right and wrong, and our perception of beauty and deformity, in conſidering the actions of moral agents. He obſerves that, in contemplating ſuch actions, we have both a perception of the underſtanding and a feeling of the heart; and that the latter, or the effects in us accompanying our moral perceptions, depend on two cauſes; partly on the poſitive conſtitution of our natures, but principally on the eſſential congruity or incongruity between moral ideas and our intellectual faculties. "Placet ſuapte natura-virtus," Seneca. "Etiamſi a nullo laudetur, natura eſt laudabile." Tully. He apprehends, that the above-mentioned author was led to derive all our ideas of virtue from an implanted ſenſe, in conſequence of not duly conſidering the difference between the "honeſtum," and "pulchrum," the "δικαιον," and "καλον," of actions; or of not carefully diſtinguiſhing between the diſcernment of the mind and the ſenſations attending it in our moral perceptions. With him the *rectitude* of an action is the ſame with its *gratefulneſs* to the obſerver; and wrong, the contrary. But what, ſays this writer, can be more evident, than that *right* and *pleaſure*, *wrong* and *pain*, are as different as a cauſe and its effect; what is *underſtood* and what is *felt; abſolute truth*, and its *agreeableneſs* to the mind. Mr. Balguy indeed (ſee his "Tracts on the Foundation of Moral Goodneſs, p. 61.") is of opinion, that all beauty, whether natural or moral, is a ſpecies of abſolute truth; as reſulting from, or conſiſting in, the neceſſary relations and congruities of ideas. As to moral beauty, ſays Dr. Price, one would think, that the author juſt cited muſt mean, though his meaning is not very intelligible, that it denotes a real quality of certain actions. But the word beauty ſeems always to refer to the reception of pleaſure; and therefore the beauty of an action, or character, muſt ſignify its being ſuch as pleaſes us, or having an aptneſs to pleaſe when perceived. Nor can it be juſt to conceive more in the action itſelf, or to affirm more of it, than this *aptneſs*, or that objective goodneſs or rectitude on which it depends. Beauty and lovelineſs are ſynonymous; but an object *ſelf-lovely* can only mean an object, by its nature, fitted to engage love. It may be added, that the epithets beautiful and amiable are, in common language, confined to actions and characters that pleaſe us highly, from the peculiar degree of moral worth and beauty apprehended in them. All virtuous actions muſt be pleaſing to an intelligent obſerver; but they do not all pleaſe to the degree neceſſary to entitle them to theſe epithets, as they are generally applied. Theſe obſervations are applicable, as Dr. Price thinks, with a little variation, to natural beauty; the general ſenſe of which, according to Dr. Hutcheſon, is uniformity amidſt variety. If we aſk, why this pleaſes? The proper anſwer is, that by its nature it is adapted to pleaſe. There ſeems, as Dr. P. obſerves, no more occaſion in this caſe to have recourſe to an implanted ſenſe than in the former. Regular objects contribute towards producing the complacency of our minds, and the preference we give them, becauſe they are more eaſily viewed and comprehended by the mind; becauſe order and ſymmetry give objects their ſtability and ſtrength, and ſubſerviency to any valuable purpoſe; and becauſe regularity and order evidence art and deſign. Brutes are incapable of the pleaſures of beauty, becauſe they proceed from a compariſon of objects, and a diſcernment of analogy, deſign, and proportion, to which their faculties do not reach.

To Dr. Hutcheſon's theory of beauty, which aſcribes it to uniformity amidſt variety, it has been objected, that, though it accounts in a ſatisfactory manner for the beauty of many figures, yet when we endeavour to apply this principle to beautiful objects of ſome other kind, as to colour or motion, it will be found irrelative. And even in external figured objects, it is not juſt, that their beauty is in proportion to their mixture of variety with uniformity, as many are highly beautiful and pleaſe us much, which have no variety at all, and others which poſſeſs variety to a degree of intricacy. With reſpect to the opinion, that natural beauty is a real quality of objects, it may be obſerved, that it ſeems impoſſible for any one to conceive the objects themſelves to poſſeſs more than a particular order of parts, and certain powers, or an affinity to our perceptive faculties, thence ariſing; and if we call this beauty, then it is an abſolute inherent quality of certain objects, and equally exiſting, whether our mind diſcerns it or not. However, order and regularity are, more properly, the cauſes of beauty than beauty itſelf.

Beauty, ſays another ingenious writer, (ſee Reid's Eſſay on the Intellectual Powers of Man, ch. iv.) is found in things ſo various and ſo very different in nature, that it is difficult to ſay, wherein it conſiſts, or what can be common to all the objects in which it is found. Of the objects of ſenſe we find beauty in colour, in ſound, in form, in motion. There are beauties of ſpeech, and beauties of thought; beauties in the arts, and in the ſciences; beauties in actions, in affections, and in characters. In things ſo different, and ſo unlike, is there any quality, the ſame in all, which we may call by the name of beauty? Why then ſhould things ſo different be called by the ſame name? They pleaſe, and are denominated beautiful, not in virtue of any one quality common to them all, but by means of ſeveral different principles in human nature. The agreeable emotion, excited by them, and called beauty, is produced by different cauſes. However, though there be nothing common in the things themſelves, yet the kinds of beauty, which ſeem to be as various as the objects to which it is aſcribed, muſt have ſome common relation to us, or to ſomething elſe, which leads us to give them the ſame name. All the objects we call beautiful, agree in two things, which ſeem to concur in our ſenſe of beauty. Firſt, when they are perceived, or even imagined, they produce a certain agreeable emotion or feeling in the mind; and, ſecondly, this agreeable emotion is accompanied with an opinion or belief of their having ſome perfection or excellence belonging to them. Whether the pleaſure we feel in contemplating beautiful objects may have any neceſſary connection with the belief of their excellence, or whether that pleaſure be conjoined with this belief, merely by the good pleaſure of our Maker, Dr. Reid does not determine. Beautiful objects excite an emotion of a ſoothing and enlivening kind, that ſweetens the temper, allays angry paſſions, and promotes every benevolent affection, and diſpoſes to other agreeable emotions, ſuch as thoſe of love, hope, and joy. "There is nothing," ſays Mr. Addiſon, "that makes its way more directly to the ſoul than beauty, which immediately diffuſes a ſecret ſatisfaction and complacence through the imagination, and gives a ſmiſhing to any thing that is great and uncommon. The very firſt diſcovery of it ſtrikes the mind with an inward joy, and ſpreads a chearfulneſs and delight through all its faculties." This agreeable emotion, produced by beautiful objects, is accompanied with an opinion or judgment of ſome perfection or excellence of thoſe objects, adapted by its nature for producing that emotion; and this, according to Dr. Reid, is a ſecond ingredient in our ſenſe of beauty. To aſſert, ſays this writer, that there is in reality no beauty in thoſe objects, in which all men perceive beauty, is to attribute to man fallacious ſenſes; and thus to think diſreſpectfully of the Author of our being; who has diffuſed over all the works of nature

nature a profuſion of beauties, which are real, and not fanciful, and thouſands of which our faculties are too dull to perceive. This author diſtinguiſhes our determinations with regard to the beauty of objects into two kinds, viz. inſtinctive and rational. In the former caſe, objects ſtrike us at once, and appear beautiful at firſt ſight, without any reflection, and without our being able to ſay why we call them beautiful, or being able to ſpecify any perfection which juſtifies our judgment. Whereas our rational judgment of beauty is grounded on ſome agreeable quality of the object, which is diſtinctly conceived, and may be ſpecified. Beauty itſelf may be diſtinguiſhed into original, and derived. It is natural and agreeable to the ſtrain of human ſentiments and of human language, ſays Dr. Reid, that in many caſes the beauty which originally and properly exiſts in the things ſignified, ſhould be transferred to the ſign; that which is in the cauſe to the effect; that which is in the end to the means; and that which is in the agent to the inſtrument. E. G. The beauty of good breeding is not originally in the external behaviour in which it conſiſts; it is derived from the qualities of mind, which it expreſſes; and though there may be good breeding without the amiable qualities of mind, its beauty is ſtill derived from what it naturally expreſſes. Good breeding is the picture; theſe agreeable qualities are the original; and it is the beauty of the original that is reflected to our ſenſes by the picture.

As to the uſe of the term beauty, ſome have extended it ſo as to include every thing that pleaſes a good taſte; and others have reſtricted it to the objects of ſight, when they are either ſeen, remembered, or imagined. But the latter ſenſe is much too limited, as there are beauties of various kinds, that are not objects of ſight, ſuch as thoſe of muſic, compoſition, character, affections, and actinns; and as perſons may be competent judges of ſeveral ſorts of beauty, who are deprived of the faculty of ſight. It may be obſerved, that as the proper object of admiration is grandeur, beauty is the proper object of love and eſteem: and this connection of beauty with real perfection was a capital doctrine of the Socratic ſchool. It is often aſcribed to Socrates in the dialogues of Plato and of Xenophon. We may, therefore, juſtly aſcribe beauty to thoſe qualities that are the natural objects of love and kind affection: of this kind are thoſe moral virtues, which in a peculiar manner conſtitute a lovely character, ſuch as innocence, gentleneſs, condeſcenſion, humanity, natural affection, public ſpirit, and the whole train of the ſoft and gentle virtues: qualities which are amiable from their very nature, and on account of their intrinſic worth. There are alſo many intellectual talents, which excite our love and eſteem of thoſe who poſſeſs them, ſuch are knowledge, good ſenſe, wit, humour, chearfulneſs, good taſte, excellence in any of the fine arts, eloquence in dramatic action, and alſo excellence in every art of peace or war that is uſeful to ſociety. There are likewiſe talents or accompliſhments, which we refer to the body, that have an original beauty and comelineſs; ſuch as health, ſtrength, and agility, the uſual attendants of youth, ſkill in bodily exerciſe, and ſkill in the mechanic arts. Dr. Reid is of opinion, that beauty originally dwells in the moral and intellectual perfections of mind, and in its active powers, and that from this, as the fountain, all the beauty which we perceive in the viſible world is derived. This was the opinion of the ancient philoſophers above named; and it has been adopted by lord Shaftſbury and Dr. Akenſide among the moderns.

" Mind, mind alone! bear witneſs earth and heav'n,
The living fountains in itſelf contains
Of beauteous and ſublime. Here, hand in hand,
Sit paramount the graces. Here, enthron'd,
Celeſtial Venus, with divineſt airs,
Invites the ſoul to never-failing joy." AKENSIDE.

But neither mind, nor any one of its qualities or powers, is an immediate object of perception to man. Theſe are perceived through the medium of material objects, on which their ſignatures are impreſſed. The ſigns of theſe qualities are immediately perceived by the ſenſes, and by them reflected to the underſtanding: and we are apt to attribute to the ſign the beauty which is properly and originally in the thing ſignified. Thus, the Inviſible Creator hath ſtamped on his works ſignatures of his divine wiſdom, power, and benignity, which are viſible to all men. The works of men in ſcience, in the arts of taſte, and in the mechanical arts, bear the ſignatures of thoſe qualities of mind, which were employed in their production. Their external behaviour or conduct in life expreſſes the good or bad qualities of their minds. In every ſpecies of animals we perceive by viſible ſigns their inſtincts, appetites, affections, or ſagacity; and even in the inanimate world, there are many things analogous to the qualities of mind; ſo that there is hardly any thing belonging to mind, which may not be repreſented by images taken from the objects of ſenſe; and, on the other hand, every object of ſenſe is beautiful, by borrowing attire from attributes of the mind. Thus, the beauties of mind, though inviſible in themſelves, are perceived in the objects of ſenſe, on which their beauty is impreſſed. Thus alſo, in thoſe qualities of ſenſible objects to which we aſcribe beauty, we diſcover in them ſome relation to mind, and the greateſt in thoſe that are moſt beautiful. The qualities of inanimate matter, in which we perceive beauty, are ſound, colour, form, and motion. The firſt being an object of hearing; and the other three of ſight. Theſe ſeveral qualities are particularly illuſtrated by Dr. Reid, with a view of evincing the beauty that reſpectively belongs to them. Every beauty in the vegetable creation, of which we form any rational judgment, expreſſes ſome perfection in the object, or ſome wiſe contrivance in the author. In the animal kingdom we perceive ſuperior beauties, reſulting from life, ſenſe, activity, various inſtincts and affections, and in many caſes, great ſagacity; which are attributes of mind, and poſſeſs an original beauty. In their manner of life we obſerve, that they poſſeſs powers, outward form, and inward ſtructure, exactly adapted to it; and the more perfectly any individual is fitted for its end and manner of life, the greater is its beauty. But of all the objects of ſenſe, the moſt ſtriking and attractive beauty is perceived in the human ſpecies, and particularly in the fair ſex. In the following well known paſſage of Milton, this great poet derives the beauty of the firſt pair in paradiſe from thoſe expreſſions of moral and intellectual qualities, which appeared in their outward form and demeanour.

" Two of far nobler ſhape, erect and tall,
Godlike erect! with native honour clad,
In naked majeſty, ſeem'd lords of all,
And worthy ſeem'd, for in their looks divine,
The image of their glorious Maker, ſhone
Truth, wiſdom, ſanctitude ſevere, and pure:
Severe, but in true filial freedom plac'd,
Whence true authority in man; though both
Not equal, as their ſex not equal ſeem'd,
For contemplation he, and valour form'd,
For ſoftneſs ſhe, and ſweet attractive grace."

The author of "Crito," or "a Dialogue on Beauty," conſidered in its reference to the human ſpecies, and particularly to the female ſex, aſcribed to the author of "Polymetis," and re-publiſhed by Dodſley, in his collection of "Fugative Pieces," reduces this ſpecies of beauty to the four heads of colour, form, expreſſion, and grace: the two former

of which may be called the body, and the two latter, the ſoul of beauty. As for the beauty of *colour*, if we allow for aſſociations and prepoſſeſſions ariſing from difference of climate and peculiarity of conſtitution, that have great influence on the internal ſenſe, as well as on thoſe ſenſes that are external, and conſequently on the judgment, it ſeems to depend, according to the common eſtimate of mankind, on that quality, as it expreſſes perfect health and livelineſs, and in the fair ſex, ſoftneſs and delicacy; nor can any thing be called deformity but what indicates diſeaſe and decline. The beauty of colour, therefore, is derived from the perfection which it expreſſes. "Venuſtas et pulchritudo corporis ſecerni non poteſt a valetudine." Cicero. The moſt beautiful *form* or proportion of parts, according to this author, is that which indicates delicacy and ſoftneſs in the fair ſex; and in the male, either ſtrength or agility; ſo that the beauty of form lies altogether in expreſſion. With regard to *expreſſion*, he obſerves, that this has greater power than either colour or form; and that it is only the expreſſion of the tender and kind paſſions that gives beauty; that all the cruel and unkind ones add to deformity; and that, on their account, good nature may very properly be ſaid to be the beſt feature, even in the fineſt face. Modeſty, ſenſibility, and ſweetneſs, blended together, ſo as either to enliven or correct each other, give almoſt as much attraction as the paſſions are capable of adding to a very pretty face. It is owing to this force of pleaſingneſs, which attends all the kinder paſſions, ſays this author, that lovers not only ſeem, but really are, more beautiful to each other than to the reſt of the world; and in their mutual preſence and intercourſe there is, as a French writer has well expreſſed it, a ſoul upon their countenances, which does not appear when they are abſent from one another, or even in company that lays a reſtraint upon their features. The laſt and nobleſt part of beauty is *grace*, which this author thinks to be incapable of an accurate definition (ſee GRACE.) All the ingredients of beauty, enumerated and deſcribed by this ingenious author, terminate in expreſſion: they expreſs either ſome perfection of the body, as a part of the man, and an inſtrument of the mind, or ſome amiable quality or attribute of the mind itſelf.

Dr. Blair (Lectures vol. i. p. 101, &c.), in his enumeration of the ſeparate principles of beauty, in each of thoſe claſſes of objects, which moſt remarkably exhibit it, begins with *colour*, as affording the ſimpleſt inſtance of beauty. With reſpect to this he obſerves, that neither variety, nor uniformity, nor any other principle which he knows, can be aſſigned as the foundation of beauty; and that it can be referred to no other cauſe but the ſtructure of the eye, which determines us to receive certain modifications of the rays of light with more pleaſure than others. As this organ varies in different perſons, they have their different reſpective favourite colours. In ſome caſes, he thinks it probable, that aſſociation of ideas has influence on the pleaſure which we receive from colour. Green, for inſtance, may appear more beautiful, by being connected in our ideas with rural proſpects and ſcenes; white, with innocence; blue, with the ſerenity of the ſky. Independently of ſuch aſſociations, thoſe colours, choſen for beauty, are, generally, delicate rather than glaring. *Figure* opens to us forms of beauty more complex and diverſified. Under this head, regularity is firſt noticed as a ſource of beauty. Thus a circle, a ſquare, a triangle, or a hexagon, pleaſe the eye, by their regularity, as beautiful figures. But regularity is not the ſole, or the chief foundation of beauty in figure. On the contrary, a certain graceful variety is found to be a much more powerful principle of beauty. Regularity, according to this author, expreſſes beauty chiefly, if not ſolely, on account of its ſuggeſting the idea of fitneſs, propriety, and uſe, which have always a greater connection with orderly and proportioned forms, than with thoſe which appear not conſtructed according to any certain rule. Nature, the moſt graceful artiſt, hath, in all her ornamental works, purſued variety with an apparent neglect of regularity. Mr. Hogarth, in his "Analyſis of Beauty," publiſhed about the year 1753, enumerates, as elements of beauty, *fitneſs*, *variety*, *uniformity*, *ſimplicity*, *intricacy*, and *quantity*; and he obſerves, that figures bounded by curve lines are, in general, more beautiful than thoſe bounded by ſtraight lines and angles. The beauty of figure principally depends, in his opinion, upon two lines which he has ſelected. One of them is the "waving line," ſomewhat in the form of the letter S: and this he calls the "line of beauty," which is found in ſhells, flowers, and ſuch other ornamental works of nature, and is alſo common in the figures deſigned by painters and ſculptors, for the purpoſe of decoration. The other line, which he calls the "line of grace," is the former waving curve, twiſted round ſome ſolid body, and exhibited in twiſted pillars and twiſted horns, and in the curling worm of a common jack. Variety plainly appears, in the inſtances which he mentions, to be ſo material a principle of beauty, that he defines the art of drawing pleaſing forms to be the art of varying well; and, according to him, the curve line, which is ſo much the favourite of painters, derives its chief advantage from its perpetual bending and variation from the ſtiff regularity of the ſtraight line. *Motion*, ſays Dr. Blair, furniſhes another ſource of beauty, diſtinct from figure; being of itſelf pleaſing, ſo that bodies in motion are, "cæteris paribus," preferred to thoſe at reſt. But the quality of beautiful belongs to gentle motion, ſuch as that of a bird gliding through the air, and that of a ſmooth running ſtream. In general, motion in a ſtraight line is leſs beautiful than that in an undulating direction; and motion upwards is alſo commonly more agreeable than motion downwards. The eaſy curling motion of flame and ſmoke is an object ſingularly pleaſing, and exhibits an inſtance of Mr. Hogarth's waving line of beauty. This artiſt obſerves, that, as all the common and neceſſary motions for the buſineſs of life are performed in ſtraight or plain lines, all the graceful and ornamental movements are made in waving lines. Dr. Beattie, in his "Diſſertations Moral and Critical," has introduced, in his digreſſion on beauty, ſome ingenious remarks on this ſubject. After obſerving that cuſtom has a perpetual influence in determining our notions of beauty, he proceeds to prove, that from aſſociations founded on habit, many, or perhaps moſt of thoſe pleaſing emotions are derived, which accompany the perception of what in things viſible is called beauty. With regard to the beauty or aukwardneſs of motion, he obſerves, that the one will be found to pleaſe, and the other to diſpleaſe, chiefly on account of certain agreeable ideas ſuggeſted by the former, and of certain diſagreeable ones aſſociated with the latter. Motions, that imply eaſe, with ſuch an arrangement and proportion of parts in the moving object, as may give reaſon to expect its continuance without injury, are generally pleaſing, at leaſt in animals, eſpecially when they betoken a ſort of perfection ſuited to the nature of the animal. But motions, that betray infirmity, unwieldineſs, imperfection, or the appearance of danger, cannot be called beautiful, becauſe they convey unpleaſing ideas. Theſe obſervations are illuſtrated by a variety of appoſite inſtances. Cicero (de Off. l. i. § 36.) blames every motion that alters the countenance, quickens the breath, or betrays any diſcompoſure. Rouſſeau obſerves, that in running, a woman is deſtitute of that grace which attends her on other occaſions.

Perhaps,

Perhaps, says Beattie, the jutting out of her elbows, the natural effect of her endeavouring with lifted hands to secure the most delicate part of the human frame, may give to her motion the appearance of timidity and constraint. Or, perhaps, she may fail in this exercise, merely because, according to our manners, she cannot be much accustomed to it. See Dancing.

It is not easy to convey, in so few words, so many charming ideas of beauty, in its several varieties of colour, shape, attitude, and motion, as Gray has combined in the following image:

"Slow melting strains their queen's approach declare;
Where'er she turns the graces homage pay:
With arms sublime that float upon the air,
In gliding state she wins her easy way:
O'er her warm cheek, and rising bosom move
The bloom of young desire, and purple light of love."

But to return from this digression. Dr. Blair observes, that though colour, figure, and motion, be separate principles of beauty; yet in many beautiful objects they all meet, and render the beauty both greater, and more complex. Thus, in flowers, trees, animals, we are entertained at once with the delicacy of the colour, with the gracefulness of figure, and sometimes also with the motion of the object. Perhaps, the most complete assemblage of beautiful objects is presented by a rich natural landscape, composed of a sufficient variety of objects; fields in verdure, scattered trees and flowers, running water, animals grazing; to which may be added some productions of art, which suit such a scene, as a bridge with arches over a river, smoke rising from cottages in the midst of trees, and the distant view of a fine building, seen by the rising sun.

The beauty of the human countenance is more complex than any which has yet been considered. It includes the beauty of colour, arising from the delicate shades of the complexion; and the beauty of figure, arising from the lines which form the different features of the face. But its chief beauty depends upon a mysterious expression which it conveys of the qualities of the mind; of good sense, or good humour; of sprightliness, candour, benevolence, sensibility, or other amiable dispositions.

Another distinct species of beauty arises from design or art, or from the perception of means being adapted to an end; or the parts of any thing being well fitted to answer the design of the whole. This is altogether different from the perception of beauty produced by colour, figure, variety, or any of the causes already mentioned. This sense of beauty in fitness and design, has an extensive influence over many of our ideas. It is the foundation of the beauty which we discover in the proportion of doors, windows, arches, pillars, and all the orders of architecture. We shall here observe, that Mr. Perrault distinguishes two kinds of beauty in architecture. The one he calls "positive," and "convincing," such as the richness of the materials, grandeur of the structure, neatness of the workmanship, symmetry, &c.; the other he calls "arbitrary," which depends on the will, and which would admit of having their proportions changed without deformity. These only please by the connection or association of their ideas with others of a different kind, which please of themselves: they owe their beauty to that prepossession of the mind, by which a thing, whose value we do know, insinuates an esteem for others which we do not know. Thus, he observes, there are many things in architecture, which reason and good sense would judge deformed, which, however, custom has not only made tolerable, but even beautiful, by their being always joined with other beauties that are positive. Being at first pleased with viewing them in company, and merely on that account, we at length become pleased with them alone; and thus we frequently become fond of faults, and fall in love with deformity. Our sense of fitness and design holds so high a rank among our perceptions as to regulate, in a great degree, our other ideas of beauty. In an epic poem, a history, an oration, or any work of genius, we always require, as in other works, a fitness, or adjustment of means, to the end which the author is supposed to have in view.

Beauty, as it is applied to writing or discourse, denotes all that pleases, either in style or sentiment, from whatever principle that pleasure flows; and a beautiful poem or oration means, in common language, no other than a good one, or one well composed. Beauty, besides this indefinite sense of it, is also used to signify a certain grace and amenity in the turn either of style or sentiment, for which some authors have been peculiarly distinguished. In this sense it denotes a manner, neither remarkably sublime, nor vehemently passionate, nor uncommonly sparkling; but such as excites in the reader an emotion of the gentle placid kind, similar to what is excited by the contemplation of beautiful objects in nature, which diffuses over the imagination an agreeable and pleasing serenity. Addison was eminently a writer of this character; and it belongs also to Fenelon, the author of the Adventures of Telemachus. Virgil, among the ancients, is distinguished, in his general manner, by beauty and grace, rather than sublimity. Among orators, Cicero has more of the beautiful than Demosthenes, whose genius led him wholly towards vehemence and strength.

The ingenious Mr. Burke, in his "Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful," excludes from the number of real causes of beauty, the proportion of parts, fitness, or that idea of utility which consists in a part's being well adapted to answer its end, and also perfection; and he observes (p. 210.) that beauty is, for the greater part, some quality in bodies, acting mechanically upon the human mind by the intervention of the senses. The qualities of beauty, as they are merely sensible qualities, which he enumerates, are the following: they should be comparatively small, smooth, various in the direction of their constituent parts; these parts should not be angular, but melted, as it were, into each other; they should be of a delicate frame, without any remarkable appearance of strength; the colours should be clear and bright, but not very strong and glaring; and any glaring colour that is introduced should be diversified with others. These are the seven properties upon which, according to this author, beauty depends; properties that operate by nature, and are less liable to be altered by caprice, or confounded by a diversity of tastes, than any others. The physiognomy also, says Mr. Burke, has a considerable share in beauty, especially in that of our own species. The manners give a certain determination to the countenance, which being observed to correspond pretty regularly with them, is capable of joining the effects of certain agreeable qualities of the mind to those of the body. So that to form a finished human beauty, and to give it its full influence, the face must be expressive of such gentle and amiable qualities as correspond with the softness, smoothness, and delicacy of the outward form. For Mr. Burke's mode of illustrating and confirming his theory of beauty, the reader is referred to his work above cited.

Dr. Sayers, in his "Disquisitions, metaphysical and literary," 8vo. 1793, has given a new analysis of beauty, conducted on the principles which were applied by Dr. Priestley in his "Lectures on Oratory and Criticism," and by Mr. Allison in his "Essays on Taste," to the explanation of the intellectual pleasures, namely the doctrines of the Hartleyan school. His argument, summed up in a few words, is as follows: that individual of a class of objects is justly to be esteemed more beautiful than the rest, with the whole of

which, or with its component parts (when properly underſtood), the greater number of the excellencies of its claſs are univerſally aſſociated. The ſame may be aſſerted of any ſpecies of objects, when compared with any other ſpecies of its kind; and that object may be juſtly eſteemed a "ſtandard of beauty," with the whole appearance, or with the component parts of which (when properly underſtood), all the excellencies of its kind are "univerſally" aſſociated.

Beauty, in the *Arts of Deſign*. Whatever of beauty or perfection becomes an object of contemplation to our minds, whether it be purely mental or perceived through the medium of our ſenſes, muſt be derived from the beautiful and perfect itſelf, and may be traced back towards its Divine ſource. However diverſified, it proceeds from this ſource, and directs us where to ſeek the principles and perfection of all ſcience and art, of all things metaphyſical, phyſical, and moral, which by their mutual connection and harmony declare their common relation and origin; therefore what is called beauty in the arts of painting and ſculpture muſt be ſought for in its principles, metaphyſical, phyſical, and moral. In this reſearch we ſhould do well to take thoſe philoſophers for our guides, who were the oracles of Greece, in the times when painting and ſculpture attained their higheſt excellence. In the dialogue between Socrates and the ſculptor Clito, (Xenophon's Memorabilia,) Socrates concludes "that ſtatuary muſt repreſent the actions of the ſoul by form." And in the former part of the ſame dialogue Parrhaſias and Socrates agree, that the good and evil qualities of the ſoul may be repreſented in the figures of man by painting. Plato, in his dialogues, reaſons to the ſame purpoſe, and declares that the good and beautiful are one.

Ariſtotle (De Mor. l. iv. c. 7. t. iii. p. 49. De Poet. c. 7. t. ii. p. 658.) obſerves, that beauty is order in grandeur. Order ſuppoſes ſymmetry, fitneſs, and harmony; and in grandeur are compriſed ſimplicity, unity, and majeſty. However, in his catalogue of virtues and their families, as well as of the oppoſite vices and their families, Ariſtotle concurs with Plato in acknowledging the relation between beauty and goodneſs, evil and deformity. Indeed, it has been one of the great objects of philoſophy, through all the ancient ſchools, to trace and demonſtrate not only the likeneſs but the identity of beauty and goodneſs. Among the Platoniſts and the Pythagoreans, malignity was abandoned, goodneſs or the juſt, and intellect or wiſdom cultivated, becauſe by this means, man is elevated to a nearer approach to the divinity. Fortitude and temperance were the virtues of the ſtoics and early epicureans, becauſe the one raiſes man above common fears and wants, and the other gives him better health and enjoyment of his faculties. Theſe concluſions are convincing, and their illuſtrations may be drawn in great abundance from the hiſtory and condition of the human race. Does any one ſupply the wants of his fellow creatures, and raiſe them from diſtreſs to a ſtate of comfort? In performing theſe and ſuch good acts his expreſſion is ſo tender, and his manner ſo gentle, that all preſent ſympathize in his feelings, and love the benefactor. If any one ſhews a magnanimous contempt of danger in a good cauſe, or manfully reſiſts the temptation to an evil act, in ſo doing his features and manner expreſs dignity and fortitude, which inſpire the beholders with awe and reſpect. We look with delight on the florid complexion of a perſon in high health, but with concern and diſguſt at a pallid colour and flaccid ſkin, becauſe they are ſigns of diſeaſe and decay. We are pleaſed to ſee a ſtout and well made perſon, becauſe ſuch a figure beſpeaks great ſtrength and agility. We are likewiſe pleaſed to ſee a more ſlender figure of agreeable and harmonious proportions, becauſe in it ſufficient ſtrength is united with varied elegance of attitude. Hence, as almoſt every circumſtance of our exiſtence furniſhes examples to the ſame purpoſe, might we not define the beauty of the human perſon in the following terms? "Goodneſs, or virtue and wiſdom, in a human form beſt ſuited to their expreſſions and exertions." It would be as abſurd as preſumptuous for us to attempt entering the councils of Infinite Wiſdom to diſcover why the figure of man was made ſuch as it is and no other. We might as well inquire why ſuch a particular number of worlds were made in or out of our ſyſtem ſubject to ſuch laws of gravity, motion, and revolution? But taking man as he is, whether we conſider the faculties of his ſoul, the component parts of his body, or the combined operations of both, the mind is overwhelmed with the ſtupendous and wonderful ſtructure of the parts, and the harmony, beauty, and utility of the whole.

Whilſt we are conſidering beauty in the works of painting and ſculpture, it will be proper to remember that the word by which the Greeks expreſſed this quality was ΚΑΛΟΣ, fair, handſome, beautiful, which applied extenſively to almoſt any being or thing giving pleaſure in conſequence of its goodneſs. According, therefore, to this uſe of the term, we ſhall inveſtigate human beauty in both ſexes, and their ſeveral diſtinctions of character. The human figure is wonderfully ſuited to its various offices and employments, as well in its internal ſtructure as in its outward form. The mechanical powers, the geometrical figures, the motion and weight of fluids, and the operations of chemiſtry, are continually engaged in its ſupport and renewal; uniting an accumulation of force with a ſimplicity of operation truly wonderful, and contributing in their effects and appearances to the beauty of the outward form, which in the preſent inquiry is to be the object of attention. The head contains the brain, which ſends nerves to all parts of the body and limbs, and the organs of four ſenſes; this is the ſuperior member of the figure, and from its elevated ſtation, by means of the underſtanding and will, directs and determines the acts of all the inferior parts. The body, which contains in its cavity thoſe parts which ſupply the animal functions, is alſo a center from which, and upon which, the five extremities act. The arms are ſupported on the body in a manner moſt favourable to all exertions of ſtrength, and with their hands are ſo formed, that theſe exertions may be alſo employed in the moſt difficult and curious labours. The legs ſtrongly ſupport the ſuperſtructure; when cloſed reſembling two pillars, when extended, like the triangular arch, and when neceſſary, ſwiftly conveying the perſon from place to place. It is proper to make theſe general remarks, becauſe, as we proceed, we ſhall find how diſtinguiſhing an ingredient utility is in the compoſition of beauty. After this ſlight view of the advantageous complication of powers and ſimplicity of operation in the human form, let us conſider its beautiful effect, animated by goodneſs, and informed by wiſdom; and as what has been ſaid in this part of the article relates to the arts of deſign, we ſhall produce illuſtrations from the antique ſculpture and painting.—The ancients aſſigned the firſt claſs of beauty to the ſuperior divinities, the ſecond to heroes, and the third to fauns. Other divinities and genii ſeem to have partaken more or leſs of theſe claſſes. Mere portraits cannot be enumerated in either, becauſe they are but faithful repreſentations of ordinary nature. Of the ſuperior gods, the Saturnian family poſſeſs the rank of ſublimity in the Καλος or beautiful. In the fine head of Jupiter (lately in the pope's muſeum, now in the national gallery at Paris,) the hair riſes from the forehead, and deſcends in abundant flowing locks on each ſide of his face and neck to the ſhoulders; his forehead is muſcular, expreſſive of great ſtrength; his noſe and cheeks are correſpondent; his eyes and mouth expreſs benevolence; his wiſe and ſerious brow, his placid countenance, and full beard, inſpire reverence and awe. His figure is the *mightieſt* of the ſuperior gods. His right arm moderately

raiſed with his thunderbolt, or leaning on his ſceptre, preſents the habitual act of governing the univerſe. Winkelman has judiciouſly remarked, that the Greek ſculptors preſerved the family reſemblance in the Saturnian race, with as much exactneſs as if they had been real portraits; therefore Jupiter's brothers ſtrongly partake of the ſame character, excepting that Neptune's countenance is more ſevere and his hair more diſturbed. Pluto's hair hanging over his forehead gives a gloomy caſt to his countenance, which is increaſed by his more open and ſtaring eyes. Winkelman has obſerved, that ſomething of the lion may be traced in the noſe, forehead, and hair of Jupiter, which adds might and magnanimity to the benevolence, wiſdom, and awful majeſty of his character. In the youthful beauty of Apollo, Bacchus, and Mercury, the ſame benevolence and wiſdom are expreſſed, modified by their peculiar characteriſtics and offices. Apollo is ſlight and ſtrong in his make; Bacchus more ſoft and luxurious, and Mercury more athletic. The peculiarity of Hercules is magnanimity and unconquerable ſtrength. The heroes have a more ſimple character throughout, approaching nearer to common nature. The fauns may be placed in the loweſt claſs of beauty expreſſed in the human figure. Although their perſons are youthful, and rather handſome, their proportions are ſhorter than thoſe of the claſſes abovementioned; and ſometimes their muſcles are turgid and tendinous, accommodated to their ſylvan habits and activity; their rounded faces have a portion of ruſtic good nature; but their united eye-brows, eyes placed diagonally to the noſe, ſmall hollowed noſes, and grinning mouths, expreſs ſome mixture of ſavage, ſervile, and miſchievous diſpoſitions. The moſt engaging and captivating ſpecies of beauty exiſts in the female ſex; and was repreſented in perfection by the Grecks in their ſuperior claſſes of ſtatues. The large eye and full under lip of Juno, give an air of haughtineſs to her countenance; her limbs are round and her figure is majeſtic. Minerva's figure partakes of Juno's majeſty; but her face is not ſo full, and has an expreſſion of abſtracted wiſdom. Venus is repreſented as an aſſemblage of female charms; her form is delicate, perfect, and elegant in the higheſt degree; her motion graceful, and her countenance expreſſive of love and ſweetneſs.

The beautiful heads of antiquity are oval in the front view; in profile, the low forehead and noſe form nearly one ſtraight line; the lips are rather full and the chin rounded. Juno has the largeſt eye of the goddeſſes, according to Homer's epithet of "Ox-eyed;" the neck is rounded like a column; the cheſt is high and expanded; in the male ſubject the abdomen is flat; and, as Winkelman remarks, "ſuch as it appears after ſound ſleep and good digeſtion;" the arms, deſcending from full ſhoulders, are tapered downwards to the wriſt with a very gentle flattened hollow towards the inner elbow, to diſtinguiſh the bend of the arm; the back of the hand is one maſs; the fingers rather long and tapered, with knuckles indicated in a manner almoſt imperceptible: the lower limb tapers more ſenſibly than the arm, becauſe the thigh is larger in its commencement; the knee-pan in youthful ſtatues is nearly oval; and the inner ſide of the tibia, or principal bone of the leg, is perceptibly marked by a curve of about 30 degrees; the great toe is large, and divided by a conſiderable ſpace from the leſſer toes which are ſtraight, and not bent over each other like ſuch as have been confined in ſhoes.

In the female form, the limbs are more round and delicate: the knuckles of the hand and foot are expreſſed by ſlight dimples; the fingers are more tapered; and their outline determined by a long curve, a little reverſed towards the end. The principal difference of relative proportions is, that the female figure ſhould be about one face ſhorter than the male; each having eight heads in height. The female figure is alſo narrower in the ſhoulders and loins, and ſomewhat broader from the os pubis to the extremities of the nates. The Grecks repreſented the goddeſſes with virgin boſoms. Winkelman, in his "Monumenti inediti," has treated largely on the beauty of the antique ſtatues. Profeſſor Camper, in his "Principles of Deſign," has alſo given excellent obſervations and rules on the beauty and proportions of the human head and figure, abſolute as well as comparative. For his account of beauty, as exhibited in ancient ſculpture and engravings, ſee his treatiſe, entitled "Verhandeling over het natuurlyk verſhilder wezenſtrikken," &c. or, on the natural difference of features in perſons of various countries and ages, publiſhed by his ſon, at Utrecht, 1792, 4to. In his diſſertation on the beauty of forms, ſubjoined to his "Lectures," publiſhed by his ſon at the ſame place and in the ſame year, entitled "Roden Voeringen," &c. it is his object to prove, that no particular form can, abſtractedly conſidered, conſtitute beauty; that the real baſis of beauty conſiſts in the means being adapted to the end; and that, excluſively of this, our ideas are influenced by cuſtoms, national prejudices, implicit confidence in the taſte and opinions of others, &c.

Proportion is an eſſential quality of beauty in the human form; and ſtriking coincidences are afforded in its relation to perfect geometrical figures, and the harmony of ſounds and numbers. A man, ſtanding upright, can ſtretch out his arms to a length equal to his height; conſequently his figure may be included in a ſquare; by ſtretching the arms not ſo much, and the legs a little, the figure may be contained in a circle, whoſe centre is the top of the os pubis. The ancients divided the height of the human figure into eight heads, and the face into three parts; five of theſe parts are the breadth of the loins; three parts, or noſes, meaſure the upper part of the thigh; two, the calf of the leg, and one, the ankle. A well proportioned figure meaſures three equal parts from the top of the ſhoulder to the ſpine of the ilium next the rectus abdominis; from thence to the top of the knee-pan; and from thence to the bottom of the inner ankle.

The term grace, as a quality of beauty, however it may have puzzled the moderns in its definition and application, was clearly underſtood by the ancients. The graces or gratiæ of the Romans were the charities of the Grecks. ΧΑΡΙΣ, is grace, beauty, fairneſs, endearing, agrecable, elegant; and the groupes, gems, &c. are comments which are ſatisfactory and convincing. The graces are three beautiful ſiſters, whoſe innocence is their only garment, embracing each other in the gentleſt manner. The Greek Chriſtians have preſerved the ancient ſignification of this word in its application to all thoſe endearing duties which preſerve happineſs to, and beſtow it on others; nor is it ſurpriſing, that theſe characteriſtics are given to women, becauſe all the milder and endearing virtues are ſtill more amiable in the female ſex. If by grace, the ſucceſſion and variation of undulating lines be intended, it is ſeen moſt perfectly in an elegant female figure moving ſlowly. It is remarkable, that man, of all creatures, preſents the moſt perfect view of his figure in front. Quadrupeds, birds, and fiſhes, are beſt ſeen in profile, and we look on the backs of reptiles and inſects. It is neceſſary, to the moſt advantageous appearance of man, that we ſhould contemplate the affections of his heart, and operations of his reaſon continually beaming in his countenance; the waving lines of his body, moving on the centre of gravity, and varied curves and angles formed by his limbs, perfect the whole of his figure, with an union

of

of faculties mental and bodily, which reminds us that "God created Man in his own Image."

The various heads touched upon in the latter part of this article, will be treated of in the ſeveral articles of PAINTING and SCULPTURE.

We cannot forbear ſubjoining the reflection with which Mr. Thomſon, (a late writer on the ſubject of beauty) cloſes his detail of the various beauties of the female form. "If we ſhould ſee a perſon employ himſelf with a ſledge hammer to daſh the enchanting form of the Venus de Medicis to pieces, break her lovely limbs, and deface her beauteous features, we ſhould not heſitate a moment to pronounce him a ſavage barbarian, without taſte, feeling, or ſentiment, though his frenzy was employed only on a ſenſeleſs piece of ſtone; what then muſt we think of the diabolical ſavage, who exerciſes the worſt of all cruelties (becauſe the moſt laſting and affecting both to body and mind,) on the moſt beautiful and amiable of all creatures on this ſide heaven?—made expreſsly for his happineſs, ſolace, and delight, by firſt corrupting and betraying her, and then baſely abandoning her to periſh with want, pain, wretchedneſs, and miſery." The ſentiments of mankind, with regard to female beauty, have been very various in different ages and nations; and it is not poſſible to eſtabliſh a ſtandard which ſhall comprehend all, without diſcrimination; among the ancients, a ſmall forehead and joined eye-brows were charming features in a female countenance; and, in Perſia, large joined eye-brows are highly eſteemed. In ſome Indian countries, black teeth and white hair are neceſſary ingredients in the character of a beauty; and in the Marian iſlands, it is a capital object with ladies to blacken their teeth with herbs, and to bleach their hair with certain liquors. Beauty, in China and Japan, is compoſed of a large countenance, ſmall, and half-concealed eyes, a broad noſe, minute feet, and a prominent belly. Some Indians of America and Aſia, compreſs the heads of their children between two wooden planks, with a view to enlarge and beautify the face; others compreſs them laterally, others depreſs the crown only, and others make the head as round as poſſible. Every nation has ideas of beauty peculiar to itſelf; and almoſt every individual has his own notions and taſte concerning this quality. The empire of beauty, however, amidſt theſe diſcordant ideas, with reſpect to the qualities in which it conſiſts, has been very generally acknowledged, and particularly in all civilized countries; and when it is united with other accompliſhments that tend to render females amiable, it contributes in no ſmall degree to give them importance and influence, to poliſh the manners of ſociety, and to contribute to its order and happineſs.

BEAUVAIS, BELLOVACUM, and CÆSAROMAGUS, in *Geography*, a city of France, and capital of the department of the Oiſe, ſeated on the Therin; and, before the revolution, the capital of the Beauvaiſis, and the ſee of a biſhop. The architecture of the cathedral has been much admired, beſides which it has ſeveral collegiate and pariſh churches. The manufacture of the city is a beautiful tapeſtry, which has ſupplied a conſiderable branch of trade. It has alſo produced great quantities of ſerge and woollen cloth. This city was unſucceſsfully beſieged by the Engliſh in 1443, and by the duke of Burgundy in 1472, at the head of 80,000 men. On the latter occaſion, the women diſplayed ſingular courage under the conduct of Jane de Hatchett, whoſe portrait is preſerved in the town-houſe; and in commemoration of their brave defence, the women form the firſt rank of a proceſſion, obſerved annually on the 10th of July. N. lat. 49° 26′. E. long. 2° 15′.

BEAUVAISIS, a ſmall fertile diſtrict of France, bordered on the north by Picardy, on the weſt by Vexin-Normand, on the ſouth by Vexin-François, and on the eaſt by Senlis; now forming a part of the department of Oiſe. See BEAUVAIS.

BEAUVAL, a town of France, in the department of the Somme, and chief place of a canton, in the diſtrict of Doulens, one league S. of Doulens.

BEAUVERAY, a little town of France, in the diſtrict called, before the revolution, Autunois, in the department of the Saône and Loire, ſeated at the foot of a mountain, and ſuppoſed by ſome to be the ancient *Bibracte*.

BEAUVILLE, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the diſtrict of Valence, 3½ leagues N. of Valence. N. lat. 44° 17′. E. long. 0° 47′.

BEAUVOIR, a town of France, in the department of Vendée, a chief place of a canton, in the diſtrict of Challans, 2½ leagues N. W of Challans.—Alſo, a town of France, in the department of the Iſere, and diſtrict of St. Marcelin, 5 leagues S. W. of Grenoble.

BEAUVOIR *ſur Niort*, a town of France, in the department of the Two Sevres, and chief place of a canton, in the diſtrict of Niort, 2½ leagues S. of Niort.

BEAUVOISIN, PONT DE, a town of France, in the department of the Iſere, and chief place of a canton, in the diſtrict of La Tour du Pin, on the borders of Savoy, 11 miles W. of Chambery. It is ſeated on the ſmall river Guier le Vif, which runs through it, and divides it into two parts.

BEAUZAT, a town of France, in the department of the Rhone and Loire, 1½ league S. W. of Moniſtrol.

BEAUZE'E, a town of France, in the department of the Meuſe, and chief place of a canton, in the diſtrict of Verdun, 4½ leagues S. S. W. of Verdun.

BEAUZELEY DE LEVEVOU, ST. a town of France, in the deparment of Aveiron, and chief place of a canton, in the diſtrict of Milhaud, 2 leagues N. W. of Milhaud.

BEBE', a large village of Egypt, on the weſt ſide of the Nile, diſtant about 3 leagues from Beniſouef; the reſidence of a kiaſchef, and the ſite of a moſque, and a convent of Copts.

BEBELINGUEN, a town of Germany, in the duchy of Wurtemberg, ſeated on a lake from which proceeds the river Worm. N. lat. 48° 45′. E. long. 9° 8′.

BEBENHAUSEN, a convent in the diſtrict of Wurtemberg, called Schonluck, at a ſmall diſtance N. E. of Tubingen; the manor of which contains 9 pariſhes. In this convent is an academy, where ſtudents are qualified for admiſſion into the ſeminary at Tubingen.

BEBENOWA, a town of Poland, in the Palatinate of Braclaw, 14 miles S. E. of Braclaw.

BEBERACI, in *Ancient Geography*, *Katounich*, a lake of Meſopotamia, between mount Singara, and the river Chaboras.

BEBRE, in *Geography*, a river of France, which runs into the Loire, oppoſite to Bourbon Lancy.

BEBRYCES, in *Ancient Geography*, the firſt inhabitants of Bithynia. The origin of theſe people, and the reaſon of their name, are uncertain. A people of this appellation, mentioned by Silius Italicus, (l. iii. v. 420.) inhabited that part of Gallia Narbonenſis, which was ſituated between Spain and the Volcæ, or near the Pyrenées, and from them called *Bebricia*.

BEC, LE, in *Geography*, a town of France, in the department of the Eure, 9 leagues W. S. W. of Rouen.

BEC CRESPIN, a town of France, in the department of the Lower Seine, 3 leagues eaſt from Havre.

BECA-

BECABUNGA, Brooklime, in *Botany*. See Veronica.

BECAH, or Bekah, a Jewiſh coin, being half a ſhekel. In Dr. Arbuthnot's table of reductions, the bekah amounts to 13 $\frac{11}{66}$*d.*; in Dr. Prideaux's computation to 1s. 6d.

Every Iſraelite paid a hundred bekahs a head every year for the ſupport of the temple. Calmet.

BECALMING, in the *Sea Language*, is when any thing keeps the wind off or away from the veſſel.

Thus one ſhip is ſaid to becalm another, when ſhe comes up with her on the weather-ſide: the like is ſaid of the ſhore, when it keeps the wind away. A ſhip is likewiſe ſaid to be becalmed, when there is no wind ſtirring.

BECANER, in *Geography*, a town of Hindooſtan, ſeated on the Ganges, nearly eaſt of Dehli.

BECARDE, in *Ornithology*, a name under which Buffon deſcribes ſome birds of the Linnæan genus Lanius: as for example, his *becarde* is *lanius cayanus* Gmel. and *becarde à ventre jaune*, *lanius ſulphuratus* of the ſame author.

BE'CASSE, Be'cassine, a generical term in Buffon's Nat. Hiſt. for ſome birds of the Scolopax genus, in the Linnæan ſyſtem.

BE'CASSEAU *ou Cul-blanc*, is alſo a name given by Buffon to the *tringa ochropus* of Linnæus.

BECCA, in the *Materia Medica of the Ancients*, a name given to a fine kind of reſin collected from the turpentine and maſtich-trees of Greece and Syria, and mixed together for uſe. It was much eſteemed formerly, and not only uſed in the country where it was produced, but carried in great quantities to Mecca, and other parts of the Turkiſh dominions, where it was valued at a very great rate.

BECCABUNGÆ, in *Entomology*, a ſpecies of Curculio, of a black colour; wing-caſes rufous; entirely bordered with black. Fabricius. In ſize and appearance it reſembles *curculio ceraſi*; inhabits Sweden; feeds on the *beccabunga*.

BECCADELLI, Antonio, in *Biography*, called *Antony* of *Palermo*, from the place of his birth; was born in 1374, ſtudied the law at Bologna, and entered into the ſervice of the duke of Milan, who allowed him an honourable penſion. He alſo became profeſſor of belles lettres and rhetoric in the univerſity of Pavia, and, in 1432, was honoured by the emperor Sigiſmund, with the poetic laurel. When Alphonſo king of Naples left Milan in 1435, he took Antonio with him to his court; and from this time, he became the inſeparable companion of this prince, who conferred upon him many honours and gifts, and intruſted him with many important commiſſions. In 1451 he was deputed to ſolicit of the ſtate of Venice, the ſuppoſed arm-bones of the hiſtorian Livy, which he obtained. Such indeed was his veneration for Livy, that he is ſaid to have ſold a farm in order to purchaſe a copy of Livy, written by the hand of Poggio the Florentine. After the death of Alphonſo, Antonio became the ſecretary and counſellor of his ſon and ſucceſſor Ferdinand. He died at Naples in 1471; leaving behind him ample teſtimonials of his talents as a Latin writer, both in proſe and verſe. For his work "De Dictis et factis Alfonſi regis Arragonum," he received the recompence of a thouſand gold crowns; which work has been frequently reprinted, with additions. A collection of five books of his epiſtles, two harangues, and ſome verſes, was printed at Venice in 1453. His "Hermaphroditus," which was a collection of ſhort poems in two books, excited by its obſcenity loud clamours againſt its author; and was publicly burnt in ſeveral cities of Italy, together with the writer's own effigy. Gen. Biog.

Beccadelli, Ludovico, was born of a noble family at Bologna in 1502, ſtudied at Padua, and accompanied cardinal Pole in his legation to Spain. He aſſiſted at the council of Trent, and was delegated by the papal court to Venice and Augſburg. In recompence of his ſervices, he was promoted to the archbiſhopric of Raguſa; but being appointed in 1563 to ſuperintend the education of the ſon of Coſmo I., grand duke of Tuſcany, and expecting the archbiſhopric of Piſa, he renounced that of Raguſa. His expectations, however, were diſappointed; and he was obliged to content himſelf with the provoſtſhip of the cathedral of Prato, in which office he died in 1572. He was reckoned eminent as a man of letters, and wrote in Latin the lives of the cardinals Bembo and Pole, and in Italian a life of Petrarch, eſteemed more correct than any other. Nouv. Dict. Hiſt.

BECCAFICO Canapino, in *Ornithology*, a name of *motacilla curruca*, in Olina.

Beccafico, and *Becſique*, are alſo names given by Olina and Buffon to *motacilla ficedula*. Linn.

BECCAFUMI, Domenico, in *Biography*, called *Micarino* and *Mecherino*, was the ſon of a peaſant near Sienna, whoſe name was Pacio, born in 1484, and employed by his father in keeping ſheep. Beccafumi, a citizen of Sienna, whoſe name he aſſumed, being prepoſſeſſed with a favourable opinion of his talents by obſerving figures which he drew, with his ſtick upon the ſand, whilſt he was ſurrounded by his flock, took him under his patronage, and placed him under the inſtruction of a painter, called Cavanna; and after having been, as ſome ſay, the diſciple of Pietro Perugino, or according to others, after having been employed in copying the pictures of this artiſt, he went to Rome, and made further improvement by ſtudying the works of Raphael and Michael Angelo. After two years he returned to Sienna, and finiſhed ſeveral pieces, not only in oil, but in diſtemper and freſco, which gained him great reputation. But he was chiefly admired for his performance on the pavement of the great church, which he wrought by combining ſtones of different colours, with pitch poured in holes for the dark ſhades, in ſuch a manner as the light and ſhadow of the object required. This kind of performance is ſaid to have been invented by one Duccio of Sienna in 1356; but it was brought to perfection by Beccafumi. He had a fine invention; his taſte was elegant; his expreſſion good; and his colouring beautiful. He was alſo an excellent engraver on wood and metal, and alſo a founder. His uſual mark on his plates is a B divided in the middle by a horizontal line. This artiſt died at Genoa in 1549. Pilkington and Strutt.

BECCARIA, Cæsar Bonesana, marquis of, an eminent Italian writer, was born about the year 1720. To the ſtudy of philoſophy he was attached from his infancy, and he availed himſelf of the light and intellectual freedom, which about his time found their way into Italy from France, England, and other countries. At Naples, Genoveſi taught the Italians how to *think*, and Beccaria diſtinguiſhed him by the title of "his learned and venerable maſter." At Milan alſo count Firmian was a diſtinguiſhed patron of literature and ſcience, and a promoter of every reform, that had philanthropy for its baſis. With ſuch enlightened men Beccaria co-operated by writing in 1767 his famous work, "On Crimes and Puniſhments," which had an extenſive ſpread, and produced a great change in the prevailing ideas on theſe ſubjects. Voltaire, in his commentaries on this work, ſays, that this ſhort treatiſe is in morals what a ſimple drug would be in medicine, which ſhould be adequate to the cure of every diſeaſe to which the human body.

body is liable. As the principles of government indirectly fupported in this work were hoftile to abfolute power, they incurred the charge of fubverting the legitimate fources of authority; and the marquis owed his protection to the influence of count Firmian. Having efcaped the danger that threatened him, he diverted his attention from fpeculations of this nature to metaphyfical fubjects. Befides fome papers, contributed to a periodical work, entitled "The Coffee-Houfe," he publifhed "Difquifitions on the Nature of Style," maintaining that by nature all men poffefs an equal degree of genius for poetry and elocution, and by the obfervance of proper rules all would be able to write equally well. Beccaria was much attached to men of letters, a patron to thofe who needed encouragement, and a cordial friend. He was charged, however, with venality in the exercife of an office of magiftracy which he held; and hence his enemies compared him to lord Bacon, with refpect both to abilities and corruption. He died November 1794. Month. Mag. 1798. Gen. Biog.

Beccaria, Giambattista, an eminent philofopher of the eighteenth century, and a monk of the Ecoles-Pies, was a native of Mendovi in Piedmont, and became profeffor of philofophy and mathematics, firft at Palermo, and then at Rome. His eftablifhed reputation occafioned his removal to Turin, where he occupied the chair of experimental philofophy. In confequence of his appointment to the office of preceptor to the princes of Sardinia, he was introduced to the Sardinian court; but neither this employment, nor the honour connected with it, diverted him from the indefatigable profecution of his ftudies; and the pecuniary advantages that refulted from the appointment were principally devoted to the increafe of his library and the improvement of his philofophical apparatus. Amidft the variety of his philofophical purfuits, his attention was particularly engaged by experiments and inveftigations in electricity; and in this department of fcience he acquired fingular reputation. For an account of his principal difcoveries and obfervations, fee Atmosphere, and Electricity. His chief works on this fubject were "Dell' Elettricifmo Artificiale et Naturale," Turin, 1753, 4to.; of which an Engliih tranflation was publifhed, in 1776, 4to. and "Lettere dell' Elettricifmo," Bologn. 1758, fol. He alfo publifhed eflays "On the caufe of Storms and Tempefts," "On the Meridian of Turin," and on other phyfical and aftronomical fubjects. Father Beccaria, no lefs refpectable for his virtues than his knowledge, died at Turin in an advanced age, May 22, 1781. Nouv. Dict. Hift.

Beccaria, James Bartholomew, born at Bononia, in 1682, received the early part of his education among the Jefuits. Turning his mind to the ftudy of natural philofophy, he foon became diftinguifhed for the variety and depth of his knowledge in phyfics, and in mathematics, of which he was made public profeffor, and, in conjunction with Morgagni, and other celebrated characters at Bononia, affifted in forming an academy there for teaching mathematics, natural hiftory, chemiftry, anatomy, and medicine. He firft gave lectures in natural hiftory, and in 1712, was appointed to the chair of medicine, which he alfo now practifed with great fuccefs. On the death of Valfalva, he was made prefident of the inftitution, and in that poft, introduced many ufeful regulations for the government of the academy, which are ftill continued. He was a frequent correfpondent with the Royal Society of London, of which he was made an honorary member. Among other communications from Beccaria, which appear in the Philofophical Tranfactions, are his "Obfervations on the Weather," "On the Ignis Fatuus," and "On the power fome perfons have enjoyed of fupporting life for a great length of time, without food." This was afterwards publifhed at Padua, under the title of "De jejuniis longis Differtatio," fol. 1748. He died Jan. 1766, being 84 years of age. Among his publications are "Differtatio Meteorologica Medica, in qua aeris temperies et morbi Bononiæ graffantes annis, 1729, et fequenti, defcribuntur." "De quamplurimis phofphoris nunc primum detectis, Commentarius," Bonon, 4to. 1744. "Scriptura Medico-legalis," 1749. For the titles of his other compofitions, and of numerous unedited pieces, fee Gen. Biog. and Hal. Bib. Anat.

BECCLES, in *Geography*, is a market and corporate town of Suffolk, in England, fituated on the northern border of that county joining to Norfolk. It is fifteen miles S.W. of Yarmouth, and 108 N.E. from London. Though not a borough town, Beccles has its corporation, conffting of a portreeve, and thirty-fix other perfons, who are diftinguifhed by the names of *twelves*, and *twenty-fours*. From the twelves, the officer called portreeve is annually elected. The town conffts of feveral ftreets, which concentrate in a fpacious area, where the markets are held every Saturday. Here are a large handfome church, whofe tower is detached from it, and the ruins of another called Ingate church, which was formerly the parifh church. The church-yard, from its elevated fituation, commands many fine and extended views of the adjacent country, and the meandrings of the river Waveney which adjoins this cemetery. Here are a town-hall and goal; the former is a fubftantial building where the quarter feffions are held; and the latter has been lately much enlarged and improved conformably to the Howardian plan. A public grammar fchool was founded here in 1712, by Dr. Fauconberg, who endowed it with certain lands for the maintenance of a clergyman, and to qualify youth for the univerfity. Sir John Leman, knight, alfo founded a free Engliih fchool in 1631, for the education of forty-eight boys; alfo for a mafter and ufher, who are appointed by truftees, being part of the corporation. On the north-weft fide of the town is a very large common field, containing nearly 1600 acres, where the inhabitants are allowed, under certain reftrictions, to turn a number of horfes and cattle. Beccles fuffered by a deftructive fire, which happened on the 29th of November, 1586, when more than 80 houfes were conffumed, with property calculated at 20,000l. value. It is rather a fingular circumftance, that neither mail, nor turnpike roads, communicate with this town: though it was fome time fince propofed at a public meeting to carry the turnpike road to Yarmouth through this place; but the propofition was negatived by a conffderable majority of the inhabitants. Here are three annual fairs. The number of houfes in the townfhip is 601; of inhabitants 2788, of which 1245 are males, and 1543 are females. In the vicinity of this town are the following, befides other gentlemens feats. *Raveningham Hall*, fir Edmund Bacon, bart. —*Langley Park*, fir Thomas Beauchamp Proctor, bart.— *Benacre Hall*, fir Thomas Gooch, bart.—*Sotterly Hall*, Miles Barne, efq.

BEC-D'OISEAU, in *Zoology*, the name lately given by French naturalifts to that moft fingular Auftralafian animal *Platypus anatinus* of Vivarium naturæ; and *Duck-billed platypus* of Dr. Shaw. It is alfo called *Ornithorhinchus paradoxus*, by M. Blumenback of Goëttingen. See Platypus.

BECEDE, La, in *Geography*, a fmall town of France on the Aude, and chief place of a canton in the diftrict of Caftelnaudary, 1½ league north of Caftelnaudary.

BECF-AAL, in *Ichthyology*, a French name of the *Electrical eel*, anguille electrique.

BECHAN, in *Geography*, a river of North Wales, which

which runs into the Severn, 3 miles W.S.W. of Montgomery.

BECHER, John Joachim, in *Biography*, an induſtrious and ſucceſsful cultivator and improver of chemiſtry, and an ingenious mechaniſt, was born at Spires in 1645. After paſſing through the uſual preliminary ſtudies, he was made profeſſor of medicine at Mentz, and ſoon after phyſician to the elector there, and to the elector of Bavaria. Acquiring conſiderable reputation in theſe honourable poſts, he was called to Vienna by the emperor Leopold, where, beſides attending to his medical duties, he was inſtrumental in forming a chamber of commerce, and in improving their manufactures. He is alſo ſaid to have projected the plan of an Eaſt India company there. But getting into diſputes with ſome of the officers about the court, he loſt his influence, and was obliged to leave Vienna. He then went to Mayence, Munich, and Wurtzburg. From Wurtzburg he was driven away, Haller ſays, on being detected diſſecting an human body, with the view probably of proſecuting ſome chemical experiments on ſome of the humours, as he did not cultivate anatomy. At Haerlem, where he now went, he invented a machine for throwing ſilk; and, as he tells us in his "La folie ſage, et la folie ſageſſe," printed at Franefort 1682, made ſome improvement in the art of printing; in what it conſiſted, is not however known. In the mean while he was not unmindful of the principal object of his ſtudies, the advancement of the knowledge of chemiſtry, as appears by a rapid ſucceſſion of publications on that ſubject. Getting again involved in diſputes with ſome principal perſons at Haerlem, and compelled to quit that place, he came to London, where he died in 1685. That he was of a turbulent and reſtleſs diſpoſition is evident by his frequent migrations, and by his conſtantly loſing the favour and protection of his patrons, whom he had made his debtors by his abilities and ſervices. Becher gave a new turn to chemiſtry, which he employed in analyſing and finding out the principles of natural bodies, and thence laid the foundation of the great improvements that have been made in that art. But he was fond of myſteries, and employed no ſmall part of his time and labour in his attempts to tranſmute metals. That he thought this practicable, appears by his "Experimentum chymicum novum, quo artificialis et inſtantanea metallorum generatio et tranſmutatio ad oculum demonſtratur;" and his "Theſes chymicæ, veritatem et poſſibilitatem tranſmutationis metallorum in aurum evincentes:" but he was conſcious of having done more in the art than had ever been done before, and therefore probably thought hardly any thing impoſſible. He had a project for an univerſal language, by which all men might make themſelves intelligible to each other: "Character pro notitia linguarum univerſali." On this ſubject he publiſhed, in 1661, a Latin folio; and as he was the firſt perſon who gave a complete treatiſe on this art, ſince known under the name of paſigraphy, he may therefore be conſidered as the inventor. (See *Univerſal* Character, and Pasigraphy.) His principal works are his "Phyſica ſubterranea," which has paſſed through ſeveral editions; "Inſtitutiones chymicæ," Mogunt. 4to. 1662; "Parnaſſus medicinalis," Ulm. 1663, fol. For the titles of the reſt of his works, ſee Eloy's Dict. Hiſt.

BECHERE Gol, in *Geography*, a lake of Caramania in Aſiatic Turkey, 40 miles W. of Cogni.

BECHERELE, a town of France, in the department of the Ille and Villaine, and chief place of a canton in the diſtrict of Montfort, 3 leagues N. of Montfort.

BECHHOFEN, a ſmall market town of Germany, in the principality of Onolzbach, ſeated on the river Wieſet, and having a ſmall caſtle.

BECHICS, formed of the Greek βηξ, βηχος, *a cough*, in the *Materia Medica*, medicines proper for relieving coughs, but theſe being of various kinds, the general term may miſlead, and is therefore improper.

Bechic *Pills*. See Pills.

BECHIN, in *Geography*, a town of Bohemia, and capital of a circle of the ſame name. It is ſeated on the river Luznice, and its citadel lies on a ſteep rock. The circle was miſerably ravaged and laid waſte in the 30 years' war, and the town was taken and burnt by general Bequoi in 1619. N. lat. 49° 14'. E. long. 15° 12'.

BECHTOLSHEIM, a market town of Swabia, in the Rheniſh circle of nobility, belonging to four co-heirs, two of whom are Roman Catholics, and two Lutherans.

BECK, a little river or brook, called alſo rivulet or rill.

According to Verſtegan, the original word is *beke*, which properly imports a ſmall ſtream of water iſſuing from ſome bourn or ſpring.

Hence, *bell-becks*, little brooks ſo called, on account of their ſhallowneſs and depth, or rather from their being covered, or much concealed. See Hell.

Beck is chiefly uſed among us in the compoſition of names of places originally ſituate on rivulets; hence Welbeck, Bournbeck, &c.

The Germans uſe *beck* in the ſame manner.

Beck, David, in *Biography*, an eminent portrait painter, was born at Arnheim in Guelderland in 1621, and became a diſciple of Vandyck, from whom he acquired a fine manner of pencilling, and that ſweet ſtyle of colouring in which this maſter excelled, together with that rapidity of execution for which he was ſo famous. He was appointed portrait painter to Chriſtina queen of Sweden; and by her recommendation, moſt of the illuſtrious perſons in Europe ſat to him for their pictures. In his perſon and behaviour he was handſome, agreeable, and polite; and though he was much favoured by his royal miſtreſs, he wiſhed to viſit his friends in Holland, very much againſt the queen's inclination; but as he ſoon after died in Holland, at the early age of 35, it was ſuſpected that he was poiſoned. As he travelled through Germany, he was ſuddenly taken ill at an inn, where he lodged, and the illneſs terminated in his apparent death, ſo that he was laid out as a corpſe. His valets, who attended, regretted the event, and as they ſat by his bed-ſide, relieved their ſorrow by drinking freely. One of them, in a ſtate of intoxication, ſuggeſted, that their maſter was fond of a glaſs while he was alive, and propoſed to teſtify their gratitude by giving him a glaſs, though he were dead. Accordingly, they raiſed his head, and endeavoured to put ſome liquor into his mouth. Upon this Beck opened his eyes, and the ſervant compelled him to ſwallow what remained in the glaſs. The painter revived, and, by due attention, not only eſcaped interment, but perfectly recovered. In teſtimony of his merit as an artiſt, he received from different princes nine gold chains, and ſeveral medals of gold of a large ſize. Pilkington.

BECKEM, or Beckum, in *Geography*, a ſmall town of Germany, in the circle of Weſtphalia and biſhopric of Munſter, ſeated on the Werſe, 17 miles S. S. E. of Munſter. In 1724 it was almoſt wholly conſumed by fire.

BECKER, Daniel, in *Biography*, was born at Dantzick, in December 1594. He took his degree of doctor in medicine at Konigſberg, and was made profeſſor of medicine there, and rector of the univerſity. Becker was author of various medical works, but that which principally contributed to preſerve his name, is his "De cultrivoro Pruſſiaco, obſervatio et curatio ſingularis," or the extraordinary cure of the Pruſſian knife-ſwallower; firſt publiſhed in 1636, and ſince frequently reprinted. The ſubject of the hiſtory is a young

body is liable. As the principles of government indirectly ſupported in this work were hoſtile to abſolute power, they incurred the charge of ſubverting the legitimate ſources of authority; and the marquis owed his protection to the influence of count Firmian. Having eſcaped the danger that threatened him, he diverted his attention from ſpeculations of this nature to metaphyſical ſubjects. Beſides ſome papers, contributed to a periodical work, entitled "The Coffee-Houſe," he publiſhed "Diſquiſitions on the Nature of Style," maintaining that by nature all men poſſeſs an equal degree of genius for poetry and elocution, and by the obſervance of proper rules all would be able to write equally well. Beccaria was much attached to men of letters, a patron to thoſe who needed encouragement, and a cordial friend. He was charged, however, with venality in the exerciſe of an office of magiſtracy which he held; and hence his enemies compared him to lord Bacon, with reſpect both to abilities and corruption. He died November 1794. Month. Mag. 1798. Gen. Biog.

Beccaria, Giambattista, an eminent philoſopher of the eighteenth century, and a monk of the Ecoles-Pies, was a native of Mendovi in Piedmont, and became profeſſor of philoſophy and mathematics, firſt at Palermo, and then at Rome. His eſtabliſhed reputation occaſioned his removal to Turin, where he occupied the chair of experimental philoſophy. In conſequence of his appointment to the office of preceptor to the princes of Sardinia, he was introduced to the Sardinian court; but neither this employment, nor the honour connected with it, diverted him from the indefatigable proſecution of his ſtudies; and the pecuniary advantages that reſulted from the appointment were principally devoted to the increaſe of his library and the improvement of his philoſophical apparatus. Amidſt the variety of his philoſophical purſuits, his attention was particularly engaged by experiments and inveſtigations in electricity; and in this department of ſcience he acquired ſingular reputation. For an account of his principal diſcoveries and obſervations, ſee Atmosphere, and Electricity. His chief works on this ſubject were "Dell' Elettriciſmo Artificiale et Naturale," Turin, 1753, 4to.; of which an Engliſh tranſlation was publiſhed, in 1776, 4to. and "Lettere dell' Elettriciſmo," Bologn. 1758, fol. He alſo publiſhed eſſays "On the cauſe of Storms and Tempeſts," "On the Meridian of Turin," and on other phyſical and aſtronomical ſubjects. Father Beccaria, no leſs reſpectable for his virtues than his knowledge, died at Turin in an advanced age, May 22, 1781. Nouv. Dict. Hiſt.

Beccaria, James Bartholomew, born at Bononia, in 1682, received the early part of his education among the Jeſuits. Turning his mind to the ſtudy of natural philoſophy, he ſoon became diſtinguiſhed for the variety and depth of his knowledge in phyſics, and in mathematics, of which he was made public profeſſor, and, in conjunction with Morgagni, and other celebrated characters at Bononia, aſſiſted in forming an academy there for teaching mathematics, natural hiſtory, chemiſtry, anatomy, and medicine. He firſt gave lectures in natural hiſtory, and in 1712, was appointed to the chair of medicine, which he alſo now practiſed with great ſucceſs. On the death of Valſalva, he was made preſident of the inſtitution, and in that poſt, introduced many uſeful regulations for the government of the academy, which are ſtill continued. He was a frequent correſpondent with the Royal Society of London, of which he was made an honorary member. Among other communications from Beccaria, which appear in the Philoſophical Tranſactions, are his "Obſervations on the Weather," "On the Ignis Fatuus," and "On the power ſome perſons have enjoyed of ſupporting life for a great length of time, without food." This was afterwards publiſhed at Padua, under the title of "De jejuniis longis Diſſertatio," fol. 1748. He died Jan. 1766, being 84 years of age. Among his publications are "Diſſertatio Meteorologica Medica, in qua acris temperies et morbi Bononiæ graſſantes annis, 1729, et ſequenti, deſcribuntur." "De quamplurimis phoſphoris nunc primum detectis, Commentarius," Bonon, 4to. 1744. "Scriptura Medico-legalis," 1749. For the titles of his other compoſitions, and of numerous unedited pieces, ſee Gen. Biog. and Hal. Bib. Anat.

BECCLES, in *Geography*, is a market and corporate town of Suffolk, in England, ſituated on the northern border of that county joining to Norfolk. It is fifteen miles S.W. of Yarmouth, and 108 N.E. from London. Though not a borough town, Beccles has its corporation, conſiſting of a portreeve, and thirty-ſix other perſons, who are diſtinguiſhed by the names of *twelves*, and *twenty-fours*. From the twelves, the officer called portreeve is annually elected. The town conſiſts of ſeveral ſtreets, which concentrate in a ſpacious area, where the markets are held every Saturday. Here are a large handſome church, whoſe tower is detached from it, and the ruins of another called Ingate church, which was formerly the pariſh church. The church-yard, from its elevated ſituation, commands many fine and extended views of the adjacent country, and the meandrings of the river Waveney which adjoins this cemetery. Here are a town-hall and goal; the former is a ſubſtantial building where the quarter ſeſſions are held; and the latter has been lately much enlarged and improved conformably to the Howardian plan. A public grammar ſchool was founded here in 1712, by Dr. Fauconberg, who endowed it with certain lands for the maintenance of a clergyman, and to qualify youth for the univerſity. Sir John Leman, knight, alſo founded a free Engliſh ſchool in 1631, for the education of forty-eight boys; alſo for a maſter and uſher, who are appointed by truſtees, being part of the corporation. On the north-weſt ſide of the town is a very large common field, containing nearly 1600 acres, where the inhabitants are allowed, under certain reſtrictions, to turn a number of horſes and cattle. Beccles ſuffered by a deſtructive fire, which happened on the 29th of November, 1586, when more than 80 houſes were conſumed, with property calculated at 20,000l. value. BEC-D'OISEAU, in *Zoology*, the name lately given by French naturaliſts to that moſt ſingular Auſtralaſian animal *Platypus anatinus* of Vivarium naturæ; and *Duck-billed platypus* of Dr. Shaw. It is alſo called *Ornithorhinchus paradoxus*, by M. Blumenback of Goëttingen. See Platypus.

BECEDE, La, in *Geography*, a ſmall town of France on the Aude, and chief place of a canton in the diſtrict of Caſtelnaudary, 1½ league north of Caſtelnaudary.

BECF-AAL, in *Ichthyology*, a French name of the *Electrical eel*, anguille electrique.

BECHAN, in *Geography*, a river of North Wales, which

which runs into the Severn, 3 miles W.S.W. of Montgomery.

BECHER, John Joachim, in *Biography*, an induſtrious and ſucceſsful cultivator and improver of chemiſtry, and an ingenious mechaniſt, was born at Spires in 1645. After paſſing through the uſual preliminary ſtudies, he was made profeſſor of medicine at Mentz, and ſoon after phyſician to the elector there, and to the elector of Bavaria. Acquiring conſiderable reputation in theſe honourable poſts, he was called to Vienna by the emperor Leopold, where, beſides attending to his medical duties, he was inſtrumental in forming a chamber of commerce, and in improving their manufactures. He is alſo ſaid to have projected the plan of an Eaſt India company there. But getting into diſputes with ſome of the officers about the court, he loſt his influence, and was obliged to leave Vienna. He then went to Mayence, Munich, and Wurtzburg. From Wurtzburg he was driven away, Haller ſays, on being detected diſſecting an human body, with the view probably of proſecuting ſome chemical experiments on ſome of the humours, as he did not cultivate anatomy. At Haerlem, where he now went, he invented a machine for throwing ſilk; and, as he tells us in his "La folie ſage, et la folie ſageſſe," printed at Francfort 1682, made ſome improvement in the art of printing; in what it conſiſted, is not however known. In the mean while he was not unmindful of the principal object of his ſtudies, the advancement of the knowledge of chemiſtry, as appears by a rapid ſucceſſion of publications on that ſubject. Getting again involved in diſputes with ſome principal perſons at Haerlem, and compelled to quit that place, he came to London, where he died in 1685. That he was of a turbulent and reſtleſs diſpoſition is evident by his frequent migrations, and by his conſtantly loſing the favour and protection of his patrons, whom he had made his debtors by his abilities and ſervices. Becher gave a new turn to chemiſtry, which he employed in analyſing and finding out the principles of natural bodies, and thence laid the foundation of the great improvements that have been made in that art. But he was fond of myſteries, and employed no ſmall part of his time and labour in his attempts to tranſmute metals. That he thought this practicable, appears by his "Experimentum chymicum novum, quo artificialis et inſtantanea metallorum generatio et tranſmutatio ad oculum demonſtratur;" and his "Theſes chymicæ, veritatem et poſſibilitatem tranſmutationis metallorum in aurum evincentes:" but he was conſcious of having done more in the art than had ever been done before, and therefore probably thought hardly any thing impoſſible. He had a project for an univerſal language, by which all men might make themſelves intelligible to each other: "Character pro notitia linguarum univerſali." On this ſubject he publiſhed, in 1661, a Latin folio; and as he was the firſt perſon who gave a complete treatiſe on this art, ſince known under the name of paſigraphy, he may therefore be conſidered as the inventor. (See *Univerſal* Character, and Pasigraphy.) His principal works are his "Phyſica ſubterranea," which has paſſed through ſeveral editions; "Inſtitutiones chymicæ," Mogunt. 4to. 1662; "Parnaſſus medicinalis," Ulm. 1663, fol. For the titles of the reſt of his works, ſee Eloy's Dict. Hiſt.

BECHERE Gol, in *Geography*, a lake of Caramania in Aſiatic Turkey, 40 miles W. of Cogni.

BECHEREL, a town of France, in the department of the Ille and Villaine, and chief place of a canton in the diſtrict of Montfort, 3 leagues N. of Montfort.

BECHHOFEN, a ſmall market town of Germany, in the principality of Onolzbach, ſeated on the river Wieſet, and having a ſmall caſtle.

BECHICS, formed of the Greek βὴξ, βηχὸς, *a cough*, in the *Materia Medica*, medicines proper for relieving coughs, but theſe being of various kinds, the general term may miſlead, and is therefore improper.

Bechic *Pills*. See Pills.

BECHIN, in *Geography*, a town of Bohemia, and capital of a circle of the ſame name. It is ſeated on the river Luznice, and its citadel lies on a ſteep rock. The circle was miſerably ravaged and laid waſte in the 30 years' war, and the town was taken and burnt by general Bequoi in 1619. N. lat. 49° 14'. E. long. 15° 12'.

BECHTOLSHEIM, a market town of Swabia, in the Rheniſh circle of nobility, belonging to four co-heirs, two of whom are Roman Catholics, and two Lutherans.

BECK, a little river or brook, called alſo rivulet or rill.

According to Verſtegan, the original word is *beke*, which properly imports a ſmall ſtream of water iſſuing from ſome bourn or ſpring.

Hence, *hell-becks*, little brooks ſo called, on account of their ghaſtlineſs and depth, or rather from their being covered, or much concealed. See Hell.

Beck is chiefly uſed among us in the compoſition of names of places originally ſituate on rivulets; hence Welbeck, Bournbeck, &c.

The Germans uſe *beck* in the ſame manner.

Beck, David, in *Biography*, an eminent portrait painter, was born at Arnheim in Guelderland in 1621, and became a diſciple of Vandyck, from whom he acquired a fine manner of pencilling, and that ſweet ſtyle of colouring in which this maſter excelled, together with that rapidity of execution for which he was ſo famous. He was appointed portrait painter to Chriſtina queen of Sweden; and by her recommendation, moſt of the illuſtrious perſons in Europe ſat to him for their pictures. In his perſon and behaviour he was handſome, agreeable, and polite; and though he was much favoured by his royal miſtreſs, he wiſhed to viſit his friends in Holland, very much againſt the queen's inclination; but as he ſoon after died in Holland, at the early age of 35, it was ſuſpected that he was poiſoned. As he travelled through Germany, he was ſuddenly taken ill at an inn, where he lodged, and the illneſs terminated in his apparent death, ſo that he was laid out as a corpſe. His valets, who attended, regretted the event, and as they ſat by his bed-ſide, relieved their ſorrow by drinking freely. One of them, in a ſtate of intoxication, ſuggeſted, that their maſter was fond of a glaſs while he was alive, and propoſed to teſtify their gratitude by giving him a glaſs, though he were dead. Accordingly, they raiſed his head, and endeavoured to put ſome liquor into his mouth. Upon this Beck opened his eyes, and the ſervant compelled him to ſwallow what remained in the glaſs. The painter revived, and, by due attention, not only eſcaped interment, but perfectly recovered. In teſtimony of his merit as an artiſt, he received from different princes nine gold chains, and ſeveral medals of gold of a large ſize. Pilkington.

BECKEM, or Beckum, in *Geography*, a ſmall town of Germany, in the circle of Weſtphalia and biſhopric of Munſter, ſeated on the Werſe, 17 miles S.S.E. of Munſter. In 1724 it was almoſt wholly conſumed by fire.

BECKER, Daniel, in *Biography*, was born at Dantzick, in December 1594. He took his degree of doctor in medicine at Konigſberg, and was made profeſſor of medicine there, and rector of the univerſity. Becker was author of various medical works, but that which principally contributed to preſerve his name, is his "De cultrivoro Pruſſiaco, obſervatio et curatio ſingularis," or the extraordinary cure of the Pruſſian knife-ſwallower; firſt publiſhed in 1636, and ſince frequently reprinted. The ſubject of the hiſtory is a young

man, aged 22 years, who endeavoured to excite vomiting by introducing the handle of a knife, ten inches long, into the œſophagus; the knife ſlipping from his fingers, dropped into his ſtomach, where it continued, occaſioning much pain, about ſix weeks. No probable means of relieving him, or of obtaining the diſcharge of the knife occurring, it was determined, by his medical attendants, to make an inciſion through the integuments of the abdomen into the ſtomach, and to extract the knife through the wound. The operation was performed, the knife taken out, and the patient recovered in a few days. The author relates ſeveral other caſes of perſons who had received wounds, penetrating into the ſtomach. In ſome, the wounds were completely healed; in others, the edges of the wounds becoming callous, left fiſtulous openings into the ſtomach, through which the food paſſed, unleſs when covered with a compreſs. This work was tranſlated into Engliſh, and publiſhed in 4to. by Dan. Lakin, in 1642, under the title of "A miraculous cure of the Pruſſian ſwallow knife." Lakin added other caſes of wounds penetrating into the ſtomach, which terminated in the ſame ways, as thoſe related by Becker. To both the Latin and Engliſh editions engravings of the ſubject are added. He died the 14th of October 1655. For the titles of his other works, none of which are of much eſtimation; See Haller's Bib. Chirurg. et Anatom. His ſon Daniel, who was educated under his father, after viſiting the principal ſchools on the continent of Europe, was made doctor of medicine at Straſbourg, in the year 1652; returning to Konigſberg, he was appointed profeſſor in ordinary, and ſoon after phyſician to the elector of Brandenburg. He died ſuddenly Feb. 6th 1670, and was ſucceeded in his honours by his ſon Daniel Chriſtopher, but they neither of them left any works deſerving notice.

Becker, Balthasar. See Bekker.

BECKET, Thomas, in *Biography*, an Engliſh prelate, famous as the occaſion of much political contention during his life, and as the object of much ſuperſtitious veneration after his death, was born in London in 1119, and proſecuted his ſtudies at Oxford, Paris, Bologna, and Auxerre. During the interval of his reſidence at Paris and Bologna, he was introduced to Theobald archbiſhop of Canterbury, who being captivated with his graceful and winning addreſs, gave him two livings in Kent, and obtained for him two prebends in the cathedrals of London and Lincoln. As at this time he was only in deacon's orders, he probably held theſe benefices by the pope's diſpenſation, which his patron might eaſily have procured. After his return from Auxerre, where he compleated his ſtudies, particularly in the civil and canon laws, he was employed by the archbiſhop as his agent to the pope, in order to ſolicit the reſtoration of the legantine powers to the ſee of Canterbury. Having conducted this negotiation with dexterity and ſucceſs, he was deputed on another important commiſſion, the object of which was to obtain from the pope thoſe prohibitory letters againſt the coronation of prince Euſtace, by which that deſign was defeated. Upon his return to England from this ſucceſsful embaſſy, the archbiſhop conferred upon him ſeveral new favours, appointing him provoſt of Beverley and dean of Haſtings, with the right of retaining his other benefices, and juſt before the death of Stephen, inveſting him with the archdeaconry of Canterbury. Immediately upon the acceſſion of Henry II. to the throne, in 1158, he was appointed chancellor of England, at the requeſt of his patron, who thought no dignity or truſt above his merit. The chancellor of England, at this time, had no diſtinct court of judicature in which he preſided; but he acted together with the juſticiary and other great officers, in matters of the revenue, at the exchequer, and ſometimes in the counties upon circuits. The great ſeal being in his cuſtody, he ſuperviſed and ſealed the writs and precepts that iſſued in proceedings pending in the king's court, and in the exchequer. He alſo ſuperviſed all charters which were to be ſealed with that ſeal. In the council his rank was very high; and he had the principal direction and conduct of all foreign affairs, performing moſt of that buſineſs which is now done by the ſecretaries of ſtate. Such was the office to which Becket was raiſed; but the favour of his maſter made him greater than even the power of that office, great as it was in itſelf. In this ſtation he paid his court ſo ſucceſsfully to his royal maſter, not only by his dexterity in buſineſs, but alſo by his ſplendid manner of living and agreeable converſation, that he became his greateſt favourite, and his chief companion in his amuſements. Employments and truſts of all kinds were heaped upon him without meaſure or propriety. Beſides the office of chancellor, and a ſcandalous number of eccleſiaſtical benefices, he had royal caſtles and forts committed to his cuſtody, the temporalities of vacant prelacies, and the eſcheats of great baronies belonging to the crown. Theſe revenues he expended without account or controul; and Henry repoſed in him ſuch a degree of confidence, that he ſeemed almoſt to ſhare the throne with the ſovereign. It muſt indeed be allowed that Becket poſſeſſed in a pre-eminent degree all the qualities that could moſt powerfully engage the affections of a prince, who had a judgment capable of diſcerning, and a heart formed to love extraordinary merit, but a temper that required ſome delicacy of addreſs in thoſe who approached him very nearly, and that yielded moſt to thoſe friends whoſe character appeared moſt congenial to his own. The perſon of Becket was graceful and his countenance pleaſing; his wit was lively and facetious, his judgment acute, his eloquence flowing and ſweet, and his memory capacious and ready on all occaſions. The time he had paſſed in that ſchool of the moſt exquiſite policy, the court of Rome, had greatly improved and refined his underſtanding. Nor was his capacity limited to the ſphere of buſineſs. He made himſelf the king's perpetual companion in moſt of his pleaſures, and conſulted his taſte ſo naturally, and with ſo much eaſe, that in paying his court he ſeemed only to indulge his own inclinations. He occaſionally laid aſide the eccleſiaſtical habit and character. In an expedition with the king to France, he aſſumed the military profeſſion, headed a body of men in his own pay, and commanded at various ſieges. In his manners there was a certain inexpreſſible grace, derived from nature and improved by art, which rendered his virtues more amiable, and even his vices agreeable. Thus his profuſeneſs and oſtentation appeared like generoſity and greatneſs of ſpirit; nor indeed was he deſtitute of theſe qualities, though he carried them far beyond proper bounds. His expence was enormous, and Henry would have been jealous of it, as intended to acquire too much popularity, if he had not been perſuaded, by the addreſs of Becket, that all his magnificence in which the ſon of a private citizen ſurpaſſed even the greateſt and moſt opulent earls, was only deſigned to do honour to his bountiful maſter, whoſe creature he was, and upon whom his whole fortune muſt abſolutely depend. Yet amidſt the luxury in which he lived for ſeveral years, and all the temptations of a court where gallantry reigned, he was, if the writers of his life may be credited, conſtantly temperate and invincibly chaſte.

At the time of the death of archbiſhop Theobald, Becket's patron, the king, was in Normandy; but as ſoon as he heard of it, he reſolved to raiſe his chancellor to the primacy, in hopes by his means of governing the church in tranquillity. This advancement however was retarded for about a

year

year by the oppoſition of the empreſs Maud, the king's mother, and of the clergy and biſhops of England. But Henry's reſolution was fixed, and his fondneſs for his favourite overcame all remonſtrances; ſo that Becket, being firſt ordained prieſt, was conſecrated at Canterbury, June 6, 1162. As ſoon as Becket found himſelf firmly ſeated in the archiepiſcopal chair of Canterbury, he ſuddenly changed his whole mode of life, and from being the gayeſt and moſt luxurious courtier, he became the moſt auſtere and ſolemn monk. Without the king's previous knowledge of his intention, and very much to his ſurpriſe and diſſatisfaction, he reſigned the office of chancellor. Before the king's return to England in 1163, he had received ſo many complaints of the ſeverities of the new primate, that he became ſenſible, when it was too late, that he had made a wrong choice. In his interview with Becket at Southampton, it was obſerved by the whole court that his affection was cooled; and he ſoon after manifeſted his diſſatisfaction with the conduct of the primate, by obliging him, much againſt his inclination, to reſign the archdeaconry of Canterbury. In 1163, Becket attended a council, ſummoned at Tours by pope Alexander III., where he was treated by the pope and cardinals with particular reſpect; and where, it is probable, he was animated by the pope in his deſign of becoming the champion of the liberties of the church, and the immunities of the clergy. It is, however, certain, that ſoon after his return he began to proſecute this deſign without his former reſerve; and the zeal which he manifeſted produced an open breach between him and his ſovereign. Henry was determined to be the ſovereign of all his ſubjects, clergy as well as laity; to oblige them to obey his laws, or to anſwer for their diſobedience in his courts of juſtice. Becket, on the other hand, maintained, that the clergy were ſubject only to the laws of the church, and were to be judged only in ſpiritual courts, and to puniſhed only by eccleſiaſtical cenſures. In order to bring this queſtion to a ſpeedy iſſue, which the licentiouſneſs of the clergy, and the atrocious crimes committed by ſome of them at this time, rendered abſolutely neceſſary, a council of the clergy and nobility was ſummoned at Weſtminſter; and at this council the king required that the archbiſhop and other biſhops would conſent to deliver to his officers a clerk, who was degraded for any crime, in order to his being puniſhed for it according to the laws of the land. This requeſt was reaſonable; but the primate's influence reſiſted the demand; and the council broke up in confuſion. Although Becket ſolemnly promiſed and ſwore, in the words of truth, and without reſerve, to obey the laws and cuſtoms, commonly called the "conſtitutions of Clarendon," which reduced eccleſiaſtics of all denominations to a due ſubjection to the laws of their country, and reſtricted the immunities of the clergy; he ſoon began to exhibit ſigns of repentance, by extraordinary acts of mortification, and by diſcontinuing the performance of the ſacred offices of his function; and he obtained from the pope a bull, releaſing him from the obligation of his oath, and enjoining him to reſume the duties of his ſacred office. Fearful however of the king's indignation, he determined to retire privately out of the kingdom; but being prevented from making his eſcape by contrary winds, he returned to Canterbury; and afterwards waited upon the king at Woodſtock, to ſupplicate forgiveneſs for attempting to leave the kingdom without his permiſſion. The king received him without any other expreſſion of diſpleaſure, beſides aſking him, "if he had left England becauſe he thought it too little to contain them both?" This interview was ſoon ſucceeded by freſh aggreſſions on the part of Becket, which induced the king to ſummon a parliament at Northampton, Oct. 17, 1164, which unanimouſly found the primate guilty of contumacy, in refuſing to attend the king's court when he was ſummoned, and ſentenced him to forfeit all his goods and chattels. He was alſo required to reſtore a ſum of 500*l.* which the king had lent to him, when he was chancellor, and to render an account of 250,000 marks, which he had received from vacant benefices. Theſe demands were of ſo ſerious a nature, that, though he appealed to the pope, many of his epiſcopal brethren deſerted him through fear, and urged him to reſign his office, aſſuring him that if he did not he would be tried for perjury and high treaſon. The barons likewiſe became loud and vehement in their clamours againſt him, ſo that Becket thought it moſt prudent to leave the kingdom. Accordingly he left Northampton at midnight, accompanied only by two monks, and travelling on foot and by night, he arrived at Lincoln, and from thence he paſſed by water to a ſolitary iſland, where he remained till an opportunity offered of paſſing over to Flanders. Some ſay that he travelled to Sandwich, and hired a fiſhing boat to convey him to Boulogne. However that be, he retired to the monaſtery of Saint Bertin. Upon his retreat, the king confiſcated the revenues of the archbiſhopric, and ſent ambaſſadors to the king of France, and the carl of Flanders, diſſuading theſe princes from affording Becket ſhelter in their dominions. The ambaſſadors met with a cold reception at the French court at Compeigne, and were told by Lewis, who was a ſuperſtitious bigot, and a great admirer of Becket, that he would protect the perſecuted prelate with all his power. They then proceeded to Sens, where the pope reſided, who after admitting them to an audience, and conſulting his cardinals, informed them, that no anſwer could be given to their petition till the archbiſhop had been heard. Becket, as ſoon as he was aſſured of the favour and protection of the king of France, paid him a viſit at Soiſſons, where he was affectionately received, and urged to accept an order on the royal treaſury for every thing he needed during his ſtay in France. From Soiſſons he proceeded with a numerous retinue for Sens, which he entered in a kind of triumph, and here the pope treated him with the greateſt reſpect and kindneſs. At a ſolemn council of all the cardinals and prelates, he was ſeated at the pope's right hand, and allowed to keep his ſeat while he explained his cauſe. Having produced, in the courſe of an artful ſpeech, a copy of the conſtitutions of Clarendon, ſeveral of which were directly calculated to abridge the power of the pope and cardinals, the whole aſſembly expreſſed their abhorrence of them in the ſtrongeſt terms, and at the ſame time paſſing the higheſt encomiums on the archbiſhop, declared that his cauſe was the cauſe of God and the church, and that he ought to be ſupported. Becket, with a view of farther ingratiating himſelf with the pope, reſigned his archbiſhopric into his hands, which, however, the pope, with the advice of his cardinals, immediately reſtored to him, appointing him a reſidence in the abbey of Pontigny in Burgundy.

When the ambaſſadors returned to England, and made their report, Henry was highly offended both with the pope and the archbiſhop; and in token of his reſentment prohibited the payment of peter-pence, and commanded all clerks who preſumed to appeal to the pope to be impriſoned. He alſo commanded all the goods and revenues of the archbiſhop, and of all the clergy who adhered to him, to be ſeized; and proceeded to confiſcate the eſtates, and to baniſh the perſons of all the primate's friends, retainers, and relations, to the number of about 400. Becket, during his reſidence at Pontigny, employed himſelf in exerciſes of devotion, and alſo in writing expoſtulatory letters to the

king and bishops of England, in issuing excommunications against several officers of the crown, and in threatening even to excommunicate the king himself. Notwithstanding a spirited remonstrance addressed to Becket by the English prelates, he persisted in his purpose; and communicated it to the pope in a letter, which represented Henry as a cruel, impious, unrelenting persecutor, who had tried and condemned Christ at Northampton, in his person. Henry was much alarmed; and called a council of his barons and prelates at Chinon in Touraine, to consider what was to be done for preventing his excommunication, or for guarding against its consequences. After a long deliberation, it was thought the most expedient to appeal to the pope. In the mean while Henry sent orders to England to guard the sea-coasts, and to take other measures of precaution. Although Becket was prevented by the interposition of the king of France from executing his design of excommunicating Henry, he excommunicated his ministers and chief confidents, and declared the impious constitutions of Clarendon null and void, absolved all the bishops of England from the unlawful oath they had taken to obey them, and excommunicated all persons who paid any regard to them. Upon these presumptuous proceedings Henry threatened to expel all the monks of the Cistercian order from his dominions, if they any longer entertained his enemy the archbishop of Canterbury at Pontigny; upon which he removed to Sens about Martinmas A. D. 1166, where an honorable asylum was provided for him by the king of France. The pertinacity of Becket rendered ineffectual for a long time all the efforts of the English prelates, of the pope, and of the king of France, for terminating the contention between him and the king of England. At length, however, all preliminaries for a reconciliation being adjusted by the papal nuncios, the archbishop was conducted in great state to an audience of his sovereign, July 22. A.D. 1170, in a meadow near Fretville, where the French and English courts, with a prodigious multitude of people of all ranks, were assembled. The conduct of the king on this occasion was singularly condescending; but Becket's lofty and resentful temper was so little impressed by it, that he returned Henry's civility and condescension with complaints and remonstrances. After a promise extorted from the king to repair all the injuries which had been done to the church, the archbishop dismounted in order to throw himself at his feet; but Henry prevented him, and stooped so low as to hold his stirrup, and assist him in re mounting. This reconciliation, however, was far from being cordial, on the part either of Henry or Becket, and it was not likely to be permanent. Whilst the archbishop was waiting at Whitsand, a sea-port in Flanders, previously to his return to England, he sent over three bulls, one for suspending the archbishop of York, who had been employed in crowning the young king, and two for excommunicating the bishops of London and Salisbury, who had assisted at this ceremony. This conduct, which was inexcusable at the moment when he pretended to return in peace, excited against him universal indignation, and eventually proved the cause of his ruin. On his reaching the English shore, attempts were made to prevent his landing, and he was insulted by some persons in arms, who commanded him in a threatening tone to absolve the excommunicated bishops. In his way to Canterbury he was accompanied by a great multitude of people, and entered the city in a kind of triumph amidst the acclamations of his attendants. Soon after his arrival, application was made to him for absolving the bishops whom he had suspended and excommunicated; and the young king, who concurred in the application, and who had issued an order for this purpose, was much incensed at his refusal, more especially as the censures which he had inflicted on those prelates who had assisted at his coronation seemed to call in question its validity. In his progress from Canterbury to Woodstock, where the young king resided, he was attended on his approach to London by prodigious crowds of people, and conducted to his lodgings in Southwark with loud acclamations; in return for which he scattered among the populace both money and episcopal benedictions. Here his vanity was mortified by a message from the young king, forbidding him to proceed any further, or to enter any royal town or castle, and commanding him to return immediately to Canterbury, and to confine himself within the precincts of his church. After his return to this city, he found himself deserted by many of his friends, and received reports of the insults they suffered, and the depredations that were committed upon his estates, so that he indulged gloomy apprehensions, and said to one of his chief confidents, "that he was now convinced this quarrel would not end without blood, but that he was determined to die for the liberties of the church." When the excommunicated prelates arrived in Normandy, and implored the protection of the king from the disgrace and ruin with which they were threatened by the primate, the indignation of Henry was roused, and in the moment of intemperate passion, he exclaimed, "shall this fellow, who came to court on a lame horse, with all his estate in a wallet behind him, trample upon his king, the royal family, and the whole kingdom? Will none of all those lazy cowardly knights, whom I maintain, deliver me from this turbulent priest?" This passionate exclamation made too deep an impression on those who heard it; and particularly on four barons, who formed a resolution, either to terrify the archbishop into submission, or to put him to death. Accordingly, having concerted their plan, they set out for Canterbury by different routes and arrived at a castle about 6 miles from the city on the 28th of December, A. D. 1170; and on the following day they proceeded to the city, and getting admission into the archbishop's apartment, they told him, that they were sent by the king with a command that he should absolve the prelates, and others whom he had excommunicated, and then go to Winchester, and make satisfaction to the young king, whom he had endeavoured to dethrone. Becket, after a violent altercation, in the course of which hints were given that his life was in danger if he did not comply, persisted in his refusal. Upon the departure of the barons, one of them charged his servants not to let him flee; to which Becket, who overheard them, replied with great vehemence; "flee! I will never flee from any man living. I am not come to flee, but to defy the rage of impious assassins." The barons, with their accomplices, finding their threats ineffectual, put on their coats of mail; and taking each a sword in his right hand, and an ax in his left, returned to the palace, but found the gate shut. When they were preparing to break it open, Robert de Broc conducted them up a back stair-case, and let them in through a window. A cry then arose, "they are armed! they are armed!" on which the clergy hurried the archbishop almost by force into the church, hoping that the sacredness of the place would protect him from violence. They would also have shut the door; but he exclaimed "begone, ye cowards: I charge you on your obedience, do not shut the door. What, make a castle of a church!" The conspirators having searched the palace, came to the church, and one of them exclaiming "Where is that traitor? where is the archbishop?" Becket advanced boldly, and replied, "here I am, an archbishop, but no traitor!—I am ready to suffer in the name of him who redeemed me with his blood. God forbid that I should fly for fear of your swords, or recede

from juſtice." They once more commanded him to take off the excommunication and ſuſpenſion of the biſhops. He replied "no ſatisfaction has yet been made; nor will I abſolve them." "Then," ſaid they, "thou ſhalt inſtantly die according to thy deſert." "I am ready to die," replied Becket, "that the church may obtain liberty and peace in my blood. But in the name of God, I forbid you to hurt any of my people." They now ruſhed upon him, and endeavoured to drag him out of the church, with an intention, as they themſelves afterwards declared, to carry him in bonds to the king, or if they could not do that to kill him in a leſs ſacred place. But as he clung faſt to one of the pillars of the choir, they could not free him from thence. During the ſtruggle, he ſhook William de Tracy ſo roughly, that he almoſt threw him down; and as Reginald Fitzurſe preſſed harder upon him than any of the others, he thruſt him away, and called him "pimp." This opprobrious language more enraged that violent man; he lifted up his ſword againſt the head of Becket, who, bowing his neck, and joining his hands together, in a poſture of prayer, recommended his own ſoul, and the cauſe of the church, to God, and to the ſaints of that cathedral. But Edward Grime, one of the monks of Canterbury, interpoſing his arm to ward off the blow, it was almoſt cut off; and the archbiſhop alſo was wounded in the crown of his head. He ſtood a ſecond ſtroke, which likewiſe fell on his head, in the ſame devout poſture, without a motion, word, or groan; but after receiving a third, he fell proſtrate on his face; and all the accomplices preſſing now to a ſhare in the murder, a piece of his ſkull was ſtruck off by one of them; upon which another ſcooped out the brains of the dead archbiſhop with the point of a ſword, and ſcattered them over the pavement of the church.

Thus was aſſaſſinated in the 53d year of his age, and 9th of his pontificate, A. D. 1170, Dec. 29, Thomas Becket;—"a man," ſays lord Lyttelton, "of great talents, of elevated thoughts, and of invincible courage; but of a moſt violent and turbulent ſpirit; exceſſively paſſionate, haughty, and vain-glorious; in his reſolutions inflexible, in his reſentments implacable. It cannot be denied that he was guilty of a wilful and premeditated perjury; that he oppoſed the neceſſary courſe of public juſtice, and acted in defiance of the laws of his country, laws which he had moſt ſolemnly acknowledged and confirmed; nor is it leſs evident, that during the heat of this diſpute, he was in the higheſt degree ungrateful to a very kind maſter, whoſe confidence in him had been boundleſs, and who from a private condition had advanced him to be the ſecond man in his kingdom. On what motives he acted can be certainly judged of by Him alone, *to whom all hearts are open*. He might be miſled by the prejudices of a bigotted age, and think he was doing an acceptable ſervice to God, in contending, even to death, for the utmoſt exceſs of eccleſiaſtical and papal authority. Yet the ſtrength of his underſtanding, his converſation in courts and camps, among perſons whoſe notions were more free and enlarged, the different colour of his former life, and the ſuddenneſs of the change which ſeemed to be wrought in him upon his election to Canterbury, would make one ſuſpect, as many did in the times wherein he lived, that he only became the champion of the church from an ambitious deſire of ſharing its power; a power more independent on the favour of the king, and therefore more agreeable to the haughtineſs of his mind, than that which he had enjoyed as miniſter of the crown. And this ſuſpicion is increaſed by the marks of cunning and falſeneſs which are evidently ſeen in his conduct on ſome occaſions. Neither is it impoſſible, that when firſt he aſſumed his new character, he might act the part of a zealot, merely or principally from motives of arrogance and ambition; yet afterwards, being engaged and inflamed by the conteſt, work himſelf up into a real enthuſiaſm. The continual praiſes of thoſe with whom he acted, the honours done him in his exile by all the clergy of France, and the vanity which appears ſo predominant in his mind, may have conduced to operate ſuch a change. He certainly ſhewed in the latter part of his life a ſpirit as fervent as the warmeſt enthuſiaſt's; ſuch a ſpirit indeed as conſtitutes *heroiſm*, when it exerts itſelf in a cauſe beneficial to mankind. Had he defended the eſtabliſhed laws of his country, and the fundamental rules of civil juſtice, with as much zeal and intrepidity as he oppoſed them, he would have deſerved to be ranked with thoſe great men, whoſe virtues make one eaſily forget the alloy of ſome natural imperfections; but unhappily his good qualities were ſo miſapplied, that they became no leſs hurtful to the public weal of the kingdom, than the worſt of his vices." Mr. Hume cloſes his account of the aſſaſſination of Becket with the following conciſe ſketch of his character. He was "a prelate of the moſt lofty, intrepid, and inflexible ſpirit, who was able to cover to the world, and probably to himſelf, the enterpriſes of pride and ambition under the diſguiſe of ſanctity and of zeal for the intereſts of piety and religion. An extraordinary perſonage, truly, if he had been allowed to remain in his firſt ſtation, and had directed the vehemence of his character to the ſupport of law and juſtice; inſtead of being engaged, by the prejudices of the times, to ſacrifice all private duties and all public connections to ties which he imagined or repreſented as ſuperior to every civil or political conſideration. But no man, who enters into the genius of that age, can reaſonably doubt of this prelate's ſincerity." Another judicious hiſtorian (Dr. Henry) ſays of Becket: "He was evidently a man of very great abilities, particularly of conſummate cunning, undaunted courage, and invincible conſtancy in the proſecution of his deſigns. But his ſchemes were of a moſt pernicious tendency, to emancipate the miniſters of religion from the reſtraints of law, and to ſubject his king and country to a foreign power. He was vain, obſtinate, and implacable; as little affected by the entreaties of his friends, as by the threats of his enemies. His ingratitude to his royal maſter admits of no excuſe, and hath fixed an indelible ſtain upon his character. Though his murderers were highly criminal, his death was very ſeaſonable, and probably prevented much miſchief and confuſion."

The reſpect paid to the memory of Becket, after his death, was extravagant beyond all bounds, and remains on record as an evidence of the ſuperſtition and credulity which prevailed at the period in which it occurred. The king of England, to whoſe commands it was generally imputed, was repreſented as "that horrible perſecutor of God, who exceeded Nero in cruelty, Julian in perfidy, and Judas in treachery;" and the pope was loudly called upon by the kings of France and many prelates to draw the ſword of St. Peter, and to inflict ſome exquiſite puniſhment upon him. But none expreſſed greater grief and horror at this deed than Henry himſelf, who broke out into the loudeſt lamentations, refuſed to ſee any company, or admit of any conſolation for three days. He alſo diſpatched an embaſſy to Rome to vindicate himſelf from the imputation of having been the cauſe of it. All divine offices were ſuſpended for nearly a year in the church where it had happened; and the church itſelf was, by order of the pope, re-conſecrated. In 1173, Becket was canonized by a bull of pope Alexander; and a particular collect was appointed to be uſed in all the churches of the province of Canterbury, for expiating the guilt of his murder. In

the

the following year, king Henry, on his return to England, went to Canterbury, where he did penance, and underwent a voluntary diſcipline, walking bareſoot to his tomb, proſtrating himſelf before it, and ſubmitting to be ſcourged by the monks, paſſing all the day and night without any refreſhment, kneeling on the bare ſtones, and beſtowing great beneſactions on the church of Canterbury, as a teſtimony of his regret for the murder. His virtues were the ſubjects of endleſs panegyric, and the miracles, operated by his relics, were more numerous, more nonſenſical, and more impudently atteſted, ſays Hume, than thoſe which ever filled the legend of any confeſſor or martyr. Gervaſe of Canterbury informs us, that two large volumes of them were preſerved in that church. In 1221, his body was taken up, in the preſence of king Henry III. and a vaſt concourſe of the nobility and others, and depoſited in a rich ſhrine erected at the expence of archbiſhop Stephen Langton. This ſhrine was enriched with preſents from all parts of Chriſtendom; pilgrimages were performed to it for obtaining the martyred prelate's interceſſion with heaven; and it has been computed that, in one year, above 100,000 pilgrims arrived in Canterbury, for the purpoſe of paying their devotions at this tomb. "It is indeed," ſays Hume, "a mortifying reflection to thoſe who are actuated by the love of fame, ſo juſtly denominated the laſt infirmity of noble minds, that the wiſeſt legiſlator and moſt exalted genius that ever reformed or enlightened the world, can never expect ſuch tributes of praiſe as are laviſhed on the memory of a pretended ſaint, whoſe whole conduct was probably, to the laſt degree, odious or contemptible, and whoſe induſtry was entirely devoted to the purſuits of objects pernicious to mankind." Lyttelton's Hiſt. Henry II. vol. ii. p. 321, &c. vol. iv. p. 361, &c. 8vo. Hume's Hiſt. of England, vol. i. p. 447, &c. 8vo. Henry's Hiſt. of Great Britain, vol. v. p. 340, &c. 8vo.

BECKET, William, ſon of Iſaac Becket, a ſurgeon of ſome eminence at Abingdon, in Berkſhire, under whom he received his education, was born in the year 1684. At a proper age, he was ſent to London, and was for ſome years pupil to Mr. Joſ. Bateman, ſurgeon to St. Thomas's hoſpital in Southwark. That he was diligent in cultivating his profeſſion, appears by the early ſpecimens he gave of the reſult of what he had ſeen in practice: for in 1707, he publiſhed a collection of chirurgical obſervations, containing relations of ſome curious caſes that had fallen under his notice; and in 1712, "New Diſcoveries in the Cure of Cancers;" and ſoon after, a recital of the caſe of Dr. James Keil, the celebrated phyſician and mathematician, who died of a cancer in his mouth. Becket had been accuſed of miſmanaging this caſe, and therefore publiſhed the account in vindication of his practice. In his New Diſcoveries, he pretends to have been frequently ſucceſsful in removing cancerous tumours, by means of a digeſtive, the manner of preparing which he does not however diſcloſe. In a ſubſequent edition of this work, he gives the deſcription of a medicine, which had been uſed ſucceſsfully, it was ſaid, in eradicating cancers by the family of the Paines of Northampton. It conſiſts of yellow arſenic and hole armenic, mixed to the conſiſtence of a paſte with the pulp of an apple. It is called the red cauſtic. A ſimilar preparation has been ſince uſed by Plunket and others. In 1721, he publiſhed two letters addreſſed to ſir Hans Sloane, in which he refutes the current opinion of the efficacy of the royal touch in curing the evil, which was perhaps preparatory to his being elected fellow of the Royal Society. About this time he publiſhed propoſals for printing an account of the lives and writings of the moſt eminent Britiſh writers in medicine, in 2 vols. 8vo. which he did not however complete. Dr. Milward, who had formed a ſimilar deſign, is ſaid to have purchaſed what manuſcripts were left by him on this ſubject, of his executors; but neither did he carry his intention into execution. It is probable that, while making this ſearch after ancient Britiſh writers, Becket met with accounts of the diſeaſe called a brenning, and conceiving that to be a ſymptom of the venereal diſeaſe, he was induced to publiſh his three diſſertations on the antiquity of that complaint, which was known, he ſays, before the diſcovery of the Weſt Indies by Columbus. Theſe were firſt printed in the Philoſophical Tranſactions. Becket died at Abingdon in 1738. His works were collected together, and publiſhed in 9 vols. 8vo. in 1740, by the noted Mr. Edmund Curl.

BECKET, Isaac, a mezzotinto engraver of ſome eminence, was born in Kent in 1653, was originally an apprentice to a callico-printer, and obtained the ſecret of ſcraping mezzotinto from one Loyd, a print-ſeller, with whom he lived for ſome time. He afterwards connected himſelf with an engraver in mezzotinto, with whom he had been acquainted at an earlier period of his life, and who aſſiſted him, as he drew better and more expeditiouſly than himſelf. His mezzotintos are often clear and well ſcraped; but his middle tints are not ſufficiently diſtinguiſhed, ſo that his ſhadows appear flat and heavy. One of his beſt prints is engraved on a middling-ſized upright plate, repreſenting Adrian Beverland drawing from a ſtatue, and having in the back ground monuments, pyramids, and ſeveral relics of antiquity. The time of his death is not known. Strutt.

Becket, St. Thomas, *Brotherhood of*, in *Commerce*, a name given to the moſt ancient company of Engliſh merchants of which hiſtory furniſhes any record, which was eſtabliſhed about the end of the 13th century, and thus called in honour of Becket. The deſign of this company was to export the woollen cloth, which about that time began to be manufactured in conſiderable quantities in England; and as that manufacture increaſed, the trade of the brotherhood alſo increaſed. Henry IV. A. D. 1406, incorporated this ſociety by a charter, regulating their government and their privileges. By this charter, any merchant of England or Ireland, who deſired it, was to be admitted into the company on paying a ſmall fine. As this ſociety was compoſed of the native ſubjects of the kings of England, it was favoured both by government and by the people, made gradual encroachments on the trade of the merchants of the ſtaple, and at length ruined that company. Anderſ. Comm. vol. i. p. 233, 260, &c. See Staple.

Becket, in *Geography*, a townſhip of America, in Berkſhire county, Maſſachuſetts, containing 751 inhabitants, 10 miles eaſt of Stockbridge, and 130 weſt from Boſton.

BECKETS, in the *Marine*, ſignify large hooks, or circular wreaths of rope, or wooden brackets, uſed to confine ropes, tackles, oars, or ſpars, in a convenient place, till they are wanted. And *to put the tacks and ſheets in the beckets*, is to hang up the weather-main and fore-ſheet, and the lee-main and fore-tack, to a little knot and eye-becket on the fore-maſt, main, and fore-ſhrouds, when the ſhip is cloſe-hauled, to prevent them from hanging in the water. Some beckets have an eye ſpliced in one end, and a ſmall walnut-knot crowned at the other, and ſome have both ends ſpliced together like a wreath. The nooſe made at the breaſt of a block, to make faſt the ſtanding part of a fall-to, is alſo called a becket.

BECKINGTON, Thomas, in *Biography*, an Engliſh prelate of the 15th century, was born in the pariſh of Beckington, in Somerſetſhire, towards the cloſe of the 14th century, educated at Wykeham's ſchool, near Wincheſter, and

and finiſhed his ſtudies at New College, Oxford, of which he was admitted fellow in 1408. After ſeveral eccleſiaſtical preferments he became dean of the arches about the year 1429, and was employed by a ſynod held in St. Paul's church, London, in conjunction with two other perſons, to draw up a form of law, by which the proſecution of the Wickliffites, or Lollards, was to be conducted. Whilſt he was tutor to king Henry VI. he wrote a book, preſerved in manuſcript in the Cottonian library, in which he ſtrenuouſly aſſerted, in oppoſition to the Salique law, the right of the kings of England to the crown of France; and then gaining the ſpecial favour and patronage of that prince, he was made ſecretary of ſtate, keeper of the great ſeal, and biſhop of Bath and Wells, to which he was conſecrated in 1443. He is repreſented as having been well ſkilled in polite learning and hiſtory, and very converſant in the holy ſcriptures; as a good preacher, and as a generous patron of ingenious and learned men, ſo that he was called the Mæcenas of his age. His works of munificence and charity were numerous. He finiſhed Lincoln college in Oxford; procured an endowment for New College, in 1440; laid out a conſiderable ſum of money in repairing houſes belonging to his ſee; and erected the weſt ſide of the cloiſters at Wells, and alſo a conduit in the market place of that city. He died at Wells, in 1465. A large collection of his letters is preſerved in the library at Lambeth; and a volume of ſermons and ſome other treatiſes are aſcribed to him. Biog. Brit.

BECMARE, in *Entomology*, a genus of inſects eſtabliſhed by Geoffroy. See RHINOMACER.

BECOUYA, in *Geography*. See BEKIA.

BECSANGIL, a name ſometimes given to a province of Aſia, which is a part of Anatolia, bounded on the north by the Black ſea, on the weſt by the ſea of Marmora and the Archipelago, on the ſouth by Natolia proper, and on the eaſt by the province of Bolli. The capital is Burſa.

BECTIVE, in the county of Meath, Ireland, where are conſiderable ruins of an abbey which belonged to the Ciſtercians. It was founded by Murchard O'Melachlin, king of Meath, in 1146; and being richly endowed, the abbot had a place among the peers in the aſſemblies of parliament, and wore a mitre. The cloiſters with a tower are almoſt entire. It was pleaſantly ſituated on the banks of the Boyne, over which river there was a bridge; and at preſent a little village, called *Bective-bridge-end*, has two fairs annually. It is 3 miles from Trim, and about 24 from Dublin. Monaſtic Hibern. Ware's Antiquities.

BECTASSE, a ſect among the Turks denominated from their founder Bectaſh, preacher to ſultan Amurath.

All the Janizaries belonging to the Porte are of the religion of Bectaſſe, and are ſaid to have derived their origin from the founder of this ſect. Their habit is white; on their heads they wear white caps of ſeveral pieces, with turbans of wool twiſted rope-faſhion. They obſerve conſtantly the hour of prayer, which they perform in their own aſſemblies, and they make frequent declarations of the unity of God.

BED, a place prepared to ſtretch and compoſe the body on, for reſt and ſleep; made chiefly of feathers incloſed in a ticken caſe. Of beds there are ſeveral ſorts: as a feather-bed, a down-bed, a ſtanding-bed, a ſettee-bed, a tent-bed, a truckle-bed, &c.

In the firſt and ruder ages of mankind, it was the univerſal practice to ſleep upon the ſkins of beaſts. This was the cuſtom among the Greeks and Romans, and alſo among the Celtic nations, and ancient Britons. This cuſtom prevailed till modern times among the common people in ſome parts of Germany. Theſe ſkins, ſome of which are worn in the day, were ſpread at night on the floors of their apartments. In proceſs of time, theſe ſkins were changed for looſe ruſhes and heath, and afterwards for ſtraw. Pliny (l. viii. c. 48. l. xvi. c. 36.) ſays, that the beds of the Roman gentry were generally filled with feathers, and thoſe of the inns with the ſoft down of reeds. Straw was uſed, even in the royal chambers of England, ſo late as the cloſe of the 13th century. Beds, filled with chaff, heath, or ſtraw, are uſed by the common people in many parts of Great Britain and Ireland, and alſo in France and Italy at this day. Beds were for a long time laid upon the ground; till at length the cuſtom of raiſing the beds on feet or pedeſtals, which anciently prevailed in the Eaſt, and which was introduced into Italy, was adopted in Britain. But ſtill the materials of which beds are made, and the manner of diſpoſing them, vary among different ranks, and in different nations. By the Engliſh ſtatutes, no beds are to be ſold, except filled with one ſort of ſtuffing only; e. gr. feather beds with only dry pulled feathers; and down beds with clean down alone. No ſcalded feathers are to be mixed with the former; nor fen down with the latter, on pain of forfeiture; the mixture of ſuch things being conceived as contagious for man's body to lie on. Stat. 11 Hen. VII. c. 19.

Alſo bed quilts, mattraſſes, and cuſhions ſtuffed with horſe-hair, fen-down, goats' hair, and neats' hair, which are dreſſed in lime; and which the heat of man's body will cauſe to exhale, and yield a noxious ſmell, whereby many of the king's ſubjects have been deſtroyed, are prohibited by the ſame ſtatute.

The ancient Romans had various kinds of beds for repoſe; as their *lectus cubicularis*, or *chamber-bed*, whereon they ſlept; their *table-bed*, or *lectus diſcubitorius*, whereon they eat (for they always ate lying, or in a recumbent poſture), there being uſually three perſons to one bed, whereof the middle place was accounted the moſt honourable, as well as the middle bed. See TRICLINIUM. Theſe beds were unknown before the ſecond Punic war: the Romans, till then, ſat down to eat on plain wooden benches, in imitation of the heroes of Homer; or as Varro expreſſes it, after the manner of the Lacedæmonians and Cretans. An innovation in this practice is aſcribed to Scipio Africanus, who brought from Carthage ſome of thoſe little beds, called "Punicani," or "Archaici," which were of wood, very low, ſtuffed only with hay or ſtraw, and covered with the ſkins of ſheep or goats, "hædinis pellibus ſtrati." Theſe beds in reſpect of delicacy differed little from the wooden benches; but when the cuſtom of bathing prevailed, the practice of reſting themſelves more commodiouſly by lying along than by ſitting down, was adopted. As for the ladies, it did not ſeem at firſt conſiſtent with their modeſty to adopt the mode of lying; accordingly they kept to the old cuſtom all the time of the commonwealth; but, from the firſt Cæſars, they ate on their beds. As to the youth, who did not yet put on the *toga virilis*, they were long kept to the ancient diſcipline. When they were admitted to table, they only ſat on the edge of the beds of their neareſt relations. Never, ſays Suetonius, did the young Cæſars, Caius and Lucius, eat at the table of Auguſtus; but they were ſet "in imo loco," or, as Tacitus expreſſes it, "ad lecti fulcra." From the greateſt ſimplicity, the Romans, by degrees, carried their dining beds to the moſt ſurpriſing magnificence. Pliny aſſures us, it was no new thing to ſee them covered over with plates of ſilver, adorned with the ſofteſt mats, and the richeſt counterpanes. Hiſt. Nat. lib. xxxiii. cap. 11. Lampridius, ſpeaking of Heliogabalus, ſays, that he had beds of ſolid ſilver; and Pompey, in his third triumph, introduced beds of gold. They had alſo their *lectus lucubratorius*, on which they ſtudied;

and

and a *lectus funebris*, or *emortualis*, on which the dead were carried to the pile. See FUNERAL.

BED *of State*. See PARADE.

BED *of Juſtice*, *Lit de Juſtice*, in the French *Laws*, denoted a throne on which the king uſed to be ſeated in parliament. In this ſenſe, he was ſaid to hold his *lit de juſtice*, when he went to the parliament of Paris, and held a ſolemn ſeſſion, under a high canopy erected for the purpoſe. The bed of juſtice was only held on affairs relating to the ſtate; on which occaſion, all the officers of the parliament appeared in red robes; at other times they wore black ones. Several authors have treated expreſly on the ceremonies of the bed of juſtice.

BED *of a great Gun*, is a piece of plank laid within the cheeks of the carriage, on the middle tranſum, for the breech of the gun to reſt on.

BED, or *Stool of a Mortar*, is a ſolid piece of oak, in form of a parellepiped, bigger or leſs, according to the dimenſions of the mortar, hollowed a little in the middle to receive the breech and half the trunnions. On the ſides of the bed are fixed the cheeks or brackets by four bolts of iron.

In ſhips, when the decks lie too low from the ports, ſo that the carriages of the pieces, with the trucks, cannot mount the ordnance ſufficiently, but that they lie too near the gunwale; the method is to make a falſe deck for ſo much as the piece will require for her traverſing to raiſe it higher; and this they call a *bed*.

BED, in *Gardening*, a ſmall elevated plot or compartment of ground, of three, four, or more feet in breadth, which is uſeful in the culture of many ſorts of plants, eſpecially thoſe of the ſmaller kinds. It is always an eligible practice to ſow and prick out different ſorts of ſmall plants on beds having narrow alleys between them, for the greater convenience of weeding, watering, gathering, &c. as by this means ſuch operations can be performed without trampling on the crops. Thus the ground intended for aſparagus and ſtrawberries ſhould be divided into four feet wide beds, with eighteen inches or two feet alleys between them. Onions are likewiſe cultivated to the beſt advantage on four feet wide beds, having ten or twelve inch alleys; the different ſorts of lettuce and endive ſhould alſo be ſown and tranſplanted into ſeparate beds occaſionally; and alſo various ſorts of ſmall plants, which can be more conveniently cultivated on beds, or in borders of ſimilar widths. Early radiſhes are generally ſown on beds, or ſimilar compartments, as being more convenient for the purpoſes of covering them occaſionally in froſty nights, and for weeding, thinning, watering, and gathering them.

All ſorts of plants that are particularly intended for tranſplantation, ſhould be ſown in beds or narrow borders, ſo as to admit of ſtanding to weed, water, and draw the plants, without treading upon them; and for the ſame reaſon, all plants neceſſary to be pricked out previouſly to their final tranſplanting, ſhould alſo be put out on ſuch beds; as celery, cabbages, cauliflowers, broccoli, &c. Aromatic and medicinal herbs of all ſorts ſhould alſo, for the greateſt part, be diſpoſed in beds with twelve or fifteen inch alleys between, or at leaſt in borders of ſimilar widths; particularly mint, thyme, ſavory, marjoram, ſage, hyſſop, balm, penny-royal, tanſey, tarragon, feverfew, rue, &c. as this method of bedding all ſorts of ſmall plants is not only more commodious for performing the neceſſary operations without injuring the plants, but has an air of uniformity which is conſtantly to be obſerved in garden work.

The moſt proper dimenſions for beds of this ſort, as has been obſerved, is four feet or four feet and a half in width, the length at pleaſure, with intervening ſhallow alleys of from nine, twelve, or fifteen inches to two feet width, according to the different ſorts of plants, ſo that a perſon in the alleys may eaſily reach half acroſs them to do the neceſſary work without trampling the plants down, or treading the ſurface of the ground hard.

Where flower gardens are wanted to be diſtinct from the general pleaſure ground, the ſpaces ſhould be divided into regular parallel beds, of three or four feet in width, with eighteen inches or two feet wide alleys, eſpecially when chiefly intended for the curious ſorts of bulbous-rooted flowers, ſuch as tulips, hyacinths, ranunculuſes, anemones, and other choice ſorts, where, by being depoſited together in beds, having intervening alleys, they admit of paſſing between them, to perform the neceſſary buſineſs of culture more eaſily, as well as to view the plants when in flower. Many ſorts likewiſe appear to greater advantage in this way.

The beds, in theſe caſes, ſhould be neatly edged with box or thrift. See EDGING.

The grounds of nurſeries intended for raiſing all ſorts of flowers from ſeeds, ſlips, cuttings, parting of roots, &c. ſhould alſo be divided into beds of three or four feet in width. And in large nurſeries for trees, the ground intended for the reception of cuttings of moſt ſorts of hardy trees and ſhrubs, ſhould alſo be generally divided into three or four feet beds, having twelve or fifteen inch alleys between them.

Beds in common ſhould only be raiſed a very little higher than the alleys, unleſs in caſes of too much ſtagnant moiſture, three or four inches higher than the level of the alley is moſtly ſufficient; for when raiſed conſiderably, the alleys aſſume the appearance of trenches, and have a diſagreeable effect.

The earth of all ſorts of beds ſhould be well broken down, and laid as even as poſſible in digging them over, being afterwards raked into neat order on the ſurface.

Beds for raiſing melons, muſhrooms, and the like, are commonly denominated *ridges*.

BEDS, in ſpeaking of hops, denote the floors whereon they are ſpread to dry.

BED *of Corn*, is a heap, flat at top, three or four feet high; otherwiſe called a *couch*.

BED-*algenſe*, a name given by the Arab *Aſtronomers* to a fixed ſtar of the firſt magnitude in the right ſhoulder of ORION. *Bed-algenſe* is of a ruddy colour, by which it is eaſily diſtinguiſhed.

BED, in *Maſonry*, denotes a courſe or range of ſtones.

BED, *Joint of the*, is the mortar between two ſtones placed over each other.

BED, in *Sea Language*, a flat, thick piece of timber laid under the quarters of caſks, containing any liquid, and ſtowed in the ſhip's hold.

BED *of a River*, the bottom of the channel in which the ſtream flows.

BEDS, in ſpeaking of minerals and foſſils, ſignify certain ſtrata, or layers of matter, diſpoſed over each other.

BEDS, in the *New Huſbandry*, denote the ſpaces occupied by the rows of corn, in contradiſtinction from the open ſpaces between them, which are called alleys.

BEDALACH, in the *Materia Medica*, a name given by ſome writers to the gum bdellium; but particularly to that kind of it which was brought from Arabia, and was of a yelloviſh colour, like wax.

BED-CHAMBER.—*Lords or Gentlemen of the* BED-CHAMBER, are perſons of the firſt rank, fourteen in number, whoſe office uſed to be, each in his turn, to attend a week in the king's bed-chamber, lying by the king on a pallet-

pallet-bed all night, and to wait on the king when he eats in private. Their ſalary is 1000l. per annum. The firſt of theſe is called *groom of the* STOLE. There are alſo twelve grooms of the bed-chamber.

BED-MOULDING, in *Architecture*, is a term uſed by workmen to expreſs thoſe members of a cornice which lie below the corona. A bed-moulding uſually conſiſts of theſe four members, an ogee, a liſt, a large boultine, and another liſt under the coronet.

BEDA, or BEDE, diſtinguiſhed by the epithet *Venerable*, in *Biography*, a learned monk of the eighth century, and one of the beſt writers of his time, was born in the neighbourhood of Weremouth, in the biſhopric of Durham, in 672 or 673. At the age of ſeven years he was brought to the monaſtery of St. Peter, founded near the place of his nativity about two years after he was born; and the care of his education was entruſted with abbot Benedict, his ſucceſſor Ceolfrid, and John of Beverly, for twelve years. Endowed with an excellent genius, and diſtinguiſhed by aſſiduous application, his progreſs in various branches of learning, during this period, was very conſiderable. At the cloſe of it, or when he had attained the age of 19 years, he was ordained a deacon by the laſt mentioned preceptor, then biſhop of Hexham, and afterwards archbiſhop of York. About this time he ſeems to have removed from the monaſtery of St. Peter's at Weremouth, where he was educated, to that of St. Paul's at Jarrow, near the mouth of the river Tyne, founded, as the former had been, by the abbot Benedict. Here he was employed in the proſecution of his own ſtudies, and in aiding thoſe of others who reſorted to this monaſtery for inſtruction. His whole life, which he ſpent in this retreat, was devoted, as he himſelf informs us, to the exerciſes of devotion in the church, and to thoſe of teaching, reading, and writing. At the age of 30, A. D. 702, he was ordained prieſt by the ſame perſon from whom he had received deacon's orders. Although he lived in retirement, the fame of his learning and character ſoon ſpread over Europe; ſo that pope Sergius addreſſed a letter to abbot Ceolfrid, in which he urged him to ſend Bede to Rome. The death of the pope, which probably happened ſoon after this letter was written, prevented Bede from leaving his own country; nor indeed does it appear, with ſufficient evidence, that he ever quitted Northumberland, though ſome have ſaid that he viſited the univerſity founded at Grantcheſter or Cambridge, and this fact they allege as a proof of the antiquity of this univerſity. Within the walls of the monaſtery, in which he choſe to reſide, he was indefatigable in the acquiſition of knowledge, and in the communication of it to others. It appears from his numerous works on a variety of ſubjects, that his knowledge comprehended every kind of literature and ſcience that was known at the period in which he lived; and from other collateral evidence of unqueſtionable authority, that he was juſtly entitled to the appellations of "the wiſe Saxon," and of "Venerable Bede," conferred on him by his contemporaries, and uniformly retained by poſterity. From his never having accepted any preferment above the humble rank of an unbeneficed prieſt, we may infer his ſingular moderation; his letter, addreſſed to his intimate friend, the learned Egbert, archbiſhop of York, and containing excellent advice, the reſult of long experience, evinces the purity of his morals and the liberality of his ſentiments; and as he was never canonized as a ſaint, and the legends of the time record no miracle performed by him, we may reaſonably conclude, that enthuſiaſm and the ſpirit of his order formed no part of his character. He appears indeed, as one of his biographers ſums up his account of him, "to have poſſeſſed the rare aſſociation of learning with modeſty, of devotion with liberality, and of high reputation in the church with voluntary and honourable poverty."

The largeſt and moſt popular of Bede's works is his hiſtory of the church, intitled, "Eccleſiaſticæ Hiſtoriæ Gentis Anglorum libri quinque," and firſt publiſhed in 731, the year to which he continued his hiſtory of Chriſtianity from its firſt introduction into Britain. In collecting materials for this hiſtory, he conſulted ſeveral chronicles of the Engliſh kings before his time; he kept up a correſpondence in the ſeveral kingdoms of the heptarchy, and he had recourſe to various records and archives preſerved in ſeveral monaſteries; and his hiſtory has been regarded as containing the moſt authentic and comprehenſive account of the early ſtate of Chriſtianity in this country. The famous Milton, indeed, has objected to this hiſtory, that it is deficient with regard to the civil affairs of the country, which are mentioned very curſorily, and which form rather a calendar of dates, than a regular hiſtory; but if it be duly conſidered, that his object was the ſtate of the church, and not the ſecular tranſactions of the period which his hiſtory comprehends, this objection muſt appear to be urged againſt it without ſufficient reaſon. Milton himſelf confeſſed, that he travelled with much worſe guides after he parted with Beda. The charge that has been alleged againſt him, of partiality to the Saxons in preference to the Britons, ſeems to be leſs exceptionable. But the chief objection to which his hiſtory is liable, is the diffuſe account which he introduced of legendary miracles and of other trivial and abſurd circumſtances, extracted without ſufficient diſcrimination and with apparent credulity from the chronicles to which he had acceſs; and yet, when we recollect the period in which he lived, and conſider, that the principal tranſactions of the church upon record conſiſted of ſuch fooleries and impoſtures, we may admit ſome apology for a writer who wiſhed to approve himſelf a faithful hiſtorian. Without adverting to the cenſures of M. du Pin, which extend to the ſtyle and ſubjects of Bede's works in general, and which are amply ſtated and ſatisfactorily obviated in the Biog. Brit. it may not be improper to mention the objection urged by father Pezron againſt the chronology of Bede. This father, who has taken great pains, after Iſaac Voſſius and father Morin, to ſupport the chronology of the Septuagint, informs us, that Bede was the firſt who endeavoured, in the weſtern church, to maintain the ſhorter chronology of the Hebrew text; and archbiſhop Uſher, in his "Sacred Chronology," obſerves, that Bede was conſidered as an heretic on account of this innovation. However, his computation was afterwards received, and ſcarcely any other was admitted in the weſt till the three learned men above-mentioned appeared in defence of the contrary opinion. If Bede, therefore, was ſingular in being an advocate for the Hebrew chronology, this ſingularity affords evidence of his learning, penetration, and good ſenſe. The author's eccleſiaſtical hiſtory is written in eaſy, though not very elegant Latin; and as to the faults in his ſtyle, which ſome, and particularly Du Pin, have cenſured, they will not appear to be very great, if compared with contemporary writers; and to compare him with others is certainly unjuſt. Of the Latin original of this Hiſtory there have been ſeveral editions with notes and commentaries; particularly at Antwerp in 1550, at Heidelberg in 1587, at Cologne in 1601, at Cambridge in 1644, at Paris in 1681, and at Cambridge in 1722. A Saxon verſion attributed to king Alfred, with learned notes by Abraham Wheeloc, was printed at Cambridge in 1644; and an Engliſh tranſlation by Dr. Stapleton was printed at Antwerp in 1505. The deſign of the latter tranſlation was to ſupport the popiſh religion, and of courſe it is not deemed very faithful; but the hiſtory of

Bede, even as he has given it in Engliſh, might in many paſſages be ſhewn to be far enough from favouring the doctrines of the church of Rome.

The laſt literary labour of venerable Bede, was "A Tranſlation of the Goſpel of St. John into the Saxon Language," which he completed with difficulty on the day and hour of his death, which happened on the 26th of May, A.D. 735. The diſorder of which he died was an aſthma; and he bore the pain that attended it with exemplary fortitude and patience, diſcharging the duties of his office, and proſecuting the works in which he was engaged, and which he wiſhed to finiſh, with unabated aſſiduity. During many ſleepleſs nights, he is ſaid to have ſung praiſes to Almighty God; and in the proſpect of diſſolution, he did not diſſemble his apprehenſions of it, though he expreſſed the utmoſt confidence in the divine mercy, and was able, on a review of his conduct, to declare ſeriouſly that he had ſo lived, as not to be aſhamed to die. During an act of devotion, and whilſt he was pronouncing the laſt word of it, he expired. It would be eaſy to cite a great number of teſtimonies to the extent of Bede's learning, as well as to the excellence of his character. William of Malmeſbury, after giving him an extraordinary character, tells us, "that it was much more eaſy to admire him in thought, than to do him juſtice in expreſſion." Bale aſſures us, that he was ſo well ſkilled in the writings of Pagan authors, that he had ſcarcely an equal in that age, and that he learned natural philoſophy and mathematics from the pureſt ſources, the Greek and Latin authors themſelves. Pits ſays, that he was ſo well verſed in all the branches of learning, that Europe ſcarcely ever produced a greater ſcholar in all reſpects; that even, while he was living, his writings were of ſuch authority, that it was ordered by a council held in England, and approved afterwards by the catholic church, that they ſhould be publicly read in the churches; that from his earlieſt years, he was remarkable for his piety and love of learning, alternating without interruption his prayers and his ſtudies; and that his intenſe application furniſhed him with a complete knowledge of poetry, rhetoric, natural philoſophy, metaphyſics, aſtronomy, arithmetic, muſic, geometry, coſmography, chronology, hiſtory, and the whole circle of the liberal arts, and all parts of mathematics, philoſophy, and divinity. Camden repreſents him as the ſingular light of our England; and many teſtimonies in his favour may be found in the works of our hiſtorians and antiquarians, ſuch as Hollinſhed, Stowe, Speed, Selden, ſir Henry Spelman, Stillingfleet, Mabillon, Warton, &c.

Beſides the Hiſtory, the tranſlation of St. John's goſpel, and the letter to Egbert, already mentioned, there are a great many works, both publiſhed and in manuſcript, that have been attributed to Bede; ſome of which, however, are of dubious genuineneſs. They are enumerated in the Biographia Britannica, Cave's Hiſt. Lit. and in the appendix to the fourth volume of Henry's Hiſtory. They compoſe a very miſcellaneous collection of verſions and commentaries upon ſeveral books of the Old and New Teſtament, of legends, and theological diſſertations; among which are ſome of greater value on the ſcripture chronology, and many elementary compilations, for the uſe of his ſcholars, on the ſubjects of arithmetic, grammar, rhetoric, aſtronomy, muſic, and natural philoſophy. The firſt general collection of his works appeared at Paris, in 1544, in 3 vols. folio; and again in 1544, at the ſame place, in 8 vols.; at Baſil, in the ſame ſize and number of volumes, in 1563, reprinted at Cologne, in 1612, and at the ſame place in 1688. Several of Bede's works have been ſeparately printed; and thoſe treatiſes, which are mentioned in his own catalogue of his works, annexed to his eccleſiaſtical hiſtory, were publiſhed by the learned and induſtrious Mr. Wharton, from three manuſcripts in the archiepiſcopal palace at Lambeth, London, 1693, 4to. Cave's Hiſt. Lit. vol. i. p. 612, &c. Henry's Hiſt. vol. iv. p. 26, &c. Warton's Hiſt. Poetry, vol. i. diſſ. 2. Biog. Brit. Gen. Dict.

It is from the *Eccleſiaſtical Hiſtory* of this worthy monk, that we know any thing concerning muſic in our country during the ſeventh and eighth centuries, the moſt barbarous period of its annals. In his account of the converſion of the Saxons to Chriſtianity, he ſpeaks of *litanies* and *alleluiahs* being ſung in the Gregorian manner, according to the Roman ritual, when biſhop Stillingfleet thinks that the goodneſs of the muſic was the principal incitement to the reception of the maſs by the Saxons.

Bede was himſelf an able muſician, and is ſuppoſed to have been the author of a ſhort muſical tract. "De Muſica Theorica, et Practica ſeu Menſurata." Of the two parts of this treatiſe aſcribed to Bede, the firſt *may* have been written by him; the ſecond, however, is manifeſtly the work of a much more modern author; for we find in it, not only the mention of muſic in two or three different parts, under the name of *diſcant*, but of inſtruments never mentioned in writers cotemporary with Bede; ſuch as the *organ*, *viole*, *atola*, &c. A notation too of much later times appears here, in which the *long*, the *breve*, and *ſemibreve*, are uſed, and theſe upon *five lines* and ſpaces, with equivalent reſts and pauſes. The word *modus* is alſo uſed for *time* in the ſenſe to which the term *mood* was applied after it ceaſed to mean *key*. Upon the whole it ſeems as if this laſt part of the tract attributed to Bede, was written about the twelfth century; that is, between the time of Guido and John de Muris.

Bede, however, informs us that, in 680, John, præcentor of St. Peter's in Rome, was ſent over by pope Agatho to inſtruct the monks of Weremouth in the art of ſinging, and particularly to acquaint them with the manner of performing the feſtival ſervices throughout the year, according to that which was practiſed at Rome. And ſuch was the reputation of his ſkill, that "the maſters of muſic from all the other monaſteries of the north came to hear him; and prevailed on him to open ſchools for teaching muſic in other places of the kingdom of Northumberland."

And it is from Bede's information that we have any knowledge of the ſocial and domeſtic ſinging to the harp in the Saxon language, upon our iſland, at the beginning of the eighth century; which is amply detailed in biſhop Percy's eſſay on the ancient Engliſh minſtrels. Reliques of Ancient Poetry.

Beda, or Bede, Noel, a doctor of divinity in the univerſity of Paris, was a native of Picardy, and flouriſhed in the beginning of the ſixteenth century. His temper was violent and impetuous, and he was a great enemy to every kind of innovation and reform. Eraſmus and Faber Stapulenſis, who were great promoters of literature, were the objects of his vehement attack. Againſt the ſcriptural paraphraſes of the former he wrote a book, in which Eraſmus detected many miſrepreſentations and calumnies; and yet ſuch was his influence among his brethren, that he induced the faculty of divinity to cenſure the works of his antagoniſt. In his oppoſition to the deſign of Francis I. for obliging the Sorbonne to concur with the other univerſities of France in giving a favourable opinion concerning the divorce of Henry VIII. of England, he acted a more juſtifiable part; but he injured his character, and ruined his cauſe, by his paſſionate and turbulent behaviour, and involved himſelf in the crime of perjury. After having made the *amende honorable*, by publicly acknowledging that he had ſpoken againſt truth and

and the king, before the church of Notre Dame, he was committed to prifon in 1535, and afterwards fentenced to be baniſhed to the abbey of mount St. Michael, where he died in the year 1537. He was a furious perſecutor of the proteſtants, and one of the chief promoters of the puniſhment of Lewis de Berguin, the proteſtant martyr. His Latin works were a treatiſe "De unicâ Magdalenâ," againſt Faber, Paris, 1519; "Two books againſt Faber's Commentaries and Eraſmus's Paraphraſes," Paris, 1526; "An Apology againſt the ſecret Lutherans," Paris; and "An Apology for the daughters and grand-children of St. Anne," againſt Faber. His works in French were "A Reſtitution of the Benediction of the Paſchal taper," and "A Confeſſion of Faith." Gen. Dict. Nouv. Dict. Hiſt.

Beda, a ſacred book of the religion and law of the Brahmins of Hindooſtan, called alſo *Vedam* and *Viedam*, which ſee; ſee alſo Brachmans, and Shastah.

BEDALE, in *Geography*, a market town of England. It is ſituated in that diviſion of the north riding of Yorkſhire called Richmondſhire, at the diſtance of 6 miles from North Allerton, and 223 miles north of London. Seated on the bank of a ſmall river, it enjoys a pleaſant and fertile ſituation; but being at ſome diſtance from any public road, its principal trade is derived from a weekly market and five annual fairs. Theſe are abundantly ſupplied with horſes; the buying and ſelling of which are the chief buſineſs of many perſons in this part of Yorkſhire. The rectory of this town is very valuable; and the church, which is a large handſome ſtructure, contains ſome ancient monuments, one of which commemorates Brian Fitz Alan, the laſt male heir of that family. A Roman road paſſed through this town to Barnard caſtle, &c.; and ſome Roman encampments are remaining on the high grounds between this town and Ripon. Here is a charity ſchool; and the townſhip contains 226 houſes, with 1005 inhabitants.

BEDANG, a commentary on the Beda of the Brahmins of Hindooſtan, called alſo *Shaſter* or *Shaſtah*; which ſee.

BEDARRIEUX, in *Geography*, a town of France, in the department of the Herault, and chief place of a canton, in the diſtrict of Beziers, ſeated on the Orbe, 5½ leagues north of Beziers. The inhabitants carry on a manufacture of druggets and other woollen ſtuffs. N. lat. 43° 27'. E. long. 3° 24'.

BEDAS, Bedahs, or Vaddahs, a name given to a ſpecies of ſavages, who occupy a ſmall diſtrict in the northern part of the iſland of Ceylon, and who ſeem to be (ſays Buffon) of a peculiar race. The ſpot which they inhabit is entirely covered with wood, where they conceal themſelves in ſuch a manner, that it is difficult to diſcover them. Their complexion is fair, and ſometimes red, like that of the Europeans. Their language has no analogy to that of any of the other Indian languages. They have no villages or houſes, and hold no intercourſe with the reſt of mankind. Their arms are bows and arrows, with which they kill a number of boars, ſtags, and other animals. They never dreſs their meat, but ſeaſon it with honey, of which they have great abundance. The wildeſt of theſe woodland wanderers recognize no authority, except that of their own chiefs; but others, without formally acknowledging the ſovereignty of the king, furniſh him with ivory, wax, and deer. Such of them as ſkirt the European territories, barter their articles with the Cingleſe for the ſimple things which their mode of life requires. To prevent themſelves from being ſurpriſed or made priſoners, while carrying on this traffic, the method they employ is curious: when they ſtand in need of cloth, iron, knives, or any other articles of ſmith's work, they approach by night ſome town or village, and depoſit, in a place where it is likely to be immediately diſcovered, a certain quantity of their goods, along with a talipot leaf expreſſive of what they want in return. On a following night they repair again to the ſame place, and generally find their expected reward awaiting them. For although they are eaſily ſatisfied, and readily allow the advantage to the perſon with whom they deal, yet if their requeſts are treated with neglect, they will not fail to watch their opportunity of doing him a miſchief. The Cingleſe, as they can afterwards diſpoſe of the articles afforded by the Bedahs, find the traffic profitable; and in ſome parts frequently go into the woods, carrying with them articles of barter. This trade, however, can only be carried on in the manner already deſcribed; for no native of the woods can be more afraid of approaching a ſtranger than the Bedahs. Few will venture even to converſe with other natives; but the wilder claſs, known by the name of "Ramba-Vaddahs," are more ſeldom ſeen even by ſtealth than the moſt timid of the wild animals. The origin of this ſmall tribe, who live in detached families, is unknown. Theſe Bedas, as well as the Chacrelas of Java, who are both fair and few in number, appear (ſays Buffon) to be of European extraction; and he conjectures, that ſome European men and women have been formerly left on theſe iſlands by ſhipwreck or otherwiſe, and that, for fear of being maltreated by the natives, they and their deſcendants confined themſelves to the woody and mountainous parts of their country, where they retain a ſavage life. See Ceylon.

BEDASPES, in *Ancient Geography*, the name given by Ptolemy to the Hydaſpes, or modern Behut, a river of Hindooſtan. See Hydaspes, and Behut.

BEDAT, Le, in *Geography*, a river of France, which runs into the Allier, near Montferand.

BEDBURG, a town of Germany, in the circle of the Lower Rhine, and electorate of Cologne, ſeated on the Erfft, 14 miles weſt of Cologne. N. lat. 51°. E. long. 6° 20'.

BEDDING, *lectoria*, in reſpect of horſes and other cattle, denotes ſtraw or litter ſpread under them to lie on.

Bedding, in ſpeaking of a roe, is uſed by ſportſmen for the lodging of that beaſt. A roe is ſaid to *bed*; a hart to *harbour*; a fox to *kennel*.

BEDE Point, in *Geography*, the eaſtern cape at the mouth of Cook's river, on the north-weſt coaſt of North America.

BEDEA, Badeah, or Baideah, the name of a valley near the Red ſea, which, according to Niebuhr, is 6 German miles from Suez, and where the ſea (Bruce ſays) is ſomething leſs than 4 leagues broad, by 50 feet deep. This valley ends in a paſs between two conſiderable mountains, called Gewoube on the ſouth, and Jibbel Attakah on the north; and opens into the low ſtripe of country which runs along the Red ſea. The mouth of this valley, opening to the flat country and the ſea, was called "Pihahiroth;" and through this valley it has been ſuppoſed that the Iſraelites made their paſſage from the purſuing army of Pharaoh to the Red ſea; and it is added, that they encamped in the bay which terminated this valley, at Pihahiroth, oppoſite to Baal-Zephon (which ſee), betwixt Migdol and that ſea. In theſe circumſtances, ſays Dr. Shaw, the Egyptians might well imagine, that the Iſraelites could have no poſſible way of eſcape; inaſmuch as the mountains of Gewoube would ſtop their flight or progreſs towards the ſouth, as thoſe of Attakah would prevent their paſſing towards the land of the Philiſtines: the Red ſea likewiſe lay before them to the eaſt; whilſt Pharaoh cloſed up the valley behind them, with his chariots and horſemen. This valley, adds Dr. Shaw, is called "Tiah Beni Iſrael," i.e. the road of

the Iſraelites, from a tradition, that is ſtill kept up by the Arabs, of their having paſſed through it. It is alſo called "Baideah," he ſays, from the *new* and unheard-of *miracle*, that was wrought near it, by dividing the Red ſea, and deſtroying in it Pharaoh, his chariots, and horſemen. Bruce obſerves, that Dr. Shaw, by interpreting "Badeah" as the "valley of the miracle," forces an etymology, becauſe there was yet no miracle wrought, nor was there ever any in the valley. But "Badeah," he ſays, means "barren," and "uninhabited;" ſuch as we may imagine a valley between ſtony mountains, a deſert valley. To his tranſlation of "Jibbel Attakah," as the "mountain of deliverance," Bruce objects, that ſo far were the Iſraelites from being delivered, on their arrival at this mountain, that they were then in the greateſt diſtreſs and danger. Attakah means, according to this traveller, to "arrive," or "come up with;" either becauſe they arrived within ſight of the Red ſea; or it might more probably derive its name from the arrival of Pharaoh, or his coming in ſight of the Iſraelites, when encamped between Migdol and the Red ſea. Shaw's Travels, p. 302. Bruce's Travels in Abyſſinia, vol. i. p. 232, &c.

A late writer obſerves, that this hypotheſis of the paſſage of the Iſraelites at Bedea, has been given up by our beſt modern critics; and the "Sinus Heroopolitanus," or gulf of Suez, pitched upon as the ſcene of action. The idea was firſt ſuggeſted by Le Clerc, and ſince adopted and defended by Michaelis, Niebuhr, and almoſt all the German commentators. Mr. Bryant, however (Obſ. on the Plagues of Egypt, p. 378.), ſtill contends for Bedea, and calls the arguments of Niebuhr prejudices and miſconceptions. The writer, to whom we now refer, who excludes from this event every thing that was miraculous, contends for the paſs at Suez, or not far from Suez, where, he ſays, at this day there are ſhallows fordable at low water, and which might, in former times, have been frequently dry. Geddes's Critical Remarks, vol. i. p. 225. See SUEZ.

BEDEC, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the diſtrict of Montfort, one league N. of Montfort.

BEDEGUAR, in the *Materia Medica*, the name of a fungus, or gall, growing upon the roſe plant (roſa ſilveſtris), which belongs to the claſs of aſtringents, as it is poſſeſſed of and celebrated for its aſtringent power; but it has hardly yet got a place in our diſpenſatories, and we are quite unacquainted with its powers. Cullen's Mat. Med. vol. ii. p. 36.

BEDEL, or BEDEO, *Bay*, in *Geography*, lies in the gulf of the river of St. Lawrence, on the ſouth-weſt coaſt of the iſland of St. John's, in North America, and is ſituated S. by E. from Egmont bay, on the ſame coaſt of the iſland.

BEDELL, WILLIAM, in *Biography*, an eminent prelate of the Engliſh church in Ireland, was born at Black Notley in Eſſex in 1570; and being deſigned for the church, was educated at Emanuel college in the univerſity of Cambridge. Having been choſen fellow of his college in 1593, and taken his degree of bachelor of divinity in 1599, he removed to St. Edmundſbury in Suffolk, where he continued in high eſtimation for his attention to the duties of his profeſſion till he accompanied ſir Henry Wotton to Venice, as his chaplain. Here he became intimately acquainted with father Paul Sarpi, who taught him the Italian language, into which he tranſlated the Engliſh common prayer book; and in return for the favour conferred upon him by father Paul, he drew up an Engliſh grammar for his uſe, and aſſiſted him in his ſtudies. During his ſtay at Venice, he availed himſelf of the aſſiſtance of Rabbi Leo, in acquiring the knowledge of the Hebrew language, and of Rabbinical learning; and by his means he had an opportunity of purchaſing a very fair MS. of the Old Teſtament, which coſt, it is ſaid, its weight in ſilver, and which he preſented to Emanuel college. He alſo formed an acquaintance with Antonio de Dominis, archbiſhop of Spalato, and communicated to him ſeveral corrections of his book "De Republica Eccleſiaſtica," afterwards printed in London. Upon his leaving Venice, after a reſidence of eight years, he received from father Paul, as tokens of his eſteem and friendſhip, his picture, and ſeveral valuable books, together with a MS. copy of his famous hiſtory of the council of Trent, his hiſtories of the Interdict and Inquiſition, and a collection of letters. At Edmundſbury, where he ſettled upon his return to England, he employed himſelf in tranſlating the hiſtories of the Interdict and Inquiſition, and the two laſt books of the hiſtory of the council of Trent into Latin, the two firſt having been tranſlated by ſir Adam Newton. In 1615, Bedell was preſented by ſir John Jermyn to the living of Horingſheath, in the ſee of Norwich; but having ſcruples about paying the fees of induction, which he regarded as a ſpecies of ſimony, he declined accepting it; however, he was afterwards admitted without fees, and lived in this pariſh for twelve years unnoticed. To ſuch a degree, indeed, was he diſregarded, that when Diodati, a famous divine of Geneva, came to England, he diſcovered his place of abode by mere accident. Bedell was introduced by Diodati to Morton biſhop of Durham, as the eſteemed friend of father Paul, and was treated by him with peculiar reſpect. In his obſcure retreat he evinced his talents by the publication of ſome letters which had paſſed between him and James Wadeſworth, formerly his fellow-collegian, but ſince become a convert to popery, and a penſioner of the inquiſition at Seville, concerning the authority of the church of Rome. Theſe letters were dedicated to king Charles I. then prince of Wales, in 1624. In this work there was a paſſage which juſtified reſiſtance to tyrannical princes. Whilſt the author lived, the paſſage eſcaped animadverſion; before the treatiſe was reprinted in 1685, in order to be bound up with biſhop Burnet's life of Bedell, it could not obtain the licence of ſir Roger L'Eſtrange, till ſome words were introduced which made the paſſage appear like a reference to arguments that were uſed by others. In 1627, Bedell was elected provoſt of Trinity college, Dublin, which he was conſtrained to accept by the king's ſpecial command. Upon his return to England, for the purpoſe of taking over his family, he had ſerious thoughts of reſigning his poſt; but he was perſuaded to retain it by an encouraging letter from the primate, Uſher. He then engaged in the diſcharge of the duties of his ſtation with vigour and activity, and was eminently uſeful in compoſing diviſions among the fellows, eſtabliſhing diſcipline, and promoting religion by weekly ſermons on the church catechiſm, which he formed into learned lectures of divinity and morals. In this employment he continued about two years, when, by the intereſt of ſir Thomas Jermyn, and the application of biſhop Laud, he was advanced to the ſees of Kilmore and Ardagh. He was conſecrated at Drogheda in September 1629, being then in the 59th year of his age. In this new ſtation he had to encounter many difficulties; but he determined to adopt plans of reformation, and to correct the abuſes and diſorders that had prevailed to a very great degree in his dioceſe. In order to ſecure ſucceſs in his laudable deſign, and the more effectually to aboliſh pluralities, he ſet an example of moderation by ſeparating the ſee of Ardagh from that of Kilmore, though he had been at a conſiderable expence in recovering ſome of its revenues; theſe fees, however, have been ſince re-united, and have ſo continued. After the compromiſe of a diſpute, which had occurred between him and lord Wentworth, afterwards lord Strafford, who was appointed lord deputy of Ireland in 1633,

on account of his having ſubſcribed a petition addreſſed to him for the redreſs of certain grievances, Bedell proceeded without interruption in his epiſcopal duties and reforms. In the exerciſe of his epiſcopal functions, he adhered ſtrictly to the rubric; but in caſes that depended on his own determination, he appeared to be jealous of all approaches to ſuperſtition. He was extremely aſſiduous in preaching, catechiſing, and employing all means for diſſeminating religious knowledge; and though he never perſecuted the papiſts, he was the moſt formidable opponent they had in Ireland. He converted ſeveral of their clergy by argument; and laboured to bring over the natives by diſperſing among them the ſcriptures, with popular tracts in their own language, and by cauſing the common-prayer in Iriſh to be read every Sunday in his own cathedral. Biſhop Bedell ſeems to have conſidered the theological differences that ſubſiſted among Proteſtants in his time as of little moment; and it was his wiſh to promote the well-intended project of Mr. Drury for effecting a reconciliation between the Calviniſts and Lutherans.

The character of biſhop Bedell was held in ſuch high eſtimation among the Iriſh, that when the rebellion broke out in 1641, the moſt barbarous of them were known to declare, that he would be the laſt Engliſhman whom they would expel the country. His houſe in the county of Cavan was an unmoleſted aſylum for many Proteſtants who were driven from their own habitations; and he treated them with hoſpitality and kindneſs, exhorting them at the ſame time by prayers and religious diſcourſes, to prepare for the diſtreſs that threatened them. His declared reſolution not to diſmiſs theſe refugees from his houſe, and to ſhare the fate that awaited them, occaſioned his being removed, with his two ſons and ſon-in-law, to a ruinous caſtle in the midſt of a lake, where they ſuffered much from the ſeverity of the weather. The biſhop and his ſons were inceſſant in preaching and praying with their diſtreſſed companions; and their piety inſpired the bigotted and rude Iriſh who guarded them with ſuch reſpect, that they never diſturbed their devotions. At length they were removed from this place to the houſe of an Iriſh miniſter, and a convert to proteſtantiſm, where the biſhop was ſeized with a fever, which terminated his life, February 7, 1641-2, in the 71ſt year of his age. At the ſolemnity of his interment, the Iriſh attended with great decency, and fired a volley over his grave; exclaiming in Latin, "Requieſcat in pace ultimus Anglorum! May the the laſt of the Engliſh reſt in peace!" And a popiſh prieſt who attended on the occaſion, is ſaid to have paid him a tribute of reſpect and veneration, in the following wiſh; "O ſit anima mea cum Bedello! May my ſoul be with that of Bedell!"

The character of Bedell, delineated by Mr. Clogy, who reſided in his family, and recorded in biſhop Burnet's life of this prelate, appears to have been in a very eminent degree exemplary and amiable; ſo that in the moſt appropriate ſenſe of the terms, he was a primitive and apoſtolical biſhop. His venerable and ſimple aſpect and habit; his indefatigable zeal in diſcharging his duty through all the viciſſitudes of his life; his profound and unaffected learning, diſplayed however in various ways, and manifeſted on a particular occaſion at the table of the earl of Straſford, which produced the witticiſm of the primate archbiſhop Uſher, after the biſhop had continued long ſilent, according to his uſual manner, "Broach him, and you will find good liquor in him;" his charity and hoſpitality, exhibited in the ſupply afforded by him to many poor Iriſh families, ſome of whom he entertained at Chriſtmas at his own table, and in the ſeaſonable relief which the perſecuted proteſtants obtained in his houſe; his detachment from worldly intereſt, of which an inſtance, ſelected from many more, has been given in the ſeparation of the ſees of Kilmore and Ardagh; his integrity and honour, and his pious reſignation under all the evils of life, in the obſcurity of his humbler ſtation, and amid the perſecutions which he ſuffered after the attainment of a higher rank;—all theſe qualities, which have been amply illuſtrated in the memoirs of his life, exalted his character to the higheſt degree of profeſſional excellence. His bequeſts at his death correſponded to the uniform tenor of his life; for out of his very limited fortune he allotted ſome legacy to every place to which he had any relation. He thus obtained the eſteem of the moſt bitter enemies of his faith and country, while he lived, and he has alſo ſecured the veneration of poſterity, and left a model for the imitation of all his ſucceſſors. He ſtudied and wrote much on the controverſy between the papiſts and proteſtants, and he had compoſed a large treatiſe in anſwer to the two queſtions, addreſſed by the former to the latter with a kind of triumph; "Where was your religion before Luther? and, What became of your anceſtors who died in popery?" But this treatiſe, which the biſhop intended to have printed, together with many other MSS., were loſt in the confuſion of the times. His Hebrew MS. Bible was preſerved, and is now repoſited in Emanuel college, Cambridge, to which the author bequeathed it.

As biſhop Bedell objected to burial in churches, partly becauſe it indicated ſuperſtition and pride, and partly becauſe the putrid effluvia of dead bodies annoyed the living, he gave orders for burying his wife in the leaſt frequented part of the church-yard of Kilmore, and directed by his will that he ſhould be placed near her. By his wife, who was of the ancient and honourable family of L'Eſtrange, he had one daughter and three ſons, of whom two ſurvived him; one provided for by a ſmall benefice of 80l. a year, beſides the entailed eſtate of the family in Eſſex, and the other by a ſmall eſtate of 60l. a year, the only purchaſe made by the father. Biog. Brit.

BEDENGIAN, in *Botany*, a name given by Avicenna and Serapion to the *poma amoris*, or *love-apples*, a ſort of fruit uſed in food by the Italians, and ſome other nations, and ſeeming to be the third kind of the *ſtrychnos*, or *ſolanum*, mentioned by Theophraſtus. That author firſt deſcribes two kinds of this plant, the one of which occaſioned ſleepy diſorders, and the other threw people who eat of it into madneſs. After theſe, which he properly accounts poiſonous kinds, he mentions a third, which was cultivated in gardens, for the ſake of the fruit, which, he ſays, is large and eſculent. This is certainly the ſame with *bedengian*, or *poma amoris*.

BEDER, in *Ancient Geography*. See Bedr.

Beder, in *Geography*, a fortified city of Hindooſtan, in the territory of the Nizam, about 80 road miles N. W. of Hydrabad; was formerly the capital of a conſiderable kingdom, and is now celebrated for the number and magnificence of its pagodas. N. lat. 18°. E. long. 78°.

BEDFORD, Arthur, in *Biography*, was the ſon of Richard Bedford, and was born at Tiddenham in Glouceſterſhire 1668. Having received the rudiments of learning from his father, he was, in 1684, at the age of ſixteen, admitted a commoner of Brazen Noſe college, Oxford, where he acquired ſome reputation as an orientaliſt. In 1688 he received holy orders from the biſhop of Glouceſter. About this time he removed to Briſtol, where the mayor and corporation preſented him to the vicarage of Temple church. At Briſtol he ſtaid a few years, devoting a great portion of his time to the ſeconding Mr. Collier's attack upon the ſtage; he was involved indeed, in a very briſk controverſy with ſeveral of the greateſt wits and ableſt writers of the age, but acquitted himſelf

himſelf with ſo much force and vivacity, as actually to produce both repentance and amendment, and was a great cauſe of that decorum which has for the moſt part been obſerved by the modern writers of dramatic poetry. From Briſtol he went to a ſmall living in Somerſetſhire, where he employed himſelf in a work on ſcripture chronology, which, in conſequence of ſir I. Newton's labour, he afterwards relinquiſhed for a time, and was engaged to aſſiſt in correcting an Arabic verſion of the Pſalter and New Teſtament, for the benefit of the poor Chriſtians in Aſia. In 1719, he communicated his thoughts to Dr. Charlet, in regard to the foundation of a Syriac profeſſorſhip at Oxford. The letter which contained them is a moſt excellent production, and is printed at length in Mr. Ellis's Hiſtory of Shoreditch, where he became chaplain to Aſke's hoſpital, in 1724. About 1730, he renewed his attack upon the ſtage, particularly directed againſt a new playhouſe in Goodman's fields, where Garrick made his firſt appearance. From this period, to the time of his death, we know few particulars of conſequence; but the 15th of Septeptember 1745, cloſed a life that had been very uſeful. Beſides many ſingle ſermons, and his tracts upon the playhouſe, his chief publications were, "The Temple of Muſic;" 1706, 8vo. "The abuſe of Muſic;" 1711, 8vo. "Eſſay on finging David's Pſalms;" 1708. "Animadverſions on Sir Iſaac Newton's Chronology;" 1728, 8vo. "Scripture Chronology;" 1730, fol. "The Doctrine of Juſtification by Faith, in Nine Queſtions and Anſwers;" 1741, 8vo: and "Horæ Mathematicæ vacuæ;" 1743, 8vo.

Bedford, in *Geography*, the county town of Bedfordſhire in England, is ſeated on the banks of the river Ouſe, nearly in the centre of the county, at the diſtance of 51 miles N.W. from London. It is a place of ſome antiquity, and was called by the Saxons *Bedan-ford*, or Bedician Forda, ſignifying the fortreſs on the ford. At the time of Offa, that powerful king of the Mercians, Bedford was probably of ſome note, as this monarch directed his corpſe to be interred in a ſmall chapel here, which, being ſeated on the river Ouſe, was carried away by the floods during an inundation. In the year 572, a pitched battle was fought here between Cuthwolf the Saxon, and the Britons; when the latter were defeated, and obliged to deliver up ſeveral of their towns to the haughty conqueror. During the Daniſh wars, this town ſuffered materially by the ravages of theſe plundering marauders; but in the year 911, they were ſeverely beaten, and driven from this neighbourhood. A ſtrong Norman caſtle was erected here by Pagan de Beauchamp, the third baron of Bedford, who fortified it with a deep intrenchment and lofty wall. "While it ſtood," ſays Camden, "there was no ſtorm of civil war which did not burſt upon it." King Stephen laid ſiege to, and conquered this caſtle; and, according to Camden, ſlaughtered the inhabitants; but other hiſtorians aſſert that he granted them honourable terms. During the conteſts between king John and his barons, it was ſeized by the latter, but reconquered again by the forces under Fulco de Brent, to whom it was given by the king as a reward for his ſervices. This rebellious villain occaſioned his own deſtruction with that of the caſtle, by oppoſing Henry III. who laid ſiege to the fortreſs, and after a conteſt of ſixty days, made himſelf maſter of this "nurſery of ſedition." De Brent was ſent to London and impriſoned, but his brother and twenty-four other knights were executed on the ſpot. (For an account of this ſiege, ſee Beauties of England and Wales, vol. i. p. 6.) The embankments of the caſtle form a parallelogram; ſome of which may be eaſily traced; but the walls are entirely raſed to the ground.

The *government* of the town is veſted in a mayor, recorder, deputy-recorder, an indefinite number of aldermen, two bailiffs, and thirteen common councilmen. The bailiffs are lords of the manor, and have the right of fiſhing in Ouſe for an extent of nine miles each way from Bedford. Henry III. granted the *borough* to the burgeſſes for 40l. yearly: Edward I. ſeized it for the crown rents, which the burgeſſes had neglected to diſcharge. The laſt renewal of their charter was in the reign of James II. when the mayor and aldermen were removed from their reſpective offices by a royal mandate, for not electing two burgeſſes to ſerve in parliament. The members were in conſequence choſen by his majeſty's miniſters. The right of election is now veſted in the burgeſſes, freemen, and inhabitant houſeholders not receiving alms, amounting to nearly 1400.

This town is ſeated in a fertile tract of land, called the vale of Bedford, which accompanies the Ouſe, and produces abundant crops of wheat, barley, turnips, &c. The land on the north ſide of the river is a ſtrong clay, that on the ſouth ſide is much lighter, yet very productive, and its natural fertility is much increaſed by the overflowing waters of the Ouſe. This river flows through, and divides the town, which is connected by a ſtrong old ſtone bridge. On the centre of this ſtood the old town gaol, which was taken down about thirty-three years ſince. The river was made navigable to Lynn in Norfolk, by act of parliament. Bedford contains five diſtinct pariſhes, and an equal number of churches, two of which are on the ſouth ſide of the river, and three on the north ſide. Of theſe St. Paul's is the principal for ſize and architecture, having a handſome octagonal ſtone ſpire. It was collegiate before the conqueſt. Here are four meeting-houſes, appropriated to different religious ſects, beſides one for the Methodiſts, and another for Moravians. To the latter is attached a dwelling-houſe for maiden ladies of this ſect, called the ſingle ſiſters' houſe.

This town is diſtinguiſhed by many charitable endowments. The hoſpital of St. John is ſuppoſed to have been founded in 980 by Robert Deparis, who was the firſt maſter. It now conſiſts of a maſter who is rector of St. John's, and ten poor men. St. Leonard's hoſpital was built and endowed towards the end of the reign of Edward I. The hoſpital of Grey Friars was founded in the reign of the ſucceeding monarch by the lady Mabilia de Paterſhall, who was buried in the cemetery. Mr. Thomas Chriſty repaired the old town-hall, founded an hoſpital for eight poor people, and endowed a charity ſchool for forty children. But the moſt conſiderable charity of this town, and one whoſe augmented revenues have been aſtoniſhingly great, was bequeathed by Sir *William Harpur*, whoſe name and benevolence it perpetuates. This gentleman was a native of Bedford, and made lord mayor of London in 1561. He purchaſed for 180l. thirteen acres and one rood of land lying in the pariſh of St. Andrew, Holborn, London. This, with his dwelling-houſe in Bedford, he gave to the corporation of that town, for the endowment of a ſchool and for apportioning young women of the town upon marriage. The annual rent of the above land was only 40l. at firſt; in 1668 it was leaſed for forty-one years at the annual rent of 99l. A reverſionary leaſe was granted for a further term of fifty-one years at the increaſed rent of 150l. A number of ſtreets, rows, and courts, were then built on the leaſed ground, and the annual rent is now 4000l. which in three or four years is expected to increaſe at leaſt another thouſand. In conſequence of this almoſt unparalleled augmentation of revenue, the truſtees have applied to parliament for two different acts, to extend the objects of the charity, and regulate the application of the receipts. The ſchool endowed by it is ſituated near St. Paul's church, having over the door a ſtatue in white marble of the founder, and a Latin inſcription beneath. Beſides the above charities a *houſe of induſtry* has lately been opened for the reception of all the poor of the five

five conſolidated pariſhes. A new town gaol has lately been erected, and a county gaol is juſt finiſhed; towards the completion of which the late Mr. Whitbread left a legacy of 500l. This town contains 800 houſes and 3948 inhabitants.

Bedford was made a dukedom by Henry the fifth, who conſtituted John Plantagenet, third ſon of Henry the fourth, the firſt duke. After being enjoyed by a Nevil, and a de Hatfield, it was beſtowed on John Ruſſel, in whoſe family it ſtill continues. See Russel.

At Elſtow, about one mile from Bedford, was an abbey of benedictine nuns, founded by Judith, niece to the conqueror. At the diſſolution its revenues were valued at 284l. 12s. 11¾d. The church of Elſtow is a very fine ancient building, with a detached tower. This place gave birth to John Bunyan in the year 1628. His allegory of the Pilgrim's Progreſs was written during confinement in the county gaol. See Bunyan. Bauties of England and Wales, vol. i.

Bedford, a townſhip of America, in Hillſborough county, New Hampſhire, incorporated in 1750, and containing 898 inhabitants. It lies on the weſt bank of Merrimack river, 56 miles weſt of Portſmouth.

Bedford, a townſhip in Middleſex county, Maſſachuſetts, containing 523 inhabitants, 13 miles northerly from Boſton.

Bedford, *New*, a flouriſhing town of Briſtol county, in Maſſachuſetts, containing 3313 inhabitants, lying at the head of navigation on Accuſhnet river, 58 miles ſouthward of Boſton. N. lat. 40° 41′. W. long. 70° 52′.

Bedford, a townſhip of Weſt Cheſter county, in the ſtate of New York, containing 2470 inhabitants, including 38 ſlaves. It lies contiguous to Connecticut, 12 miles N. from Long Iſland ſound, and 35 from the city of New York. In the cenſus of 1796, it appeared to have 302 electors.

Bedford, a town on the weſt end of Long Iſland in New York, 4 miles N. W. from Jamaica bay, and 6 E. from the city of New York.

Bedford, a village near the Georgia ſide of Savannah river, 4 miles above Auguſta.

Bedford, a county of Pennſylvania, lying on Juniatta river, and having part of the ſtate of Maryland on the ſouth, and Huntingdon county north and north-eaſt. It contains 13,124 inhabitants, including 46 ſlaves; half of its lands is ſettled, and it is divided into nine townſhips. Bedford, the chief town of this county, lies on the ſouth ſide of Rayſtown branch of the ſame river, 25 miles E. of Berlin, and 210 W. of Philadelphia. It is regularly laid out, and has a ſtone gaol, and a market-houſe, court-houſe, and record-office built of brick. It was incorporated in 1795. N. lat. 40°. W. long. 78° 50′.

Bedford, a county of Virginia, is ſeparated from that of Amherſt on the north by James river, and has Campbell on the eaſt, Botetourt on the weſt, and Franklin county on the ſouth. It is 34 miles long, 25 broad, and contains 10,531 inhabitants, including 2,754 ſlaves. Its ſoil is good, and it is agreeably diverſified with hills and vallies. In ſome parts chalk and gypſum have been diſcovered. The chief town is New London.

Bedford's *bay*. See Torrington *bay*.

Bedford, *Cape*, is more than 80 leagues E. by N. from the weſt entrance of Baffin's ſtraits, and the S. E. point of James's iſland; its latitude is more than 68°, and it forms one of the weſtern limits of Davis's ſtraits.

Bedford, *Cape*, is alſo the extreme north eaſt point of the coaſt of New Holland, opening to the ſouth-weſt into Endeavour river, in S. lat. 15° 18′. E. long. 145° 15′. The ſea to the eaſt and north is almoſt every where full of ſhoals and reefs.

Bedford Level, is the name given to a large tract of fenny, boggy land in England, which remained a ſteril waſte for many ages. It was calculated to contain 400,000 acres, diſtributed through the ſeveral counties of Cambridge, Huntingdon, Northampton, Lincoln, Norfolk, and Suffolk. The chief part of this extenſive tract appears, from the various phenomena noticed by different authors, to have been formerly a dry and cultivated land; but either from injudicious embankments, which prevented the waters from the uplands iſſuing at their proper outlets, or from ſudden and violent convulſions of nature, it was reduced to the ſtate of a moraſs; where the waters, ſtagnating and becoming putrid, filled the air with noxious exhalations; and not only deſtroyed the health of the inhabitants, but likewiſe impeded their endeavours to obtain the neceſſaries of life; the country being almoſt rendered impaſſable even to boats, by the ſedge, reeds, and ſlime with which it was covered. The name given to it originated with Francis earl of Bedford, who having large poſſeſſions in the fens, moſtly granted him by Henry the eighth, upon the diſſolution of monaſteries, engaged, in conjunction with thirteen other gentlemen, to drain the whole upon the condition of having 95,000 acres in the reſult of ſucceſsful accompliſhment. Theſe terms were acceded to by the commiſſioners and the country at large, and in 1634 the king granted theſe adventurers a charter of incorporation. In the courſe of three years and a half this Herculean taſk was completed to the ſatisfaction of the commiſſioners, who, with the king's ſurveyor, ſet out the allotted land to the corporation. Above 100,000l. was expended upon this work. The king, and ſome perſons devoted to his intereſt, afterwards oppoſed the right of the earl of Bedford, and diſpoſſeſſed him of his property. Other perſons engaged in the concern, but the civil wars breaking out fruſtrated all their ſchemes, and in 1649, William earl of Bedford, the heir and ſucceſſor of Francis, was reſtored by the convention-parliament, to all the rights of his father. A new act was obtained to repair the decayed works, and extenſive operations were adopted. In 1653 the level was adjudged to be fully drained, and after the adventurers had expended 400,000l. more, the 95,000 acres were confirmed to them. In 1697 the Bedford level was divided into three diſtricts, called north, middle, and ſouth, having one ſurveyor for each of the former, and two for the latter. This diſtribution, intended for its better government, proved a cauſe of conſiderable oppoſition and contention, and it was many years before the whole was ſettled in a ſyſtematic and equitable manner. To purſue the hiſtory of thoſe litigations, charters, and laws, originating in, and made for this great concern, would lead us into a narrative too extenſive for the limits of our work: we muſt therefore refer thoſe perſons, deſirous of further information, to the "Beauties of England and Wales," vol. ii. and to a work recently publiſhed, entitled "An Hiſtorical Account of the Bedford Level," with the laws, &c. relating to the ſame, 8vo.

That this vaſt tract was at ſome former period dry habitable land, is evident from the quantity of trees and various other natural and artificial ſubſtances that have been dug from different depths in various parts of it. Dugdale, in his "Hiſtory of Embanking," ſtates that many oak, fir, and other trees, were found in draining the iſle of Axholm. Theſe were at the depths of three, four, and five feet from the ſurface, lying cloſe to the roots, which were in firm earth below the moor. The bodies or boles of the trees appeared to have been burnt aſunder (not cut down with ſaws or axes) as the ends of them being *coaled* do manifeſt. The oaks were lying

lying in multitudes, and of an extraordinary ſize, being five yards in compaſs, and ſixteen yards long; and ſome ſmaller of a great length, with a great quantity of acorns and ſmall nuts near them." Other authors relate ſimilar facts: and Mr. Elſtob, in his "Hiſtorical Account of the Bedford Level," ſtates that in the year 1764 many roots of trees, ſtanding as the trees had grown, were found near Boſton in Lincolnſhire at the depth of eighteen feet below the thin paſturage ſurface. Tacitus, in his life of Agricola, relates, that "the Britons complained of their hands and bodies being worn out and conſumed by the Romans, in *clearing the woods* and *embanking the fens*." This ſentence ſeems particularly applicable to the forementioned circumſtances, and alludes to the period when ſome great operations of this nature were exacted from the enſlaved Britons. The emperor Severus is ſaid to have been the firſt who interſected the fens with cauſeways: one of which is deſcribed by Dugdale as extending about 24 miles from Denver in Norfolk to Peterborough. It was compoſed of gravel three feet in depth and ſixty feet wide, and about five feet beneath the ſurface. In 1635 ſome workmen diſcovered, at eight feet below the bottom of Wiſbech river, a ſecond ſtony bottom, with ſeven boats lying in it covered with ſilt; and at Whittleſea, on digging eight feet beneath the ſurface, a perfect ſoil was found with ſwaths of graſs on it; as they lay when firſt mowed. Near Boſton, at the depth of ſixteen feet, were diſcovered a ſmith's forge, with many of his tools, ſome horſe ſhoes, and other iron articles. Various other things have been found at different times, and in different places, all tending to prove the extraordinary effects that nature has produced here in one of her revolutions. The cauſe and time of this event are not recorded. Henry of Huntingdon, who wrote in the time of king Stephen, deſcribes this part of the country as then "very pleaſant and agreeable to the eye, watered by many rivers which run through it, diverſified with many large and ſmall lakes, and adorned with many woods and iſlands." William of Malmſbury, living in the firſt year of Henry II. deſcribes this diſtrict in glowing colours, as "a very paradiſe; for that in pleaſure and delight it reſembled heaven itſelf; the very marches abounding in trees, whoſe length without knots do emulate the ſtars. There is not any *waſte* place in it; for in ſome parts thereof there are apple trees; in others vines, which either ſpread upon the grounds, or run along the poles." From theſe teſtimonies it appears that the *great inundation* of the fens muſt have occured after the time of the latter hiſtorian. The firſt attempt at draining them was in the reign of Edward I.; ſince which time numerous ſchemes have been propoſed, and tried to render this large tract of country ſubſervient to agriculture.

Bedfordshire, one of the inland counties of England, bounded on the north by Huntingdonſhire and Northamptonſhire, on the weſt by Buckinghamſhire, on the ſouth by Hertfordſhire, and on the eaſt by part of the latter, and Cambridgeſhire. Its limits are very irregular and artificial, having only two ſhort ſpaces of the Ouſe as natural boundaries on the eaſt and weſt.

This part of the kingdom, with the diſtricts now called Hertfordſhire and Buckinghamſhire, were inhabited at the time of the Roman invaſion, by a tribe of Britons called Cattieuchlani, whoſe chief or governor Caſſivellaunus, was choſen by unanimous conſent to lead them againſt the arrogant, invading Cæſar. In the year 310 the emperor Conſtantine divided this iſland into five Roman provinces, when Bedfordſhire was included in the third diviſion, called Flavia Cæſarienſis. At the eſtabliſhment of the Mercian kingdom it was made part of that government, and continued ſo till the year 827, when, with the other diviſions of the iſland, it became ſubject to the weſt Saxons under Egbert. Alfred having ſubdivided his kingdom into ſhires, hundreds, and tythings, and marked the limits and name of each diviſion, this was called Bedefordſcire, ſince contracted to its preſent name. Its length is computed at 35 miles, and breadth at 20. It contains an area of about 260,000 acres, which are divided into nine hundreds, containing ten market towns, 124 pariſhes, 58 vicarages, 550 villages, about 12,000 houſes, and nearly 64,000 inhabitants.

The face of the country, though not characteriſed by high hills and deep vallies, is conſiderably diverſified with ſome inequalities of ſurface, and on the ſouthern ſide is a range of chalk hills. Beneath theſe is an extenſive tract of cold, ſteril land. The weſtern ſide of the county is moſtly ſandy and flat, yet from the improvements adopted and recommended by the duke of Bedford, lord Oſſory, &c. the greateſt part is appropriated to ſome ſpecies of agriculture. On the north and north-eaſt the ſoil is a deep loam, famous from the ſkill employed in its cultivation, for producing large crops of corn, particularly barley. A large proportion of the land in this county had long continued in open or common fields, but within the laſt five or ſix years great quantities have been incloſed, and farther incloſures are intended. The chief employment for the lower claſſes of perſons in this county ariſes from agriculture, making of lace, and the manufacturing of ſtraw hats. In the two latter, numbers of women and children are conſtantly occupied, and from them derive a bare ſubſiſtence. There is no ſuch thing as *bone lace* made in the county, and the *fuller's earth* pits are all in Buckinghamſhire. Bedfordſhire is watered by the rivers Ouſe and Ivel, and ſome ſmaller ſtreams. The former enters the county on the weſtern ſide, and after a devious courſe through many fine meadows, paſſes through the town of Bedford, where it becomes navigable. Flowing eaſtward it leaves the county at St. Neot's, on the confines of Huntingdonſhire. (See Ouse). The river Ivel riſes in Hertfordſhire, and paſſing Baldock and Biggleſwade, falls into the Ouſe a little above Tempsford.

Bedfordſhire is in the Norfolk circuit, in the province of Canterbury, and biſhopric of Lincoln. It is croſſed by two Roman roads, the Watling-ſtreet and the Ichnild-way, and contains ſome encampments attributed to that people: one at Sandy near Potton, called Salenæ, and another near Dunſtable, called Maiden-bower, ſuppoſed to be the magiovinum of Antoninus. The duke of Bedford has a magnificent ſeat at Wooburn Abbey in this county. Luton Hoo, the marquis of Bute's; Ampthill Park, lord Oſſory's; and Wreſt-houſe, lady Lucas's, are very fine ſeats in the county. Beauties of England and Wales, vol. i.

BEDIRUM, or Bedeiron, in *Ancient Geography*, a town of Africa, in the interior of Libya. Ptolemy.

BEDKA, in *Geography*, a town of European Turkey, in the Sangiakſhip of Belgrade, ſeated on the Kolubra.

BEDNORE, or Biddanore, a fine province of Hindooſtan, lying north-weſt of the Myſore country, and deriving its name from Bednore, the capital. Hyder Ally took poſſeſſion of this province about the year 1763; and it was afterwards comprehended within the dominions of his ſon Tippoo Sultan, who ſtyled himſelf regent of Myſore, and who retained it till the time of his death in 1799, when, after the capture of Seringapatam by the Britiſh troops, his dominions were diſtributed among the conquerors. Part of Biddanore was aſſigned to the Mahrattas; the ſons and relations of Tippoo were removed into the Carnatic; and a deſcendant of the ancient rajahs of Myſore, about five years old, was placed upon the throne, under certain conditions.

Bednore, a city of Hindooſtan, and capital of the forementioned province. N. lat. 13° 47'. E. long. 75° 7'.

Bednore, Ranny, a town of Hindoſtan, ſeated on the Toombuddra river, in the territory belonging, by the treaty of 1792, to the Mahrattas. N. lat. 14° 35'. E. long. 75° 42'.

BEDOWEENS or Bedouins, in Arabic *Bedouai*, formed of *bid*, deſert, or country without habitations, a denomination given to a wandering tribe of Arabs, who retain the cuſtoms and manners of their anceſtors, the "Arabes Scenitæ," and who are ſaid to be deſcended from Iſhmael. They originate from the deſerts of Arabia, where they live in tents, and are ſeparated into diſtinct tribes, ſubject to their ſcheiks, who direct and ſuperintend in every tranſaction; and they have migrated with their flocks and herds into Egypt and Syria, and other countries both of Aſia and Africa, inhabiting the vaſt deſerts which extend from the confines of Perſia to Morocco. They ſelect thoſe ſpots which afford them ſprings and paſtures, and they are in the ſtricteſt ſenſe a race of rovers or wanderers, without any permanent abode.

Although they are divided into independent communities, or tribes, not unfrequently hoſtile to each other, they may ſtill be conſidered as forming one nation. The reſemblance of their language is a manifeſt token of this relationſhip. The only difference that exiſts between them is, that the African tribes are of a leſs ancient origin, being poſterior to the conqueſt of theſe countries by the caliphs or ſucceſſors of Mahomet; while the tribes of the deſerts of Arabia, properly ſo called, have deſcended by an uninterrupted ſucceſſion from the remoteſt ages.

The Arabs, ſays M. Volney, ſeem to be eſpecially condemned to a wandering life, by the very nature of their deſerts. To paint to himſelf theſe deſerts, the reader muſt imagine a ſky almoſt perpetually inflamed, and without clouds, immenſe and boundleſs plains, without houſes, trees, rivulets, or hills, where the eye frequently meets nothing but an extenſive and uniform horizon like the ſea, though in ſome places the ground is uneven and ſtony. Almoſt invariably naked on every ſide, the earth preſents nothing but a few wild plants thinly ſcattered, and thickets, whoſe ſolitude is rarely diſturbed but by antelopes, hares, locuſts, and rats. Such is the nature of nearly the whole country, which extends 600 leagues in length, and 300 in breadth, and ſtretches from Aleppo to the Arabian ſea, and from Egypt to the Perſian gulf. The ſoil, however, varies conſiderably in different places; and this variety in the qualities of the ſoil is productive of ſome minute differences in the condition of the Bedoweens. In the more ſterile countries, or thoſe which produce few plants, the tribes are feeble and very diſtant; which is the caſe in the deſert of Suez, that of the Red Sea, and the interior of the Great Deſert, called the Najd. Where the ſoil is more fruitful, as between Damaſcus and the Euphrates, the tribes are more numerous and leſs diſtant from each other; and in the cultivable diſtricts, ſuch as the pachalics of Aleppo, the Hauran, and the neighbourhood of Gaza, the camps are frequent and contiguous. In the former caſe the Bedoweens are merely paſtors, and ſubſiſt only on the produce of their herds, and on a few dates and fleſh-meat, which they eat, either freſh, or dried in the ſun and reduced to a powder. In the latter they ſow ſome land, and add cheeſe, barley, and even rice to their fleſh and milk. Such is the ſituation in which nature has placed the Bedoweens, to render them a race of men equally ſingular in their phyſical and moral character. This ſingularity is ſo ſtriking, that even their neighbours, the Syrians, regard them as extraordinary beings; eſpecially thoſe tribes which dwell in the depths of the deſerts, ſuch as thoſe of Anaza, Kaibar, Tai, and others, which never approach the towns. In general, the Bedoweens are ſmall, meagre, and tawny; more ſo, however, in the heart of the deſert, than on the frontiers of the cultivated country; but they are always of a darker complexion than the neighbouring peaſants. They alſo differ among themſelves in the ſame camp: the ſcheiks, that is, the rich, and their attendants, were always taller, and more corpulent than the common claſs. Some of them are more than five feet five or ſix inches high; though in general they do not exceed five feet two inches. This difference can only be attributed to their food, with which the former are more abundantly ſupplied than the latter. The Bedoweens of the lower claſs live in a ſtate of habitual wretchedneſs and famine: and it is an undoubted fact, that the quantity of food conſumed by each of them does not exceed ſix ounces a day. This abſtinence is moſt remarkable among the tribes of the Najd and the Hedjaz. Six or ſeven dates ſoaked in melted butter, a litle freſh milk, or curds, ſerve a man a whole day, and he thinks himſelf happy when he can add a ſmall quantity of coarſe flour, or a little ball of rice. Meat is reſerved for the greateſt feſtivals, and they never kill a kid but for a marriage or a funeral. A few wealthy and generous ſcheiks only can kill young camels, and eat baked rice with their victuals. In times of dearth the vulgar, half famiſhed, eat locuſts, rats, lizards, and ſerpents, which they broil on briars.

It has been already obſerved, that the Bedoween Arabs are divided into tribes, which conſtitute ſo many diſtinct nations. Each of theſe tribes appropriates to itſelf a certain tract of land, and is collected in one or more camps, which are diſperſed through the country, and which make a ſucceſſive progreſs over the whole, in proportion as it is exhauſted by the cattle. Such is the law among them, that if a tribe, or any of its ſubjects, enter upon a foreign territory, they are treated as enemies and robbers, and a war enſues. Moreover, as all the tribes have affinities to each other by alliances of blood or treaties, leagues are formed which render theſe wars more or leſs general. As ſoon as the offence is made known, they mount their horſes, and ſeek the enemy; when they meet, they enter into a parley, and the diſpute is frequently compromiſed; if not, they attack either in ſmall bodies, or man to man. They encounter each other at full ſpeed with fixed lances, which they ſometimes dart, notwithſtanding their length, at the flying enemy; the victory is rarely conteſted; it is decided by the firſt ſhock, and the vanquiſhed fly off at full gallop over the naked plain of the deſert. The tribe which has been defeated ſtrikes its tents, removes by forced marches to a diſtance, and ſeeks an aſylum among its allies. The enemy, ſatisfied with their ſucceſs, drive their herds further on, and the fugitives ſoon after return to their former ſituation. Diſſenſions, however, are often perpetuated by the ſlaughter that is made on theſe occaſions; and they have eſtabliſhed laws among themſelves, that the blood of every man who is ſlain muſt be avenged by that of his murderer. This vengeance is called "Tar," or retaliation; and the right of exacting it devolves on the neareſt of kin to the deceaſed. If any one neglects to ſeek his retaliation, he is for ever diſgraced. He therefore watches every opportunity of revenge. If his enemy periſhes in any other way, he ſeeks ſatisfaction by inflicting vengeance on the neareſt relation. Theſe animoſities are tranſmitted, as it were, by inheritance, from father to children, and never ceaſe but by the extinction of one of the families, unleſs they agree to ſacrifice the criminal, or purchaſe the blood for a ſtated price, in money or in flocks. Such being the condition of ſociety, moſt of the tribes live in an habitual ſtate of war; and this circumſtance, together with their mode of life, renders the Bedoweens a military people, though they have made no great progreſs

in war as an art. Their camps are formed in a kind of irregular circle, compoſed of a ſingle row of tents, with greater or leſs intervals. Theſe tents, made of goat's or camel's hair, are black or brown, or ſtriped black and white, and thus differ from thoſe of the Turkmans, which are white. They are ſtretched on three or four pickets, only five or ſix feet high, which gives them a very flat appearance; ſo that at a diſtance one of theſe camps appears like a number of black ſpots. To the colour of theſe tents, ſays Dr. Shaw, there is a beautiful alluſion, (Cant. i. 5.) "I am black, but comely like the tents of Kedar." For nothing, adds this writer, can afford a more delightful proſpect than a large extenſive plain, in its verdure, or even ſcorched up by the ſunbeams, with theſe moveable habitations, ſituated in circles upon them. Theſe tents are the ſame with what the ancients called "Mapalia," (Sil. Ital. l. xvii. 90. Lucan. l. iv. 684.) and are repreſented by Salluſt, (Bell. Jug. §. 21.) as reſembling the bottom of a ſhip turned upſide down. The length of theſe tents is much greater than their breadth; and they are entirely open on one of their long ſides, that is ſheltered from the wind, and on that which is expoſed they are cloſed. The tent of the ſcheik is in ſome of their encampments diſtinguiſhed from the others merely by a large plume of black oſtrich feathers placed upon its top. Each tent, inhabited by a family, is divided by a curtain into two apartments, one of which is appropriated to the women. In theſe tents the Bedoweens, when they take their reſt, lie ſtretched out upon the ground, without bed, mattreſs, or pillow; wrapping themſelves in their hykes or blankets, and lying upon a mat or carpet, in any part of them, where they can find room. A number of theſe tents, from 3 to 300, are arranged in a circle, and called Douwar. The empty ſpace within the large circle ſerves to fold their cattle every evening. As the ſhade of trees is very agreeable in torrid regions, the Bedoweens in the deſert take pains in ſelecting ſhaded ſituations for their encampments: but thoſe of Egypt encamp on ſpots deſtitute of trees; and when any happen to be there, it is no conſideration with them in the pitching of their tents. They never have any entrenchments, their only advanced guards and patroles are dogs: their horſes remain ſaddled and ready for being mounted on the firſt alarm; but being utter ſtrangers to all order and diſcipline, theſe camps, always open to ſurpriſe, afford no defence in caſe of an attack. Accidents, therefore, frequently happen, and cattle are carried off every day. The tribes which live in the vicinity of the Turks, are ſtill more accuſtomed to alarms and attacks; for theſe ſtrangers arrogating to themſelves, in right of conqueſt, the property of the whole country, treat the Arabs as rebel vaſſals, or as turbulent and dangerous enemies; and on this principle they never ceaſe to wage ſecret or open war againſt them. The Arabs, on their ſide, regarding the Turks as uſurpers and treacherous enemies, watch every opportunity to do them injury. On the ſlighteſt alarm, the Arabs, confounding the innocent with the guilty, cut their harveſts, carry off their flocks, and interrupt their communication and commerce. Theſe depredations produce a miſunderſtanding between the Bedoweens and the inhabitants of the cultivated country, which renders them mutual enemies. Such is the external ſituation of the Arabs.

As to their internal conſtitution, each tribe is compoſed of one or more principal families, the members of which have the title of ſcheiks, that is, chiefs or lords. One of theſe ſcheiks has the ſupreme command over the others. He is the general of their little army, and ſometimes aſſumes the title of "Emir," which ſignifies commander and prince. The more relations, children, or allies he has, the greater is his influence. To theſe he adds other adherents, whom he attaches to himſelf by ſupplying their wants. Beſides, a number of ſmall families, who, not being ſtrong enough to maintain their own independence, and needing alliances and protection, range themſelves under the banner of this chief. Such an union is called "Kabila," or tribe. Theſe tribes are diſtinguiſhed by the names of their reſpective chiefs, or by that of the ruling family; and when they ſpeak of any of the individuals that compoſe them, they call them the "children" of ſuch a chief; as, e. g. "Beni Temin," "Oulad Tai," the children of Temin and of Tai.

The ſcheiks and their ſubjects are born to the life of ſhepherds and ſoldiers. The more conſiderable tribes rear many camels, which they either ſell to their neighbours, or employ in the carriage of goods, or in their military expeditions. The ſmaller tribes keep flocks of ſheep. Among thoſe tribes which apply to agriculture, the ſcheiks live always in tents, and they leave the culture of their ground to their ſubjects, whoſe habitations are wretched tents. The peculiar diſtinctions which characteriſe their different tribes reſult from their different modes of living. The genuine Arabs diſdain huſbandry, as an employment by which they would be degraded. They maintain no domeſtic animals but ſheep and camels, except, perhaps, horſes. Thoſe tribes which are of a pure Arab race, live on the fleſh of their buffaloes, cows and horſes, and on the produce of ſome little ploughing. The former tribes, diſtinguiſhed as noble, by their poſſeſſion of lands, are denominated "Abu el Abaar:" and the ſecond "Moædan," which are eſteemed a middle claſs, between genuine Arabs and peaſants. Theſe are ſometimes mentioned contemptuouſly, becauſe they keep buffaloes and cows. The "Moædan," tranſport their dwellings from one country to another, as paſturage fails; ſo that a village ſprings up ſuddenly in a ſituation where, on a preceding day, was not to be ſeen a ſingle tent. The genuine Bedoweens, living always in the open air, have a very acute ſmell; and the fetid exhalations produced by cities are one cauſe of their diſlike of them. So acute is their ſmell, that, according to Niebuhr, if they are carried to the ſpot from which a camel has ſtrayed, they will follow the animal by ſmelling its track, and diſtinguiſh the traces of its footſteps from thoſe of other animals that have paſſed the ſame way. Thoſe Arabs, who wander in the deſert, will ſubſiſt five days without drinking, and diſcover a pit of water by examining the ſoil and plants in its environs. Like other people that lead an erratic life, they are addicted to robbery, and of courſe are formidable enemies to thoſe who traverſe the deſerts; but they never murder thoſe whom they rob, unleſs travellers in their own defence ſhould chance to kill a Bedoween, in which caſe the others are eager to revenge his death. Upon all other occaſions they act in a manner conſiſtent with their natural hoſpitality. Of their hoſpitality Niebuhr has recorded ſeveral very pleaſing inſtances. The pillaging of the caravans, he ſays, is not always owing merely to their propenſity for robbing, but their expeditions for this purpoſe are commonly conſidered by themſelves as lawful hoſtilities againſt enemies, who would defraud the natives of their dues, or againſt rival tribes, who have undertaken to protect thoſe illegal traders.

The government of the Bedoweens is at once republican, ariſtocratical, and even deſpotic. It is republican, as the people have great influence, and nothing can be tranſacted without a majority: it is ariſtocratical, becauſe the families of the ſcheiks poſſeſs ſome of the prerogatives which every where accompany power: and it is deſpotic, becauſe the principal ſcheik has an indefinite, and almoſt abſolute authority, which he may abuſe; though the ſtate of the tribes confines this abuſe within very narrow limits; for if he ſhould kill an Arab, it would be almoſt impoſſible for him to

eſcape puniſhment, and the law of retaliation would be in force. His ſubjects, haraſſed by ſeverity, would abandon him, and join another tribe; his own relations would depoſe him, and advance themſelves to his ſtation. The dignity of ſcheik is hereditary, but not confined to the order of primogeniture; the petty ſcheiks, who form the hereditary nobility, chuſe the grand ſcheik out of the reigning family, without conſidering his immediate relation to his predeceſſor. Little or no revenue is paid to the grand ſcheik. In fact, the principal ſcheik in every tribe defrays the charges of all who arrive at or leave the camp. His rank ſubjects him to great expence by the entertainment of his allies, and of the principal men, who aſſemble to deliberate concerning encampments and removals, peace and war, and the litigations between individuals. To theſe he muſt give coffee, bread baked on the aſhes, rice, and ſometimes roaſted kid or camel. In a word, he muſt keep open table. On his generoſity depend his credit and his power. To provide for theſe expences, the ſcheik has nothing but his herds, a few ſpots of cultivated ground, the profits of his plunder, and the tribute he levies on the high roads, the total of which is very inconſiderable. The moſt powerful ſcheiks among the Bedoweens, though ſometimes denominated princes and lords, may be compared to ſubſtantial farmers, whoſe ſimplicity they reſemble in their dreſs, as well as in their domeſtic life and manners. A ſcheik, who has the command of 500 horſe, does not diſdain to ſaddle and bridle his own, nor to give him his barley and chopped ſtraw. In his tent, his wife makes the coffee, kneads the dough, and ſuperintends the dreſſing of the victuals. His daughters and kinſwomen waſh the linen, and go with pitchers on their heads, and veils over their faces, to draw water from the fountain. Theſe manners agree preciſely with the deſcriptions in Homer, and the hiſtory of Abraham in the book of Geneſis.

The ſimplicity, or rather poverty of the lower claſs of the Bedoweens, correſponds to that of their chiefs. The whole wealth of a family conſiſts of moveables, of which the following is a pretty exact inventory. A few male and female camels, ſome goats and poultry, a mare with her bridle and ſaddle, a tent, a lance 16 feet long, a crooked ſabre, a ruſty muſket, with a flint or matchlock, a pipe, a portable mill, a pot for cooking, a leathern bucket, a ſmall coffee-roaſter, a ſtraw mat, which ſerves equally for a ſeat, a table, and a bed, ſome clothes, which are put up in leather bags hung up in their tents, a mantle of black woollen, and a few glaſs or ſilver rings which the women wear upon their legs and arms. But the principal and moſt important article in the poſſeſſion of a Bedoween is his mare, which ſerves in making his excurſions againſt hoſtile tribes, or ſeeking plunder in the country or on the highways. The mare is preferred to the horſe, becauſe, as Volney, Chenier, and others ſay, ſhe does not neigh, is more docile, and yields milk, which occaſionally ſatisfies the thirſt, and even the hunger of her maſter.

The Bedoweens of the deſert preſerve their butter in a leathern bag; and their water in goat ſkins. Their hearth conſiſts of a hole made in the ground, and laid with ſtones; inſtead of an oven they uſe an iron plate in preparing their bread, which is made into ſmall cakes. In their excurſions, they carry with them a ſupply of meal, and their other proviſions are dates, milk, cheeſe, and honey. They are dreſſed much like their brethren in Egypt, except that they wear ſhoes of undreſſed leather, and of a peculiar ſhape; and that many of them walk bare-footed over the ſcorching ſand, which renders their ſkin at length inſenſible. Their women appear leſs ſhy and ſcrupulous than the other females of the eaſt, converſe more freely with ſtrangers, and expoſe themſelves with their faces unveiled.

The arts of the Arabs, whoſe wants are few, conſiſt in weaving their clumſy tents, and in making mats and butter. Their whole commerce only extends to the exchanging of camels, kids, ſtallions, and milk, for arms, clothing, a little rice or cotton, and money, which they bury. They are totally ignorant of all ſcience, and have not even any idea of aſtronomy, geometry, or medicine. They have not a ſingle book; and nothing is ſo uncommon among the ſcheiks as to know how to read. Their whole literature conſiſts in reciting tales and hiſtories, in the manner of the Arabian Nights Entertainments. For ſuch ſtories they have a peculiar paſſion; and in the evening they ſeat themſelves on the ground, at the door of their tents, or under cover, if it be cold, and there, ranged in a circle, round a ſmall fire of dung, with their pipes in their mouths and their legs croſſed, after indulging for ſome time ſilent meditation, they amuſe themſelves with the recital of tales of this kind. They have likewiſe, beſides their love-ſtories, their love-ſongs, which have in them more nature and ſentiment than thoſe of the Turks and the inhabitants of the towns.

It has been obſerved, that the Bedoweens, though their condition in the depths of the deſert reſembles, in many reſpects, that of the ſavages of America, have not the ſame ferocity. So that, accuſtomed to endure hunger, they have never been addicted to the practice of eating human fleſh; and their manners are in general much more ſociable and mild. Volney attributes this difference of manners to the difference of their ſituation. The American ſavages have been induced by the nature of their country to become hunters rather than ſhepherds; and their habits have contributed to produce and cheriſh a ferocity of character. But the Bedoweens, whoſe naked plains, without water or foreſts, are deſtitute of fiſh or game, and poſſeſſing the camel, have been determined to a paſtoral life, and hence they have acquired manners which have influenced their whole character. Finding at hand a light, but conſtant and ſufficient nouriſhment, they have acquired the habit of frugality. Content with the milk of the camel and dates, they have not deſired fleſh; they have ſhed no blood; their hands are not accuſtomed to ſlaughter; nor their ears to the cries of ſuffering creatures, and they have preſerved a ſenſible and humane heart. Nevertheleſs, when the Arab ſhepherd became acquainted with the uſe of the horſe, his mode of life was conſiderably changed. The facility of paſſing over extenſive tracts of country rendered him a wanderer. He became greedy from want, and a robber from greedineſs: and ſuch is his preſent character. A plunderer rather than a warrior, the Arab poſſeſſes no ſanguinary courage; he attacks only to deſpoil; and if he meets with reſiſtance, never thinks a ſmall booty is to be put in competition with his life. To irritate him, you muſt ſhed his blood; and then he is found to be as obſtinate in his vengeance as he was cautious in avoiding danger. The ſpirit of rapine, with which the Arabs have been often reproached, is exerciſed only towards reputed enemies, and is accordingly founded on the acknowledged laws of almoſt all nations. Among themſelves they are remarkable for a good faith, a diſintereſtedneſs, and a generoſity, which would do honour to the moſt civilized people. What can be more noble than the right of aſylum ſo reſpected among all the tribes? A ſtranger, nay even an enemy, touches the tent of the Bedoween, and from that inſtant his perſon becomes inviolable. It would be reckoned a diſgraceful meanneſs, an indelible ſhame,

to ſatisfy even a juſt vengeance at the expence of hoſpitality. Has the Bedoween conſented to eat bread and ſalt with his gueſt, nothing can induce him to betray him. The power of the ſultan himſelf would not be able to force a refugee from the protection of a tribe but by its total extermination. The Bedoween, ſo rapacious without his camp, has no ſooner ſet his foot within it, than he becomes liberal and generous. What little he poſſeſſes he is even ready to divide; and when he takes his repaſt, he ſeats himſelf at the door of his tent, in order to invite paſſengers; and this act of generous hoſpitality he regards as a matter of duty; and of courſe he himſelf takes the ſame liberty with others. So far does this reciprocal generoſity prevail, that one would imagine the Arabs poſſeſſed all their goods in common. Nevertheleſs, they are no ſtrangers to property; but without that ſelfiſhneſs which the increaſe of the imaginary wants of luxury has given it among poliſhed nations. Among the Arabs there exiſt a kind of equality in the partition of property, and a variety of conditions, which have appeared, ſays Volney, to the wiſeſt legiſlators as the perfection of human policy. From this ſtate of things, it becomes difficult for their ſcheiks to form a faction for enſlaving and impoveriſhing the body of the nation. Each individual, capable of ſupplying all his wants, is better able to preſerve his character and independence; and private property becomes at once the foundation and bulwark of public liberty. This liberty extends even to matters of religion. Whilſt the Arabs of the towns crouch under the double yoke of political and religious deſpotiſm, thoſe of the deſert, or the Bedoweens, live in a ſtate of perfect freedom from both. On the frontiers of the Turks, indeed, the Bedoweens from policy preſerve the appearance of Mahometaniſm; but ſo relaxed is their obſervance of its ceremonies, and ſo little fervour has their devotion, that they are generally conſidered as infidels, who have neither law nor prophets. They ſcruple not to ſay, that the religion of Mahomet was not made for them; for, they add, "how ſhall we make ablutions, who have no water? How can we beſtow alms, who are not rich? Why ſhould we faſt in the Ramadan, ſince the whole year with us is one continued faſt? And what neceſſity is there for us to make the pilgrimage to Mecca, if God be preſent every where?" In ſhort, every man acts and thinks as he pleaſes; and the moſt perfect toleration is eſtabliſhed among them. Volney obſerves, that there are few poliſhed nations, whoſe morality is, in general, ſo much to be eſteemed as that of the Bedoween Arabs. If this be the fact, we may reaſonably aſcribe it to a variety of circumſtances altogether independent of that ſingularity which he mentions in connection with it, and which ſerve to counteract its effects. Among theſe Bedoweens, as well as the Turkmans and Curds, religion is the freeſt from exterior forms, inſomuch that no man has ever ſeen among theſe claſſes of people either prieſts, temples, or regular worſhip. We can ſcarcely imagine, that even M. Volney himſelf, though we are not unapprized of his mode of thinking on the ſubject of religion, would preſume to aſcribe the excellence of the morality of theſe tribes to their total want or diſuſe of all the outward means of producing and maintaining it; but he would probably ſuggeſt the inefficacy, in a moral view, of thoſe forms and modes of worſhip which are eſtabliſhed and practiſed among the Mahometans. The manners of theſe people are preſerved pure and ſimple, and ſuch as are deſcribed in their ancient hiſtories, as Sonnini obſerves, by the abſence of luxury and factitious pleaſures, bringing immorality in their train, which have made no attempt to fix their abode on the parched and barren ſands occupied by the Bedoweens.

The Bedoweens, who live in tents in the deſert, have never been ſubdued by any conqueror; but thoſe who have ſettled near towns, and fertile provinces, are reduced, in ſome meaſure, to a ſtate of dependence on the ſovereigns of thoſe provinces. Such are the Arabs, in the different parts of the Ottoman empire; ſome of whom pay a rent or tribute for the towns or paſturages which they occupy; and others frequent the banks of the Euphrates only in one ſeaſon of the year and in winter return to the deſert. Theſe laſt acknowledge no dependence on the Porte, neither are, properly ſpeaking, ſubject to the Turks; but the police of the latter occaſions frequent, but neither long nor bloody, wars among the Bedoweens. Whenever the Turks interfere in their quarrels, all the tribes combine to repulſe the common enemy of the whole nation. Every grand ſcheik conſiders himſelf as abſolute lord of his whole territory, and accordingly exacts the ſame duties upon goods carried through his dominions as are levied by other princes. The Europeans, therefore, are wrong in ſuppoſing the ſums paid by travellers to the grand ſcheiks to be merely a ranſom to redeem them from pillage. The Turks, who ſend caravans through the deſert to Mecca, have ſubmitted to the payment of theſe duties, paying a certain ſum annually to the tribes who live near the road to Mecca; and theſe in return keep the wells open, permit the paſſage of merchandiſe, and eſcort the caravans. If the Bedoweens ſometimes pillage theſe caravans, the haughty perfidious conduct of the Turkiſh officers is always the firſt cauſe of ſuch hoſtilities. The tribes of Bedoweens on the confines of the deſert, are thoſe who have preſerved the national character in its greateſt purity, and who have maintained their liberty unimpaired. Of theſe, that denominated "Beni Khaled" is one of the moſt powerful, on account of its conqueſts and wealth, and the number of other tribes ſubject to it. It has advanced from the deſert of Nedsjed to the ſea, and conquered the country of Lachſa. That of the tribe of "Kiab" inhabits north from the Perſian gulf, and rarely encamps. Theſe have poſſeſſions in the province of Chuſiſtan in Perſia, in which province there are five different conſiderable tribes of independent Bedoweens. Thoſe of the tribe "Beni Lam," inhabiting between Korne and Bagdad, upon the banks of the Tigris, receive duties upon goods carried from Baſſora to Bagdad, and ſometimes pillage caravans. The "Montefidſi," or "Montefik," are the moſt powerful tribe north from the deſert, with reſpect to extent of territory and number of ſubaltern tribes, acknowledging their authority. They poſſeſs all the country on both ſides of the Euphrates, from Korne to Ardje. The Arabs of this tribe often plunder travellers paſſing between Helle and Baſſora, and are frequently chaſtiſed by the pacha of Bagdad, who depoſes their ſcheik, and ſubſtitutes another in his room. This tribe derives its appellation from one Montefik, who came from Hedjaz, and was deſcended from a family, illuſtrious before the days of Mahomet. All theſe tribes, that live on the confines of the deſert, are genuine Arabs, who breed ſheep and camels, and live in tents. This, however, is the caſe with reſpect to the reigning tribes; though ſome of the ſubaltern ones have loſt their nobility, by intermixing the practice of agriculture with the habits of paſtoral life.

The rich plains of Meſopotamia and Aſſyria, which were once cultivated by a populous nation, and watered by ſurpriſing efforts of human induſtry, are now inhabited, or rather ravaged, by wandering Arabs. The lands between the Tigris and the Euphrates are occupied by tribes practiſing agriculture, or "Moædan." All travellers complain of the robberies of the Bedoweens of Aſſyria. The reſtleſs and thieviſh diſpoſition of theſe people ſeems to increaſe the farther they recede from their native deſerts, and to approach

proach the country inhabited by the plundering Curds and Turkmans. The pachas of Syria are as much intereſted in guarding againſt the depredations of the wandering Arabs, as the Turkiſh governors on the Perſian frontier. As it is of great conſequence to the cities of Aleppo and Damaſcus (which ſee) that their caravans travelling to Bagdad or Baſſora ſhould be ſuffered to paſs in ſafety through the deſert, the pachas, in order to protect them from inſult and pillage, artfully venture to employ one tribe of Arabs againſt the reſt; and with this view they give the title of Emir to the moſt powerful ſcheik in the neighbourhood. To him they pay an annual ſum, or the produce of a certain number of villages, for guiding the caravans, for keeping the other Arabs in awe, and for levying the dues from thoſe who feed their cattle on the pacha's grounds. The moſt powerful tribe near Aleppo, is denominated "Mauali," beſides which, there are many other tribes, amounting to twenty, or more, who pay a trifling ſum to the Emir for liberty to hire out or ſell their camels, and to feed their cattle through the country. Other tribes pay a tax for the privilege of gathering ſalt in the "Deſert of Salt." In the vicinity of Damaſcus there are numerous tribes, one of which, named "Abu Salibe," it is ſaid, conſiſts ſolely of Chriſtians. The greateſt tribe in the deſert of Syria is that called "Anæſe," which is ſpread into Nedsjed, and reckoned the moſt numerous tribe in the heart of Arabia. The caravans of Turkiſh pilgrims pay the Bedoweens of this tribe a conſiderable duty for their free paſſage through the country; when diſſatisfied, they plunder the caravans, and they often make war on the pacha of Damaſcus. The Bedoweens, who occupy thoſe countries, that are uſually comprehended under the appellation of "Arabia Petræa," or the deſerts that lie between Egypt, Syria, and Arabia, properly ſo called, are diſtributed into ſeveral tribes which wander among dry ſands and rocks, ſeeking ſome few interſperſed ſpots, that afford ſcanty food for their cattle. The Arabs of Paleſtine ſeem to be poor neglected hordes, who inhabit that barren and diſmal country; and the pilgrims that viſit the Holy Land have given exaggerated relations of the moleſtations and injury which they have ſuffered from them.

Of the Bedoweens, there are ſeveral tribes, who arrive every year in Egypt after the inundation, from the heart of Africa, to profit by the fertility of the country, and who in the ſpring retire into the depths of the deſert. Others of theſe are ſtationary in Egypt, where they farm lands, which they ſow, and annually change. All of them obſerve among themſelves ſtated limits, which they never paſs, on pain of war. They all lead nearly the ſame kind of life, and have the ſame manners and cuſtoms. Ignorant and poor, they preſerve an original character diſtinct from ſurrounding nations. Pacific in their camp, they are every where alſo in an habitual ſtate of war. Some of theſe, diſperſed in families, inhabit the rocks, caverns, ruins, and ſequeſtered places where there is water; others, united in tribes, encamp under low and ſmoaky tents, and paſs their lives in perpetual journeyings, ſometimes in the deſert, ſometimes on the banks of rivers; having no other attachment to the ſoil, than what ariſes from their own ſafety, or the ſubſiſtence of their flocks. The huſbandmen, whom they pillage, hate them; the travellers whom they deſpoil, ſpeak ill of them; and the Turks, who dread them, endeavour to divide and corrupt them. It is calculated that the different tribes of them in Egypt might form a body of 30,000 horſemen; but theſe are ſo diſperſed and diſunited, that they are only conſidered as robbers and vagabonds. The young women among the Bedoweens of Egypt might be reckoned not deſtitute of beauty, ſays Sonnini; though they have a tawny hue, and indelible compartments, not eaſily reconcilable to the eyes of an European, which they painfully mark on the lower part of the face, with a needle and a black dye. The men are, in general, very handſome. A ſimple and uniform mode of life, uninjured by exceſs, prolongs their exiſtence to the period fixed by nature. They live to be very old, and at an advanced age, they are remarkable for their truly venerable and patriarchal phyſiognomy. Thoſe, however, who are wandering, predatory, and wretched, are for the moſt part of a ſlender make and mean appearance. Some of the Egyptian Bedoweens have among them a tradition, that their anceſtors were Europeans and Chriſtians, one of whoſe ſhips having been wrecked on the coaſt of Egypt, the crew had been plundered, and reduced to the neceſſity of living in the deſert. The only remnant they have of the ſuppoſed Chriſtianity of their forefathers is the ſign of the croſs, which they traced with their fingers upon the ſand. In the plans that have been adopted in Egypt, under Ali Bey, for preventing robbery and eſtabliſhing public tranquillity, the extermination of the Bedoweens has been a principal object. Several hordes fell victims to the policy of the governor; and whole tribes retired into the deſert. However, the people of Egypt, far from approving thoſe means of protecting their property, murmured aloud at the ſcarcity of camels, ſheep, and other animals, with which the Bedoweens had been accuſtomed to ſupply them in great abundance, though it was their practice to ſteal the property which they had ſold. It has ſince appeared, that the proſperity of Egypt is intimately connected with the preſervation of the Bedoweens.

To the above accounts of the Bedoweens, extracted from modern travellers, we ſhall ſubjoin the deſcription given of their anceſtors above 1800 years ago by Diodorus Siculus, l. xix.

"The wandering Arabs dwell in the open country, without any roof. They themſelves call their country a ſolitude. They do not chuſe for their abode places abounding in rivers and fountains, leſt that allurement alone ſhould draw enemies into their neighbourhood. Their law or their cuſtom forbids them to ſow corn, to plant fruit-trees, to make uſe of wine, or to inhabit houſes. He who ſhould violate theſe uſages would be puniſhed infallibly with death, becauſe they are perſuaded, that whoever is capable of ſubjecting himſelf to ſuch conveniences, would ſoon ſubmit to maſters in order to preſerve them. Some lead their camels to graze, ſome their ſheep. The latter are the wealthieſt; for, beſides the advantages they derive from their flocks, they go to ſell in the ſea-ports frankincenſe, myrrh, and other precious aromatics, which they have received in exchange from the inhabitants of Arabia Felix. Extremely jealous of their liberty, at the news of the approach of an army, they take refuge in the depth of the deſerts, the extent of which ſerves them as a rampart. The enemy, in fact, perceiving no water, could not dare to traverſe them, whilſt the Arabs, being furniſhed with it by means of veſſels concealed in the earth, with which they are acquainted, are in no danger of this want. The whole ſoil being compoſed of clayey and ſoft earth, they find means to dig deep and vaſt ciſterns, of a ſquare form, each ſide of which is the length of an acre. Having filled them with rain-water, they cloſe up the entrance, which they make uniform with the neighbouring ground, leaving ſome imperceptible token, known only to themſelves. They accuſtom their flocks to drink only once in three days, ſo that when they are obliged to fly acroſs theſe parched ſands, they may be habituated to ſupport thirſt. As for them.

themſelves, they live on fleſh and milk, and common and ordinary fruits. They have in their fields the tree which bears pepper; and a great deal of wild honey, which they drink with water. There are other Arabs who cultivate the earth. They are tributary, like the Syrians, and reſemble them in other reſpects, except that they do not dwell in houſes. Such are pretty nearly the manners of this people." Volney's Travels in Egypt and Syria, vol. i. Niebuhr's Travels through Arabia, &c. vol. i. p. 158—183. Sonnini's Travels in Upper and Lower Egypt, p. 303. 317—322. 390. Savary's Letters in Egypt, vol. ii. p. 274, &c. See ARABIA.

BEDR, or BEDDER HOUNEINE. in *Geography*, a place of Arabia, 20 miles from Medina, and 40 from Mecca, lying in the high road of the caravan of Egypt. The fertile vale of Bedr is rendered famous by the battle fought between Mahomet and the Koreiſh of Mecca, in the ſecond year of the Hegira, A. D. 623. In this vale Mahomet was informed by his ſcouts of the caravan that approached on one ſide, and of the Koreiſh, conſiſting of 100 horſe, and 850 foot, who advanced on the other. After a ſhort debate, the holy prophet ſacrificed the proſpect of wealth to the purſuit of glory and revenge; and a ſlight intrenchment was formed to cover his troops, and a ſtream of freſh water that glided through the valley. "O God," he exclaimed, as the Koreiſh deſcended from the hills, "O God, if theſe are deſtroyed, by whom wilt thou be worſhipped on the earth? Courage, my children, cloſe your ranks; diſcharge your arrows, and the day is your own." At theſe words he placed himſelf, with Abubeker, on a throne or pulpit, and inſtantly demanded the ſuccour of Gabriel and 3000 angels. His eye was fixed on the field of battle; the Muſſulmans fainted and were preſſed: in that deciſive moment the prophet ſtarted from his throne, mounted his horſe, and caſt a handful of ſand into the air: "Let their faces be covered with confuſion." Both armies heard the thunder of his voice; their fancy beheld the angelic warriors; the Koreiſh trembled and fled; ſeventy of the braveſt were ſlain; and ſeventy captives adorned the firſt victory of the faithful. The dead bodies of the Koreiſh were deſpoiled and inſulted; two of the moſt obnoxious priſoners were puniſhed with death; and the ranſom of the others, 4000 drams of ſilver, compenſated in ſome degree the eſcape of the caravan. Herbelot. Bib. Orient. p. 180. Gibbon's Hiſt. vol. ix. p. 300.

BEDRIACUM, in *Ancient Geography*, a village of Italy, ſituate, according to Tacitus, between Verona and Cremona, or about 16 miles from the confluence of the Adda and Po. Cluvier places it between Cremona and Mantua, and ſuppoſes it to have been the preſent Caneto, a large village on the left of the Oglio. M. d'Anville thinks that it was the place now called Cividale on the right ſide of that river. It is famous for two battles fought within a month by Romans againſt Romans, A. D. 69; in the firſt of which the emperor Galba was defeated by Otho, and in the ſecond Otho was defeated by Vitellius.

BEDRIEGER, GROOTE BEDRIEGER, in *Ichthyology*, a name given by ſome to the *ſparus inſidiator* of Pallas and Gmelin. Vide *Ruyſch, theatr. &c.*

BEDRIP, or BEDREPE, or BEDERAPE, the cuſtomary ſervice which inferior tenants anciently paid their lord, by cutting down his corn, or doing other work in the field. The word is formed from the Saxon *biddon, to pray*, and *repe, to reap*, or *cut corn.*

BEDROLA, in *Geography*, a town of Spain, in Arragon; 8 leagues from Sanguela.

BEDSTRAW, in *Botany*. See GALIUM.

BEDUSTA, in *Ancient Geography*, the ancient Hindoo name of the river Hydaſpes, or the modern BEHUT.

BEDWIN, GREAT, in *Geography*, is an ancient borough town ſituated on the eaſtern ſide of the county of Wilts, in England; at the diſtance of 70 miles weſt of London, and 17 miles north from Saliſbury. It is an ancient borough by preſcription, and ſent members to all the parliaments of Edward the firſt. During ſome parts of the ſubſequent reigns, it intermitted ſending; but from the 9th of Henry V., two members have conſtantly repreſented the borough. Theſe are elected by about eighty perſons who poſſeſs freeholds, or inhabit ancient burgage houſes. The town is governed by a port-reve, aſſiſted by a bailiff, and ſome inferior officers, all of whom are choſen by the former. Bedwin had formerly a market on Tueſday, but this has been diſcontinued for ſome years, in conſequence of its proximity to the larger market town of Marlborough.

Dr. Stukely and ſome other antiquaries have given to this place the honours of a Roman ſtation, and a Saxon city; but there is little proof or probability, that it was ever the former. There are ſome entrenchments remaining on a hill ſouth of the town, where it is ſaid Ciſſa erected a caſtle, and where he ſeated himſelf as viceroy of Wiltſhire and Berkſhire. Towards the end of the ſeventh century, a ſevere and deſtructive battle was fought near this town, between Wulfhere, king of Mercia, and Æſcuin, a powerful Saxon nobleman, when, as Mr. Turner in his Anglo-Saxon Hiſtory, characteriſtically obſerves, "mutual deſtruction was more conſpicuous, than the deciſion" of the battle.

The church of Bedwin is a large ancient ſtructure, built moſtly with flints, and ſhaped in the form of a croſs. Among the monuments it contains, is one to ſir John Seymour, who was father of the protector, and of the unfortunate lady Jane Seymour. According to the tradition of the neighbourhood, this lady was married to the tyrannic monarch at a place called Wolf-hall near Bedwin, where ſir John Seymour then reſided.

Here are two annual fairs. The pariſh contains 316 houſes, and 1632 inhabitants, moſt of whom are employed in agriculture. The famous Oxonian phyſician, Dr. Thomas Willis, was born here.

About two miles weſt of the town is Tottenham park, a ſeat of the earl of Aylesbury. The houſe was built by the celebrated earl of Burlington, on the ſite of an ancient palace belonging to the marquis of Hertford, who was afterwards created duke of Somerſet. Tottenham-park is part of the foreſt of Savernake, which is the only private foreſt in England independently belonging to a ſubject. It is a large tract of wild ground, profuſely wooded, and containing much fine old oak timber.

BEE, APIS, in *Natural Hiſtory*, a genus of the *Hymenopterous* order, in the Linnæan claſſification of inſects; in *Phyſiology*, and in *Huſbandry*, more commonly expreſſive of the common honey-bee (*apis mellifica*), although likewiſe applicable to the various other ſpecies of honey-bees; and in a ſtill more general ſenſe to thoſe which do not, as well as thoſe which do, produce honey; thoſe which live in ſocieties, as well as thoſe which lead a life of ſolitude, or independence from their kindred kinds; all which have a certain appearance and caſt of character, which, in the common acceptation of the word, claim the diſtinctive epithet of *bee*, or *honey-bee, humble bee, wild bee, &c.*

The bee, or apis tribe, is characteriſed in the Linnæan ſyſtem as having, in common with other hymenopterous inſects, four membranaceous wings, and the female being armed

armed with a ſting. This genus comprehends an amazing number of diſtinct ſpecies, many of which are clearly aſcertained; ſome are doubtful; and many, if we may be allowed to reaſon by analogy, are moſt likely yet unknown. Upon the whole, there are ſcarcely any genera of inſects that comprehend a greater number or variety of ſpecies than the *apes*. The majority of thoſe correctly known have been already enumerated under the article Apis, to which the reader is requeſted to refer. The principal ſubdiviſions, or natural families of the genus under which they have been deſcribed by Linnæus, and by various writers before and ſince the time of that naturaliſt, will be alſo found there. Deſcending from the minutiæ of critical inquiry into the complicated characters of thoſe ſubdiviſions, it reſts with us in this place to ſpeak of the *apes* in another point of view:—as a race of animals highly entertaining, for their manners, habits, and inſtinctive properties, to the naturaliſt; important to the œconomiſt in rural life; and familiar to every one by the trivial appellation of "a bee."

Under this head, the common honey, or domeſticated bee, demands the firſt conſideration, as it will ſerve to elucidate the peculiarities of the whole tribe, at leaſt ſo far as they are of material conſequence in the concerns of human life. By the indiſcriminate term of the common honey-bee, we comprehend what are individually named the *queen bee*, or female; *male bee*, or drone; and *working bee*, or neuter. The natural hiſtory of the common bee has been more fully and impartially conſidered than that of any other creature of the inſect tribe; with the exception of the ſilk-worm, and the coccus employed in dyeing, there appears to be none more deſerving of the regard paid to it. As an object of advantage, the honey-bee has been deemed, by the common conſent of mankind in all ages, of ſufficient conſequence to be particularly attended to. We are not to forget the occaſional recurrence of claſſic writers of antiquity to the bee: the paſtoral poets celebrate its praiſe; nor was the cultivation of this uſeful creature overlooked even by the earlieſt Britons, of whom we poſſeſs any record. Its preſervation and its culture were recognized in their laws; the bee itſelf was conſidered as a moſt ſerviceable domeſtic, and the honey one of the greateſt delicacies the bounty of heaven had granted them. In modern days, the importance of the bee has ſuffered a very ſenſible diminution in this country: ſtill it is cultivated, and with advantage, by the thrifty agriculturaliſt. But in the warmer regions of Europe, ſuch as the ſouth of France, Italy, and the neighbouring parts of Aſia, its cultivation is attended with more ſucceſs than with us; the climate of thoſe countries, mild, invigorating, and abundantly productive of luxuriant vegetation, is perfectly congenial with the nature of the bee; there it requires but little care from the hand of culture, and amply repays that little beſtowed with the ſpontaneous produce of its induſtry.

Whilſt we are ſpeaking on this particular topic, it will not be thought ſuperfluous to advert to a few remarks that have lately fallen from the pen of M. Latreille, an ingenious French naturaliſt, in an introductory diſcourſe to the ſtudy of bees publiſhed laſt year in Paris. "Dans la grande ſérie des animaux appelés inſectes (ſays that writer), il n'en eſt pas dont l'hiſtoire préſente une auſſi grande richeſſe de faits, et une auſſi prodigieuſe fécondité de merveilles, que celle des abeilles. Sous les rapports de l'induſtrie, ces inſectes ſont le chef d'œuvre de la toute-puiſſance du Créateur; et l'homme lui-même, ſi fier de ſes dons naturels, eſt, en quelque ſorte, humilié à la vue de l'intérieur d'une ruche. Ceſſons de nous extaſier ſur la cabane ſingulière du caſtor, ſur la conſtruction ingénieuſe du nid de quelques oiſeaux; tout cela eſt oublié, lorſqu'on voit les travaux de l'abeille. Quoi! un animal, qui échappe preſque à la vue, dont l'organiſation, comparée avec celle des êtres des claſſes ſupérieures, eſt ſi imparfaite, ſe réunit en ſociété pour fonder une ville, s'y gouverner par des loix invariables, y vivre dans une harmonie que ni une population exceſſive, ni la diverſité d'humeurs et des caractères des individus qui la compoſent, ne ſauroient altérer! Quoi! une inſecte ſi vil en apparence, travaillera ſans relâche pour raſſembler atomes par atomes, les matériaux de ſon habitation, les pétrira, les façonnera avec tant d'art, élévera ces ſuperbes edifices, dont l'architecture á été le ſujet des méditations des plus grandes géomètres, recoltera avec tant de peine cette liqueur ſi agréable, cette eſpèce de nectar connu ſous le nom de miel; et votre ame ne ſeroit pas ravie d'étonnement! vous ne ſeriez pas en contemplation! L'abeille n'a pas ſeulement des droits a votre admiration, elle en a auſſi ſur votre cœur. Si elle travaille avec tant de zèle, c'eſt moins pour la converſation de ſa frèle exiſtence, que pour celle de ſes ſemblables, pour la proſpérité de l'etat." In purſuing this lofty ſtrain of comment, we are leſs inclined to admit the accuracy of his reaſoning, than the energy of diction with which it is advanced. The philoſophy of his arguments is loſt in emphaſis; and that which requires coolneſs to diſarm us of prejudices, is placed in a moſt flattering and glowing light, more likely to miſlead than to inform. We may reply to nearly all that he has ſaid in this reſpect, in the preciſe words of the late Mr. John Hunter, who, after a patient inveſtigation of the bee, its operations, and mode of life, has given his opinion, in the Philoſophical Tranſactions, upon this point, to the following effect.—"From theſe animals forming colonies, and from a vaſt variety of effects being produced, and with a degree of attention and nicety that ſeem even to vie with man; man, not being in the leaſt jealous, has wiſhed to beſtow on them more than they poſſeſs, viz. a reaſoning faculty; while every action is only inſtinctive, and what they cannot avoid or alter, except from neceſſity, not from fancy. They have been ſuppoſed to be legiſlators, even mathematicians: indeed, on a ſuperficial view, there is ſome ſhew of reaſon for ſuch ſuppoſitions; but people have gone much farther, and have filled up from their own imagination every blank, but in ſo unnatural a way, that one reads it as if it were the deſcription of a monſter." The prevailing ſentiments of this latter writer preciſely correſponding with thoſe of a well-known moralizing poet, may be ſtill more elegantly enforced:—

* * * * * * * The realm of bees
* * * * * * * * * * * *
* * theſe, for ever, though a monarch reign,
Their ſeparate cells and properties maintain.
Mark what unvaried laws preſerve each ſtate;
Laws wiſe as nature, and as fix'd as fate."

Pope.

To a certain extent this opinion is inadmiſſible. The unerring laws by which the bees are governed, imply rather the inſtinctive compliance of the creature to the appointed ordinance of the Creator, than the reſult of any reaſoning faculty. We are "to look through nature, up to nature's God." We admire, we are wrapt in aſtoniſhment at the wonderful order preſerved amidſt ſuch a vaſt ſociety of contemptible animals: their ſkill is worthy of our contemplation, their induſtry of our imitation; but when we hear of the prudence, the ſagacity, or wiſdom of a bee, compared, nay analyſed, by the ſame criterion as the ſtupendous powers of intellect in man, the wild conjectures of the enthuſiaſtic obſerver ſink into contempt beneath the calm reflection of the mind, and beneath the pen of criticiſm. Much as we are amuſed with the perfection of its works, with the prevailing order, the policy, and aſſiduities of the bee, in its ſocial mode

mode of life, we cannot perceive the benefit likely to refult to the architect, the geometrician, or the ſtateſman, by making theſe the ſubjects of their contemplation.

Thus far we have proceeded only in a general manner; in deſcending to particulars, the ſubject before us naturally divides itſelf into a variety of diſtinct branches, under every one of which it is neceſſary the Bee ſhould be conſidered. The line of diſcrimination is to be firſt drawn between thoſe which herd in ſocieties, and are moſt conducive to the intereſt of mankind: thoſe which, living in ſocieties, are rather injurious than of utility; and thoſe which are ſolitary, and of courſe, like the latter, live in a ſtate of wildneſs. Bees of the firſt deſcription conſiſt only of a few ſpecies; the ſpecies of wild aſſociated bees are rather more numerous; but the far greater number are ſolitary.

While we are ſpeaking of thoſe included in the firſt claſs, our attention again reverts with much propriety to the common bee, between which, and the other ſorts of honey-bees, the line of parallel is ſo intimately connected, that they cannot eaſily, and need not neceſſarily be regarded ſeparately. Of the common bee we are to conſider the queen bee, male bee, and working bee; their ſtructure and anatomy; their economy, generation, preſervation, and varieties; the other analogous ſpecies productive of honey; the general habits of thoſe bees which live in ſocieties; and of thoſe which are of a ſolitary diſpoſition. The *architecture* of Bees, ſo far as it relates to the common honey-bee, will fall under notice in the article Honey-Comb;—*Colonies* of Bees, under Hive and Hiving;—the *ſwarming* of Bees, their Wax and Honey, under their reſpective articles.

Bees, *Sexes of.* There are in every hive or colony three ſorts of bees, which Linnæus calls regina (fœmina), fuci (mares), and operariæ (ſpadones). The firſt is the *queen*, or female; the ſecond the *drones*, or males; and the laſt the *working* bees, or neuters. The queen is larger than the others; ſhe is armed with a ſting, and has thirteen joints in the antennæ, including the radicle; thoſe of the male have one joint more in the antennæ; the eyes in this ſex are large, and it is deſtitute of a ſting: the working bees are armed with a powerful ſting, and have fifteen joints in the antennæ. And here it will be proper to obſerve, that the circumſtance of the antennæ in the female and neuter bee, containing the ſame number of articulations, were not obſerved till lately. Linnæus tells us the antennæ of the female has ten joints, the male eleven, and the working bee fifteen; the diſcovery to the contrary is due to Mr. Kirby, who, to uſe his own language, ſays: "In every one of theſe aſſertions, with due deference to a name ſo great be it ſpoken, Linnæus is miſtaken."

Bees, *Structure and Anatomy of.* There is nothing particularly ſtriking in the ſtructure of the bee. In their form they vary in different ſpecies, and in different ſexes, but generally ſpeaking they are uniformly bulky animals, having the head large, the eyes oval and conſpicuous, the thorax broad and thick, as well as the body, and moſt are commonly covered with hair or down; the ſexes diſtinguiſhable by the number of articulations in the antennæ (being one more in thoſe of the male than the female), and the mouth furniſhed with ſtrong *inſtrumenta cibaria*. The jaws and lip of the apis mellifica are membranaceous at the tip, the former bidentated; as in other bees, the jaws open to the right and left, and ſerve to carry out of the hives any thing that incommodes them. To thoſe which have no ſting, the teeth of theſe jaws are of eſſential ſervice in their wars with ſuch as poſſeſs that formidable weapon; and it is believed, but on what foundation is uncertain, that the wounds inflicted by means of theſe teeth inevitably prove mortal to the other, or ſtinging bees, when they bite. The tongue in different kinds of bees is very different in ſhape. It has been obſerved, that in the more induſtrious ſpecies, this inſtrument, when ſtretched out, is ſhorter than in the others: be this as it may, the tongue of the common honey-bee is long, inflected, and extremely pliant; by means of this, the bee not only procures itſelf neceſſary ſubſiſtence, but it is alſo employed by the animal to collect the honey, which we appropriate to ourſelves. The parts of which the tongue conſiſts in different bees are not uniformly diſtinguiſhed by the ſame terms in the works of entomological writers. Proboſcis is that by which Mr. Kirby, after the example of Linnæus, when defining the Apis genus, calls the tongue, together with all the machinery that belongs to it, incluſive of the ſheath or vagina. This is more fully illuſtrated in his diſſections of the proboſcis of the male, the female, and the neuter of the common honey bee, wherein the ſtructure of this inſtrument, and the ſeveral parts of which it conſiſts, are correctly diſcriminated. It may not be altogether irrelevant to our purpoſe to follow this agreeable writer, in ſome degree, whilſt explaining the ſtructure of the proboſcis or tongue. This part of the bee is ſaid to conſiſt of ſeven pieces; Mr. Kirby ſpeaks of more, viz. the fulcrum, tubus, valvulæ, cardo, lora, palpi exteriores, palpi interiores, laciniæ exteriores, laciniæ interiores, and lingua. The *fulcrum* is that part upon which the tube is ſeated, and has been noticed both by Swammerdam and Reaumur; the latter of whom calls it le pivot. *Tubus* is that part called by Fabricius the baſe of the tongue, and by Swammerdam and others the ſheath of the tongue, including the baſe of that organ; and in a certain meaſure anſwering the ſame purpoſe as the valvulæ. The latter, or *valvulæ*, form the exterior ſheath of the tongue. As to the *cardo*, cardines i tervene between the valvulæ and the lora, and ſeem to perform the office of hinges. Reaumur mentions theſe as "filets tendineux par les quels les tiges ſont attachées à leurs appuis." *Lora* are ſo named by Mr. Kirby from their uſe, which ſeems to be to let out or pull in the proboſcis, being thoſe parts which Reaumur calls "les leviers;" when the proboſcis is extended, the angle on which the fulcrum of the tube ſits, is obſerved to point towards the breaſt, but when retracted, its poſition changes, and it points towards the mouth. *Palpi exteriores* are organs noticed in the rude ſketch of the proboſcis of the hive bee by Swammerdam, who does not, however, ſpeak of them. In this kind they are ſmall, and conſiſting only of a ſingle joint, eſcaped the obſervation of Reaumur; in ſome bees they are large, and contain from one to ſix joints. *Palpi interiores* are thoſe parts of the proboſcis which Reaumur diſtinguiſhes by the term "barbes;" in the common bee, theſe conſiſt only of two articulations; in other ſpecies they are known to contain a greater number. De Geer calls theſe little organs, "les petit barbillons." *Laciniæ exteriores* are to be met with in almoſt every family of the apis genus. *Laciniæ interiores* are peculiar to the apis, and embrace and defend the tongue where it enters the tube; theſe are called by Swammerdam the third pair of joints of the proboſcis; Reaumur mentions them as "piéces qui embraſſent et fortifient la trompe.;" Latreille, in his *Nomada* family, names them "ſoies laterales." *Lingua*, or the true tongue, called ſometimes by De Geer "le lévre inferieur," or inferior lip, is occaſionally mentioned by Fabricius under the term of labium, or lip. Roemer, in a work entitled "Genera Inſectorum, &c." lays down the character of apis thus:—"Jaws dentated, with an inflected prohoſcis, with two bivalve ſhells, in which the tongue is included." Latreille, in a work recently publiſhed, divides the apis genus into two families: the firſt, correſponding

corresponding with the *melitta* of Kirby, has these characters: "Mâchoires et langue très alongées, deux ou trois fois plus longues que la tête, dirigées en avant dans l'inaction, et dont la base resort inférieurement de la cavité ou elles sont logées. Partie saillant de la langue évasée, a trois divisions plus courte que la gâine: celle-ci longue et cylindrique." The two Fabrician genera, *hylæus* and *andrena*, are arranged under this family; the tongue in *hylæus* is thus described, "langue large; divisions du milieu échancrée, dentelée, ciliée." In *andrena*, "langue oblongue; division au milieu en point renfendue." La gâine, or sheath of the tongue, is not invariably cylindrical in this division (*melitta*) of *apes*; it is sometimes conical.

In the family which includes the true *apes* of Kirby, the tongue is thus described by Latreille: "langue très prolongée, etroite, lincaire presque, cylindrique, un peu coriacée, a papilles vers l'extrémité, fléchie à la sortie de la gâine." *Nomada*, *apis*, and *eucera* of Latreille are included under this head. His *nomada* is thus characterised still further: "langue d'une pièce avec deux très petites soies latérales." *Apis*, "langue de trois pieces (organes de la nutrition plus petits dans les mâles)." *Eucera*, "langue de cinq pièces." We have deemed it requisite to be thus minute in following the observations of Kirby, Latreille, and others, who have dissected and examined the structure of the proboscis in different bees, with the aid of microscopic glasses, for the purpose of shewing the fallacy of the commonly received opinion, that in all bees the structure of this organ must be the same. For instance, we see that in one family the tongue is very long, more than twice or thrice the length of the head, with the extremity opening into three divisions, the whole of which is contained within a sheath of a cylindrical form; in others this part is conical. Some have a large tongue, with the middle division of it sloping, jagged, and ciliated, and the end truncated; again, others have an oblong tongue, the middle piece of which is cleft or lacerated at the tip. In many, the tongue is very long, straight or linear, almost cylindrical and papillous at the extremity; while the tongue in others consists of a single piece, having two lateral laciniæ of a small size; and sometimes, on the contrary, the tongue is formed of five pieces; in the *hylæus*, *andrena*, and *nomada* families, the tongue is three-cleft, in *apis* five-cleft, and in *eucera* seven-cleft.

In the formation of the proboscis, the purpose for which nature has designed this curious instrument is very apparent. That of the common bee has been examined with attention. First, the sheath or external parts are observed to protect and strengthen the organs of nutrition which they contain; the valves of the sheath are disposed on each side of the tongue in pairs; with the tongue itself, which is pervious, the bee extracts and gathers the nectareous juices from flowers, which are shortly after converted into honey. The two pieces of the exterior sheath are horny or membranaceous; those of the inner sheath are placed higher above the base than the exterior ones. The proboscis is partly membranaceous, and partly of a gristly nature, and has the lower part formed in such a manner that it is capable of considerable distension, by means of which the internal cavity may be prodigiously enlarged, and rendered capacious enough to receive a great quantity of native honey. When the proboscis is shut up, and inactive, it is very much flattened, and broader than it is thick. The lower and membranaceous parts of the trunk at the base have no hairs upon them, but are covered with little transparent protuberances that are placed in regular order, and at equal distances from each other; these are supposed to be glandules, and may have a considerable share in changing or preparing the honey that is swallowed or taken up by the proboscis. Down the middle of the proboscis there is a tube of a much harder nature than the sides, which becomes rather tapering towards the apex, where the proboscis is very thick set with small hairs, which may serve to keep it in a proper situation when in use.

The proboscis is not cylindrical, but rather a kind of convex blade, terminating to all appearance in a point; and the sheaths are so contrived as to cover little more than the upper part of it. These exterior sheaths lap over each other on the upper part, so that the outside of the proboscis is protected by a very strong double case; a covering that was unnecessary for the under part, because, when this instrument is in use, the sheaths are opened, but when inactive, it is so folded, that the under part is protected by the body of the bee. Within the exterior sheath, and near the bottom, are two levers, which are fixed to the end of the proboscis, and by the motion of which it is raised or lowered. If a bee is attentively observed when it alights upon a full blown flower, the activity and address with which it employs this apparatus will prove highly entertaining. The tongue is first protruded, then lengthened, then shortened, and continually kept in motion, bending and turning in every possible direction to adapt itself to the form of the flower.

The sting of the Bee is a curious weapon, adapted to the industrious habits of its life, which expose it to a multitude of dangers. It is truly an instrument in every manner calculated for offensive or defensive operations in the annoyance of its enemies. The wound which the bee inflicts with its sting is severe, to its little antagonists it oftentimes proves mortal, because it not only strikes deeply into their bodies, but conveys at the same time a powerful poison into the wound which it occasions. In the queen, or female bee, the sting is longer as well as stouter than in the working bee, and is bent a little under the belly. The female and the working bee are those only which are furnished with a sting; for the male, as before observed, has none. The sting in both is put in motion by means of certain muscles attached to its base, and contained within the abdomen, where also the glands for the secretion of the poison is concealed. This internal apparatus for the preparation of the poison has been misconceived: every writer, except the late Mr. Hunter, considers it as a single receptacle; whereas it appears, from the observations of that judicious anatomist, to consist not of one, but of two small ducts, although those two seem to unite into one: these are situated in the region of the abdomen among the air vessels, and when pressed, inject into the passage of the sting the poisonous fluid drop by drop. The sting is apparently thick and solid at the base, and at the extremity remarkably acute; such is its appearance to the common observer: but strictly speaking, this is nothing more than the sheath or case in which the genuine sting is contained; the latter is an apparatus consisting of two extremely slender barbed darts, each of which has five or six recurved teeth or barbs placed near their extremity, or, according to Derham, they amount to eight recurved teeth on each dart. The sheath is of an horny substance, round at the base, and on the sides grooved, ending in a sharp point, and has an opening near the tip, through which the two bearded darts are protruded beyond the sheath, when the bee is in the act of stinging. When the two barbed darts, of which the true sting consists, are united, they easily enter the flesh, and then opening a little, become for a moment most securely fixed by means of the teeth with which they are beset. Some say one of these darts is rather longer than the other, and fixes its beards, or teeth, first; and the other instantly following, they penetrate alternately deeper and deeper, holding themselves firmly in the flesh with their beards,

till the whole ſting is buried in the wound, and the poiſon injected. When once the bee has completely transfixed its ſting into the fleſh, the acrid cauſtic liquor, called the poiſon, is preſſed from the glands in which it is ſecreted, and paſſing down the channels of the darts, diſcharges its malignant contents into the wound, occaſioning an acute pain and ſwelling of the part, the inflammation of which continues not unfrequently for ſeveral days after. Dr. Hunter, being deſirous of aſcertaining the force of this poiſonous fluid, dipped needles into it, with which he pricked the back of his hand; the like experiment he tried on the ſame part with needles that were not dipped into it, and found that the punctures occaſioned by the former grew ſore and inflamed, while the others did not.

But if the wound which the bee inflicts be painful to thoſe who receive it, to the bee it is attended often with more ſerious harm, for it inevitably proves fatal, if by any accident the ſting is broken off in the act of inflicting it. When the creature ſtrikes its ſting deep into the fleſh, and the perſon ſtarts, and diſcompoſes the bee before it can diſengage itſelf, the ſting is almoſt certain of being broken off, and left ſticking in the wound. On the contrary, if he has patience to ſtand quiet, the bee will bring the two ſlender darts cloſe together, and withdraw the whole, in which caſe the wound is always leſs painful. A waſp is not ſo liable to leave its ſting in the wound as a bee; the beards of the darts being ſhorter, and the inſect more nimble and vigorous in its operations. When the bee means to ſting, it flies about the object of its anger very quickly, and by the velocity of its motions, ſeems to evade being ſtruck or attacked to advantage, while preparing for the aſſault. The ſound emitted at this time is alſo peculiar, and to thoſe accuſtomed to bees is perfectly well underſtood. "The danger of being ſtung by bees (it has been ſaid), may be in a great meaſure prevented by a quiet compoſed behaviour. A thouſand bees will fly and buzz about a perſon without hurting him, if he will but ſtand ſtill and forbear diſturbing them, even when near his face; in which caſe he may obſerve them for hours together without danger; but if he moleſts or beats them away, he uſually ſuffers for it. In the "Edinburgh Medical Commentaries" it has been affirmed, that a perſon is in perfect ſafety in the midſt of myriads of bees, if he were to keep his mouth carefully ſhut, and breathe gently through the noſtrils only; the human breath, it would ſeem, being peculiarly offenſive to their delicate organs: and merely with this precaution, it is ſaid, the hives may be turned up, and even part of the comb cut out, while the bees are at work.

Reaumur made uſe of no other remedy for the ſting of the bee than to bathe the part affected with cold water, a remedy which in moſt caſes will allay the pain and inflammation only during the time of its application. Oil of olives, or ſweet almonds, applied to it alleviates the pain. Lombard, a late French writer, in his "Manuel neceſſaire au villageois pour ſoigner les abeilles," preſcribes a better remedy. He recommends that the wound be preſſed, to cleanſe it as much as poſſible from the venomous fluid, and then rubbed with alkali, or with a little diluted quick lime, by means of which the properties of the poiſon will be neutralized; the wounded part, after the application of this remedy, muſt be well waſhed with cold water, when both the pain and ſwelling will be found to have received conſiderable relief.

Bees, *Voice of.* The bee is capable of emitting either by the mouth or motion of the wings, a variety of ſounds, expreſſive of its anger, fear, contentment, and other paſſions; a circumſtance hitherto but very ſlightly regarded by thoſe writers who have, in other reſpects, entered moſt minutely into the hiſtory of this animal. Mr. Hunter, in his paper on the honey-bee, inſerted in the Philoſophical Tranſactions, ſays a few words on this ſubject. Bees, he tells us, may be ſaid to have a voice; or at leaſt, that they are able to form ſeveral diſtinct ſounds. They give a ſound when flying, which they can vary according to circumſtances. One accuſtomed to bees can immediately tell when a bee intends to make an attack by the ſound, moſt likely of the wings, but that is not certain; it may iſſue from the mouth. The bees may be ſeen ſtanding at the door of their hive, with the belly rather raiſed, and moving their wings, by which means a noiſe is occaſioned. But they produce a noiſe independent of that made by the wings; for if a bee be ſmeared all over with honey, ſo as to cauſe the wings to adhere together, the bee will be perceived to make a ſhrill and peeviſh ſound while the wings remain motionleſs. To aſcertain this matter with a ſtill greater degree of accuracy, Mr. Hunter held a bee by the leg with a pair of pincers, and very clearly obſerved that the creature made the ſame peeviſh noiſe while the wings were perfectly ſtill. After this, he even cut the wings off, when the poor bee continued to make the ſame noiſe as before. He immerſed the bee in water, but it did not then produce any noiſe, till it was much teaſed, when the ſame ſound was heard as in the former inſtance: during this experiment, he could obſerve the water, or rather the ſurface of contact of the water with the air, vibrating at the orifice of an air-hole ſituated at the root of the wing. The ſame writer remarks, that the bees, or ſome kinds of them at leaſt, make a noiſe the evening before they ſwarm, which is a kind of ring or ſound reſembling that of a ſmall trumpet; and by comparing it with the notes of the piano-forte, it ſeemed to be the ſame with the lower *A* of the treble.—When the bees return from their daily excurſions in the fields, to their hives at evening, loaded with farina and honey, they are well known to ſing or hum a ſoft melodious tone expreſſive of their contentment. Entomologiſts are well aware that the ſound emitted by the bee is ſuſceptible of certain modulations. Some of theſe proceed undoubtedly from the motion of the wings, and vary in tone as they are moved with greater or leſs velocity, juſt as we obſerve in other inſects furniſhed with tranſparent wings; and in ſome degree throughout the whole of the inſect race, with the exception of thoſe which have very ſmall wings, or are entirely deſtitute of them. From the obſervation of Mr. Hunter on the emiſſion of air from the lateral trachea, or air veſſel in the ſide, it would ſeem, that a certain ſound may be cauſed by means of theſe little organs: the remark of this anatomiſt deſerves more conſideration than he appeared to be himſelf perſuaded of, ſince we know that the ſinging of the *cicada*, a noiſy tribe of inſects, proceeds not from the mouth, but from two lateral openings, one on each ſide of the abdomen; the ſound being produced by means of a moſt ſingular internal organization, and tranſmitted through thoſe openings at the pleaſure of the creature. It is not unlikely, that many inſects may be furniſhed with lateral organs for the purpoſe of making a certain noiſe, although not exactly of the ſame ſtructure in the *cicada*, and certainly upon a much ſmaller ſcale. That a bee emits a ſound from the mouth, is alſo believed. A gentleman within our knowledge, who has made the manners of bees his particular ſtudy, can with the utmoſt facility declare the ſex of any bee that may chance to paſs near him, by attending only to the motion and ſound emitted by it whilſt in flight.

Bees, *Age of.* Writers are not agreed as to the duration of the term of life in the honey-bee. Among the ancients

it was thought to extend to nine or ten years. Virgil and Pliny limit it to ſeven. Some ſuppoſe that they are annual; others, that they live many years, but the latter idea is almoſt exploded at this time. On the other hand, although they may be conſidered as annual, a few of the females certainly live through the winter, and lay the foundation for a new ſociety in the enſuing ſummer. In the month of Auguſt, Mr. Hunter imagines the queen, or queens, to be impregnated by the males, and as the males do not provide for themſelves, they become burdenſome to the working bees, and are therefore deſtroyed as uſeleſs, and thrown out of the hives. When the bees ſet about the buſineſs of providing their winter ſtore, every operation ceaſes, excepting that of collecting honey and bee-bread for the future ſubſiſtence of the colony. At this particular criſis, it would ſeem as if the males were conſcious of their approaching danger, for they do not reſt as before on the mouth of the hive either when going in or coming out; activity is apparent in all their actions. But this avails them little, nor does it avert, though it may protract, their fate, for a ſhort time; they are commonly attacked by the labouring bees, one, two, or three together, and ſeeming to be incapable of making any reſiſtance, or anxious to avoid the conteſt, attempt only to enſure their ſafety by haſtening out of the way of their cruel enemies as ſpeedily as poſſible. The labourers do not ſting the males, Mr. Hunter tells us, but only pinch, torment, and pull them about, as if to wear them out, and haſten, by ſuch violent treatment, the death of theſe hapleſs creatures, who would die naturally in the ſpace of a little time after.

Bees, *Economy of.* When we ſpeak in a familiar manner of the economy of bees, ſuch as the ſecreting of wax, the conſtructing of honey combs, ranging the fields and gardens to collect farina and nectarious juices for the preparation of wax and honey; attending, nurturing, and feeding the maggots or larvæ, covering in the chryſaliſes or pupæ, &c. the labouring bee alone is meant, for the females and the males are only implicated in the common concern, ſo far as relates to the well government of the colony, and generation of the future brood. Among thoſe who have minutely treated on this ſubject, (the economy of bees), many have related very wonderful and incredible circumſtances; the moral virtues (as it has well been ſaid) have all, at one time or other, been attributed to the bees. They have been celebrated for their prudence, induſtry, mutual affection, unity, loyalty to their ſovereign queen, public ſpirit, ſobriety, and cleanlineſs. The ſagacity of bees in foreſeeing rain, or cold has been often mentioned; this is not very queſtionable; for a ſhort time, at leaſt, before we are ſenſible of the alteration in the ſtate of the weather, their conduct proves that they are not ignorant of it. Mr. Hunter frequently obſerved their return home in great numbers before rain or cold was coming on, without being able to perceive himſelf, till ſome time after, the change in the temperature of the atmoſphere. Bees require a conſiderable degree of heat; the eggs muſt be kept warm, and neither the larvæ nor chryſaliſes, it is aſſerted, will live in cold of 60° or 70°. "Bees (ſays one writer) ſeem to be warned of the appearance of bad weather, by ſome particular feeling. It ſometimes happens, even when they are very aſſiduous and buſy, that they on a ſudden ceaſe from their work; not a ſingle one ſtirs out; and thoſe that are abroad hurry home in ſuch prodigious crouds, that the doors of their habitations are too ſmall to admit them. On this occaſion, look up to the ſky, and you will ſoon diſcover ſome of thoſe black clouds which denote impending rain. Whether they ſee the clouds gathering for it, as ſome imagine, or whether (as is much more probable) they feel ſome other effects of it upon their bodies, is not yet determined; but it is alleged, that no bee is ever caught even in what we call a ſudden ſhower, unleſs it have been at a very great diſtance from the hive, or have been injured by ſome accident, or been ſickly, and unable to fly ſo faſt as the reſt. Cold is a great enemy to them. To defend themſelves againſt its effects during a hard winter, they croud together in the middle of the hive, and buzz about, and thereby excite a warmth that is often perceptible by laying the hand upon the glaſs window of the hive. They ſeem to underſtand one another by the motion of their wings: when the queen wants to quit the hive, ſhe gives a little buzz; and all the others immediately follow her example, and retire along with her."

Although many of the accounts that have been given of the bee are fabulous, an intimate acquaintance with them in their domeſtic operations, has furniſhed many real facts that are as ſurpriſing as thoſe which are apparently, or perhaps wholly, groundleſs. It is not to be diſputed, that at certain times, when they think their ſtores likely to fall ſhort, they make no ſcruple to kill and throw out of the hives their own offſpring; the larvæ and young bees of the male or drone kind, ſcarcely extricated from their pupa ſtate, have been carried away and left to periſh. They may be juſt in ſome reſpects in their own kingdom, and to thoſe who are to be conſidered as their fellow ſubjects, but they rob and plunder ſtrangers whenever they have power and opportunity; and they have frequently battles in committing depredations on neighbouring colonies and hives, or in repelling the aggreſſions of other invaders, in their own defence, which always terminate fatally to many of their number. This indeed does not often happen, except early in the ſpring, or late in autumn, when honey is ſcarce in their hives, and there are no flowers abroad to furniſh them with more. In this caſe, when they have ranged the fields without ſucceſs, they endeavour to ſupply themſelves at the hazard of their lives, from the ſtores of other bees. However, in all theſe conflicts, if the queen of either hive that happens to be engaged is killed, the battle ceaſes, and both parties unite under the ſurvivor.

The induſtry and activity of bees in their domeſtic labours, afford a very inſtructive and amuſing ſpectacle; all are buſily engaged in their ſeveral departments. While ſome are employed in gathering honey and wax, others repair the rotten combs; others carry out the dead, and cleanſe the filth; others keep guard, placing themſelves in five or ſix files eight or ten deep upon the floor of the hives, ſo that all the bees when they enter muſt paſs between them; ſome are even ſaid to ſerve for bridges or ladders for others to paſs over; and when they are tired with labour, they recruit themſelves with reſt. For this purpoſe, they form larger or ſmaller cluſters in the following manner: each bee with its two fore-legs lays hold of the hinder legs of the bee that is next above it, and thus a chain is formed by the ſucceſſive application of one to another, and the firſt bee ſupports the weight of all the reſt to the bottom of the chain. The larger cluſters are only a multitude of theſe chains, of which there are ſometimes an hundred together. The bees, it is ſaid, never lay hold of any part of one another, except the legs. In this way, they likewiſe guard themſelves from the effects of cold, and continue for ſeveral weeks together in a ſtate of torpidity.

Bees, we are told, when they begin to work in their hives, divide themſelves into four companies; one of which roves in the fields in ſearch of farina for the wax; another is employed in laying out the bottoms and partitions of the cells; a third in making the inſide ſmooth from the angles

and corners; and the fourth in collecting and bringing food for the ſupport of the reſt, or in relieving thoſe who return heavily laden. Neither of theſe four companies is kept conſtantly to one employment; they often change the taſks aſſigned them: thoſe that have been at work, for example, in the conſtruction of the cells, are permitted to go abroad, and thoſe which have been in the fields already, are allowed to take their places in the hive. They are believed, and not without reaſon, to have certain ſigns, by means of which they underſtand each other, and one ſtriking inſtance is adduced in proof of this: when any one of the bees is in want of food, the creature bends down its trunk to the bee from whom it is expected, the latter immediately opens its honey-bag, and lets ſome drops of honey fall into the mouth of the other, which is at that time obſerved open to receive it. Many other circumſtances might be likewiſe mentioned, were they neceſſary to confirm this idea. Theſe particulars relate almoſt excluſively to the operations of the neuter, or labouring bee; the males anſwering no other purpoſe than ſimply that of males in their ſexual capacity; and the queen or female breeder only attending to the diſcharge of her more important duties, the laying of eggs, and influencing, by her preſence, the working bees, to perſevere in their reſpective labours.

Bee, *Generation of.* Theſe inſects begin to breed in the upper part of the hive, in the cells adjoining to thoſe which are filled with honey, and they deſcend gradually into the lower parts, as the flowers which furniſh them with wax increaſe in plenty. The cells deſigned for the working bees, are commonly half an inch deep; thoſe for the drones, three quarters of an inch; and thoſe intended to contain the honey only, ſtill deeper. The queen bee is generally concealed in the moſt ſecret part of the hive, and is never viſible, except when ſhe happens to lay her eggs in ſuch combs as are expoſed to light. When ſhe does appear, ſhe is always attended by ten or a dozen of the common ſort, who form a kind of retinue, to follow and guard her wherever ſhe goes. Before ſhe lays her eggs, ſhe examines the cells where ſhe deſigns to lay them; and if ſhe finds they contain neither honey, wax, nor embryo, ſhe introduces the poſterior part of her body into the cell, and fixes to the bottom of it a ſmall white egg, which is compoſed of a thin membrane, filled with a whitiſh liquor. In this manner ſhe proceeds on, till ſhe fills as many cells as ſhe has eggs to lay, which are generally many thouſands. Sometimes more than one egg has been depoſited in the ſame cell; when this is the caſe, the working bees remove the ſupernumerary eggs, and leave only one in each cell. On the firſt or ſecond day after the eggs are lodged in the cells, the drone bee is ſuppoſed by many to inject a ſmall quantity of whitiſh liquid, which in about the courſe of a day is abſorbed by the egg. On the third or fourth day is produced a maggot, which, when it is grown ſo as to touch the oppoſite angle of the cell, coils itſelf up in the ſhape of a ſemicircle, and floats in a certain liquid whereby it is nouriſhed, and enlarged in its dimenſions: this liquid is of a whitiſh colour, of the thickneſs of cream, and of an inſipid taſte, like flour and water. The origin and qualities of this liquid, are not correctly explained: ſome have ſuppoſed that it conſiſts of ſome generative matter injected by the male or drone bee into each cell, in order to give fecundity to the egg: a more probable opinion is, that it is the ſame with what ſeveral writers call the *bee-bread;* and that it is a mixture of water with the juices of plants and flowers, collected merely for the nutrition of the young while they are in a weak and helpleſs ſtate. Whatever may be the nature of this aliment, it is certain the bees are very induſtrious in ſupplying the worms with it. The larva, or maggot, is fed by the working bees for about eight or ten days, till one end touches the other in the form of a ring, and when it begins to find itſelf uneaſy in its firſt poſture, it ceaſes to eat, and begins to unroll itſelf, thruſting the head forwards towards the mouth of the cell. The attendant bees, obſerving theſe ſymptoms of approaching transformation, deſiſt from their labours in carrying food, and employ themſelves in faſtening up the top of the cell with a lid of wax formed in concentric circles, and by their natural heat aſſiſt in cheriſhing the brood, and haſtening the birth. In this ſtate, the larva extends itſelf at full length, and prepares a kind of ſilky covering, which forms a complete lining for the cell, and affords a convenient receptacle for the transformation of the larva to the pupa ſtate. Some naturaliſts ſuppoſe, that as each cell is deſtined to the ſucceſſive breeding of ſeveral larvæ, the whole web, which is compoſed of many cruſts or doubles, is, in reality, a collection of as many webs as there have been larvæ. M. Maraldi apprehends, that this lining is formed of the ſkin of the larva, thrown off at its entrance into the nymph or pupa ſtate; but it is urged by others, that if the cells are opened when recently covered by the bees, the larva within will be found in its own form, and detected in the act of ſpinning its web; and by means of glaſſes, it will be found compoſed of fine threads, regularly woven together, like thoſe of other ſpinning animals.

In the ſpace of eighteen or twenty days, the whole proceſs of transformation is finiſhed, and the bee endeavours to diſcharge itſelf from confinement, by forcing an aperture with its jaws through the covering of the cell; the paſſage is gradually dilated; ſo that one of the maxillæ or jaws appears firſt; then the head, and afterwards the whole body; this is uſually the work of three hours, and ſometimes of half a day. The bee, after it has diſengaged itſelf, ſtands on the ſurface of the comb, till it has acquired its natural complexion, and full maturity and ſtrength, ſo as to become fit for labour. The reſt of the bees gather round it in this ſtate, congratulate its birth, and offer it honey out of their own mouths. The exuviæ, and ſcattered pieces of wax which are left in the cell, are removed by the working bees; and the cavity is no ſooner cleanſed, and fit for new fecundation, but the queen depoſits another egg in it; inſomuch, that M. Maraldi ſays, he has ſeen five bees produced in the ſame cell, in the ſpace of three months. The young bees, it is ſaid, are eaſily diſtinguiſhed from the others by their colour: they are grey, inſtead of the yellow brown of the common bees, the reaſon of which is, that their body is black, and the hairs that grow upon it are white; from the mixture of theſe that are ſeen together, reſults a grey; but this colour forms itſelf into browniſh by degrees; the rings of the body becoming more brown, and the hairs yellower.

Reaumur ſuppoſed, before the time of Linnæus, the queen bee to be the only female in the hive, and conſequently, the mother of the next generation: that the drones are the males by which ſhe is fecundated; and that the working bees, or thoſe which collect wax on the flowers, that knead it, and form the combs and cells, and afterwards fill them with honey, are the neuters.

Schirach, in his "Hiſtoire Naturelle de la Reine des Abeilles, &c" publiſhed in 1772, has advanced a different opinion upon this ſubject. He ſuppoſes, that all the common, or honey bees, are females in diſguiſe, in which the organs that diſtinguiſh the ſex, and particularly the ovaria, are obliterated, or at leaſt from their extreme minuteneſs, have eſcaped the obſerver's eye; that every one of theſe bees, in the earlier period of exiſtence, is capable of becoming a queen bee, if the whole community ſhould think proper to nurſe it in a particular manner, and raiſe it to that rank;

rank; in ſhort, that the queen bee lays only two kinds of eggs, thoſe which are to produce the drones, and thoſe from which the working bees are to proceed. This author made his experiments not only in the ſpring months, but even as late as November. He cut off from an old hive a piece of the brood comb, taking care that it contained larvæ (or *worms* as they are termed) which had been hatched about three days. This he fixed in an empty hive, together with a piece of honey-comb for food to his bees, and then introduced a number of common bees into the hive. As ſoon as the bees found themſelves deprived of their queen, and liberty, a dreadful uproar took place, which laſted twenty-four hours. On the ceſſation of this tumult, they betook themſelves to work, firſt proceeding to conſtruct a royal cell, and then taking the proper meaſures for feeding and hatching the brood incloſed within them; ſometimes, even on the ſecond day, the foundations of one or more royal cells were to be perceived, which proved a certain indication that they had elected one of the incloſed larvæ to the ſovereignty.

The final reſult of theſe experiments ſeemed to be, that the colony of working bees being thus ſhut up with a piece of brood comb, not only hatch, but at the end of eighteen or twenty days, produce from thence one or two queens, which, it was ſuppoſed, proceeded from the larvæ of the common working bee, and which had been converted by the colony into a queen, merely becauſe they wanted one. —From theſe, and other experiments repeated, Mr. Schirach concluded, that all the common working bees muſt be originally of the female ſex; although, if they are not fed, lodged, and brought up in a particular manner while in the larva ſtate, their organs are not developed; and that it is this circumſtance attending the bringing up of the queen, that allows the full extenſion in the female organs in the firſt inſtance, and produced afterwards that difference in her ſize and aſpect, ſo diſſimilar to that of the working bee.

Mr. Debraw, an ingenious apothecary of Cambridge, made many experimental remarks on bees, which are inſerted in the Philoſophical Tranſactions for 1776. He profeſſes to have detected the impregnation of the eggs by the males, as well as to have diſcovered the difference in ſize among the drones or males, of which Maraldi and Reaumur, beſides ſome others, had conceived there might be two diſtinct kinds. Mr. Debraw ſays, he watched the glaſs hives with indefatigable attention from the moment the bees (among which he took care there ſhould be a large number of drones) were put into them, to the time of the queen's laying her eggs, which generally happens the fourth or fifth day. He obſerved, that on the firſt or ſecond days, (always before the third) from the time the eggs are placed in the cells, a great number of bees faſtening themſelves to one another, hung down in the form of a curtain from the top to the bottom of the hive. They had done the ſame at the time the queen bee depoſited her eggs, an operation which ſeems contrived on purpoſe to conceal what is tranſacting; however, through ſome parts of the veil he was enabled to ſee ſome of the bees inſerting the poſterior part of their bodies, each into a cell, but continuing there only a ſhort time. When they had retired, it was eaſy to diſcover a whitiſh liquor left in the angle of the baſis of each cell which contained an egg. In a day or two this liquor was abſorbed into the embryo, which on the fourth day aſſumes its larva ſtate, and is attended by the working bees, who bring it a little honey for nouriſhment, and continue to feed it for the ſpace of eight or ten days after its birth. When the bees find that the larva has attained its full ſize, they deſiſt from bringing any more food, knowing that the larva has no more occaſion for it while in that ſtate; but they have ſtill another ſervice to beſtow upon it, in which they never fail to perform their duty: this is to ſhut up the top of the ſhell in which the larva is encloſed; for eight days longer it remains within the cell after being thus immured, during which time a further change takes place; the larva, which was before idle, begins to work as ſoon as the bees commence their operation of cloſing up the cell; while the latter are employed in making the covering of wax, the larva is at work within the cell, which it lines with a fine ſilk. The larva thus concealed, voids its excrements, quits its ſkin, and aſſumes the pupa form; at the end of ſome days, the young bee acquires ſufficient ſtrength to quit the covering of the pupa, tear through the waxen encloſure of its cell, and proceed from thence a perfect winged inſect.

To prove ſtill further that the eggs are fecundated by the males, and that their preſence is neceſſary at the time of breeding, Mr. Debraw made the following experiments: he left in the hive the queen, with only the common or working bees, without any drones, to ſee whether the eggs ſhe laid would be prolific: for this purpoſe, he took a ſwarm, and ſhook all the bees into a tub of water, leaving them there till they were quite ſenſeleſs, by which means he was able to diſcover the drones without any fear of being ſtung by the others: he then reſtored the queen and working bees to their former ſtate, by ſpreading them on a brown paper in the ſun, after which he placed them in a glaſs hive, and they began very ſoon to work as uſual. The queen laid eggs, which to his great ſurpriſe were impregnated; for he imagined he had ſeparated all the drones, or males, and therefore omitted watching them. At the end of twenty days, he found ſeveral of the eggs had, in the uſual courſe of changes, produced bees, while ſome had withered away and others were covered with honey. Hence he inferred that ſome of the males had eſcaped his notice, and impregnated part of the eggs. To convince himſelf of this, he took away all the brood comb that was in the hive, in order to compel the bees to provide a freſh quantity, being determined to watch narrowly their motions after the new eggs ſhould be laid in the cells. On the ſecond day after the eggs were placed in the cells, he perceived the ſame operation that was mentioned before, namely, that of the bees hanging down in the form of a curtain, while others thruſt their poſterior end of the body into the hive. He broke off a piece of the comb in which were two of theſe inſects, and found in neither of them any ſting; (a circumſtance peculiar to the drones); upon diſſection, with the aſſiſtance of a microſcope, he diſcovered the four cylindrical bodies which contain the glutinous liquor, of a whitiſh colour, as obſerved by Maraldi in the large drones. He was therefore now under the neceſſity of repeating his experiments, after deſtroying the males, and even thoſe which might be ſuſpected to be ſuch.

He once more immerſed the ſame bees in water, and when they appeared to be in a ſenſeleſs ſtate, he gently preſſed every one, in order to diſtinguiſh thoſe armed with a ſting from thoſe which had none, and which of courſe he ſuppoſed to be males. He replaced the ſame ſwarm in a glaſs hive, where they immediately applied themſelves again to the work of making cells, and on the fourth and fifth day, very early in the morning, he had the pleaſure to ſee the queen bee depoſit her eggs in thoſe cells; he continued watching moſt part of the enſuing days, but could diſcover nothing of what he had ſeen before.

The eggs, after the fourth day, were found in the ſame ſtate as on the firſt day, except that ſome of them were covered with honey. A ſingular event happened next day about

about noon; all the bees left their hive, and were ſeen attempting to get into a neighbouring one, on the ſtool of which the queen bee was found dead, being, no doubt, ſlain in an engagement. This event Mr. Debraw ſuppoſes to have ariſen from the deſire of the bees to perpetuate their ſpecies, to the concurrence of which the males were neceſſary, and that this conſideration alone induced them to deſert their habitation where no males where left, and to fix their reſidence in a new one, where there was a ſtock of them.

To be more fully ſatisfied in this reſpect, Mr. Debraw took the brood comb which had been impregnated, and divided it into two parts; one of which he placed under a bell glaſs with honey-comb, for the food of the bees, taking care to leave a queen, but no drones among the bees confined in it; the other piece of bread-comb, he placed in another bell glaſs with a few drones, a queen, and proportionable number of common bees. The reſult was, that in the piece put into the firſt glaſs there was no impregnation, the eggs remaining in the ſame ſtate as they were when firſt placed in it, and on giving the bees their liberty on the ſeventh day they all flew away; whereas in the other glaſs, which contained the ſecond piece of brood-comb, the very day after the bees had been put into it, the eggs were impregnated by the drones, and the bees did not ſhew the leaſt inclination to abandon their new habitation when the glaſs was left open to allow them to eſcape.

Such are briefly the different opinions of thoſe experienced obſervers of the bee, Reaumur, Maraldi, Schirach, and Debraw, whoſe ſeveral ideas founded, as it muſt appear, upon the moſt laborious, indefatigable, and minute inveſtigation, have met with many advocates. On a ſubject of this intereſt we ought not to aſſume any opinion haſtily, or in an affair ſo myſterious, obtrude our own without a conſiderable degree of caution. Some writers of no mean celebrity have treated, ſince the time of theſe obſervers, upon the ſame topic, whoſe remarks deſerve to be impartially conſidered. To the foregoing obſervations, and ſome others made by Schirach in particular, the late Mr. Hunter has replied, in a paper written by him expreſsly on bees, and inſerted in the Philoſophical Tranſactions for 1792, of which we are to avail ourſelves. The experiments performed by Schirach, Mr. Hunter is diſpoſed to think inaccurate, and the reſult inferred from them of courſe unworthy of credit: how far the arguments of the latter are likely to refute the obſervations of Schirach, remains to be decided, when we have conſidered them in his own words. The criticiſms of this anatomiſt are introduced to notice, in ſpeaking of the queen bee. "The queen bee, as ſhe is termed, (ſays Mr. Hunter) has excited more curioſity than all the others, although much more belongs to the labourers. From the number of theſe, and from their expoſing themſelves, they have their hiſtory much better made out; but as there is only one queen, and ſhe ſcarcely ever ſeen, it being only the effect of her labour we can come at, an opportunity has been given to the ingenuity of conjecture, and more has been ſaid than can well be proved. She is allowed to be bred in the common way, only there is a peculiar cell for her in her firſt ſtage, and Reaumur ſays, "her food is different when in the maggot ſtate;" but there is probably but one queen, and that the whole might not depend on one life, it is aſſerted that the labourers have a power of forming a common maggot into a queen. If authors had given this as an opinion only, we might have paſſed it over as improbable, but they have endeavoured to prove it by experiments, which require to be examined; and for that purpoſe I ſhall give what they ſay on that head, with my remarks upon it."

Abſtracts from Schirach.—"In twelve wooden boxes were placed twelve pieces of the comb; in each box was ſhut up a handful of working bees. Knowing that when bees are forming a queen, they ſhould be confined, the boxes were kept ſhut for two days. When examined at the end of that period," (ſix boxes only were opened) "in all of them royal cells were begun, one, two, or three in each, all of theſe containing a maggot four days old. In four days, the other ſix boxes were opened, and royal cells were found in each, containing maggots five days old, ſurrounded by a large proviſion of jelly, and one of theſe maggots, examined in the microſcope, in every reſpect reſembled a working bee."

"This experiment was repeated, and the maggots ſelected to be made queens were three days old; and in ſeventeen days there were found in twelve boxes fifteen lively handſome queens. Theſe experiments were made in May, and the bees were allowed to work great part of the ſummer. The bees were examined one by one, but no drone could be diſcovered, and yet the queens were impregnated, and laid their eggs." [Here is a wonder! queens laying eggs, (which we muſt ſuppoſe Mr. Schirach meant we ſhould believe) and they hatched without the influence of the male.]

"The above experiment was repeated with pieces of comb, containing eggs only, in ſix boxes, but no preparation was made towards producing a queen."

"The experiment of producing a queen bee from a maggot was repeated every month of the year, even in November."

"A maggot of three days old was procured from a friend enclofed in an ordinary cell, and ſhut up with a piece of comb containing eggs and maggots. That, three days old, was formed into a queen, and all the other maggots and eggs were deſtroyed."

"In above a hundred experiments a queen bee has been formed from maggots three days old [The working bees, as all females, although the ovaria is too ſmall for examination," &c. Vide Phil. Tranſ.]

Mr. Hunter next proceeds to ſpeak of another author who repeated the experiments of Schirach. "Wilhelmi (he ſays) obſerves that a queen cell, which is made while the bees are ſhut up, is formed by breaking down three common cells into one, when the ſides are repaired."—"A young queen was put into a hive which had been previouſly aſcertained to contain no drones, and whoſe queen was removed, and yet the young queen laid eggs. [Probable.] In repeating Mr. Schirach's experiment, he ſhut up four pieces of comb with one maggot in each: after two days the maggots were all dead, and the bees had deſiſted from labour. [There is no myſtery in this: but did they hatch?]—"A piece of comb, from which all the eggs and maggots had been removed, was ſhut up with ſome honey, and a certain number of workers: in a ſhort time they became very buſy, and upon the evening of the ſecond day 300 eggs were found in the cells. [This would ſhow that labourers can be changed into queens at will, and that neither they nor their eggs require to be impregnated; if this was the caſe, there would be no occaſion for all the puſh in making a queen or a male.] He repeated this experiment with the ſame reſult, and the bees were left to themſelves: they placed the queen maggots in the queen cells newly conſtructed, and others in male cells, the reſt were left undiſturbed. He again took two pieces of comb, which contained neither eggs nor maggots, and ſhut them up with a certain number of workers, and carried the box into a ſtove; next evening one of the pieces of comb contained ſeveral eggs, and the beginning of a royal cell was empty."

Beſides theſe ſhort obſervations contained in the brackets, Mr. Hunter tells us he has his doubts reſpecting the whole of

of theſe experiments of Schiraeh, &c. from ſeveral circumſtances that occurred in the courſe of his experiments. The three following facts appear, in his mind, much againſt their probability. Firſt, a ſummer's evening in England is commonly too cold for ſo ſmall a parcel of bees to be lively, ſo as to ſet about new operations; they get ſo benumbed that they could hardly recover in the day, and he ſuſpects, where theſe experiments were made, it alſo was too cold; and indeed ſome even are ſaid to have been tried in this country. Secondly, if the weather ſhould be ſo warm as to prevent this effect, then they are ſo reſtleſs that they commonly deſtroy themſelves, or weary themſelves out; at leaſt, after a few days confinement we find them moſtly dead; and, thirdly, the account given of the formation of a royal cell, without mentioning the above inconvenience, which is natural to the experiment, leads him to ſuſpect the whole to be fabricated. To obviate the firſt objection, which he found from experiment would prevent any ſucceſs that might otherwiſe ariſe, he put parcels of bees with their comb, in which were eggs and maggots, (and in ſome trials chryſalifes beſides) into a warmer place, ſuch as a glaſs frame over tan, the ſurface of which was covered with mould to prevent the ill effects of the unwholeſome effluvia ariſing from it; but from knowing that the maggot was fed with bee-bread, or farina, he took care to introduce a cell or two with this ſubſtance, and alſo the flowers of plants that produce a great deal of farina, together with ſome honey for the old bees. In this manner his bees were preſerved from the cold, and alſo provided with neceſſaries; but after being confined for ſeveral days, upon opening the doors of the hive, thoſe which remained alive came to the door-way, walked and flew about, but gradually left it, and on examining the combs, &c. he found the maggots dead, and nothing like an operation going on. He choſe to have ſome chryſalifes in the comb, ſuppoſing that if the bees died or flew away, thoſe newly hatched afterwards from thoſe chryſalifes, which would happen in a few days, not knowing where to go, might ſtay and take care of the maggots that would be hatched from the eggs; but to his ſurpriſe he found on opening the box that neither the eggs hatched; nor the chryſalifes came forth, all died; from which he began to ſuſpect that the preſence of the bees was neceſſary for both. "The queen, the mother of all, (he concludes with ſaying) in whatever manner produced, is a true female, and different from the labourers and the male." He deſcribes the difference between the female and the male, obſerves that he believes a hive has only one queen; and mentions Riem, who aſſerts that there are ſupernumerary queens, which he has ſeen killed both by the labourers and the males.

With due reſpect to the memory of ſo great a man, we had expected better reaſoning, and a more copious and extenſive inveſtigation of this myſterious affair, from the pen of Mr. John Hunter. After following him through his various remarks, we are almoſt at a perfect loſs to conceive their tendency. He ſets forward with expreſſing his doubts as to the accuracy of Schirach's experiments, who had, it ſeems, endeavoured to prove, that a queen bee might be reared from the humble condition of the larva of a common worker: the ſuggeſtion meets his ridicule, a ſtrong vein of which is apparent throughout his notes; and in the true ſpirit of critical analyſis, he proceeds to examine the experiments by which this ſuggeſtion has been ſupported. Some few inadvertencies of expreſſion in the ſtatement of particulars, are mentioned by him, and after relating two or three unſatisfactory experiments, made in order to invalidate the obſervations of Schirach, he tells us, that "the queen bee, the mother of all, in whatever manner produced, is a true female," an inference ſo logical, that no one would be inclined, we may preſume, to diſpute it; but ſurely it could require no matter of argument, nor criticiſm, nor ſeries of experiments, to prove, that the mother of all muſt be a female; nay ſtill leſs was it incumbent to ſupport, by the uſe of many words, that this female was produced in ſome manner or another; this is apparent enough; we need not be therefore ſolicitous to enquire whether ſhe is produced, but to know in what manner that production is accompliſhed: and here we are left in uncertainty. If Mr. Hunter was convinced, that the obſervations of Schirach were erroneous, he could not, we apprehend, be ignorant of the manner in which ſhe is produced; or, if he was, he muſt have been unauthoriſed to cenſure Schirach. In a word, it ought to be acknowledged in candour, between the two parties, that we had expected, in the outſet, Mr. Hunter would have fairly controverted the arguments of his opponent, but in the concluſion perceive, too evidently, that he is content to contradict them only.

But the experiments of Schirach have been found in many reſpects conſiſtent with the diſcoveries of later naturaliſts; experience has proved that in many points he is correct. It is almoſt enough to ſay that they are in part confirmed by Huber. The latter writer, after profeſſing his opinion, that there are no ſuch creatures as mules or neuters in the ſociety of bees, endeavours to ſhew that the working bees are all originally of the female ſex; and that each is conſequently provided with an *ovaria*, or womb, which neither Swammerdam, Reaumur, and perhaps no other before him, had ever ſeen, although they had conjectured it muſt be ſo. He cites in proof of the poſition that they muſt be females, the diſcovery of Schirach; who, although he had not detected the ovaries, had ſeen the larvæ of the working bees converted into queens, when the neceſſities of the ſtate required it; a fact of which Huber had been occaſionally himſelf a witneſs. Huber is perſuaded, that however ſtrange it may appear, it depends entirely on the manner in which the larva is treated while remaining in the comb, whether the individual will become a perfect female, fitted for the purpoſe of perpetuating the race, the mother of the future ſwarm, and of being inveſted with the powers of ſovereignty; or be doomed to a life of labour as a common working bee. If the larva be intended for the latter condition, the egg is lodged within the confines of a narrow cell; which, when the larva hatched from it attains a certain ſize, effectually prevents the diſtenſion of thoſe organs of the ovaria that are neceſſary to the great purpoſe of rendering the creature prolific in the laſt ſtage of being. Thus it happens, that unleſs the larva be allowed ſufficient room for theſe organs to expand, they continue to be crippled, compreſſed, and afterwards incapable of that expanſion which is abſolutely requiſite in impregnation. Hence we perceive the motives for that eſpecial care which the working bees beſtow on the enlargement of the cells of thoſe larvæ which any fortuitous accident may induce them to adopt for the female parent of the future brood. If the larva of a working bee is to be converted into a prolific female, the cell in which it has been lodged is broken into and made more capacious than before: this permits the creature to attain its full and proper ſize; the ovaria, no longer ſtraitened by the compreſſion of its cell, aſſumes a new and more expanſive form; and when the inſect comes forth in the winged ſtate, the ſexual organs are found to have acquired that degree of maturity which can alone render it capable of fulfilling the ordinary functions for which they were deſigned. There is alſo another cauſe to which the barrenneſs of the working bee is attributed, the quantity of aliment which it receives in the larva form. At this time the creature is pent up within its narrow cell, and is allowed only a certain portion of the

paſte deſtined for food; the queens, on the contrary, are more liberally ſupported; they are cheriſhed with the utmoſt care, and their growth is promoted by every means poſſible. There are ſometimes ſeveral worms, or at any rate two or three reared in every comb for queens; and for the reception of which, if the royal chambers had not been before conſtructed, ſeveral common cells are broken down to effect an enlargement ſuitable for the purpoſe. Theſe larvæ are ſupplied with what is called by ſome the royal jelly, the powerful properties of which are ſometimes obſerved to operate on the larvæ of the common workers; for when it happens that the eggs and worms of ſuch, contained within the cells adjacent to the royal chambers, receive by accident a quantity of this jelly, we are told they produce prolific working bees, although ſuch are very rarely obſerved; but the reaſon of which is obvious: the queen bees are no ſooner hatched than they attack theſe prolific workers without mercy, and deſtroy them. The ſame fate, as is well known, attends all the queen bees, with the exception of the queen bee elect, who muſt ſupport her claim in the firſt inſtance by conquering and deſtroying her rivals, who would aſpire to the ſame honours.

There have been many very ſtrange conceits indulged reſpecting the impregnation of the eggs of bees by the drones, or male bees. Among the ancients, as well as the moderns, it was, and is ſtill believed, that the eggs are fecundated like thoſe of fiſhes by the males diffuſing a prolific fluid over them, correſponding with the milt in the finny tribe. Butler, Swammerdam, Maraldi, &c. carried matters to a much higher pitch of extravagance; they imagined even that it was ſufficient for the female to be for ſome ſhort time in the company of the males to become fruitful, conceiving that the fumes ſhe would imbibe from them would vivify the eggs within her womb. Reaumur thought he diſcovered the union of the drone with the female, as in moſt other animals; his obſervations are not however completely ſatisfactory on this head, although his conjecture has received at length the ſanction of indubitable authority. The diſcoveries of Huber prove him to have been in the right. Huber, diſſenting from the abſurd conceptions of ſome preceding writers, affirms that the intimate aſſiſtance of the male is required in this affair. He tells us, that the eggs are impregnated by the male, while in the ovaria of the female bees; and gives as a reaſon why this connection of the ſexes has not been obſerved before, that it never takes place within the hive. For this purpoſe, the bees reſort into the fields, firſt the female eſcapes from the hive upon a certain ſignal, and the ſwarm immediately follows. If in the firſt flight the female be not impregnated by ſome one of the male attendants, ſhe returns to the hive, and takes a ſecond flight preciſely in the ſame manner, but does not afterwards return without being fecundated. Huber ſuppoſes that this ſingle conſummation of its deſire is ſufficient to vivify all the eggs ſhe may lay for the ſpace of two years after, or even of thoſe laid by her during life, which muſt amount to many millions, ſince ſhe lays four or five thouſand at once, or even ten thouſand in a month. But the male, who contributes his aſſiſtance to give life to this numerous brood, has never the pleaſure of ſeeing his poſterity, for he dies in the accompliſhment of the duty impoſed on him by nature; the ſexual organs remaining too firmly fixed in the body of the female to be withdrawn, he is deprived of them in his ſeparation from her, and left to periſh miſerably.

One of the moſt perſuaſive arguments in favour of Huber's idea reſpecting the working-bees being originally of the female ſex, and not neuters, as is almoſt univerſally believed, may be drawn from the recent diſcovery of Mr. Kirby, who found that the antennæ in both the female and the neuter contain the ſame number of joints. While we tacitly admitted the aſſertion of Linnæus, that there were no leſs than five articulations more in the antennæ of the neuter than the female bee, it required no ſmall ſhare of credulity to believe that ſuch an aſtoniſhing difference in the formation of theſe organs could be produced by the mere effect of feeding the creature under the larva form in one particular manner inſtead of another; but this miſtake being aſcertained, removes one difficulty moſt certainly, namely, the impoſſibility of the working bee having been transformed into a queen, if it does not go very far to prove the fact itſelf. There are, it muſt be owned, however, ſome other objections of a ſimilar nature, which ſtill remain to be removed. Mr. Kirby, than whom we know no firmer advocate for the opinion of the working bees being ſtrictly neutral from their origin, does not appear to have been aware, when he corrected this miſtatement of Linnæus, that his remark would tend, in one material point, to ſupport an idea ſo contrary to that which he entertains himſelf in this reſpect.

Mr. Wildman, who, from his conſtant habit of rearing bees, was perfectly converſant with their attachment to the female, or queen bee, relates one curious particular; the manner in which he could cauſe a ſwarm of bees to follow him, and alight in any particular ſpot he might think proper. "Long experience," ſays this writer, "has taught me, that as ſoon as I turn up the hive, and give it ſome taps on the ſides and bottom, the queen immediately appears to know the cauſe of this alarm, but ſoon retires again among her people. Being accuſtomed to ſee her ſo often, I readily perceive her at firſt glance; and long practice has enabled me to ſeize her inſtantly with a tenderneſs that does not in the leaſt endanger her perſon: this is of the utmoſt importance; for the leaſt injury done to her brings immediate deſtruction to the hive, if you have not a ſpare queen to put in her place, as I have too often experienced in my firſt attempts. When poſſeſſed of her, I can, without injury to her, or exciting that degree of reſentment that may tempt her to ſting me, ſlip her into my other hand, and returning the hive to its place, hold her there, till the bees, miſſing her, are all on wing, and in the utmoſt confuſion. When the bees are thus diſtreſſed, I place the queen wherever I would have the bees to ſettle. The moment a few of them diſcover her, they give notice to thoſe near them, and thoſe to the reſt; the knowledge of which ſoon becomes ſo general, that in a few minutes they all collect themſelves round her, and are ſo happy in having recovered this ſole ſupport of their ſtate, that they will long remain quiet in their ſituation. Nay, the ſcent of her body is ſo attractive to them, that the ſlighteſt touch of her along any place or ſubſtance, will attach the bees to it, and induce them to take any path ſhe takes."

Bees, *Preſervation of.* The preſervation of theſe induſtrious and uſeful creatures deſerves every conſideration. This depends chiefly on ſupplying them with a ſufficient quantity of food, guarding them from their enemies, and deſpoiling them of the produce of their labour without deſtroying them. Beſides the attention which ſhould be beſtowed upon the neceſſities of bees, in the choice of an eligible ſituation for the Apiary, it may be neceſſary to feed them towards the cloſe of autumn, in the winter, or in the ſpring, when they have conſumed their winter ſtock. This ſhould be done, eſpecially in cloudy, milly weather, when they go abroad but little, and when ſeveral days of bad weather immediately follow their ſwarming. Mr. Thorley directs, that no hive ſhould be kept which does not weigh twenty pounds; and that the ſupply ſhould be given in quantities of honey, which

which is their proper food, not leſs than a pound and a half or two pounds at a time. The honey ſhould be firſt diluted with water, or ſmall beer, and then poured into an empty comb. A drone comb is the ſtrongeſt and beſt for the purpoſe; and in the evening, when the bees are quiet, the hive ſhould be gently raiſed on one ſide, and the comb put under it, the contents of which will be conveyed away the next day into the ſeveral magazines.

Reaumur recommends a plate of liquid honey unmixed with water, croſſed with ſtraws, and covered with a paper full of holes, through which the bees will ſuck the honey without daubing themſelves. But care ſhould be taken that the hive be well guarded from robbers, whenever it is provided with a freſh ſupply. The winter quarters of the bees ſhould likewiſe be well ſecured, both againſt the weather and the enemies that would annoy them. Mild winters, as well as ſevere cold, are injurious; ſunſhine in winter tempts them to go abroad, and expoſes them to the fatal effects of ſudden changes either of cold or rain. Bees are moſt likely to ſurvive in cold winters, becauſe they are then in a torpid ſtate, and require very little nouriſhment, provided the apiary be well ſecured from the keen effects of northerly and eaſterly winds; whereas a ſmall degree of warmth enlivens them, when they too often conſume their winter ſtock, and are left deſtitute of food in a wet unfavourable ſpring. When bees are chilled with cold, and to all appearance dying with cold, and the cluſters of them are broken, ſo that they drop down in the hive, they may be recovered oftentimes by the means of heat. Some have adviſed the application of hot or warm aſhes to be laid about the hives, or ſprinkled over the cluſters of bees which lie ſeemingly dead at the bottom of the hive. A ſufficient warmth may be given them by putting them into an handkerchief, and breathing upon them, or by laying them before a fire. This precaution ſhould be taken immediately when the ſymptoms of diſeaſe are ſhewn, otherwiſe their vitals may be impaired, and the bees be irrecoverably loſt. Reaumur made many attempts to preſerve the bees from the ill effects of cold in the winter without removing the hives out of the places where they ſtand in the ſummer. With this view, he covered ſome of the hives with ſtraw, by means of ſticks fixed round them, and reaching a few inches above the top; but the moſt ſucceſsful method he found to be that of preſerving them in large tubs, with earth or hay, contriving at the ſame time to convey air to them through a ſquare tube of wood two inches in width, and half an inch in depth, which paſſed through the ſide of the tub, and was of ſuch a length as to reach the mouth of the hive, projecting at the ſame time three or four inches beyond the ſides of the tub. Since the time of Reaumur, many ingenious contrivances have been deviſed to obviate this, and other objections againſt the hives that were formerly in uſe. A new kind of hive, contrived by M. Huber of Geneva, ſeems to have obtained celebrity upon the continent at this time. There are alſo others conſtructed by Paitcau, Maſſac, Boisjugan, Blangy, Saint de Foy, Ravenal, &c. well deſerving the attention of the farmer. The agricultural committee in Paris has been recently engaged in the examination of the beſt, moſt economical, and advantageous kinds of hives, when M. Lombard, a gardener near that city, preſented one for their inſpection on a plan entirely new, under the name of "*ruche villageoiſe*," the contrivance of which was very much approved. For the ſake of preſerving the bees, due attention ſhould be paid to the ſituation in which the hives are placed: they ought to be ſtationed in gardens ſtored with ſweet-ſcented plants, fruit trees, and the like. The hives ſhould not be placed too near to theſe, becauſe they harbour vermin injurious to the bees, and ſtill more, weeds muſt not be allowed to flouriſh cloſe to the hives, ſince they nouriſh others far more detrimental to the bees than the former.

It is no unuſual circumſtance for one colony of bees to attack and plunder the hive of another. This happens chiefly in the ſpring and autumn. The moſt effectual way to guard againſt their incurſions, is to leſſen the entrance into the hive, ſo as to leave room for only two or three bees to paſs a-breaſt, or to ſtop up the hives that are attacked, till the rovers diſappear; or if ſtrangers have gained admittance, the proper inhabitants of the hive may be rouſed to ſelf-defence by diſturbing them with a bunch of ſtinking madder faſtened to the end of a ſmall ſtick, which will inſtantly raiſe their reſentment, and make them ſeize upon the robbers. This is indeed needleſs while the queen of the hive attacked is ſafe.

Bees, *Enemies of.* In the domeſtic ſtate the bee has many enemies; but in a ſtate of nature theſe are far more numerous. While in the apiary, waſps and hornets are among the moſt formidable of thoſe enemies; they will often contrive to enter the hive, and build their neſts in it, and haraſs the bees without mercy, till they leave their habitation, unleſs proper care be taken to prevent ſuch encroachments. The fox is a dangerous enemy in the winter, as he is able to make a paſſage into the hive, and devour the honey. Rats are equally injurious; the houſe and field-mice ſhould alſo be guarded againſt, by diminiſhing the entrance into the hive, as the cold comes on, when the bees become leſs able to defend themſelves. The hives may be placed in ſuch a manner that it will be impoſſible for the mice to reach them. Birds are bitter enemies to the bees; the ſparrow, houſe-lark, and ſwallows in particular. Toads and frogs will place themſelves at the entrance of the hive, and devour many. Spiders will expand their ſnares near the hive, and entrap numbers. The ſpecies *aranea calcina* lies in ambuſh for the bees in the corolla of flowers, and faſtens upon them when they come to ſip the nectareous fluids. Ants of almoſt every kind penetrate into the hive, attack the young brood, and plunder the combs of the honey. The ſtink of certain ſpecies of ants is ſo offenſive to bees, that they will quit their hives to avoid it, or if they remain, become ſickly. Some larvæ, or caterpillars, are likewiſe exceedingly injurious to the bees, the honey, the comb, and hive. *Phalæna mellonella*, or honey moth, too frequently ſecures its reſidence in the hive, and depoſits its eggs; which hatching produces a larva of a pale fleſh colour, that ſubſiſts entirely on the honey. The eggs of another phalæna, the wax moth, *P. cerella*, give birth to far more deſtructive larvæ than the former: for theſe no ſooner burſt from the eggs, than their operations commence; they attack the comb, which they perforate in a variety of intricate paſſages, burrowing and feeding as they proceed, till they reach the bottom of the cells in which the bees are lodged; here they remain in ſecurity, and not uncommonly compel the colony of bees to leave their reſidence. The old combs are thoſe that are generally infeſted by this creature. A third ſort of moth, *phalæna ſociella*, breeds likewiſe in the honey-combs of ſome bees. Hives of bees that have ſwarmed more than once, and ſuch alſo as contain but little honey, are moſt expoſed to the depredations of theſe inſects; for the half-exhauſted combs ſerve to ſhelter them, and the ſcanty ſtore of honey or wax ſupplies them at leaſt with food to the detriment of the colony. Bees are ſubject alſo to a peculiar ſpecies of *pediculus*, called the bee-louſe. Hives of bees that have ſwarmed more than once, and ſuch as contain but little honey, are moſt expoſed to thoſe troubleſome vermin. The hives in this caſe ſhould be cleaned at the farthеſt once every week, and the ſtools on which they ſtand every morning, for the latter are likely to harbour the larvæ and moths, or other inſects, as well as the

hive. But theſe obnoxious creatures cannot be entirely extirpated without taking away the infected hive, removing the bees, and cleanſing it, before it is reſtored to the former ſtation. The lice of bees are of a ſlender ſhape, or filiform, and of a ferruginous colour, and may be deſtroyed by ſtrewing tobacco over the bees. In a wild ſtate the common honey-bee inhabits the cavities of hollow trees, where they are unavoidably expoſed to a prodigious hoſt of enemies, eſpecially field and wood-mice of every deſcription, rats, and birds. Of the bird tribe in particular, ſome ſpecies are ſuppoſed to feed excluſively on bees, ſuch as the honey-buzzard (*falco apivorus*), the European bee-eater (*merops apiaſter*), &c. woodpeckers, the kingfiſher, and many others: they do not feed, indeed, excluſively on them, as is imagined, but they are formidable enemies to the bees in a wild ſtate. The animals and birds which prey upon exotic honey-bees are numerous likewiſe; of this kind we might inſtance the various ſpecies of ant-eaters (*myrmecophagæ*), the black bear (*urſus arctos*), the honey cuckow (*cuculus indicator*), peacocks, &c.

Bees, *Maladies of.* In the ſpring the bees are ſubject to a kind of dyſentery, which proves often fatal. The matter which they void at this time, when ſo affected, inſtead of being of a reddiſh yellow colour, is of a muddy black, and has an intolerable ſmell. Columella ſuppoſed this annual diſtemper to be occaſioned by the bees extracting too freely the juices from the bloſſoms of the ſpurge and elm trees, or, as others believe, from the lime tree. There are writers who, diſſenting from this opinion, attribute it to the quantity of new honey, of which they are known to eat to exceſs at that ſeaſon of the year. Again, others imagine that it is cauſed only by their long ſtay in the hive during the winter, when they are conſtrained to feed on the coarſe wax, if their honey fails to afford them a ſufficient quantity of food. Madame Vicat, in the "Memoires, &c." of the Berne Society for 1764, aſcribes this diſtemper to the honey, which the cold has candied in the hive during winter. The true cauſe of this diſtemper ſeems to be unknown; but it is certainly contagious and very deſtructive. A good remedy for it was long unknown. Ariſtomachus recommends the removal of the vitiated combs. For the recovery of the bees affected with this diſtemper, a new remedy has been adopted upon the continent: they prepare a ſyrup compoſed with an equal quantity of good wine and ſugar, which is adminiſtered to the bees in every hive, either by pouring it into the cells, or placing it within the hive in a ſaucer, or any other ſhallow veſſel; this has been found an excellent reſtorative.

About the end of the ſpring, another diſorder ſometimes makes its appearance, which Du Carne de Blangy calls a "vertige," or vertigo. This is ſuppoſed to be occaſioned by the venomous properties of certain plants on which they feed. The ſymptoms are manifeſted by a dizzy manner of flight, by their involuntary ſtartings, falls, and other geſtures, in attempting to perform their uſual operations, or in approaching the hive, and by the laſſitude that ſucceeds theſe ſymptoms. This diſtemper has been hitherto found incurable.

Bees are liable to a third diſtemper, the ſymptoms of which are a ſwelling at the extremity of the antennæ, which becomes alſo much inflamed, and of a yellow colour; the head aſſuming ſhortly after the ſame tint, the bees loſe their vivacity, and languiſh till they die, unleſs a proper remedy be applied. In France, they give them Spaniſh wine for this diſorder.

There is ſtill another diſtemper which ſometimes makes its appearance among bees, for which the continental agriculturaliſts adminiſter Spaniſh wine, as in the former caſes. This is a kind of peſtilence by which many bees are cut off. It happens when the queen bee has placed the eggs careleſsly in the comb, ſo that the larvæ periſh in the cells, or that they are killed by the cold, or bad management in nouriſhing and feeding them; when numbers die, and infect the reſt. The only attention requiſite in this caſe is to take away the infected combs, ſcent the hive with the perfume of aromatic plants, and give them the wine to ſip, as above mentioned, in order to ſtrengthen and reſtore them from their ſickneſs.

For the methods of preſerving bees in hives and boxes, and for collecting the produce of their labour, ſee Hive, Honey, and Wax.

Honey-Bees, *Varieties and Species of.* The cultivation of the common honey-bee, in the warmer countries of Europe, being an object of the utmoſt conſequence to the farmer, every means that ingenuity could deviſe to improve the breed and management of theſe profitable creatures have been adopted, and with ſucceſs. They diſtinguiſh three kinds or varieties of the common bee (*apis mellifica*). The firſt is large, and of a deep brown colour; the ſecond is ſmaller and blackiſh; thoſe of the third ſort called "the little Flemings," or "little Hollanders," are much ſmaller than either, and of a fine gloſſy yellow colour. It is the latter that is very generally cultivated on the continent at this time. Apis mellifica is an European inſect. Mr. Hunter ſuppoſes it an inhabitant of Aſia and Africa alſo; its appearance in America may be accounted for on the preſumption that it was originally introduced there from Europe, and in the courſe of time has become completely habituated to that climate. It is ſaid to have been originally peculiar to the continent of Europe, but this will admit of doubt. In thoſe parts of Aſia and Africa neareſt to the ſouth of Europe, they cultivate the ſame kind as ourſelves. There are ſome other ſpecies of bees domeſticated like the common bee with us, in different parts of the world; and others again, whoſe wax and honey are ſought after by the natives, who do not care to take the charge and trouble of domeſticating them. In Cayenne and Surinam, the ſpecies called by Olivier *amalthea*, is an abundant and moſt profitable creature. This little bee is of a black colour, with white wings and long poſterior feet. They build their neſt, in the ſhape of a bag-pipe, upon the tops of the higheſt trees. The honey is very ſweet and agreeable, and thin, and of a reddiſh colour. From the latter the Indians extract a ſpirituous liquor, of which they are paſſionately fond; of the wax they make candles. This is ſuppoſed to be the ſmall black innoxious wood-bee of Barrère, which is called *ouano* in Cayenne. M. Latreille mentions this ſpecies, and alſo another, which he calls "l'abeille ſociale" (*apis ſocialis*), among his "apiares domeſtiques," an inſect rather ſmaller than the common honey-bee (*mellifica*), that is found in India. Specimens of it, he tells us, were received at the muſeum of natural hiſtory in Paris, among a collection of other inſects from Bengal. If we are not miſtaken in the ſpecies, the ſame kind was likewiſe introduced into the cabinets of the curious in this country, about twelve months ſince by Mr. Fichtell, who found it to be very commonly cultivated by the inhabitants in the vicinity of Bengal.

Wild Bees. Except thoſe ſpecies of the bee tribe which are ſubſervient to the purpoſes of human life, mankind has ſhewn a manifeſt degree of inattention to this curious race of creatures. Some few naturaliſts have regarded them as objects of amuſement: and what the common obſerver is content to name a wild bee, without further inquiry, is diſcriminated by them as forming many diſtinct families; each of which have their peculiar manners and mode of life, and diſplay a greater or leſs proportion of economy, ſkill, induſtry, &c. by no means unworthy of being more minutely attended to. Of the wild bees there are certain natural families, whoſe diſtinctive characters, in a ſcientific point of view, have been deſcribed already; they are diſtinguiſhed alſo by their manners

ners of life, the formation of their nefts, and many other particulars. Some are called leaf-cutters, others wood-piercers, mafons, earth-diggers, &c. correfponding with what the French call "abeilles coupeufes, abeilles pierce-bois, abeilles maçonnes, abeilles qui creufent la terre, &c. Under each of thefe families many fpecies are arranged by entomologifts. A fimilar mode of nidification (it has been well remarked) may be, and indeed very often is the characteriftic of a family, or rather that of a fpecies; thus the cells of the different fpecies of bombanitrices are compofed of fimilar materials, and refemble each other in form; and the various genuine fpecies of the genus VESPA (*Wafp*) conftruct cells, for the moft part, of the fame figure, and employ the fame kind of materials, according to Reaumur; the mode of nidification, therefore, fhould never be affumed as characteriftic of a fpecies, but after the moft mature confideration, and the clofeft inveftigation of its hiftory; for it generally happens that thofe infects which agree together in habit, and belong to the fame natural divifions or fubdivifions of a genus, are connected likewife by their mode of life.

Of the leaf-cutters there are feveral fpecies; thefe are fo named becaufe they cut the leaves of trees, chiefly thofe of the rofe, into pieces of a convenient fize to compofe their little cells, in which the eggs of the future brood are depofited. This defcription of bees is injurious; the female perforates the folid timber of trees in a furprifing manner in order to place her eggs (which are carefully wrapped up in thefe cylindrical pellets, if they may be fo termed, of leaves), within the cavity. The hollow or pipe which fhe bores for their reception is ufually about the thicknefs of a fmall finger, but the depth is very various, being from a few inches to a foot or more; the whole cavity is filled with thofe little pellets, each of which contains an egg, with a provifion of honey for the larva when hatched; fo nicely are thefe pellets formed that they precifely fit the cavity in diameter, and are placed one above the other from the opening to the very bottom of the cavity. Apis centuncularis is one of the fpecies belonging to this natural family. There are others which belong to it likewife, that conftruct their cells in the fame manner, of leaves, but place them in cylindrical cavities in the earth, inftead of timber. Some line or envelop their nidus with the downy fubftance collected from the woolly leaves of particular plants; the tapeftry bee employs the tender petals of the rofe to line its cells, &c. The mafon bees are alfo fingular for the mode of nidification which they adopt. Reaumur has entered at length into its hiftory, a brief account of which muft clofe our general remarks upon the fubject for the prefent, fince thefe muft be again repeated when fpeaking of the refpective fpecies, or of the families to which thofe habits are peculiar.—"The female of thefe bees (for the males, like the drones of the hive-bee, do not work, and thefe infects have only two fexes) undertakes the whole labour of the building, and is at the fame time both architect and mafon. Her firft ftep is to fix upon an angle, fheltered by any projection, on the fouth fide of a ftone wall. Sometimes fhe contents herfelf with a more expofed part of the furface, where the ftone happens to be uneven, and fit for her purpofe. Having chofen a fpot proper to receive the foundations of the future manfions of her offspring, her next care is to provide materials. As her houfe is to be built entirely of a kind of mortar, the bafis of which muft be fand; fhe is very curious in her choice of it, felecting it grain by grain, from fuch as contains fome mixture of earth. To fhorten her labour, before fhe tranfports it for ufe, by means of a kind of faliva, which is very vifcid, fhe glues as many grains as fhe can carry into a little mafs, about the fize of a fmall fhot. Taking this up with her maxillæ, fhe conveys it to the fpot fhe has fixed upon for the fcite of her caftle. A circular plane, compofed of many of thefe little maffes, forms the bafis on which it is to be erected; it contains from three to eight cells, which are fimilar to each other in their form, and equal in dimenfions. Each cell is about an inch in length, and fix lines in diameter; and, before its orifice is clofed, in form refembles a thimble. When its walls are raifed to a fufficient height, our little mafon lays up in it a ftore of pollen feafoned with honey, for the fuftenance of its future inhabitants; fometimes the proportion of honey is fo great that this provifion is entirely liquid. This bufinefs fettled, fhe depofits her egg, finifhes and covers in the cell, and then proceeds to the erection of a fecond, which fhe furnifhes and finifhes in the fame manner, and fo on with refpect to the whole neft. Thefe cells are not placed in a line, or any regular order; fome are parallel with the wall, others are perpendicular to it, and others are inclined to it at different angles; this occafions fome empty fpaces between the cells, which this laborious architect fills up with the fame kind of cement, and then beftows on the whole group a common covering, made with coarfer grains of fand; fo that at length the neft becomes a mafs of mortar, very hard, and not eafily penetrated, even by the blade of a knife; its form is more or lefs oblong; its colour depends on the colour of the fand employed in its conftruction."—Another fpecies forms its nidus, with earth intermixed with chalk, upon ftone walls; and a third for the fake of greater fecurity prefers the hollows and cavities in the ftone itfelf for this purpofe.

BEES, WILD HONEY, *Hunting of.* In the Philofophical Tranfactions, No. 376, Mr. Dudley fpeaks of a method of hunting bees in order to difcover the fpot in which their nefts are fecreted, as practifed fome years ago in the woods of New England in America. It confifts merely in catching a bee, then letting it fly, and duly obferving the way to which it directs its courfe: this points out to the hunter the direction in which the neft is to be fought after. To find the diftance, he takes an off-fet of an hundred perches, and then lets fly another bee, but which muft be of the fame neft; and it is afferted, that the angle or point where thefe two courfes interfect, is the fpot in which the neft is concealed.

BEES, *Swarming of.* See SWARM.

BEES, *Writers on.* Many authors have written on bees. Among the ancients, Ariftomachus is faid to have ftudied them fixty years. Phillifcus retired into a defert wood, that he might have the opportunity of obferving them to better advantage; Ariftotle made a great number of curious obfervations on this infect, which Virgil has put into Latin verfe: they have been enlarged and confirmed by Pliny and others. Theophraftus has a fragment ftill extant, Περὶ μελιττων, *concerning bees;* or as entitled in Laertius, Περὶ μελιτος, *of honey.*

Among the moderns, the number of writers who have treated on bees is very great, a few only of which it will be expected in this place to mention. Prince Frederic Cefi, inftitutor of the Roman Academy of Sciences, wrote expreſsly on bees, as did alfo Swammerdam, Maraldi, and Reaumur, each of whom have treated minutely of them. Schirach is a diftinguifhed writer on this fubject. Hattorff deferves notice. Among the Engliſh, Butler, Gurnay, Mills, Levets, Thorley, Southern, Remnant, Rufden, Warder, White, Wildman, Debraw, Hunter, and others, have publifhed difcourfes on the management of bees, &c. Writers, who have treated fcientifically of the fpecies in their entomological works, are fuch as Linnæus, Fabricius, Geoffroy, Schæffer, Villiers, Poda, Rœfel, De Geer, Foureroy, Donovan, Coquebert, &c. A monographia of bees has lately appeared in this country by Kirby, and another in France about the fame time by Latreille. Nor fhould we omit to mention feveral works of reputation on this fubject that have

been publiſhed on the continent within the laſt few years: of this deſcription are the work of Huber of Geneva; "Le Mémoire de Bernard ſur l'Education des Abeilles;" "Le cours d'Agriculture," by Rozier; "Abregé de l'Hiſtoire des Inſectes pour ſervir a l'Hiſtoire Naturelle des Abeilles," by Bazin Gilles Auguſtin, firſt publiſhed in 1747; "Le Manuel Néceſſaire au Villageois pour ſoigner les Abeilles," by Lombard; and the works of Berthaud, Duchet, Ducarne, Blangy, Della Rocca, &c.

Bee, in *Aſtronomy*. See Apis.

Bee is alſo uſed figuratively to denote ſweetneſs, induſtry, &c. Thus Xenophon is called the Attic bee, on account of the great ſweetneſs of his ſtyle. Antonius got the denomination meliſſa, or bee, on account of his collection of common places.

Leo Allatius gave the appellation of *apes urbanæ* to the illuſtrious men at Rome, from the year 1630 to the year 1632.

Bee-*bird*, in *Ornithology*. See Trochilus minimus; the bee humming bird, or *le plus petit Oiſeau mouche* of Buffon. Some refer this name likewiſe to Trochilus Bicolor of Gmelin, the *Colibri* of *Ferm.* Surin. N. 2.

Bee, *Black*. See Æthiops.

Bee *blocks*. See Blocks.

Bee-*boxes*. See Hive.

Bees-*bread*. See *Bee* Bread, Farina, and Bee *ſupra*.

Bee-*eater*, in *Ornithology*. See Falco Apivorus, *Honey Buzzard*.

Bee-*flower*, or Orchys, in *Botany*. See Ophrys.

Bee-*glue*, a ſoft unctuous matter employed by bees to cement the combs to the hives, and to cloſe up the cells.

Bee-*hive*. See Hive.

Bee-*humble*, *humming bee*, wild bee, ſynonymous with the Bourdon family of bees, adopted by French writers.

Bee-*humble*, *fly*. See Bombylius.

Bee, *Order of*, was inſtituted at Sceaux in France, for men and women, in 1703, by Louiſe, wife of Louis of Bourbon. The enſign is a medal of gold, bearing on one ſide the portrait of the foundreſs, and on the other a bee, with this motto, "Je ſuis petite, mais mes pictures ſont profondes."

Bee-*rocks*, in *Geography*, lie on the coaſt of France, a little to the weſt of North from the point of St. Maloes. They are called the Great and Little Bee; the latter of which is weſt of the other, and lies N. W. from the town about a gun-ſhot. On each of the bee-rocks is a little houſe. Ships may ſail within a cable's length of the outermoſt or Little Bee, and anchor on the ſouth of it in 5 or 6 fathoms at low-water, when Bore tower, on the ſouth of St. Maloes, is a little eaſt of the ſmall tower on the point to the ſouth of the town.

Beech-tree, in *Botany*. See Fagus.

Beech *galls*, in *Natural Hiſtory*, the name of a ſpecies of galls or protuberances found on the beech-tree, and ſerving for the lodgment of inſects.

Theſe galls are found on the leaves of the beech, and are ſometimes only one upon a leaf, ſometimes more; they always grow from the ſame point, owing, no doubt, to the fly's having laid ſo many eggs in the ſame ſpot.

Theſe galls are of an oblong figure, and ſomewhat flatted. They reſemble the ſtone of a plum in ſhape, and are ſo hard that they are not to be broken between the fingers; their ſubſtance ſeems of the ſame nature with that of a nut ſhell. In each gall there is only one cavity, inhabited by a white worm, which in time paſſes through the nymph ſtate into that of the fly, to which it owed its origin.

Beech-*maſt*, the fruit of the beech-tree. It fattens hogs and deer, and has ſometimes ſupplied men inſtead of bread. Chios is ſaid to have endured a memorable ſiege by means of it.

Beech, *Oil of*, *Huile de Faine*, the fruit of this tree, the beech-maſt, is an oily farinaceous nut highly nutritious to hogs, poultry, and other animals, and like the other fruits of this deſcription, may be made to yield a very large quantity of pure oil by preſſure. This oil has long been prepared in ſeveral diſtricts in the ſouth of France. An intereſting account of this manufacture is publiſhed in the Journal de Phyſique for 1781, by Mr. Verdier.

The taſte of the beech-maſt is mild, unctuous, and ſomewhat aſtringent. About the month of October it falls ſpontaneouſly from the tree, and is collected in this and the ſucceeding month. When gathered and picked it is ſlowly dried in the ſhade, or with the heat of a very gentle ſtove; after which it is at any time fit to be preſſed for the oil. The very fineſt oil is made with the beſt nuts picked out by hand, but for the larger quantity the maſt is ſifted and winnowed like corn. It is then ground by a machine ſimilar to a ſtamping mill, formed of upright beams of wood alternately riſing and falling, ſet on motion by a large wheel, and when the fruit gets too dry in the mill a little water is added. When ground ſufficiently fine, it is wrapped up in a coarſe hair cloth once doubled, and ſubmitted to the ſame kind of preſs which is employed for coleſeed, and other oils.

The beech oil when well made, and from the beſt ſelected fruit, is equal to the beſt olive oil, and with this advantage, that it will keep much longer; olive oil beginning to grow rancid in about a year and a half, whereas the other improves by keeping, to the ſixth or eighth year. It is fit for uſe a month after it is made. To obtain the fineſt oil, beſides the perfection of the fruit, it is neceſſary that the working of the mill in which it is ground, ſhould be very moderate, ſo as not to overheat it.

The water uſed to give the fruit a proper conſiſtence in grinding, mixes with the oil when preſſed, ſo that it requires ſome weeks repoſe to allow them to ſeparate. In general the oil ſtands about three months to clarify, after which it is drawn off clear from the water and dregs, and packed up either in bottles or in very cloſe caſks. The general yield of oil is about ten pounds from 4½ buſhels, Paris meaſure.

The uſes to which it is applied are all thoſe of the common fixed vegetable oil. The beſt ſorts are equally grateful for the table as the beſt olive oil. The inferior, are uſed for lamps, for preparing leather, and other purpoſes of economy and manufacture.

The cakes that remain after the oil is preſſed out are particularly uſeful in the fabrication of the oil from nuts, as this latter fruit is not alone of a proper conſiſtence for the preſs, but muſt be mixed with ſome more ſolid ſubſtance to make it work well. Beſides this, the cakes of beech-maſt are proper for fattening animals, or make a very good fuel.

An attempt was made in the beginning of the laſt century to introduce the preparation of beech-maſt oil in this country. The poet and ſpeculator, Aaron Hill, obtained a patent for this manufacture, and went to ſome expence in eſtabliſhing it in England about the year 1714. It would appear from a letter of his to the earl of Cheſterfield (in the Harleian Collection, and inſerted in the Monthly Magazine for 1803, p. 339,) that he had formed very ſanguine hopes of the ſucceſs of this plan. However he was obliged ſoon to abandon it, probably in part from a want of a proper ſupply of the fruit, and certainly in a conſiderable degree from the very limited uſe of oil as an article of food in this country.

BEEF, in *Domeſtic Economy*, the fleſh of black cattle prepared for food. The fleſh of the *bos* or ox kind, ſays Dr. Cullen (Mat. Med. vol. i. p. 369,) is the moſt denſe of all the quadrupeds; and how far that denſity goes in preventing ſolubility, we have an inſtance in the bull, whoſe fleſh is ſeldom choſen as a part of our diet. The fleſh of the female ſex is of a more ſoluble nature, and ſufficiently fit for nouriſhment; but we commonly prefer the caſtrated ox, in which the fat is better mixed, and as more alkaleſcent, the fleſh is more ſapid;

ſapid; and, unleſs it be from a very old animal, is generally to be preferred. The chief difference of aliment in the ox kind is that which appears between the old and young. This author obſerves, that beef, though of a more firm texture, and leſs ſoluble than mutton, is equally alkaleſcent, perſpirable and nutritious. See Food.

Beef-eater, in *Ornithology*, the Engliſh name of *Buphaga Africana*, a bird found on the banks of the rivers in Senegal, and the only ſpecies of the genus known. See Buphaga.

Beef-*iſland*, in *Geography*, a ſmall iſland near the coaſt of America, in the ſouth-eaſt angle of the bay of Campeachy, the weſt end of which is waſhed by the eaſtward opening of St. Peter and Paul river. It lies cloſe to Trieſte iſland, is 7 leagues long, and from 3 to 4 broad, and has a fine ſandy bay, where ſhips may ride in 7 or 8 fathoms and be well ſheltered. N. lat. 18° 30′. W. long. 91° 30′.

Beef-*iſland* is alſo one of the ſmaller Virgin iſlands in the Weſt Indies, ſituate between Dog iſland on the weſt, and Tortola on the eaſt, in Sir Francis Drake's bay. It is about five miles long, and one broad. N. lat. 18° 23′. W. long. 63° 2′.

BEEKMAN, a conſiderable townſhip of America in Ducheſs county, New York, containing 3,597 inhabitants, including 106 ſlaves. In the State cenſus of 1796, there appear to be 502 electors in this townſhip.

BEELE, in *Mining*, an inſtrument uſed by the workmen to break and pick out the ore from the rocks in which it lies. This inſtrument is called by the tinmen in Cornwall a "tubber." It is an iron inſtrument of eight or ten pounds weight, made ſharp, and ſteeled at both ends, and having a hole in the middle, where the handle is fixed in. When the ore lies in hard rocks, this inſtrument wears out ſo faſt, that it muſt have new points made to it every fortnight. The miners who dig up the ore in the mines, are, from the uſe of this inſtrument, called beele-men; and thoſe who attend them, and whoſe buſineſs it is to take up the matter the others looſen or break up, are, from their inſtrument, which is a broad and hollow iron ſhovel, or a wooden one, with a very ſtrong iron lip, called the "ſhovellers." In Cornwall, when the ore lies in a hard bed, they allow two ſhovellers to three beele-men; and when it lies in a ſoft and earthy matter, two beelemen and three ſhovellers are the proportion. Phil. Tranſ. N° 69. p. 2104.

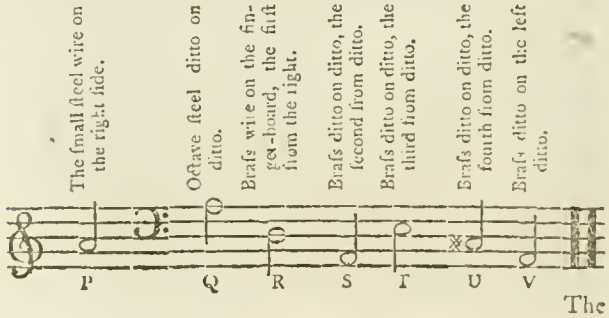
BEELIKE, in *Geography*, a town of Germany, in the circle of the Lower Rhine, and duchy of Weſtphalia, 4 miles weſt of Rhuden, and 10 E.N.E. of Arenſberg.

BEELZEBUB, or Baalzebub, i. e. *the lord of a fly*, in *Ancient Mythology*, was a god of the Philiſtines, and had a temple and oracle at Ekron. (2 Kings, i, 2.) From this paſſage it appears, that the name was not given to this object of idolatrous worſhip by way of contempt; becauſe it was uſed by Ahaziah at the very time when he was acknowledging his divinity, and deſirous of conſulting him concerning his recovery. This is farther evident, from the meaning of the appellation and the reaſon of its being given. Hiſtory informs us, that thoſe who lived in hot climates, and where the ſoil was moiſt, which was the caſe with the Ekronites, who bordered upon the ſea, were exceedingly infeſted with flies; and theſe inſects were thought to occaſion contagious diſtempers. Pliny (N. H. l. x. c. 28. § 40.) mentions a people who ſtopped a peſtilence which had been thus occaſioned by ſacrificing to the "fly-hunting god." It ſeems not improbable that ſome imagined cure of this kind, or a general perſuaſion of his power of driving away flies from the places they frequented, might be the reaſon why the god of Ekron was called Beelzebub. For it was cuſtomary with the Heathens, to call their gods by the name of thoſe inſects from which they were believed to deliver their worſhippers. The "god of flies," Μυιαγρος, and the "fly-hunter," Μυιοδης, were titles aſcribed to Jupiter as well as to Hercules. Indeed, ſome of the Greek fathers thought, that this "fly-god" was worſhipped under the form of a fly: and it is obſerved by Mr. Young (On Idolatry, vol. ii. p. 91, 92.) that it was cuſtomary with the Heathens to repreſent their gods by ſome creatures that were ſacred to them. However, the ſuppoſed power of this god over that noxious inſect, the fly, ſeems to be the moſt probable reaſon of the name of Beelzebub. Beelzebub, therefore, being a title of honour, and as ſuch applied by his worſhippers to the god of Ekron, there is no reaſon for doubting, that it was in uſe among the Philiſtines, as well as among the Jews. (Bochart, vol. ii. p. 36, &c. Op. vol. iii. p. 500. Selden de Diis. Syr. Syntag. ii. c. 6. p. 227. ed. Amſt. 1680.) Among the Jews, the appellation Beelzebub, notwithſtanding its ſeeming meanneſs, could not be uſed as a term of deriſion. For the Jews had learned of the heathens to regard a power of driving away flies, as a divine prerogative; endeavouring to perſuade men, that the temple of Jeruſalem, though ſo many ſacrifices were daily offered there, never had a fly upon it; thus copying, rather than deriding, what the heathens fabled concerning ſome of their temples, into which, according to Pliny, Solinus, and others, no fly could enter. It has been ſaid, indeed, that the Greek word uſed in the New Teſtament, is not "Beelzebub," but "Beelzebul," which ſignifies the "lord of a dunghill;" and hence it has been inferred, that this name could not have been uſed by the Heathens; but muſt have been given by the Jews in deriſion. Jerom, however, not underſtanding the common reading, changed Βεελζεβελ into Βεελζεβεβ; and this ſubſtitution has been approved by ſeveral critics, has been adopted in the vulgate, and thence tranſferred into Luther's tranſlation. In the ancient languages it was not uncommon to change *b* into *l* (ſee letter B;) and, on this ſuppoſition, the Greek word will agree with the Hebrew, (2 Kings, i, 2). But if Beelzebul be uſed as a different name from Beelzebub, there will be no reaſon for ſuppoſing that it was uſed by the Jews as an expreſſion of contempt. The Hebrew word זְבוּל, zebel, properly ſignifies "an habitation," and as Stockius obſerves, is applied to the heavens, the manſion of the deity. In this ſenſe it will agree with the title of Beelſemin, or Beelſamen, "the lord of heaven," which the Ekronites, and other Phœnicians, gave to their ſupreme numen. Whether, therefore, Beelzebub and Beelzebul be different names, or the ſame name with different terminations, they deſcribe the perſon whom the Heathens regarded as their chief deity.

Beelzebub, in the New Teſtament, (Matt. xii. 24. Mark, iii. 22.) is called αρχων των δαιμονιων, the prince of demons, (prince of the devils, Engl. Tranſ.); and it has been commonly apprehended, that demons and their prince are the ſame ſpirits as the devil and his angels. Satan and Beelzebub, ſay thoſe that adopt this opinion, (See Doddridge on Matt. xii. 25. Fam. Expoſ. vol. i. p. 391, note *g*. and Pegge's Anſwer to Sykes) are names for the ſame perſon; for when Chriſt was reproached with caſting out demons by the aſſiſtance of the prince of demons, he replied, "How can Satan caſt out Satan? (Matt. xii. 26. Mark, iii. 23. Luke, xi. 18.) Now if Satan, who is conſidered as the ſame perſon with the devil (Rev. ix. 12. Matt. iv. 1. compared with Mark, i. 12.), was the prince of thoſe demons, who were caſt out by Chriſt; then demons are the ſame ſpirits as the devil's angels. And on this ſuppoſition, there can be no other difference between demons and the devil than that which ſubſiſts between a prince and his ſubjects, who both partake of one common nature, though the prince, as preſiding over the reſt, hath a peculiar name of his own. Dr. Lardner (Caſe of Demoniacs, p. 42. Works, vol. i. p. 448.)

p. 448.) admits, that the devil, who is ſuppoſed to be the chief or prince of the fallen angels, is often called Satan and Beelzebub. Mr. Farmer is of opinion (Eſſay on the Demoniacs of the N. T. p. 16.) that it doth not follow from the above-cited paſſage, that the devil is ever called Beelzebub. The term "Satan," he ſays, is not appropriated to one particular perſon or ſpirit, but ſignifies "an adverſary" or opponent, in general. The Jews called every demon by this name, and uſed it in the plural number; and the words of our Saviour, "How can Satan caſt out Satan," taken in their ſtricteſt ſenſe, imply that there were ſeveral Satans: ſo that our Lord might only mean, "that it was unreaſonable to ſuppoſe that one demon would caſt out another." Or if you underſtand him to the following purpoſe: "were Beelzebub, whom you regard as the chief of the *poſſeſſing* demons, to expel himſelf, which would in effect be the caſe were he to exp l his agents and inſtruments, he would act againſt his own intereſt, and defeat his own ſchemes;" it will not follow, that Beelzebub was conſidered as the ſame perſon with the devil. There ſeems to be no reference to the latter. He and Beelzebub might be regarded as two diſtinct perſons; and yet each be called "Satan," an adverſary, or opponent. "If Beelzebub and his demons were, in our Saviour's time, conceived to be the very ſame perſons as the devil and his angels, is it not very ſurpriſing," ſays this author, "that the New Teſtament, in its original language, ſhould always ſpeak of the diſeaſed perſons under conſideration as poſſeſſed by a "demon" or "demons," and never by "the devil" or "devils?" a word, as all muſt allow, that is never there applied to evil ſpirits in the plural number, whatever its uſe may be in the ſingular. He adds, "inaſmuch as Chriſt is here replying to the Phariſees, and reaſoning with them on their own principles, he cannot be ſuppoſed to ſpeak of a different order of beings from what they did. Satan, therefore, muſt be equivalent to demon, in the ſenſe in which demon was uſed by them." See DEMON. "Should it then appear," ſays Mr. Farmer, "that by demons and their prince they underſtood human ſpirits, it will from hence follow, that Chriſt cannot be ſpeaking of ſpirits of a celeſtial origin." If by the devil, we are to underſtand a fallen angel, this writer thinks that he could not be the ſame with Beelzebub. The Jews, in their ancient writings, were not accuſtomed to call the devil by this name, but by that of Aſmodæus, or Samael; as Bochart, (Oper. vol. iii. p. 501.) Selden, (ubi ſupra, p. 231.) and others allow. Beelzebub, in the eſtimation of the Phariſees, was the prince of the "poſſeſſing demons," and therefore, as Mr. Farmer ſuppoſes, he was, in their eſtimation, a human ſpirit; and in proof of this he alleges the teſtimony of Joſephus (De Bell. Jud. l. vii. c. 6. § 3). Beſides, Beelzebub was, as we have already ſtated, a heathen deity; expreſsly denominated in the Old Teſtament, the god of Ekron; and repreſented by the Phariſees under the ſame title and character as the heathens themſelves aſcribed to their gods. "If Beelzebub," ſubjoins Mr. Farmer, "was a heathen demon, or deity, he was no other than a deified human ſpirit; for ſuch were all the heathen demons, who were the more immediate objects of the public eſtabliſhed worſhip; and thoſe in particular to whom divination and oracles were aſcribed. And if the prince of demons was of human extract, no doubt his ſubjects were ſo likewiſe.

BEELZEBUL, in *Entomology*, a ſpecies of SCARABÆUS that inhabits America. On the thorax is a triple prominence; and three horns on the head, the middle one larger than the others. Fabricius.



BEELZEBUL, in *Zoology*, a ſpecies of SIMIA that inhabits South America; and is tailed, bearded, and black; tail prehenſile; tip, with the feet, brown. Linnæus. This appears to be the *guariba* of Marcgrave; *howling baboon* of Bancroft; *preacher monkey* of Pennant; and *l'ouarine* of Buffon. It is ſaid to be about the ſize of a fox, of a black colour, and the hair of its far long, gloſſy, and remarkably ſmooth. This is a fierce animal, and inhabits the woods of Braſil, and Guiana, in vaſt numbers; wanders in large flocks in the night time, and howls hideouſly. Dr. Shaw obſerves that this howling faculty is owing to the conformation of the os hyoides, or throat bone, which is dilated into a bottle-ſhaped cavity. Marcgrave, in ſpeaking of the guariba, acquaints us, that one ſometimes mounts the top of a branch, and aſſembles a multitude below; he then ſets up a howl ſo loud and horrible, that a perſon at a diſtance would imagine that a hundred joined in the cry; after a certain ſpace, he gives a ſignal with his hand, when the whole aſſembly join in chorus, but on another ſignal, a ſudden ſilence prevails, and then the orator finiſhes his harangue. Virey calls this animal Beelzebut, retaining however at the ſame time the name *l'ouarine* under which it is deſcribed by Buffon.

BEEMAH, in *Geography*, a river of Hindoſtan, which is a principal branch of the Kiſtnah, joining it near Edghir, riſes in the mountains, on the north of Poonah, probably not far from the ſources of the Godavery, and paſſes within 30 miles of the eaſt ſide of Poonah, where it is named Bewrah, as well as Beemah. It forms the eaſtern boundary of Viſiapour, and paſſes about 80 or 82 geographical miles to the weſt of Golconda, croſſing the road from it to Ralicotte. The Beemah, according to Mr. Orme, poſſeſſes virtues ſimilar to thoſe of the rivers eſteemed ſacred by the Hindoos; that is, ablutions performed in its ſtream have a religious efficacy ſuperior to thoſe performed in ordinary ſtreams. Rennell's Memoir, p. 244, &c.

BEEMEN, or SHEEMEN, in *Aſtronomy*, ſeven ſtars of the fourth magnitude, following each other, in the fourth flexure of the conſtellation Eridanus.

BEEMSTER, in *Geography*, a large drained lake or marſh of North Holland. It was formerly a lake, covering a great extent of country, which, by the induſtry of the Hollanders, who, by means of various canals, have drained the waters, is converted into an excellent paſture ground. It has neither towns nor villages, but a great number of houſes, which are diſperſed along the ſides of the canals and roads.

BEEN, in *Muſic*, the name of an Indian fretted inſtrument of the guittar kind. The finger-board is 21 $\frac{6}{8}$ths inches long. A little beyond each end of the finger-board are two gourds, and beyond theſe are the pegs and tail-piece which hold the wires. The whole length of the inſtrument is three feet ſeven inches. The firſt gourd is fixed at ten inches from the top, and the ſecond at about two feet 11$\frac{1}{2}$. The gourds are very large, about fourteen inches diameter, and have a round piece cut out of the bottom, about five inches diameter. The finger-board is about two inches wide. The wires are ſeven in number, and conſiſt of two ſteel ones, very cloſe together, in the right ſide; four braſs ones on the finger-board; and one braſs one on the left ſide. They are tuned in the following manner.

The

The great ſingularity of this inſtrument is the height of the frets; that neareſt the nut is one inch $\frac{1}{8}$, and that at the other extremity about $\frac{3}{8}$ths of an inch, and the decreaſe is pretty gradual. By this means the finger never touches the finger-board itſelf. The frets are fixed on with wax by the performer himſelf, which he does entirely by ear.

The frets are nineteen in number. On the wires R and S, which are thoſe principally uſed, there is an extent of two octaves, a whole note with all the half notes complete in the firſt octave, but the *g* ♮, and *b* ♭ wanting in the ſecond. The performer's apology for this was, that he could eaſily get thoſe notes by preſſing the ſtring a little hard upon the frets *f* ♯ and *a*' ♮, which is very true from the height of the frets; but he aſſerted that this was no defect in his particular inſtrument, but that all beens were made ſo. The wires TU are ſeldom uſed, except open.

The been is held over the left ſhoulder, the upper gourd reſting on that ſhoulder, and the lower one on the right knee.

The frets are ſtopped with the left-hand; the firſt and ſecond fingers are principally uſed. The little finger of this hand is ſometimes uſed to ſtrike the note V. The third finger is ſeldom uſed, the hand ſhifting up and down the finger-board with great rapidity. The fingers of the right hand are uſed to ſtrike the ſtrings of this hand; the third finger is never uſed. The two firſt fingers ſtrike the wires on the finger-board, and the little finger ſtrikes the two wires. The two firſt fingers of this hand are defended by a piece of wire put on the tops of them in the manner of a thimble: when the performer plays ſtrong, this cauſes a very jarring diſagreeable ſound; whereas, when he plays ſoftly, the tone of the inſtrument is remarkably pleaſing.

The ſtyle of muſic on this inſtrument is in general that of great execution. I could hardly ever diſcover, ſays Mr. Fowke, any regular air or ſubject. The muſic ſeems to conſiſt of a number of detached paſſages, ſome very regular in their aſcent and deſcent: and thoſe that are played ſoftly, are moſt of them both uncommon and pleaſing. Aſiatic Reſearches, vol. i. p. 295, &c. See *Plates* of *Muſic*.

BEER, a ſpirituous liquor, made from any farinaceous grain; but generally from barley. Accordingly, it is a liquor of very ancient and general uſe. See ALE.

The word is Saxon, formed from the German *bier*, of the Latin *bibere*.

Several authors have maintained, that there was no malt liquor known by the appellation of beer, as diſtinguiſhed from the ancient liquor called ale, till the uſe of hops was introduced. See HOPS. However, we find, by a ſtatute of the twelfth parliament of the 23d year of king James III. of Scotland, (c. 88.) that it was enacted, that no perſons ſhould mix wine or "beer," under pain of death. Beſides this inſtance, occurring in 1482, many others might be produced confuting the vulgar tradition, that beer, as a liquor, diſtinct from ale, was not known in England till the reign of Henry VIII. In the year 1492, we find a licence from king Henry VII. to a Fleming (cited in the 12th tome of the "Fœdera," p. 471.) for exporting fifty tons of ale, called "beer" or "bere;" and in the ſame year one of the king's attendants into France was a beer-brewer of Greenwich in Kent. Although it may probably be true, that beer, brewed with hops, was not known in England till after this time; yet other materials were uſed, before hops were known, for making the liquor that was called "beer," ſuch as wormwood, and other plants, which ſerved inſtead of hops, for preſerving malt-liquor, either by ſea or land.

Beer is made from malt by extraction with water and fermentation. With this view, a quantity of malt, freed from its germs, and ſufficient for one intended brewing, is coarſely bruiſed by grinding, and in the maſh-tub, firſt well mixed with ſome cold, then ſcalded with hot water drawn upon it from the boiler. It is afterwards ſtrongly and uniformly ſtirred. When the whole maſs has ſtood quietly for a certain time, the extract (maſh), or ſweet-wort, is brought into the boiler; and the malt remaining in the tub is once more extracted by infuſion with hot water. This ſecond extract, treated in like manner, is added to the firſt, and both are boiled together. This clear decoction is now drawn off, and called boiled wort. To make the beer more fit for digeſtion, and at the ſame time to deprive it of its too great and unpleaſant ſweetneſs, the wort is mixed with a decoction of hops, or elſe theſe are boiled with it. After which it ought to be quickly cooled, to prevent its tranſition into acetous fermentation, which would enſue, if it were kept too long in a high temperature. On this account, the wort is transferred into the cooler; where it is expoſed with a large ſurface to cold air, and from this to the fermenting tub, that by addition of a ſufficient portion of recent yeaſt it may begin to ferment. When this fermentation has proceeded to a due degree, and the yeaſt ceaſes to riſe, the beer is conveyed into caſks, placed in cool cellars, where it finiſhes its fermentation, and where it is well kept and preſerved under the name of "barrelled beer," with the precaution of occaſionally filling up the vacancy cauſed in the veſſels by evaporation. Or, the beer is bottled before it has done fermenting; and the bottles are ſtopped a little before the fermentation is completely over. By ſo doing, the bottled beer is rendered ſparkling. In this ſtate it frequently burſts the bottles, by the diſengagement of the carbonic acid gas which it contains; and it ſtrongly froths, like champaign, when brought into contact with air on being poured into another veſſel. Gren's Chymiſtry, vol. ii. p. 63. For the proceſs of brewing, particularly according to the Engliſh mode; ſee BREWING.

Beer, well prepared, ſhould be limpid and clear, poſſeſs a due quantity of ſpirit, excite no diſagreeable ſweet taſte, and contain no diſengaged acid. By theſe properties, it is a ſpecies of vinous beverage, and is diſtinguiſhed from wine, in the ſtrict ſenſe, and other liquors of that kind, by the much greater quantity of mucilaginous matter which it has received by extraction from the melted grains; but which alſo renders it more nouriſhing. "Brown beer" derives its colour from malt ſtrongly roaſted in the kiln, and its bitteriſh taſte from the hops. "Pale beer" is brewed from malt dried in the air, or but ſlightly roaſted, with but little or no hops at all.

Tacitus, in ſpeaking of the ancient Germans, as alſo Dioſcorides, Galen, &c. condemn beer, as prejudicial to the head, nerves, and membranous parts, as occaſioning a more laſting and more uneaſy drunkenneſs than wine, and as promoting a ſuppreſſion of urine, and ſometimes a leproſy.

Meſſ. Perrault, Rainſſant, and others, defend the modern beer: urging, that the hops uſed with us, and which the ancients were ſtrangers to, having a faculty of purifying the blood, and removing obſtructions, ſerve as a corrective, and free our drink from the inconveniences objected to that of the ancients. For the qualities of beer, ſee MALT-LIQUOR.

In New England they make beer from maiſe, or even the bread made thereof. Some phyſicians recommend beer made of oats and birch-water, as preferable, in nephritic caſes,

cafes, to that made of barley. Phil. Tranf. N° 97. p. 6135. N° 138.

Mr. Park, in the account of his travels through Africa, informs us, that the negroes make excellent beer of one fpecies of their corn, by malting the feeds nearly in the fame manner as barley is malted in England; and he fays, that the beer, thus made, was to his tafte equal to the beft ftrong beer he had ever tafted in his native country.

Sour or decayed beer may be reftored divers ways; as by falt made of the afhes of barley-ftraw, put into the veffel, and ftirred; or by three or four handfuls of beech-afhes thrown into the veffel, and ftirred; or, where the liquor is not very four, by a little put into a bag, without ftirring; chalk calcined, oyfter-fhells, egg-fhells burnt, fea-fhells, crabs eyes, alkalized coral, &c. do the fame, as they imbibe the acidity, and unite with it into a fweetnefs. Beer, it is faid, may be kept from turning four in fummer by hanging into the veffel a bag containing a new-laid egg, pricked full of little pin-holes, fome laurel-berries, and a few barley-grains; or by a new-laid egg and walnut-tree leaves. Laurel berries alone, their fkin being peeled off, will keep beer from deadnefs; and the throwing fixed air into it will reftore it. Glauber commends his fal mirabile and fixed nitre, put into a linen bag, and hung on the top of the cafk, fo as to reach the liquor, not only for recovering four beer, but for preferving and ftrengthening it. See Ale.

Beer tafting of the cafk, may be freed from it, by putting a handful of wheat in a bag, and hanging it to the veffel. The grounds of beer form a very rich manure.

Beer-*Poffet*. See Zythogala.

Beer, *Euger*, is ufed by callico-printers, chemifts, lapidaries, fcarlet-dyers, vinegar merchants, white-lead-men, &c.

Beer-*Meafure*. See Measure.

Beer-*Vinegar*. See Vinegar.

Beer-*Haven*, in *Geography*. See Bear-Haven.

BEERING, Behring, or Bering, Vitus, in *Biography*, an eminent navigator, was a native of Denmark, and born towards the concluſion of the 17th century. After having made two voyages to India, he entered in 1704, as a lieutenant in the Ruſſian navy, in which he afterwards roſe to the rank of captain and commodore. In purſuance of a plan conceived by Peter I., and communicated on his death-bed to Beering, for making diſcoveries in that tempeſtuous ſea which lies between Kamtſchatka and America, this adventurous navigator ſet ſail in 1728, accompanied by Tſcherikof, from the mouth of the Kamtſchatka river, with a view of aſcertaining whether the two continents of Aſia and America were ſeparated, according to the inſtructions prepared by Peter I. on his death-bed for this purpoſe. Coaſting along the eaſtern ſhore of Siberia, he arrived at the latitude of 67° 18′, but made no diſcovery of the oppoſite continent. In 1729, ſoon after his return, he ſailed again in proſecution of the ſame deſign, but without ſucceſs. A third expedition was planned in 1741, and the conduct of it was entruſted with Beering and Tſcherikof, who encountered many diſaſters, and paved the way to all the important diſcoveries afterwards made by the Ruſſians. Two veſſels, named the St. Peter, and St. Paul, were deſtined for this enterpriſe: the former was commanded by Capt. Beering, and had on board 76 perſons, including officers, and the latter by Capt. Tſcherikof, accompanied by Delile, profeſſor of Aſtronomy, and the ſame number of mariners. From the bay of Awatſcha, which they left on the 4th of June, they proceeded northwards; and the veſſels parted in a ſtorm, and never more ſaw one another during the voyage. Beering ſteered in a ſouthern direction from the 50th to the 46th degree of latitude in ſearch of Tſcherikof, but finding the ſearch to be fruitleſs, he directed his courſe eaſtwards, and at the end of ſix weeks from the time of firſt ſailing, deſcried land in the latitude of 59° and ſome minutes, and in the longitude of 40° from Awatſcha. On the 20th of July they anchored among ſome iſlands, on one of which they landed; but they neglected to accompliſh the main object of their miſſion, which was the diſcovery of the American coaſt, which afterwards appeared to be ſo near their preſent ſtation. This, however, ſeems to have been owing to the diſcontent and inſubordination that prevailed among the crew and officers of the ſhip. Having obſerved ſeveral iſlands in the courſe of their voyage, they at length, viz. on the 5th of November, found themſelves, as they apprehended, on the coaſt of Kamtſchatka, near the bay of Awatſcha; but the land which they perceived proved to be an iſland, on which the ſhip was wrecked, and where the commander, and ſeveral of the crew, died ſoon after their landing, of the ſcurvy, famine, and fatigue. Steller, who accompanied Beering, and wrote a journal of the voyage, obſerves, in juſtice to the commodore, that he exerted himſelf to the utmoſt of his ability in executing the deſign of his miſſion, but that he was himſelf conſcious of his unfitneſs for the arduous taſk on account of his age and irreſolution. His temper was too mild for the government of a diſorderly crew: and his deference to his officers led them to preſume on their own importance, and to deſpiſe his authority. Worn out at laſt with hunger, thirſt, cold, weakneſs, and anxiety, the oedematous tumours in his feet, from which he had long ſuffered, increaſed by the ſeverity of the weather, and a mortification of the belly taking place, he breathed his laſt on the 8th of December; and was buried between his adjutant commiſſary and two grenadiers. "On our departure from the iſland," ſays Steller, "we erected over the grave a wooden croſs to ſerve as a monument, and at the ſame time to be a teſtimony of our having taken poſſeſſion of the country." Steller alledges ſeveral arguments to prove that Beering diſcovered the continent of America, at cape St. Elias, lying, according to his eſtimation, in N. lat. 58° 28′, and in longitude from Ferro 236°; and that the coaſt touched at by Tſcherikof was ſituated in lat. 56°. long. 241°. The coaſts, ſays Steller, were bold, projecting chains of high mountains, ſome of which were covered with ſnow, and their ſides clothed from the bottom to the top with large tracts of thick and fine wood. Steller went on ſhore and obſerved ſeveral ſpecies of birds not known in Siberia, and one in particular, deſcribed by Cateſby under the name of the blue jay, peculiar to North America. The ſoil was different from that of Kamtſchatka, and of the neighbouring iſlands, and he found ſeveral plants which botaniſts deem peculiar to America. Beſides, it has been alledged that they muſt at leaſt have approached very near that continent; as the natives of the iſlands on which they touched, preſented to them the "calumet" or pipe of peace, which is a ſymbol of friendſhip univerſal among the people of North America, and an uſage of arbitrary inſtitution peculiar to them. Soon after the return of Beering's crew from the iſland, where he was ſhipwrecked and died, the inhabitants of Kamtſchatka ventured over to that iſland, to which the ſea-otters and other ſea-animals were accuſtomed to reſort in great numbers. Steller's Journal apud Pallas. Coxe's Ruſſian Diſcoveries, p. 20. p. 277, &c. Tooke's View of the Ruſſian Empire, vol. i. p. 156. vol. iii. p. 40. p. 499. See Asia, and the following articles, Beering's *baſin*, &c.

Beering's *Baſin*, in *Geography*, a name given in honour of commodore Beering, to that part of the North Pacific Ocean, compre-

comprehending about 1200 leagues in circuit, which is formed by the Archipelago, called the Aleutian or Aleoutſkie iſlands, with the north-weſt coaſt of America, and the north-eaſt coaſt of Aſia, and which communicates towards the ſouth with the great Boreal ocean by as many ſtraits as the iſlands form channels between them, and towards the north, under the 66th parallel, with the Arctic Frozen ocean, by Beering's Straits alone. See ALEUTIAN.

BEERING's, or BEHRING's *Bay*, a bay on the north-weſt coaſt of America, ſituated between cape Suckling and cape Fair-weather, and ſo called in honour of commodore Beering, who, in 1741, diſcovered this bay, and anchored in it. The extreme points of this bay, in Vancouver's chart, are port Manby and port Turner; cape Phipps lies to the ſouth of it, and port Mulgrave, formed by iſlands, and affording a convenient anchoring place ſecure from all winds, is ſituated within the bay. In this part of the bay Beering is ſuppoſed to have anchored. Beering's mount, St. Elias, lies at a ſmall diſtance to the north of this bay. Mr. Dixon called it Admiralty bay. La Perouſe deſcribes it under the denomination of Behring's river. According to captain Cook, the opening of this bay was in N. lat. 59° 18′; and La Perouſe makes it 59° 20′. Cook's longitude was 220° 19′ E. or 139° 41′ W. 142° 1′ W. from the Meridian of Paris. La Perouſe fixes his longitude at 142° 2′, making only a difference of 1′ from that of Cook. Vancouver, who reconnoitred this coaſt more accurately than capt. Cook had an opportunity of doing, as he paſſed it at ſome diſtance from the ſhore, places it further to the north and weſt, its opening being about 59° 32′, and E. long. 220° 35′.

BEERING's *Iſland*, an iſland in the north Paciſic ocean on the north eaſt of Kamtſchatka, which ſome have conſidered as one of the groups called the Aleutian iſles, (ſee ALEUTIAN) and others have ſeparated from it. This iſland was diſcovered by Beering in 1741. This adventurous navigator having been for ſome time in a ſtate of indiſpoſition and decay, was unable to concern himſelf about the management of his ſhip, and his crew were generally attacked by the ſcurvy, and in a ſickly, enfeebled condition. Purſuing their navigation, they were at length driven by the winds and ſeas on this iſland, with the poſition of which, with regard to the two continents, they were unacquainted, and here the ſhip was caſt away. On the 8th of December, Beering died on this iſland, which has very properly aſſumed the name of the firſt navigator who ventured into theſe ſeas, and who diſcovered the weſt continent of America, in a latitude which, before him, no known voyager had attained. In the following year, the ſurviving crew contrived, with great trouble, to conſtruct a boat, which conveyed them to Kamtſchatka. This iſland is ſituated between the north latitude of 55° and 56° and E. long. 167° 20′, about 50 leagues from the coaſt of Kamtſchatka. It is 165 verſts in length, and of various breadths, the greateſt breadth being 23 verſts; and it conſiſts of a range of bold cliffs and hills, which, ſeparated by ſeveral very narrow vallies, lying north and ſouth, ſeem to riſe from the ſea like a ſingle rock. The higheſt of theſe mountains are elevated perpendicularly, not above a thouſand fathoms, covered with a yellow clay, and much riven by ſtorms and weather. The mountains conſiſt of granite, thoſe rows excepted that ſtand neareſt the ſea, which are commonly of ſand-ſtone, and form, not unfrequently, ſtone walls, that are very ſteep. In theſe mountains, there are many caverns. In the year 1741, three ſmart ſhocks of earthquakes were perceived in this iſland; the ſea about it is not covered with ice, and the cold is in general moderate, although there are mountains on which the ſnow never diſſolves. Neither thunder nor the aurora borealis has been obſerved here. The iſland has ſprings of excellent water, and beautiful cataracts. Of animals there are only ice foxes, ſeals, ſea-bears, ſea-lions, ſea-cows, &c. No wood grows upon this iſland; but ſeveral kinds of plants are found upon it. It is uninhabited. The ſhips which have been accuſtomed to navigate theſe ſeas have frequently wintered on this iſland, in order to procure a ſtock of ſalted proviſions from the ſea-cows and other amphibious animals, that are found here in great abundance. Tooke's View of the Ruſſian Empire, vol. i. p. 156, &c. Marchand's Voyage, vol. i. Introd. p. 33.

BEERING's *Straits*, ſeparate Aſia from America, being bounded on the American ſide by cape Prince of Wales, in N. lat. 65° 50′. E. long. 191° 50′, and on the ſide of Aſia by the eaſt cape in N. lat. 66° 6′ and E. long. 190° 22′. The breadth of this ſtrait is about 13 leagues, or near 40 miles. Its depth is from 12 to 30 fathoms. It was diſcovered firſt by Beering, and afterwards by captain Cook. Beering, in his voyage of 1718, is ſaid to have proceeded as far north as 67° 18′, and therefore muſt have reached a latitude more northerly by about a degree and a quarter than that of the moſt eaſtern part of the old continent. He had, therefore, entered the Frozen ocean, and muſt have actually paſſed this ſtrait, probably in the uſual fogs of the climate, without diſcovering land to the eaſt; however, our great navigator, captain Cook, gave the name of the Daniſh adventurer to theſe ſtraits, when with his uſual accuracy he afterwards explored them. To the north of theſe ſtraits the Aſiatic ſhore leads rapidly to the weſtward; but the American proceeds nearly in a northern direction, till, at the diſtance of about 4 or 5 degrees, the continents are joined by ſolid and impenetrable bonds of ice. The ſea from the ſouth of theſe ſtraits to the creſcent of iſles between Aſia and America, is very ſhallow, and deepens from theſe ſtraits till ſoundings are loſt in the Paciſic ocean, ſouth of theſe iſles. Between them and the ſtraits there is ſaid to be an increaſe from 12 to 54 fathoms, excepting off cape Thaddeus, where the channel is of greater depth. From this, and other circumſtances, it has been thought not improbable that a ſeparation of the continents may have taken place in ſome unknown period, at theſe ſtraits, and that the whole ſpace from the iſles to that ſmall opening might once have been dry land; and that the fury of the watery element, actuated by that of fire, might have ſubverted and overwhelmed the tract, and left the iſlands as volcanic remains of this great eruption. The famous Japaneſe map places ſome iſlands apparently within theſe ſtraits, denominated "Ya Zue," or the kingdom of the dwarfs. Hence it has been imagined, that America was not unknown to the Japaneſe, and that they had, as Kæmpfer and Charlevoix have ſuggeſted, made voyages of diſcovery; and according to the laſt writer, that they had actually wintered upon the continent, where probably meeting with the Eſquimaux, they might, in compariſon with themſelves, juſtly diſtinguiſh them by the name of dwarfs. See ASIA.

BEERO, a Mooriſh kingdom of Africa, lying to the north of Bambara, and north-weſt of a Foulah ſtate, called Maſſina. Its capital is Walet, ſituate, according to Mr. Park's information, about 240 geographical miles to the eaſt of Benowm. In Rennel's map of North Africa, Walet is in N. lat. 15° 45′, and W. long. 2° 45′. The kingdom of Beeroo borders on Sahara, or the Great Deſert.

BEEROTH, in *Ancient Geography*, a city of the Gideonites, afterwards of the tribe of Benjamin, Joſh. ix. 17. According to Euſebius, it was diſtant 7 miles from Jeruſalem, in the way towards Nicopolis.

BEEROTH, of the children of Jaakan, was a ſtation of the

Iſraelites (Deut. x. 6.), placed by Euſebius 10 miles from the city of Petra.

BEER-SHEBA, called alſo Bersabe and Barsheba, a city given by Joſhua to the tribe of Judah, and afterwards transferred to Simeon. Joſh. xv. 28. It derived its name from באר-שבע *beer-ſheba*, the well of an oath, from the well on which Abraham and Iſaac ratified their alliance by an oath with Abimelech. It was diſtant ſouth from Hebron 20 miles, and had a Roman garriſon in the time of Euſebius and Jerom. The limits of the Holy Land are often expreſſed in Scripture by the terms "from Dan to Beer-ſheba" (2 Sam. xvii. 11. &c.); Dan being the northern and Beer-ſheba the ſouthern extremities of the land. It is now a poor village, adjoining a large, ſandy, barren deſart, altogether uninhabited, except towards the ſea-coaſt.

BEES, in *Naval Architecture*, denote pieces of elm-plank bolted to the outer ends of bowſprits.

BEESENSTADT, in *Geography*, a town of Germany, in the circle of Upper Saxony, and county of Mansfeld, 6 miles eaſt of Eiſzleben.

BEES-HEAD, St. a cape of England in the weſtern extremity of the county of Cumberland, in the Iriſh ſea, about 10 leagues E. by N. from the Iſle of Man, and 2 S. of Whitehaven. It has a light-houſe, and is a noted promontory for ſea-fowl. N. lat. 54° 31′. W. long. 30° 43′.

BEESHEN, a town of Germany, in the circle of Weſtphalia, and county of Lingen, 7 miles S. S. E. of Lingen.

BEESKOW, a town of Germany, in the circle of Upper Saxony and Uckermark of Brandenburg, and capital of a lordſhip, to which it gives name, ſeated on the Spree; 16 miles S. W. of Frankfort on the Oder, and 34 E. S. E. of Berlin. A cloth manufacture is carried on in this town.

BEES-WAX. See Wax.

BEESTINGS, or Breastings, denote the fineſt milk taken from a cow after calving.

The beeſtings are of a thick conſiſtence and yellow colour, ſeemingly impregnated with ſulphur. Dr. Morgan imagines them peculiarly fitted and intended by nature to cleanſe the young animal from the recrements gathered in its ſtomach and inteſtines during its long habitation *in utero*. The like quality and virtues he ſuppoſes in women's firſt milk after delivery; and hence infers the neceſſity of the mother's ſuckling her own child, rather than committing it to a nurſe, whoſe firſt milk is gone.

BEET, in *Botany*. See Beta.

Beet, *hare's*, *beta leporina*, a name given by ſome of the old Latin writers to a ſmall green plant of an acrid taſte.

Beet-*gall-inſect*. See Gall-*inſect*.

BEETLE, in *Entomology*, a common Engliſh name for all inſects that are furniſhed with ſhelly-wing-caſes: thoſe which have them divided by a ſtraight ſuture are properly beetles, and belong to the coleoptera order; but the blattæ, or cock-roaches, are alſo called beetles, though the ſuture is oblique, or in other words one wing-caſe croſſes the other; and therefore it belongs to the hemiptera order. See Coleoptera. The ſcarabæi are beetles in the ſtricteſt ſenſe of the word.

Beetles, *water*, is likewiſe a common name for moſt inſects that have wing-caſes, and inhabit the water, including the dytiſci, and ſome other aquatic inſects, that are truly beetles, with ſuch as are not of the ſame order, ſuch as the nepæ, notonectæ, &c. See Hemiptera.

Beetle, in a *Mechanical Senſe*, denotes a large wooden inſtrument, formed after the manner of the mallet, having each face bound with a ſtrong iron hoop, to keep it from ſpreading, and uſed for driving piles, ſtakes, paliſades, wedges, and the like.

In this ſenſe, the word is corruptly written in ſome places *boytle*. Skinner derives it from the Engliſh *beating*. For the military uſe, beetles, called alſo ſtampers, are thick round pieces of wood, a foot and a half long, and eight or ten inches in diameter, having a handle of about four feet long. Their uſe is for beating or ſettling the earth of a parapet, or about paliſades; which is done by lifting up the beetle a foot or two, and letting it fall with its own weight. The name beetle is alſo given to the paviour's rammer, or inſtrument wherewith the ſtones are beaten down, and faſtened.

BEEVES, a general name for oxen.

BEFARIA, in *Botany*. See Bejaria.

BEFORT, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Upper Rhine, ceded to France by the houſe of Auſtria in the year 1648, at the treaty of Weſtphalia. It was fortified by Vauban. In this town ſeveral forges are employed in the manufacture of iron. N. lat. 47° 9′. E. long. 6° 46′.

BEFROI, Grand Befroi, and Petit Befroi, in *Ornithology*, the names of the two ſpecies of Turdus, called *tinnions* and *lineatus* by Gmelin, in Buffon's Hiſt. Birds.

BEG, or Bey, in the *Turkiſh Government*. See Bey.

BEG, Lough, in *Geography*, or the Little Lough, in the province of Ulſter, Ireland, a ſmall lake into which the waters from Lough Neagh again expand, after a courſe of about a mile, through a very narrow channel. The form of Lough-beg, its iſlands, ſome wooded points of land with intervening lawns and rocks, a magnificent rotunda at Ballyſcullen, and the beautiful lightneſs of Toome-bridge, produce the moſt happy effect. It is ſituated between the counties of Armagh and Londonderry.

BEGA, or BEGEYN, Cornelius, in *Biography*, a painter and engraver, was born at Haerlem in 1620, and became the diſciple of Adrain Oſtade, whoſe manner he imitated, and by whoſe inſtructions he profited, ſo as to acquire conſiderable reputation as a painter. But contracting habits of diſſipation and licentiouſneſs, he was diſowned by his father, and reſenting the indignity, he aſſumed the name of Bega inſtead of Begeyn, which was that of his family. He had a fine pencil, and a delicate mode of handling his colours, ſo as to give them a neat and tranſparent appearance; and his performances are ſo much eſteemed in the Low Countries as to be placed among the works of the beſt artiſts. He alſo etched ſeveral drolleries, and a ſet of 34 prints, repreſenting ale-houſe ſcenes, &c. His death, which happened in 1664, was occaſioned by the plague, which he caught from a favourite female, to whom he was ſo ſtrongly attached that he viſited her, againſt the remonſtrances of his friends and phyſicians, to the laſt moments of her life; and he outlived her only a few days. Pilkington and Strutt.

Bega, or Vega, in *Geography*, a river of Germany, which runs into the Werra, 4 miles N. W. of Lemgo, in the circle of Weſtphalia.

BEGANNA, in *Ancient Geography*, a town of Arabia Deſerta, in the neighbourhood of Meſopotamia. Ptolemy.

BEGARMEE, or Baghermi, in *Geography*, ſuppoſed to be the "Begama" of Edriſi, and the "Gorham" of D'Anville, an extenſive kingdom of Africa, ſituate S. E. of Bornou, at the diſtance of about 20 days' travelling, or allowing, with major Rennell, 15 miles for a day's journey, 300 miles, and ſeparated from it by ſeveral ſmall deſerts. The extent, according to Browne's Travels in Africa, p. 468, is from E. to W. 12 days, and from N. to S. 15 days, allowing 12½ geographical miles per day. The inhabitants are rigid Mahometans, and though perfectly black in their complexions, are not of the Negro caſt. Beyond this kingdom to the eaſt, (ſee Proceedings of the Aſſociation for promoting the diſcovery of the Interior Parts of Africa, p. 155) are

ſeveral tribes of Negroes, idolaters in their religion, ſavage in their manners, and accuſtomed, it is ſaid, to feed on human fleſh. They are called the Kardee, the Serrowah, the Showvah, the Battah, and the Mulgui. Theſe nations, the Begarmeeſe, who fight on horſeback, and are great warriors, annually invade; and when they have taken as many priſoners as opportunity affords, or their purpoſe may require, they drive the captives like cattle to Begarmee. It is ſaid, that if any of them, matured by age, or exhauſted by fatigue, happen to linger in their pace, one of the horſemen ſeizes on the oldeſt, and cutting off his arm, uſes it as a club to drive on the reſt. From Begarmee they are ſent to Bornou, where they are ſold at a low price; and from thence many of them are conveyed to Fezzan, where they generally embrace the Muſſulman faith, and are afterwards exported by the way of Tripoli to different parts of the Levant. Begarmee, the capital of the kingdom, lies in N. lat. 15°. E. long. 26° 30′. according to Rennell's Map; but according to Browne, N. lat. 16° 40′. E. long. 22° 25′.

BEGARRA, a town of Spain in New Caſtile, 4 leagues from Alcarez.

BEGEMDER, a province of Abyſſinia, north eaſt of Tigré, bordering upon Angot, and ſeparated from Amhara, which runs parallel to it on the ſouth, by the river Baſhilo. Both theſe provinces are bounded by the river Nile on the weſt. The greateſt length of Begemder is about 180 miles, and its breadth 60; and it comprehends "Laſta," a mountainous province, ſometimes depending upon Begemder, and often in rebellion. The inhabitants are eſteemed the beſt ſoldiers in Abyſſinia, being men of great ſtrength and ſtature, but cruel and uncivilized; ſo that they are called, in common converſation and writing, the peaſants, or barbarians of Laſta. They pay to the king 1000 ounces of gold.

Several ſmall provinces are now diſmembered from Begemder, ſuch as Foggora, a ſmall ſtripe of land reaching ſouth and north about 35 miles between Emfras and Dara, and about 12 miles broad from eaſt to weſt, from the mountains of Begemder to the lake Tzana. On the north end of this are two ſmall governments, Dreeda and Karoota, the only territory in Abyſſinia that produces wine; the merchants trade to Caſſa and Narea, in the country of the Galla.

Begemder is the ſtrength of Abyſſinia in horſemen. It is ſaid that, with Laſta, it can bring out 45,000 men; but this account Bruce thinks to be much exaggerated. It is well ſtocked with cattle of every kind, that are very beautiful. The mountains are full of iron mines; they are not ſo ſteep and rocky as in other provinces, if we except Laſta, and abound in all ſorts of wild fowl and game. The ſouth end of the province near Nefas Muſa is cut into prodigious gullies, apparently by floods, of which no hiſtory remains. It is the great barrier againſt the encroachments of the Galla, who have made many attempts to obtain a ſettlement here, but without ſucceſs; and they have loſt whole tribes in theſe ineffectual efforts. Begemder is a province of ſuch conſequence to the ſtate, reaching ſo near the metropolis, and regularly ſupplying it with all ſorts of proviſions, that none but noblemen of rank, family, and character, able to maintain a large number of troops always on foot, and in good order, are truſted with its government. It lies in about N. lat. 11° 45′. and from 37° 30′. to 38° 30′. E. long.

BEGER, Laurence, in *Biography*, a German antiquarian, was the ſon of a tanner at Heidelberg, and born in 1653. At the requeſt of his father he firſt ſtudied theology, and afterwards gratified his own inclination by the ſtudy of the law. Devoting himſelf to claſſical literature and antiquities, he acquired ſuch reputation that, in 1677, he was appointed librarian and keeper of the cabinet of antiquities by Charles Lewis, elector Palatine; and he retained the ſame office under Frederick William, elector of Brandenburg, to whom the cabinet was tranſferred in 1685. He was a member of the Society of Berlin from its inſtitution, and died there in 1705. He was the author of various learned works. His "Conſiderations on Marriage, by Daphnæus Arcuarius," was written in German, as a defence of polygamy, to gratify the elector Palatine, who wiſhed to marry another lady, to whom he was attached, whilſt his wife was living. He afterwards gratified the ſon by compoſing a refutation of this work, which was never printed. The principal of his other works, which relate to hiſtory and antiquities, are "Theſaurus ex Theſauro Palatino Selectus," 1685, fol.; "Theſaurus Reg. elect. Brandenburgius Selectus," 3 vols. fol.; "Regum et Imperator. Roman. Numiſmata," 1700, fol.; "De Nummis Cretenſium ſerpentiferis," 1702, fol.; "Lucernæ Veterum ſepulchrales," 1702; "Numiſmata Pontif. Roman. aliorumque rariora," 1703, fol.; "Meleagrides et Ætolia," 1696, 4to.; "Cranæ inſula Laconica," 1696, 4to.; "Bellum et Excidium Trojanum illuſt." 1699, 4to. Moreri.

Laurentius Beger, the nephew of this famous antiquarian, was an engraver of ſome eminence at Berlin, about the year 1700.

Beger, in *Geography*, a town of Spain, in the country of Seville, 14 leagues from Medina Sidonia.

BEGGA, in *Entomology*, a ſpecies of *Phalæna*, (Bombyx) with white wings, having a black rib. This kind inhabits Surinam. The body is white; antennæ and legs yellow, black at the tips. Fabricius, Gmelin, &c.

BEGGAR. Beggars pretending to be blind, lame, &c. found begging in the ſtreets, are to be removed by the conſtables; and refuſing to be removed, ſhall be whipped, &c. ſtat. 12. Anne; and our ſtatutes have been formerly ſo ſtrict for puniſhing of beggars, that in the reign of king Henry VIII. a law was enacted, that ſturdy beggars convicted of a ſecond offence ſhould be executed as felons. But this ſtatute was afterwards repealed. See Rogue and Vagabond.

BEGGING Order. See Mendicant.

BEGHARDI, Beguardi, or Begghardi, in *Eccleſiaſtical Hiſtory*, called alſo in Italy *bizochi*, and in France *beguins*, derive their name from the old German word *beggen*, *beggeren*, which ſignifies "to ſeek any thing with zeal and importunity." Accordingly, perſons of this deſcription were called Beghardi, whence probably the Engliſh word *beggar* is derived; and Beguttæ denoted female beggars. This was a general appellation, and given to no leſs than thirty ſects or orders, that ſprung up in the thirteenth century, which differed widely from each other in their opinions, their diſcipline, and manner of living. It was at firſt indiſcriminately applied to all perſons who embraced, with reſignation and free choice, the horrors of abſolute poverty; begging their daily bread from door to door, and renouncing all their worldly poſſeſſions and occupations. It was afterwards reſtricted to thoſe who diſtinguiſhed themſelves by an extraordinary appearance of devotion, and was uſed much in the ſame ſenſe with the term *Methodiſt* among us. Theſe perſons formed a ſort of intermediate order between the monks and citizens, reſembling the former in their manner of living, without aſſuming their name, or contracting their obligations. They were divided into two claſſes, which derived their different denominations of *perfect* and *imperfect* from the different degrees of auſterity that they diſcovered in their manner of living. The *perfect* lived upon alms, abſtained from wedlock, and had no fixed habitations. The *imperfect* conformed to the cuſtoms of the reſt of their fellow-citizens in theſe reſpects. The name was at firſt honourable, but by degrees it ſunk into reproach, being adopted by many, who,

under the mask of religion, concealed the moſt abominable principles, and committed the moſt enormous crimes.

The Beghards of Germany, deprived of the protection of the emperor Lewis, ſuffered extreme miſery under Charles IV. who was advanced, by the intereſt of the pope, to the imperial throne in 1345. Deſirous of gratifying the deſires of the court of Rome, he ſupported by his edicts and by his arms the papal inquiſitors, and allowed them to apprehend and put to death all thoſe that were deemed enemies; and among others the Beghards were victims to their perſecuting power. The emperor himſelf, who reſided at Lucca in Italy, not only approved theſe violent meaſures, but iſſued out in 1369 ſevere edicts, commanding all the German princes to extirpate out of their dominions the Beghards and Beguines, or, as he himſelf interpreted the name, "the voluntary beggars," as enemies of the church and of the Roman empire, and to aſſiſt the inquiſitors in their proceedings againſt them. By another edict, publiſhed not long after, he gave the houſes of the Beghards to the tribunal of the inquiſition, ordering them to be converted into priſons for hereties; and at the ſame time ordered all the effects of the Beguines to be publicly ſold, and the profits ariſing from them to be equally divided between the inquiſitors, the magiſtrates, and the poor of thoſe towns and cities where ſuch ſale ſhould be made. The Beghards, being reduced to great ſtraits by this and other mandates of the emperor, and by the conſtitutions of the popes, fought a refuge in thoſe provinces of Swiſſerland that border upon the Rhine, and alſo in Holland, Brabant, and Pomerania. But the edicts and mandates of the emperor, together with the papal bulls and inquiſitors, followed them wherever they went, and diſtreſſed them in their moſt diſtant retreats, ſo that, during the reign of Charles IV., the greateſt part of Germany (Swiſſerland, and thoſe provinces that are contiguous to it, excepted), was thoroughly purged of the Beghards, or rebellious Franciſcans, both perfect and imperfect.

The Beghards of Flanders are a denomination by which certain unmarried perſons, both bachelors and widowers, are diſtinguiſhed, who formed themſelves into communities of the ſame kind with thoſe of the female *Beguines*, reſerving to themſelves the liberty of returning to their former method of life. The firſt ſociety of thoſe Beghards was eſtabliſhed at Antwerp in the year 1228, and continues ſtill; though the brethren of which it is compoſed have long ſince departed from their primitive rule of diſcipline and manners. This firſt eſtabliſhment was ſucceeded by many others in Germany, France, Holland, and Flanders. Theſe fraternities long enjoyed the toleration of the Roman pontiffs; but moſt of the convents are now either demoliſhed or converted to other uſes. See Brethren *of the Free Spirit*, Fratricelli, and Tertiaris. Moſheim's Eccl. Hiſt. vol. iii. p. 86. 8vo. 1758.

BEGIA, in *Geography*. See Bavjah.

BEGIS, in *Ancient Geography*, a town of Illyria, which belonged to the Tradians. Steph. Byz.

BEGKAWE, in *Geography*, a town of Bohemia, in the circle of Breſlaw, 3 miles weſt of Melnik.

BEGLAISEH, a town of Aſiatic Turkey, in the province of Caramania, 8 miles north of Kirſhehr.

BEGLERBEG, a Turkiſh title for the chief governor of a province, who has under him ſeveral *beys* or *ſangiacs*, that is, ſubgovernors. The word is alſo written "beylerbey," "beglerbey," "beghelerbeghi," and "beylerbeg." It is compounded of "begler," lords; the plural of "beg," lord, with the word "beg," ſubjoined; importing as much as *lord of lords*.

The next to the viſier *azem*, or the firſt viſier, are the beglerbegs in Turkey, who, according to Rycaut, may be compared to archdukes in ſome other countries, being the next miniſters below the prime viſier, and having under their juriſdiction many ſangiacs, or provinces, and their begs, agas, &c. To every beglerbeg the grand ſignior gives three enſigns or ſtaves, trimmed with a horſe-tail, to diſtinguiſh them from the baſhaws, who have but two, and from ſimple begs, or ſangiac-begs, who have but one. See Bashaw.

The province or government of a beglerbeg is call'ed "beglerbeglik," or beglierbeglik." Theſe are of two ſorts; the firſt called "baſile beglerbeglik," which has a certain rent aſſigned out of the cities, countries, and ſignories allotted to the principality; the ſecond called "ſalianæ beglerbeglik," for maintenance of which is annexed a certain ſalary or rent, collected by the grand ſignior's officers with the treaſure of the empire. The beglerbegs of the firſt ſort are in number twenty-two, viz. thoſe of Anatolia, Caramania, Diarbekir, Damaſcus, Aleppo, Tripoli, Trebizond, Buda, Temeſwar, &c. The beglerbegs of the ſecond ſort are in number ſix, viz. thoſe of Cairo, Babylon, &c. Five of the beglerbegs have the titles of viſiers, viz. thoſe of Anatolia, Babylon, Cairo, Romania, and Buda. The beglerbegs appear with great ſtate, and a large retinue, eſpecially in the camp, being obliged to bring a ſoldier for every five thouſand aſpers rent which they enjoy.

The beglerbegs of Romania brought ten thouſand effective men into the field.

Beglerbeg is alſo a title given to the chief governors of provinces in the Perſian empire, having the command over all kans, ſultans, &c. in their reſpective diſtricts.

BEGON, Michael, in *Biography*, was born of a good family at Blois, in 1638. After having occupied ſome law offices in his native province, he was introduced by his kinſman, the marquis de Seignelai, into the marine department, and became ſucceſſively intendant of Havre, of the French colonies in America, and of the gallies. In 1688, he removed to Rochefort, and poſſeſſed the intendance of that poſt till his death, which happened in 1710. His leiſure hours were aſſiduouſly devoted to the cultivation of literature, and he was owner of a valuable library, which was free of public acceſs. In moſt of his books was written "Michaelis Begon et amicorum," i. e. the property of Begon and his friends; and when he was once cautioned by his librarian againſt lending his books for fear of loſing them, he replied, "I would rather loſe them, than ſeem to diſtruſt any honeſt man." His cabinet was richly ſtored with medals, antiques, prints, and various curioſities, collected from all parts of the world. Having procured engravings of ſeveral eminent Frenchmen of the ſeventeenth century, he collected memoirs of their lives, which furniſhed materials for Perrault's "Hommes Illuſtres." Of his botanical reſearches in the American colonies father Plumier availed himſelf in his publication. Nouv. Dict. Hiſt.

BEGONIA, ſo named by Plumier after Monſ. Begon, in *Botany*. Lin. gen. n. 1156. Schreb. 1442. Dryander in Linn. Tranſ. 1. 158. Gærtn. fruct. t. 31. Juſſ. gen. 436. Claſs and order, *monoecia polyandria*. Nat. Ord. *holoraceæ. Incertæ*, Juſſ. Gen. Char. * Male flowers. *Cal.* none. *Cor.* petals four (in B. *octopetala* ſix to nine), of which two oppoſite ones are larger, commonly roundiſh (in B. *ferruginea* all nearly equal, oblong.) *Stam.* filaments numerous (15 to 100), inſerted into the receptacle, very ſhort, ſometimes united at the baſe; anthers oblong, erect. * Female flowers. *Cal.* none. *Cor.* petals in moſt ſpecies five, in ſome ſix, in others perhaps four, commonly unequal. *Piſt.* germ inferior, three-ſided, in very many winged; ſtyles in moſt three, bifid; ſtigmas ſix. *Per.* capſule in moſt three-cornered, winged, three-celled, opening at the baſe by the wings; ſome are two-celled, and others perhaps one-celled.

Eſſent.

Eſſent. Char. Male. *Cal.* none. *Cor.* many-petalled. *Stam.* numerous. Female. *Cal.* none. *Cor.* many-petalled, ſuperior. *Capſ.* winged, many-ſeeded.

Species, 1. B. *nitida.* Dryand. in Linn. Tranſ. 1. 159. Ait. Hort. Kew. 3. 352. B. obliqua, L'Herit. Stirp. Nov. 1. 95. t. 46. B. minor, Jacq. Collect. 1. 128. n. 3. B. purpurea, Swartz. Prodr. 86. "Shrubby, erect; leaves very ſmooth, unequally cordate, obſcurely toothed; largeſt wing of the capſule roundiſh." This elegant ſhrub, which is now a common ornament to our hot-houſes, was introduced here in 1777 by William Brown, M. D. A native of Jamaica; flowering here from May to December. 2. B. *iſoptera.* Dryand. ubi ſupra. Smith ic. ined. 2. t. 43. "Cauleſcent; leaves ſmooth, ſemicordate, obſcurely toothed; wings of the capſule almoſt equal, parallel." A native of Java, where it was obſerved by Thouin. 3. B. *reniformis.* Dryand. "Cauleſcent; leaves kidney-ſhaped, angular, toothed: the largeſt wing of the capſule acute-angled, the others parallel, very ſmall." A native of Braſil, near Rio de Janeiro, in ſhady clefts of rocks; obſerved there by ſir Joſeph Banks. 4. B. *erminia.* Dryander. L'Herit. Stirp. Nov. 1. 97. t. 47. "Cauleſcent; leaves cordate, acuminate, ſerrate, the largeſt wing of the capſule ſickle-ſhaped, the reſt obliterated." A native of Madagaſcar, on ſtones and rocks by brooks, collected there by J. G. Bruguiere, M. D. who conſiders the appendices to the leaves, reſembling the galls on lime-tree leaves, or the tails in ermine, as belonging to the leaves themſelves, and not occaſioned by punctures of inſects. 5. B. *crenata.* Dryander. "Cauleſcent; leaves unequally cordate, roundiſh, obtuſe, crenate-toothed; capſules two-celled. A native of the Eaſt Indies, in the iſland Salſette, and near fort Victory, on walls and rocks. Found there by Ant. Pantaleon Hove. 6. B. *tenuifolia.* Dryander. "Cauleſcent; leaves unequally cordate, ovate, acute-angular, obſcurely toothed; capſules two-celled." A native of Pulo Pontangh, or Prince's iſland, near Java. Found there by ſir Joſeph Banks. 7. B. *ferruginea.* Dryander. Smith. Linn. Supp. 419. Lamarck Encycl. 1. 395. n. 9. Jacq. Coll. 1. 128. n. 1. "Cauleſcent; leaves unequally cordate, toothed; petals of the male flower oblong, nearly equal." Diſtinguiſhed from the other ſpecies hitherto known by the long and narrow petals of the male flowers, all of the ſame breadth, and very little differing in length. Gathered in New Canada by Mutis. 8. B. *grandis.* Dryander. B. obliqua. Thunb. Jap. 231. Kæmpf. ic. ſelect. t. 20. Sjukaido. Kæmpf. Amœn. 888. "Cauleſcent; leaves unequally cordate, angular, ſerrate; wings of the capſule a little unequal." This and the next ſpecies have by far the largeſt leaves of any in the genus; but in this the flowers are twice as large as in *macrophylla.* A native of Japan. 9. B. *macrophylla.* Dryander. Lamarck Encycl. 1. 394. n. 6. B. grandifolia. Jacq. Collect. 1. 128. n. 2. B. purpurea et nivea maxima, folio aurito. Plum. ic. 34. t. 45. f. 1. "Two feet high, entirely ſmooth; female flowers five-petalled." A native of the iſlands in the Weſt Indies. 10. B. *acutifolia.* Dryander. Jacq. Collect. 1. 128. n. 4. Sloan. Jam. t. 127. f. 1, 2. "Cauleſcent; leaves ſemicordate, angular, toothed; the largeſt wing of the capſule obtuſe-angled, the others acute-angled." A native of Jamaica, obſerved there by ſir H. Sloane, and ſince by Maſſon. 11. B. *acuminata.* Dryander. "Cauleſcent; leaves hiſpid, ſemicordate, acuminate, unequally toothed; the largeſt wing of the capſule obtuſe-angled; the others acute-angled. A native of Jamaica, on the blue mountains; introduced into Kew garden in 1790. 12. B. *humilis.* Dryander. Ait. Hort. Kew. "Cauleſcent, upright; leaves hiſpid, ſemicordate, doubly ſerrate; wings of the capſule rounded, a little unequal." A native of the iſland of Trinidad in the Eaſt Indies; found there by Alex. Anderſon. Suppoſed, on its firſt introduction to Mr. Lee's garden at Hammerſmith, in 1788, to be annual; it was then very low, and was called *humilis;* but it has ſince ſtood over the winter, and grown much taller. 13. B. *hirſuta.* Dryander. Aubl. Guian. 913. t. 348. Lamarck. Encycl. 1. 393. n. 3. Jacq. Collect. 1. 129. n. 8. "Cauleſcent; leaves hiſpid, ſemicordate, doubly ſerrate; the largeſt wing of the capſule obtuſe-angled, the others parallel and very ſmall." Obſerved by M. F. Aublet, on the rocks of Guiana. 14. B. *urticæ.* Dryander. Linn. Supp. 420. Lamarck Encycl. 1. 394. n. 8. Jacq. Collect. 1. 129. n. 7. B. urticæfolia. Smith. ic. ined. 2. t. 45. "Cauleſcent, radicant; leaves hiſpid on both ſides, unequally ovate, doubly ſerrate; capſules three-horned at the baſe." Gathered by Mutis in New Granada. 15. B. *ſcandens.* Dryander. Swartz. Prodr. 86. B. glabra. Aubl. Guian. 916. Lamarck Encycl. 1. 394. n. 4. Jacq. Collect. 1. 129. n. 5. "Scandent; radicant; leaves ovate-roundiſh, obſcurely toothed; the largeſt wing of the capſule obtuſe-angled, the others parallel and very ſmall." Perennial: a native of Guiana, the iſle of France, and Jamaica. 16. B. *tuberoſa.* Dryander. Lamarck Encycl. Empetrum acetoſum. Rumph. Amb. 5. 457. t. 169. f. 2. "Creeping; leaves unequally cordate, angular, toothed; wings of the capſule parallel." A native of Amboina, the Molucca iſlands, and Celebes. 17. B. *rotundifolia.* Dryander. Lamarck. B. obliqua Linn. Spec. 1498. B. roſeo flore, folio orbiculari. Tournef. Inſt. 660. Plum. Cat. Amer. 20. ic. 33. t. 45. "Creeping; leaves reniform, roundiſh, crenate." A native of South America, on rocks and trees; found there by Plumier. 18. B. *nana.* Dryander. L'Herit. Stirp. Nov. 1. 99. t. 48. "Stemleſs; leaves lanceolate; ſcape with about two flowers." A native of Madagaſcar, on rocks and trunks of trees; found by Bruguiere. 19. B. *tenera.* Dryander. Falkea tenera. Koenig. "Stemleſs; leaves unequally cordate; flowers umbelled." A native of Ceylon, found there by Koenig. 20. B. *diptera.* Dryander. B. capenſis. Linn. Supp. 420. Jacq. Coll. 1. 130. n. 9. Linn. Mant. 502. "Stemleſs; leaves unequally cordate; peduncles dichotomous; one wing of the capſule very large, another narrow, and the third obſcure." A native of the iſland of Joanna, in ſhady places, by the ſides of mountains; found there by Koenig. 21. B. *cœlopetala.* Dryander. L'Herit. Stirp. Nov. 1. 101. "Stemleſs; leaves cordate, five-lobed; peduncles dichotomous." Found on the mountains of Lima by Dombey, who ſent the ſeeds to the Paris garden, where it has grown ſome years, but not flowered. 22. B. *malabarica.* Dryander. Lamarck. Jacq. Collect. Rheed. Malab. 9. 167. t. 86. "Stems herbaceous; peduncles axillary, ſhort, ſubtriflorous; fruits berried." A native of Malabar. 23. B. *repens.* Dryander. Lamarck. B. obliqua γ. Linn. Spec. 1498. Plum. Amer. 20. ic. 34. t. 45. f. 2. "Stems creeping, rooting at the joints; leaves one-eared; peduncles axillary, long, many-flowered." A native of St. Domingo. Mr. Dryander denominates the two laſt obſcure ſpecies; and has added alſo ſome others.

The whole plant in the Begonias is fleſhy; the ſtem in moſt of the ſpecies is herbaceous, but ſome are ſtemleſs. The leaves are petioled, in the cauleſcent ſpecies alternate. At the baſe of the petioles is a pair of ſtipules. The peduncles in the greater part are dichotomous; and in the cauleſcent ſpecies, axillary. They are natives of Aſia and America within the tropics. Three ſpecies have been found on the iſlands near the coaſt of Africa, but none on that continent. To Mr. Dryander botaniſts are principally indebted for their knowledge of this genus. Linn. Tranſ. vol. i. p. 159.

Propagation and Culture. Theſe plants increaſe readily by cuttings; and if kept in the bark-ſtove prove highly ornamental,

mental, being much eſteemed, both for the beauty of the flowers, and the ſingularity of the leaves. Where a bark-ſtove is wanting, they will do very well over the flue of the dry ſtove. Martyn's Miller's Dict.

BEGRAS, in *Geography*, a town of Aſiatic Turkey, in Syria, at the foot of the Black mountain, between Alexandretta and Antioch.

BEGUE, Achilles William, in *Biography*, born in the diſtrict of Orleans, was admitted doctor in medicine by the univerſity of Paris the 30th of September 1760. He is known principally by his tranſlations into French of Dr. Whytt's Treatiſe on Nervous Affections; Dr. Monroe's Obſervations on the Diſeaſes of the Army; Baron Stork's Eſſays on the virtues of hemlock, the thorn-apple, henbane, and other poiſonous vegetables; and Baron Van Swieten's account of the uſe of the corroſive ſublimate in curing the venereal diſeaſe. His original compoſitions are "Le Conſervateur de la Santé," et "Etrennes ſalutaires," both publiſhed in 12mo. in 1763; the idea of which ſeems to have been borrowed from Tiſſot's "Avis au Peuple ſur ſa Santé," of which he publiſhed an edition at Paris, 1762, in 2 vols. 12mo. Eloy. Dict. Hiſt.

BEGUINS, in *Eccleſiaſtical Hiſtory*, were, as well as the Beghards, a kind of half-monks, called Tertiaries, who attached themſelves to the genuine followers of St. Francis. In Italy they were denominated "Bizochi," and "Bocaſoti;" in France, "Beguins," and in Germany, "Beghards," or "Beguards," which laſt was the denomination by which they were commonly known in almoſt all places. If we except their ſordid habit, and certain obſervances and maxims which they followed in conſequence of the injunctions of the famous ſaint now mentioned, they lived after the manner of other men, and were therefore conſidered in no other light than as ſeculars and laymen. See Beghards, and Tertiaries.

We muſt not confound, ſays Moſheim, theſe Beguins and Begnines, who derived their origin from an auſtere branch of the Franciſcan order, with the German and Belgic Beguines, who crept out of their obſcurity in the 13th century, and multiplied prodigiouſly in a very ſhort ſpace of time. Their origin was of an earlier date than this century; but they now acquired a name, and made a noiſe in the world. It appears from authentic and unexceptionable records, that, ſo early as the 11th and 12th centuries, there had been ſeveral ſocieties of Beguines eſtabliſhed in Holland and Flanders. However, the only convent of Beguines that exiſted before the 13th century, was that of Vilvorden, in Brabant, where they were ſettled, as appears by public acts, in the years 1065, 1129, and 1151. Their primitive eſtabliſhment was undoubtedly the reſult of virtuous diſpoſitions and upright intentions. A certain number of pious women, both virgins and widows, in order to maintain their integrity, and preſerve their principles from the contagion of a vicious and corrupt age, formed themſelves into ſocieties, each of which had a fixed place of reſidence, and was under the inſpection and government of a female head. Here they divided their time between exerciſes of devotion, and works of honeſt induſtry, reſerving to themſelves the liberty of entering into the ſtate of matrimony, as alſo of quitting the convent, whenever they thought proper. And as all thoſe among the female ſex, who make extraordinary profeſſions of piety and devotion, were diſtinguiſhed by the title of Beguines, i. e. perſons who were uncommonly "aſſiduous in prayer," as the name imports (ſee Beghards); that title was given to the women now mentioned. All the Beghards and Beguines that yet remain in Flanders and Holland, where their convents have almoſt entirely changed their primitive form, affirm unanimouſly, that both their name and inſtitution derive their origin from St. Begghe, ducheſs of Brabant, and daughter of Pepin, mayor of the palace to the king of Auſtraſia, who lived in the ſeventh century. This lady, therefore, they conſider as their patroneſs, and honour her as a kind of tutelary divinity with the deepeſt ſentiments of veneration and reſpect. Thoſe, on the other hand, who are no well wiſhers to the cauſe of the Beguines, deduce their origin from Lambert de Begue, a prieſt and native of Liege, who lived in the twelfth century, and was much eſteemed on account of his eminent piety.

The firſt ſociety of this kind, of which record remains, was formed at Nivelle in Brabant, in the year 1226; or, according to other hiſtorians, in 1207; and was followed by ſo many inſtitutions of a like nature in France, Germany, Holland, and Flanders, that, towards the middle of the thirteenth century, there was ſcarcely a city of any note that had not its "beguinage," or vineyard, as it was ſometimes called in conformity to the ſtyle of the "Song of Songs." All theſe female ſocieties were not governed by the ſame laws; but in the greateſt part of them, the hours that were not devoted to prayer, meditation, or other religious exerciſes, were employed in weaving, embroidering, and other manual labours of various kinds. The poor, ſick, and diſabled Beguines were ſupported by the pious liberality of ſuch opulent perſons as were friends to the order. In the 14th century theſe ſocieties were more numerous in various parts of Germany; but, adopting ſome of the extravagant opinions of the "Myſtic Brethren and Siſters of the Free Spirit," they ſhared with them in the perſecution which they ſuffered. The "Clementina," or conſtitution of the council of Vienne, A. D. 1311, againſt the Beguines, gave riſe to a perſecution of theſe perſons, which laſted till the reformation by Luther, and ruined the cauſe of the Beguines and Beghards in many places. From this Clementina, many took occaſion to moleſt the Beguines in their houſes, to ſeize and deſtroy their goods, to offer them many other inſults, and to involve alſo the Beghards in the like perſecution. In the year 1324, however, they obtained ſome relief by a ſpecial conſtitution of the Roman pontiff, John XXII. in which he explained the Clementina, and ordered that the goods, chattels, habitations, and ſocieties of the innocent Beguines ſhould be preſerved from every kind of violence and inſult; and this example of clemency and moderation was afterwards followed by other popes. The Beguines, on the other hand, in hopes of diſappointing the malice of their enemies, and avoiding their ſnares, embraced, in many places, the third rule of St. Francis, and of the Auguſtines. But this meaſure was unavailing; for from this time they were oppreſſed in ſeveral provinces by the magiſtrates, the clergy, and the monks, who caſt a greedy eye on their treaſures, and were extremely eager to divide the ſpoil. Moſheim's Eccl. Hiſt. vol. iii. p. 232, 377, &c.

Communities of Beguines, or Beguinages, ſtill ſubſiſt in Holland, Flanders, and Germany. In Bruſſels, there is a ſingular part of it, which is in fact a little town, incloſed by a wall and ditch, and divided into ſtreets. It is called the Beguinage. The number of Beguines is near a thouſand, governed by matrons, and under the ſpiritual direction of the biſhop of Antwerp. There are alſo Beguinages at Amſterdam, Antwerp, and Malines.

BEGZAM, in *Geography*, a town of Africa, in the country of Agadez, ſouth of Agad or Agades, the capital of the country, and at a greater diſtance ſouth of Aſouda, and weſt of the deſert of Jazr. N. lat. 19° 28′. E. long. 12° 50′.

BEHAIRAT-EL-MARDJ, or *Lake of the Meadow*, a moraſs of Syria, about 3 leagues from Damaſcus to the ſouth-eaſt, into which flow the rivulets that fertilize the gardens in the neighbourhood of the city. See Damascus.

BEHAM, Hans, or John Sebald, in *Biography*, an eminen

eminent engraver, flouriſhed about the year 1540. Like Henry Aldegrever and Albert Durer, whoſe works were the ſources from which he derived his greateſt improvement, he engraved in wood, and alſo on copper, and etched ſome few plates. He was alſo a painter of reputation, and celebrated by the poets of that age under the name of Bohemus. He was a man of good genius, and diſtinguiſhed by fertility of invention. But the Gothic taſte which prevailed in Germany in his time, is too apparent in all his works. His brother Bartolomeo Beham flouriſhed as an engraver about the ſame time. He is ſaid to have ſtudied under Marc Antonio Raimondi, whoſe manner he imitated. His chief reſidence was at Rome, where he died. Strutt.

BEHAMBERG, in *Geography*, a town of Germany, in the archduchy of Auſtria, 3 miles eaſt of Steyr.

BEHAMKIRCHER, a town of Germany, in the archduchy of Auſtria, 6 miles ſouth-eaſt of St. Polten.

BEHAVIOUR, Good, in *Law*. See Good *Abearing*.

BEHBEHAN, a town of Perſia, in the province of Fars.

BEHDUROO, a country of Hindoſtan, in the northern parts of Lahore, near the Imaus mountains, where one branch of the river Rauvee ſprings.

BEHEADING, a capital puniſhment, wherein the head is ſevered from the body by the ſtroke of an ax, ſword, or other cutting inſtrument.

Beheading was a military puniſhment among the Romans, known by the name of *decollatio*. Among them the head was laid on a *cippus*, or block, placed in a pit dug for the purpoſe; in the army, without the *vallum*; in the city, without the walls, at a place near the *porta decumana*. Preparatory to the ſtroke, the criminal was tied to a ſtake, and whipped with rods. In the early ages the blow was given with an ax; but in after-times with a ſword, which was thought the more reputable manner of dying. The execution was but clumſily performed in the firſt times; but afterwards they grew more expert, and took the head off clean with one circular ſtroke.

In England and France, beheading is the puniſhment of nobles; being reputed not to derogate from nobility, as hanging does.

Beheading is part of the puniſhment of high treaſon, affecting the king's perſon or government. The king may, and often does, diſcharge all the puniſhment, except beheading, eſpecially when any of noble blood are attainted. For, beheading being part of the judgment, that may be executed, though all the reſt be omitted by the king's command.

In Scotland they do not behead with an ax, as in England; nor with a ſword, as in Holland and formerly in France where they now uſe the guillotine; but with an edged inſtrument called the maiden.

BEHEM, Beheim, Behen, Boehm, Martin, in *Biography*, ſuppoſed to be the ſame with Martin Behenira, to whom Garcilaſſo de la Vega aſcribes the firſt diſcovery of America, was a famous geographer and navigator of the 15th century. The chriſtian name, ſays M. Otto, (*ubi infra*) is the ſame with that of Garcilaſſo, and the ſyllables "ira" he conceives, were added to his name in conſequence of his receiving the honour of knighthood from John II, king of Portugal. Behem was born of a noble family, of which ſome branches ſtill remain at Nuremberg, an imperial city in the circle of Franconia. Addicted from his infancy to the ſtudy of geography, aſtronomy, and navigation, and having enjoyed the advantage of Regiomontanus's inſtruction, he entertained the thought, at more mature age, of the poſſibility of the exiſtence of the antipodes, and of a weſtern continent. Under the influence of this imagination, he paid a viſit, in 1459, to Iſabella, daughter of John I, king of Portugal, and regent of the duchy of Burgundy and Flanders; and having informed her of his deſigns, he procured a veſſel, in which he diſcovered the iſland of Fayal in 1460. Here he eſtabliſhed a colony of Flemings, whoſe deſcendants are ſaid ſtill to exiſt in the Azores, which for ſome time were called the "Flemiſh iſlands." For the proof of this fact M. Otto refers to the records of Nuremberg, and to the teſtimony of Wagenſeil, one of the moſt learned men of the laſt century, in his "Univerſal Hiſtory and Geography." Having obtained a grant of Fayal from the regent Iſabella, and after having reſided there 20 years, Behem applied, in 1484, eight years before the expedition of Columbus, to John II. king of Portugal, for the means of undertaking a great expedition towards the ſouth-weſt. In the proſecution of this undertaking he diſcovered that part of America, which is now called Brazil, and ſailed to the ſtraits of Magellan, or to the country of ſome ſavage tribes, whom he called Patagonians, becauſe the extremities of their bodies were covered with a ſkin more like a bear's paws than human hands and feet. One of the records, preſerved in the archives of Nuremberg, and containing this fact, affirms, that "Martin Behem, traverſing the Atlantic ocean for ſeveral years, examined the American iſlands, and diſcovered the ſtrait, which bears the name of Magellan, before either Chriſtopher Columbus or Magellan ſailed thoſe ſeas; and even mathematically delineated, on a geographical chart, for the king of Luſitania, the ſituation of the coaſt, around every part of that famous and renowned ſtrait." This aſſertion is ſupported by Behem's own letters, written in German, and preſerved in the ſame archives; which letters are dated in 1486. The diſcovery of Behem is alſo noticed by contemporary writers. In the chronicle of Hartman Schedl, or Herman Schedel, entitled "Chronicon Mundi," and of which a German tranſlation was publiſhed at Nuremberg in 1493, we have the following paſſage to this purpoſe: "In the year 1485, John II., king of Portugal, a man of a magnanimous ſpirit, furniſhed ſome gallies with proviſions, and ſent them to the ſouthward beyond the ſtraits of Gibraltar. He gave the command of his ſquadron to James Canus, a Portugueſe, and Martin Behem, a German of Nuremberg in Upper Germany, deſcended of the family of Bonna, a man very well acquainted with the ſituation of the globe, bleſſed with a conſtitution able to bear the fatigues of the ſea, and who, by actual experiments and long ſailing, had made himſelf perfectly maſter with regard to the longitudes and latitudes of Ptolemy, in the weſt. Theſe two, by the bounty of Heaven, coaſting along the ſouthern ocean, and having croſſed the equator, got into the other hemiſphere, where facing to the eaſtward, their ſhadows projected to the ſouth and right hand. Thus, by their induſtry, they may be ſaid to have opened to us another world hitherto unknown, and for many years attempted by none but the Genoeſe, and by them in vain. Having finiſhed this cruiſe in the ſpace of 26 months, they returned to Portugal, with the loſs of many of their ſeamen, by the violence of the climate." This paſſage was cited by the publiſhers of the works of Æneas Sylvius, afterwards pope Pius II. Two years before the expedition of Columbus, Petrus Matæus, a writer on the canon law, remarks, that "the firſt Chriſtian voyages to the newly diſcovered iſlands became frequent, under the reign of Henry, ſon of John king of Luſitania. After his death, Alphonſus V. proſecuted the deſign; and John, who ſucceeded him, followed the plan of Alphonſus, by the aſſiſtance of Martin Bœhm, a very experienced navigator; ſo that, in a ſhort time, the name of Luſitania became famous over the whole world." Cellarius alſo ſays expreſsly, "Bœhm did not think it enough to ſurvey the iſland of Fayal, which he firſt diſcovered, or the other adjacent iſlands

which.

which the Luſitanians call Azores, and we, after the example of Bœhm's companions, call Flemiſh iſlands, but advanced ſtill farther and farther ſouth, until he arrived at the remoteſt ſtrait, beyond which Ferdinand Magellan, following his tract, afterwards ſailed, and called it after his own name." Magellan, it is ſaid, ſaw a chart of the coaſt of America, drawn by Behem, and preſerved in the archives of Nuremberg, and hence conceived the project of following the ſteps of this great navigator. Riccioli, in his Geog. Reform. l. iii. p. 90, ſays, "Chriſtopher Columbus never thought of an expedition to the Weſt Indies, until ſome time before, while in the iſland of Madeira, where, amuſing himſelf in forming and delineating geographical charts, he obtained information from Martin Bœhm, or, as the Spaniards ſay, from Alphonſus Sanchez de Huelva, a pilot, who, by mere chance, had fallen in with the iſland afterwards called Dominica." In another place he ſays, "Let Bœhm and Columbus have each their praiſe; they were both excellent navigators; but Columbus would never have thought of his expedition to America, had not Bœhm gone there before him. His name is not ſo much celebrated as that of Columbus, Americus, or Magellan, although he is ſuperior to them all." Martin Behem, in conſideration of his great ſervices to the crown of Portugal, was knighted by king John in 1485, in the preſence of his whole court. In 1492, the chevalier Behem, crowned with honours and riches, undertook a journey to Nuremberg, to viſit his native country and his family; and there he made a terreſtrial globe of curious conſtruction, which is ſtill preſerved in the library of that city. On this globe is marked the tract of his diſcoveries, under the appellation of the weſtern lands; and from their ſituation it cannot be doubted, that they are the preſent coaſts of Brazil, and the environs of the ſtraits of Magellan. This globe was made in the ſame year when Columbus ſet out on his expedition; and hence it is inferred, that Behem could not have profited by the obſervations of this navigator. After having performed ſeveral other intereſting voyages, the chevalier Behem died at Liſbon in July 1506, univerſally regretted, and leaving behind him no other work beſides the globe already mentioned, which was conſtructed from the writings of Ptolemy, Pliny, Strabo, and eſpecially from the account of Mark Paul the Venetian, a celebrated traveller of the 13th century, and of John Mandeville, an Engliſhman, who, about the middle of the 14th century, publiſhed an account of a journey of 33 years in Africa and Aſia. He has alſo added the important diſcoveries made by himſelf on the coaſts of Africa and America.

Dr. Robertſon treats the hiſtory of Behem as a fiction of ſome German authors, who were inclined to attribute to one of their countrymen a diſcovery which has produced ſo great a revolution in the commerce of Europe. Nevertheleſs, he acknowledges with Herrera, that Behem had ſettled in the iſland of Fayal; that he was the intimate friend of Columbus, and that Magellan had a globe made by Behem, by the help of which he undertook his voyage to the ſouth ſea. He alſo relates, that in 1492 this geographer viſited his family at Nuremberg, and left there a map drawn by himſelf, a copy of which was procured for him by Dr. Reinhold Foſter, and which, in his opinion, partakes of the imperfection of the coſmographical knowledge of the 15th century; as he found in it, under the name of the iſland of St. Brandon, land which appears to be the preſent coaſt of Guiana, and which lies in the ſame latitude with the cape Verd iſles; and he conceives that this is an imaginary iſland, which has been admitted into ſome ancient maps, on no better authority than the legend of the Iriſh St. Brandon or Brendan, whoſe ſtory is ſo childiſhly fabulous as to be unworthy of any notice. He adds, that hardly any one place is laid down in its true ſituation. M. Otto thinks that Dr. Robertſon furniſhes, in his own hiſtory, means of refuting his objections againſt the truth of Behem's hiſtory. This learned hiſtorian allows, that Behem was very intimate with Columbus, that he was the greateſt geographer of his time, and that he had been the diſciple of the celebrated John Muller or Regiemontanus; that he had diſcovered, in 1483, the kingdom of Congo on the coaſt of Africa; that he conſtructed a globe, uſed by Magellan; that he drew a map at Nuremberg, containing the particulars of his diſcoveries; and that he placed in this chart land, which is found to be in the latitude of Guiana. Whilſt Dr. Robertſon aſſerts, without any proof, that this land was but a fabulous iſland, we may ſuppoſe, ſays M. Otto, upon the ſame foundation, that the chevalier Behem, engaged in an expedition to the kingdom of Congo, was driven by the winds to Fernambouc, and from thence by the currents, very common in theſe latitudes, towards the coaſt of Guiana; and that he took for an iſland the firſt land which he diſcovered. The courſe which Chriſtopher Columbus afterwards ſteered, makes this ſuppoſition ſtill more probable; for if he knew only of the coaſt of Brazil, which they believe to have been diſcovered by Behem, he would have laid his courſe rather to the ſouth-weſt. The expedition took place in 1483; it is then poſſible that, at his returning, Behem propoſed a voyage to the coaſts of Brazil and Patagonia, and that he requeſted the aſſiſtance of his ſovereign, which has been already mentioned. "It is certain," ſays M. Otto, "that we cannot have too much deference for the opinion of ſo eminent a writer as Robertſon, but this learned man not having it in his power to conſult the German pieces in the original, which we have quoted, we may be allowed to form a different opinion, without being too preſumptuous." For a farther diſcuſſion of this ſubject, ſee M. Otto's Memoir on the diſcovery of America, in the Tranſactions of the American Society at Philadelphia, vol. ii. p. 263, &c. Robertſon's Hiſt. of America, vol. i. p. 371, &c.

BEHEME, or Ramsey, Sand, in *Geography*. See Ramsey.

BEHEMOTH, in *Zoology*, a huge animal mentioned in Scripture, concerning which interpreters are much divided. The ſtrength of this creature, his manner of life, and ſome other particulars, we find admirably pourtrayed in the forty-firſt chapter of the book of Job, and from that deſcription ſome have thought it could apply only to the elephant, but it certainly more fully agrees with the hippopotamus, or river horſe; and this is now pretty generally believed to be the animal in queſtion. Bochart, Franzius, and others, who have endeavoured to aſcertain all the animals mentioned in the Old Teſtament, entertain this opinion. See Hippopotamus and Mammoth.

BEHEN, in *Botany*. See Centaurea and Cucubalus.

BEHERUS, in *Geography*, a town of Aſia, in the Arabian Irak, 20 miles N.N.E. of Bagdat.

BEHIRE, in *Geography*, a lake of Lower Egypt, 7 leagues in compaſs, near Aboukir. This is alſo the name of a diſtrict called Bahira, which ſee.

BEHIU, a town of Egypt, near the Nile, 17 miles S. of Abu Girgé.

BEHKER, or Bhakor, a diſtrict of India, in the ſouthern part of the country of Moultan, confined chiefly to the eaſt ſide of the Indus. This is alſo the name of a town, which is the capital of the country to which it gives name, about 215 geographical miles diſtant from Moultan to the ſouth, and ſuppoſed in the Ayin Acbaree to be the ancient Manſurah. N. lat. 27° 12'. E long. 70° 1'.

BEHLULIA,

BEHLULIA, a town of Syria, 40 miles ſouth weſt of Aleppo.

BEHMEN, or Boehm, Jacob, in *Biography*, commonly called by his admirers, the "German Theoſophiſt," was born of poor parents at a village near Gorlitz, in Upper Luſatia, in 1575. Having been taught to read and write, at the age of 10 years, he was apprenticed to a ſhoe-maker, or taylor, and in 1594 became a maſter and was married. Although he never entirely forſook his occupation, his eccentric genius ſoon carried him "ultra crepidam," beyond his laſt. Engaging in thoſe theological controverſies, which were ſpreading in his time through Germany, among the lower claſſes of the people, he was much perplexed concerning many articles of faith, and prayed earneſtly for divine illumination. In this ſtate of mind he fell into a trance or extacy in 1600, which laſted for ſeven days, and afforded him an intuitive viſion of God. Soon afterwards he had a ſecond extacy, in which he found himſelf ſurrounded on a ſudden with celeſtial irradiations, his ſpirit being carried to the inmoſt world of nature, and enabled to penetrate through the external forms, lineaments, and colours of bodies, into the receſs of their eſſences. In a third viſion of the ſame kind, other more ſublime myſteries were revealed to him, concerning the origin of nature, and the formation of all things, and even concerning divine principles and intelligent natures. Theſe wonderful communications he committed to writing in 1612; and publiſhed a book, entitled "Aurora," the principles and ſtyle of which are ſo myſterious and obſcure, that it is not eaſy to underſtand or explain them. Indeed the author himſelf declares that the myſteries of this book are incomprehenſible to fleſh and blood, and that though the words be read, their meaning will lie concealed, till the reader has by prayer obtained illumination from that heavenly ſpirit, which is in God, and in all nature, and from which all things proceed. Gregorius Richter, a clergyman of Gorlitz, having ſeen this work, reproved the author from the pulpit, and procured an order from the ſenate of the city for ſuppreſſing it; and Behmen was required to diſcontinue his attempts for enlightening the world by his writings. Behmen acquieſced, and refrained from writing for 7 years. A copy of the work, however, found its way to the preſs at Amſterdam, in 1619; and in the ſame year he wrote another book on the three principles, to which in the courſe of a few years he added ſeveral others. In 1624 he travelled to Dreſden, where he was examined by a body of divines, and diſmiſſed without cenſure. He died in the ſame year, after having received the ſacrament from the hands of Elias Dietrich, and was honourably interred at Gorlitz. His other works are "Of the Three-fold Life of Man;" "Anſwer to the Forty Queſtions of the Soul;" "Of the Incarnation of Chriſt, his Sufferings, Death, and Reſurrection;" "A Book on the Six Points;" "On Celeſtial and Terreſtrial Myſteries;" "De Scriptura Rerum;" "On the Four Complexions;" "On True Repentance;" "On True Reſignation;" "On the Second Birth;" "Myſterium Magnum;" "On the Firſt Book of Moſes;" "On Spiritual Life," &c. Theſe treatiſes appeared ſeparately, and were afterwards collected and printed together. The beſt edition is ſaid to be that in 12mo. publiſhed in German, at Amſterdam, in 1682. An Engliſh edition of his works was given by Mr. William Law, in 2 vols. 4to.

In Jacob Behmen, a warm imagination, united with a gloomy temper, produced that kind of enthuſiaſm, which in its paroxyſms diſturbs the natural faculties of perception and underſtanding, and produces a preternatural agitation of the nervous ſyſtem, during which the mind is filled with wild and wonderful conceptions, which paſs for viſions and revelations. Every page of his works, and even the hieroglyphic figures prefixed to his works, manifeſt a diſordered imagination, and it is in vain to attempt to derive his "Theoſophia," from any other ſource; unleſs we incline to admit his own account, in which he boaſts that he was neither indebted to human learning, nor was to be ranked among ordinary philoſophers. He ſays that he wrote "not from an external view of nature, but from the dictates of the ſpirit; and that what he delivered concerning the nature of things, and concerning the works and creatures of God, had been laid open before his mind by God himſelf." The conceptions of this enthuſiaſt, ſufficiently obſcure in themſelves, are often rendered more obſcure by being clothed under allegorical ſymbols, derived from the chemical art. As he frequently uſes the ſame terms with Paracelſus, he was probably converſant with his writings. He alſo appears to have acquired ſome knowledge of the doctrine of Robert Fludd, a native of England, and the Roſicruſians, which was propagated in Germany with great oſtentation during the 17th century. However he ſeems, upon the whole, to have followed no other guides than his own inventive genius and enthuſiaſtic imagination; and every attempt which has been made by his followers to explain his ſyſtem has been only raiſing a freſh ignis fatuus, to lead the bewildered traveller farther aſtray. Among other tenets, equally inexplicable, this myſtic makes God the eſſence of eſſences, and he ſuppoſes a long ſeries of ſpiritual natures, and even matter itſelf to have flowed from the fountain of the divine nature. Upon theſe ſubjects his language reſembles that of the Jewiſh cabbala. The whole Divine Trinity, he ſays, ſpreading forth bodily forms, produces an image of itſelf, "as a God in miniature." If any one name the heavens, the earth, the ſtars, the elements, and whatever is beneath or above the heavens, he herein names the whole deity, who, by a power proceeding from himſelf, thus makes his own eſſence corporeal. There is a great darkneſs, he ſays, among the ſtars, where the devil holds his principality; all arts and ſciences flow from the ſiderial ſpirit of this world; the ſeven liberal arts proceed from ſeven ſpirits of nature; and all human things are compoſed of the four firſt properties, bitter, ſour, heat, and pain. The divine grace, ſays this chimerical writer, operates by the ſame rules, and follows the ſame methods that the divine Providence obſerves in the natural world; and the minds of men are purged from their vices and corruptions in the ſame way that metals are purged from their droſs; and this maxim was the principle of his fire-theology. But it is needleſs to give any farther account of a ſyſtem which exhibits a motley mixture of chemical terms, crude viſions, and myſtic jargon. The elements of Behmen's theology may be collected from his "Aurora," and his treatiſe "on three principles."

Some have beſtowed high praiſes on this enthuſiaſt, on account of the wiſdom which they pretend is contained in his writings, and alſo of his piety, integrity, and ſincere love of truth and virtue. Others have accuſed him of the moſt dangerous errors, and have written volumes in oppoſition to his doctrines. Amongſt the moſt eminent of his followers and admirers, we may reckon John Lewis, Giftthiel, John Angelus, Werdenhagen, Abraham Franckenberg, who wrote his life, Theodore Tſchetch, a Sileſian nobleman, Paul Felgenhaver, Quirinus Kuhlman, who was burnt at Moſcow in 1684, John Jacob Zimmermann, and our viſionary countryman William Law, author of "Chriſtian Perfection." Among Behmen's numerous followers, no one rendered himſelf more conſpicuous than John Pordage, a phyſician and naturaliſt, and member of the "Philadelphian Society," who pretended to divine revelation, and declared that he was thus convinced of the truth of Behmen's doctrines. He publiſhed a book entitled "Divine and True Metaphyſics," with other ſimilar works in favour of Behmen's opinions, which

being ſoon ſpread throughout Germany, became, together with his other writings, the ſtandard books of all enthuſiaſts. To the claſs of his adverſaries we may refer Gilbert Iſchefchius, who publiſhed an admonition againſt his works in 1643, which was anſwered by Tſchetſch, Gerrard Antagroſſus, who refuted Tſchetſch, and who endeavoured to ſhew that Behmen entertained the ſame opinions as the Manichæans and Gnoſtics; Tobias Wagner, and Dr. Henry More, who wrote a treatiſe againſt Behmeniſm, entitled "Cenſura Philoſophiæ Teutonicæ," printed in his works, p. 520. Some perſons have attempted to prove from Behmen's writings, that he did not acknowledge a deity; and particularly Von Muller, in a work entitled "The Fanatic Atheiſt." Brucker's Hiſt. Phil. by Enfield, vol. ii. p. 494, &c. Moſheim's Eccl. Hiſt. vol. v. p. 340, &c.

BEHMENISTS, or Boehmists, in *Eccleſiaſtical Hiſtory*, the denomination of a claſs of myſtic philoſophers, who were the followers of Jacob Behmen, commonly called the Teutonic philoſopher. See the preceding article.

BEHN, Aphara, in *Biography*, a writer of novels and plays, was deſcended of a good family of the name of Johnſon in Canterbury, and born in the reign of king Charles I. Her father died at ſea in a voyage for Surinam, of which he was appointed lieutenant governor by the intereſt of lord Willoughby, to whom he was related; but his daughter, with the reſt of the family, arrived thither. Here ſhe became acquainted with the ſtory and perſon of the American prince Oroonoko, whoſe adventures ſhe deſcribed in a novel under this title. After her return to England ſhe married Mr. Behn, a merchant in London, of Dutch extraction. During the Dutch war in the reign of Charles II. ſhe was employed for gaining intelligence on the continent, and with this view ſhe reſided at Antwerp. By her intrigues, it is ſaid, ſhe diſcovered the deſign, formed by the Dutch, of ſailing up the river Thames, and burning the Engliſh ſhips in their harbours; but her intelligence was ſlighted by the Engliſh court, to which it was imparted. On her return to England ſhe narrowly eſcaped ſhipwreck. Her future life was devoted to pleaſure and poetry; and by writing ſhe gained a ſubſiſtence. With a good perſon, and diſtinguiſhed talents for converſation, ſhe formed an intimate acquaintance with ſeveral poets and wits of her time, as well as men of pleaſure. Her compoſitions, in verſe and proſe, were numerous; and ſhe publiſhed three volumes of miſcellaneous poems, ſeventeen plays, and a collection of hiſtories and novels, beſides ſome tranſlations and letters. She borrowed much from other writers, and the merit, that was properly her own, conſiſted in a fluent eaſy ſtyle, occaſionally glowing with the ardour of love, when this ſubject was the topic, and in ſome ſprightly thoughts and facility of invention. Many of her plays ſucceeded on the ſtage, at a period when groſs indecency of plot and language was no impediment to their reception. Her poetical appellation was Aſtrea; and her dramatic compoſitions are characteriſed by Mr. Pope in the following lines:

"The ſtage how looſely does Aſtrea tread,
Who fairly puts all characters to bed."

None of her dramatic pieces are now acted; her poetry has been long forgotten; but her novels, which were once popular, are now occaſionally read. Her death, which was haſtened by an injudicious phyſician, happened in 1689, when ſhe was between the age of 40 and 50; and ſhe was buried in the cloiſters of Weſtminſter Abbey. Biog. Brit. Gen. Dict.

BEHNESE, or Bahnasaa, in *Geography*, a town of Egypt, 10 miles north of Abu Girgé.

BEHRENS, Conrad, Berthold, in *Biography*, was born at Hilderſheim, in Lower Saxony, Auguſt 26th 1660. After paſſing through the uſual courſe of ſtudies in the claſſics and philoſophy, in his own country, and reſiding for ſome time at Straſburg and Leyden, he took the degree of Doctor in Medicine at Helmſtadt, was made phyſician to the army of the duke of Brunſwick, and in 1712 to the court of Brunſwick Lunenburg, and member of the Academy Naturæ Curioſorum, to the Memoirs of which he was a conſiderable contributor. His principal works are, "De Conſtitutione Artis Medicæ," Helmſt. 1691, 8vo. "Medicus Legalis," 1696, 8vo. publiſhed in German. In this he treats of the duties and office of phyſicians, ſurgeons, apothecaries and midwives, of alchemy, of magnetiſm applied to medicine, and of the cauſes of ſudden death, on which he has ſome judicious obſervations. "Selecta Dietetica, ſive de recta ad ſanitatem vivendi ratione tractatus," Francf. 1710, 4to. He died October 4th 1738. His ſon Rodolph Auguſtus Behrens, who ſucceeded to his honours and practice, publiſhed "De Felicitate Medicorum Aucta in terris Brunvicenſibus," 1747, 4to. occaſioned by ſome additional privileges accorded to the phyſicians there. In this work he takes occaſion to comment on, and refute the opinion of Middleton, as to the ſervile condition of phyſicians among the Romans.

BEHUT, called alſo Betuh, Ihylum, or Chelum, in *Geography*, a river of Hindoſtan, is the weſternmoſt of the five rivers that water the Panjab; and its general courſe is eaſt, and nearly parallel to that of the Attock, but it is of a leſs bulk. This is the famous Hydaſpes of Alexander, on the banks of which he was oppoſed by Porus, a powerful monarch of the country, at the head of a numerous army. By the Ayin Acbaree, it is ſaid to be anciently called Beduſta. The Behut iſſues from the ſpring of Wair, or Wair Naig, in the ſouth-eaſt part of Caſhmere, and after a northweſt courſe through that valley, enters the mountains at Barehmooleh. During this ſhort courſe it receives abundance of rivulets and ſtreams from ſome large lakes, and becomes navigable at a few miles below its remoteſt ſpring. After entering the mountains it purſues the direction of the Panjab by a very crooked courſe, being pent up in a deep winding valley, whilſt eſcaping from the wide baſe of the Caſhmerian mountains, and ruſhing with ſuch rapidity and violence that even the ſtouteſt elephant cannot preſerve his footing in it. It emerges from the mountains in the diſtrict of Puckholi, and is afterwards joined by two ſmall but celebrated rivers named Kiſkengonga and Nainſook. After this it traverſes the territory of the Ghickers, ſtill holding its courſe through a hilly country, until it croſſes the upper or great road leading from Lahore to Attock, where the hilly tract is confined to the weſtern bank. Here ſtood, not long ſince, a city of the name of Ihylum, which communicated its name to the river, during the remaining part of its courſe; and hence it is as commonly named Ihylum as Behut. From Ihylum it purſues its courſe along the eaſtern borders of the Joud mountains, and unites with the Chunaub at about 50 geographical miles above Moultan; loſing its name in that of the Chunaub, as heretofore it loſt its name of Hydaſpes in that of Aceſines, the ancient name of the Chunaub. The interval between the Behut and the Indus, in the wideſt part, is about 94 geographical miles. Pliny allows only 120 Roman miles between the Indus and the Hydaſpes. Rennell's Mem. p. 99. Robertſon's India, p. 18.

BEIA, Pax Julia, an ancient city of Portugal, in the province of Alentejo, near a lake of the ſame name. It is mentioned by Pliny, Ptolemy, and Antoninus. Several Roman coins and inſcriptions have been found near this place. Its ſituation is on a gentle hill in a fertile country rich in corn, and it is ſurrounded with walls and gates; and it is the

ſee

ſee of a biſhop, a corregidor, and a governor. It was taken from the Moors in 1162. N. lat. 37° 58′. W. long. 7° 20′.

BEJA, a large extent of country in Abyſſinia, lying between the northern tropic and the mountains of Abyſſinia, reaching from Maſuah along the coaſt of the Red Sea to Suakem; then turning weſtward, and continuing in that direction, with the Nile on the ſouth, the tropic on the north, to the deſerts of Selima, and the confines of Libya on the weſt. See Abyssinia.

Beja of Tunis. See Bay-jah.

BEJAD, a village of Egypt, oppoſite to Benifouef, partly inhabited by Copts.

BEJAPOUR, or Visiapour, a conſiderable city of Hindoſtan, and once the capital of a large kingdom of the ſame name. It is now in the hands of the Poonah Mahrattas; diſtant 234 miles from Bombay, from Calcutta by the Circars, 1183, and by Aurungabad 1216, from Delhi 916, from Hydrabad 269, from Madras 534, from Poonah 136, from Seringapatam 405, from Benares 876, and from Agra 825 miles. N. lat. 17° 28′. E. long. 75° 27′.

BEJAR, a ſmall town of Spain in the province of Eſtremadura, ſeated in the midſt of a pleaſant valley between high mountains, whoſe tops are continually covered with ſnow. It is famous for its baths, and in its vicinity is a lake, which is ſaid to preſage bad weather by an unuſual agitation. It was raiſed into a duchy in 1448.

Bejar *de Melena*, or *Bejer*, a town of Spain, in Andaluſia, near the ſtraits of Gibraltar, 8 leagues ſouth of Cadiz.

BEJARIA, ſo called by Mutis, in honour of Bejar, a Spaniſh botaniſt, in *Botany*. Lin. Gen. Reich. n. 648. Schreb. 811. Juſſ. 159. Claſs and order, *dodecandria monogynia*. Nat. Ord. *bicornes*. *Rhododendra*, Juſſ. Gen. Char. *Cal.* perianth one leafed, gibbous downwards, ſubventricoſe, ſeven-cleft; diviſions ſubequal, ovate, acute, converging, ſmall; the outer ones broader, permanent. *Cor.* petals ſeven, oblong, broader above, obtuſe, patulous, inſerted into the receptacle. *Stam.* filaments fourteen, ſubulate, rather ſhorter than the corolla, alternately leſs; anther oblong, incumbent. *Piſt.* germ ſuperior; ſtyle columnar, middle-fized, permanent; ſtigma thickiſh, ſeven-ſtriated. *Per.* berry juiceleſs, ſeven-cornered, depreſſed, umbilicate, ſeven-celled. *Seeds* numerous, columnar-oblong, imbricate.

Eſſent. Char. *Cal.* ſeven-cleft. *Petals* ſeven. *Stam.* fourteen. *Berry* ſeven-celled, many ſeeded.

Species, 1. B. *aſtuans*. Mutis Amer. i. t. 7. "Leaves lanceolate, flowers in racemes." A ſhrub twelve feet high, with roundiſh ſpreading branches. A native of Mexico. Found in New Granada by Mutis. 2. B. *reſinoſa*. Mutis Amer. i. t. 8. "Leaves ovate, flowers heaped." A tree with proliferous branches, and an irregular, tender, ſubpubeſcent bark; corolla purple, very reſinous or viſcid. Found in New Granada by Mutis. Theſe have a peculiar bitter flavour, and are allied to the rhododendrum. The name was erroneouſly made "Befaria" by Linnæus.

BEIBENIÆ *Stellæ*, in *Aſtronomy*, a name given by ſome aſtronomers to the principal fixed ſtars in each conſtellation.

The appellation is more particularly given to the ſtars of the firſt magnitude, otherwiſe called the hearts, *cordæ*, of the ſeveral conſtellations; though ſome would diſtinguiſh between *cordæ*, and *beibeniæ ſtellæ*, reſtraining the former to ſtars only of the firſt magnitude, and extending the latter to ſeveral of the ſecond, or even third.

Hermes has a treatiſe expreſs De Stellis Beibeniis, publiſhed by Junctinus, in his Speculum Aſtrologicum, and alſo in his commentaries upon Jo. de Sacroboſco's book De Sphæra.

BEICHLINGEN, in *Geography*, a town of Germany, in the circle of Upper Saxony, and country of Thuringia, 6 miles S. W. of Wiehe. N. lat. 51° 20′. E. long. 11° 50′.

BEILA, a town of Italy, in Piedmont. N. lat. 45° 2′. E. long. 7° 45′.

BEILAM, a town of Syria, S. E. of Scanderoon or Alexandretta. N. lat. 36° 26′. E. long. 36° 31′.

BEILNGRIES, a town of Germany, in the circle of Franconia, and biſhopric of Aichſtadt, at the conflux of the Attmuhl, and the Soulz, 16 miles north of Ingolſtadt.

BEILSTEIN, a ſmall town and citadel of Germany, in the Rheniſh circle, and capital of a lordſhip to which it gives name, compriſing about fifty villages, in the principality of Naſſau Dillenburg; 5 miles ſouth of Dillenburg. The lordſhip belongs to the princely houſe of Naſſau-Orange Dietz, which enjoys, in conſequence of it, a ſeat and voice at the diets of the electoral Rheniſh circle. N. lat. 50° 31′. E. long. 8° 11.—Alſo, a ſmall town of Germany, in the duchy of Wurtemberg. In 1693, it was burnt by the French. Its diſtrict comprehends ſeveral villages.

BEILUL, a town of Abyſſinia, ſituate on the Red Sea north of Aſſab. N. lat. 14°. E. long. 41° 58′.

BEINA, a river of Norway, in the government of Chriſtiania, which runs into the lake of Sperdillon; and ſerves for exporting timber.

BEINAC, a town of France, in the department of Correze, and chief place of a canton, in the diſtrict of Brive, 8 miles ſouth of Tulle.

BEINASCHI, Giovanni Battista, in *Biography*, an hiſtorical painter, was born in Piedmont in 1634, and ſtudied at Rome under Pietro del Po, and as ſome ſay, was afterwards a diſciple of Lanfranc. He died in 1688. Beinaſchi was an admirable deſigner, of a lively invention, and not only expeditious, but correct. As an acknowledgment of his merit, he received the honour of knighthood.

BEINASCO, in *Geography*, a town of Piedmont, 4½ miles S.S.W. of Turin.

BEINDGHURA, a town of Hindoſtan, in the diſtrict of Beneapour, part of the territory of the Mahrattas. N. lat. 15° 15′. E. long. 75° 11′.

BEING, in *Metaphyſics*, includes not only whatſoever actually is, but whatſoever can be. It is the firſt and moſt obvious, the moſt ſimple and natural conception that we can frame of any thing which we ſee, hear, feel, or know. It is in ſome ſenſe comprehended in all our other conceptions of things, and is therefore the moſt general or univerſal of all our ideas. By the affections of being, are meant all powers, properties, accidents, relations, paſſions, diſpoſitions, internal qualities, external adjuncts, conſiderations, conditions, or circumſtances whatſoever; or, in a word, all thoſe modes which belong to things, either as they are in themſelves, or as they ſtand in relation to other things, or as they are repreſented or modified by our ideas and conceptions. The various kinds of beings have been referred by writers on this ſubject into three diſtinct claſſes; and they have been conſidered as either ſubſtances or modes, finite or infinite, and natural, artificial, or moral. For the two former claſſes, ſee Substance, Mode, Finite, and Infinite. Natural beings are all thoſe things that have a real and proper exiſtence in the univerſe, and are conſidered as formed and ordained by God the creator; ſuch are bodies, ſpirits, men, beaſts, trees, fruit, countenance, ſenſe, reaſon, fire, air, light, &c. Artificial beings are made by the contrivance or operations of men, whether they are of a more corporeal nature, ſuch as houſes, windows, pictures, ſtatues, arms, garments, writing, muſic, and the various utenſils of life; or whether they relate more to intellectual matters, as words, ſciences, rules, arguments, propoſitions, verſe, proſe, &c. Moral beings are thoſe which belong to the conduct and government of intelligent creatures, or creatures endowed with underſtanding and volition, conſidered as lying under obli-

gations to particular actions or abſtinences: but theſe conſidered as moral are only modal; ſuch are law, duty, virtue, vice, ſin, righteouſneſs, judgment, condemnation, reward, puniſhment. Theſe diſtinctions however might, perhaps, be more properly reſerved to the ſeparate claſſes of different ideas than different beings. Being is the ſubject of Ontology. See Ontology. See alſo Essence and Existence.

BEINHEIM, in *Geography*, a town of Germany, in the circle of Swabia, ſeated on the weſt ſide of the Rhine, and belonging to the marquiſate of Baden; 6 leagues N.N.E. of Straſburg.

BEINIGKEMEN, a town of Lithuania, 12 miles north of Pilkallen.

BEIRA, a large and fertile province of Portugal, bounded on the north by the province of Entre Duero a Minho, from which it is ſeparated by the river Duero or Douro, and by Tralos Montes; on the weſt by the ocean and part of Eſtremadura; on the ſouth by another part of that province and by the Tagus; and on the eaſt by the Spaniſh Eſtremadura, and the kingdom of Leon. It is divided into Upper and Lower Beira; the former being the northern part, and lying on the ſea-coaſt; the latter lying towards Spain and Eſtremadura. Its extent from eaſt to weſt is generally computed at betwixt 33 and 36 Portugueſe miles; and from north to ſouth about as many. It was erected into a principality by John V. in honour of his grandſon, the eldeſt ſon of the prince of Braſil. It produces wheat, rye, and millet; and, in ſeveral parts, excellent wine and oil in ſuch abundance, that conſiderable quantities of each are exported. Beira comprehends eight juriſdictions, and its principal cities and towns are Coimbra, Lamego, Guarda, Viſeu, Miranda do Corvo, Tentugal, Aveiro, Ovar, Pinhel, Almeida, Francoſo, Meda, Caſtello Branco, Penamacor, and Covilhaa; the four firſt are epiſcopal cities. The militia of this province conſiſt of eight regiments, each regiment including about 1000 men.

BEIRAGUR, a town of Hindoſtan, on the weſt of Boad, and near the Mahanuddy river, noted in the Ayin Acbaree, as having a diamond mine in its neighbourhood.

BEIRAM. See Bairam.

BEIRUT. See Bairout and Berytus.

BEISCH, Joachim Francis, in *Biography*, a painter of landſcapes and battles, was born at Ravenſburg, in Swabia, in 1665; and having received the firſt rudiments of the art of painting from his father, who employed himſelf in this way for his amuſement, he became a good artiſt by the force of his own genius and by aſſiduous practice. He was engaged at the court of Munich, and painted the battles fought in Hungary by the elector Maximilian Emanuel. During the abſence of the emperor on ſome of his expeditions, Beiſch viſited Italy, and there, with a view to his further improvement, ſtudied and copied the famous models to which he had acceſs. Before his journey to Italy, his manner was true, but too dark; his ſecond had more clearneſs and more truth; and his laſt was more clear, but more weak. The ſcenes of his landſcapes are agreeably picturesque; his touch is light, tender, and full of ſpirit; and his ſtyle of compoſition frequently reſembled that of Gaſpar Pouſſin, or Salvator Roſa. He died in 1748. Pilkington.

BEISHEHIA, or Bishehri, in *Geography*, a town of Aſiatic Turkey, in Caramania, ſeated near a lake. N. lat. 37° 45′. E. long. 32° 11′.

BEISSKER, in *Ichthyology*. See Beyssker, or Beyzker, and Cobitis Fossilis. Linn.

BEISSONS, in *Geography*, a place of Africa, in the kingdom of Tunis, ſituate between Taberſoke and Dugga, at which there are found ſome antique remains and inſcriptions.

BEISTEN, a town of Pruſſia, in the province of Natangen, 26 miles ſouth of Konigſberg.

BEIT Abufarra, a town of Arabia, 24 miles N.N.E. of Wadeij.

Beit *el Adham*, a town of Arabia, 24 miles S.W. of Sanaa.

Beit *Elam*, a town of Syria, ſouth of Antakia. N. lat. 36° 5′. E. long. 36° 32′.

Beit *el Fakih*, a city of Arabia, in the country of Yemen, ſituated on a plain, which though far from being naturally fertile, is induſtriouſly cultivated. The houſes, many of which are of ſtone, are ſeparated from one another; and the city has a citadel, which is thought of the utmoſt importance in a country where armies are deſtitute of artillery. The town is much moleſted by a ſpecies of ants, called by the Arabs, "Ard." Beit el Fakih is not very ancient: though it has exiſted for ſome centuries. It owes its origin to a ſaint, called "Achmed iba Muſa" from whom it has derived its name; Beit el Fakih denoting the "houſe or dwelling of the ſage." Near the city is ſhewn the tomb of the ſaint, upon a ſandy hill, where a fine moſque has been erected, and where ſeveral devout perſons have built cottages round the tomb. When the harbour of Ghalefka was choaked up, the inhabitants of that city, for the convenience of trade, removed their effects to the vicinity of this tomb, and ſettled about it. When it became a conſiderable city, the lord of the territory erected a citadel for its defence, in the place where water had been found. This city is very favourably ſituated for trade; being only half a day's journey from the hills in which coffee grows, and but a few days' journey from the harbours of Loheia, Hodeida, and Mocha, from which this commodity is exported. This trade brings hither merchants from Egypt, Syria, Barbary, Perſia, Habbeſch, India, and often from Europe. Beit el Fakih is the reſidence of a Dola, whoſe juriſdiction extends over a large diſtrict. Niebuhr mentions a ſingular inſtance, which occurred at this place, and which ſtrikingly indicates the coolneſs of temper and firmneſs of mind, that diſtinguiſh the Arab character. The ſouthern end of a houſe caught fire; and as the wind blew ſtrong from the ſouth, a great part of the city was ſoon burnt down. The inhabitants, however, retained their uſual tranquillity. No cries nor complaints were heard in the ſtreets; and when the people were addreſſed with expreſſions of condolence, upon their misfortune, they calmly replied, "It is the will of God." N. lat. 14° 31′. E. long. 43° 12′. Niebuhr's Trav. vol. i. p. 311.

Beit *el Kadi*, a town of Arabia, in the country of Yemen, 34 miles north of Chamir.

Beit *el Naum*, a town of Arabia, in Yemen, 24 miles ſouth-eaſt of Sanaa.

Beit *Ebn Safan*, a town of Arabia in Yemen, 28 miles S.S.E. of Saade.

Beit *Ebn Meri*, a town of Arabia, in Yemen, 38 miles N. of Chamir.

Beit *Ebn Nafr*, a town of Arabia, in Yemen, 34 miles N. of Chamir.

Beit *Rodsje*, a town of Arabia, in Yemen, 24 miles S.E. of Sanaa.

Beit *Il Toba*, a town of Arabia, in Yemen, 28 miles S. of Saade.

Beit *Ebn Shemſhar*, a town of Arabia, in Yemen, 28 miles E. of Abu-Ariſch.

Beit *El Weil*, a town of Arabia, in Yemen, 3 miles N. of Denn.

BEITH, a town of Scotland, in the diſtrict of Cunningham, and county of Ayr. It is ſeated on a ſmall eminence, and the ſtreets pretty regularly laid out. A linen manufactory

factory gives employment to many of its inhabitants, and others are occupied in making ſilk-gauſe and cotton. Some conſiderable manufacturers reſide in the town, and though it is ſaid to have conſiſted of only a few inhabitants at the commencement of the laſt century, yet the population now amounts to about 1800. The pariſh, extending about five miles in length, by four in breadth, conſiſts principally of arable land; but ſome farms, with others at Dunlop, are appropriated to the dairy ſyſtem, and have long been famous for a particular cheeſe called the *Dunlop cheeſe*. Within the boundary of the pariſh is a ſmall loch, containing abundance of fiſh, and near it is plenty of peat moſs. Coal is found in many places; freeſtone is abundant, and the limeſtone quarries are almoſt inexhauſtible. In the latter ſubſtance are frequently found various petrifactions of ſhells, and other marine exuvia; alſo many other ſiliceous petrifactions of woods, moſſes, &c. The population of the pariſh and town in 1792, was 2872. Sinclair's Statiſtical Account of Scotland.

BEITHAR, Ben, in *Biography*, a learned Arabian botaniſt, called *Aſchad*, the botaniſt, from his ſkill in the ſcience of plants, was born in Spain; and after viſiting Africa, travelled into the Levant, Aſia, and even as far as the Indies to improve his knowledge. After his return, he was patroniſed by Saladin at Cairo, and died in 1248. He wrote "A General Hiſtory of Simples, or of Plants, arranged in alphabetical order;" in which he gives the Greek, Arabic, and vernacular names, with the deſcriptions of each, and particularly, in a more detailed manner, thoſe not deſcribed by Dioſcorides and Pliny. Beithar's work is extant in the Pariſian, Eſcurial, and other libraries. Herbelot. Pulteney's Hiſt. and Biog. Sketches, &c. vol. i. p. 19.

BEITSTADT, in *Geography*, a lake in the northern part of Norway.

BEIUCO, in *Botany*. See Hippocratea.

BEJWARA, called alſo *Hoſhearpour*, in *Geography*, a town of Hindoſtan, in the country of Lahore, about 3 journies or 36 coſſes from Sirhind, 16 coſſes N.E. of Jallindhar, and about 25 geographical miles north of Rahoon, and about 30 ſuch miles from Hurepour.

BEIZA, or Beziath, a Hebrew word, ſignifying an egg, in Jewiſh *Antiquity*, a certain meaſure in uſe among the Jews; they ſay that the beiza contains the ſixth part of a log.

The beiza is alſo a ſort of gold coin common among the Perſians; it weighs forty drachmas, and from this word, not from the city of Byzantium, the bezant was formed. A bezant is worth two dinars, and every dinar twenty or five and twenty drachmas.

BEK, David, in *Biography*. See Beck.

BEKAA, in *Geography*, a valley of Syria, anciently called Cœle-Syria, or the hollow Syria, ſeparates the chain of mountains denominated by the ancients Anti-Libanus, from the Libanus of the Druzes and Maronites, and by being the depoſitory of the water of the mountains that encloſe it, is rendered one of the moſt fertile diſtricts of all Syria; but the heat of the ſun, the rays of which are concentrated by the mountains, is in ſummer not inferior to that of Egypt. The air, however, which is perpetually refreſhed by the north wind and by the agitation of the waters, is not unhealthy. Before the earthquake of 1759, this whole country was covered with villages and plantations of the Motoualis; but the deſtruction occaſioned by this terrible calamity, and the ſubſequent wars with the Turks, have occaſioned a general deſolation. In this vale is ſituated the famous Balbec.

BEKAVA, or Bekawa, a ſmall town of Poland, in the palatinate of Lublin.

BEKES, a town of Upper Hungary, on the river Koros, which gives name to the Gepenſchaft.

BEKI, Beg, or Beye, a river of Hungary, which runs into the Temes, near Temeſwar.

BEKIA, Becouya, or Boquio, a ſmall Britiſh iſland of the Weſt Indies, about 12 leagues in compaſs, and containing 3,700 acres, being the leaſt of the Grenadilles, called by the French, "Little Martinico;" 35 miles N. E. of Grenada, and 65 leagues from Barbadoes. It has a ſafe harbour, called "Admiralty-bay," but no freſh water; and is principally viſited by the inhabitants of Grenada and St. Vincent's for the purpoſe of catching turtle. The ſoil produces wild cotton, and plenty of water-melons. This iſland is dependent on the government of St. Vincent.

BEKIER, a name given by mariners to Aboukir, which ſee.

BEKING, a town of France, in the department of the Moſelle, and chief place of a canton, in the diſtrict of Sar-Louis, on the Sarre, 5 miles N.N.W. of Sar-Louis.

BEKKER, or Becker, Balthasar, in *Biography*, a famous Dutch divine of the 17th century, was born in 1634, at Warthuiſen, a village in the province of Groningen, and purſued his ſtudies firſt in the univerſity of Groningen, and afterwards at Franeker, where he became rector of the Latin ſchool. In 1665, he took his degree of doctor of divinity at Franeker, and in the following year he was choſen one of the miniſters of that city. In 1670, he publiſhed a catechiſm, intended for perſons of mature age, in which he maintained ſome opinions concerning the right of Chriſtian congregations to chuſe their own miniſters, and concerning the antiquity and uſefulneſs of biſhops, archbiſhops, &c. and in which he introduced ſome ſuggeſtions that implied his doubt of the eternity of hell torments, as inconſiſtent with the divine goodneſs, which gave offence to ſeveral divines, and which incurred a proſecution before the eccleſiaſtical aſſemblies. This catechiſm, however, was approved and commended by ſeveral learned profeſſors; and it appears that the author had not, at the time of its publication, adopted thoſe ſentiments which involved him in future difficulties. In 1679, he was elected miniſter at Amſterdam; and in 1683, he publiſhed his "Inquiry concerning Comets," in which he concurred with Mr. Bayle in maintaining that they are not preſages of any evil. By this work, as well as his "Expoſition upon Daniel," he gained great reputation; but having attached himſelf from an early period of his life to the Carteſian philoſophy, he adopted Deſcartes's definition of ſpirit, and he was hence led to deny all thoſe operations of the devil and other infernal agents upon mankind, which are related in the ſcriptures. His argument, as it is briefly ſtated by Dr. Maclaine, the tranſlator of Moſheim's hiſtory, is as follows: "The eſſence of mind is thought, and the eſſence of matter is extenſion. Now, ſince there is no ſort of conformity or connexion between a thought and extenſion, mind cannot act upon matter, unleſs theſe two ſubſtances be united as ſoul and body are in man; and therefore no ſeparate ſpirits, either good or evil, can act upon mankind. Such acting is *miraculous*; and miracles can be performed by God alone. It follows of conſequence, that the ſcripture accounts of the actions and operations of good and evil ſpirits muſt be underſtood in an allegorical ſenſe." To this argument it is replied, that by proving too much, it proves nothing at all: for if the want of a connexion or conformity between thought and extenſion renders mind incapable of acting upon matter, it is hard to ſee how their union ſhould remove this incapacity, ſince the want of conformity and connexion remains notwithſtanding this union. Beſides, according to this reaſoning, the ſupreme being cannot act upon material beings: and it is in vain that Bekker maintains the affirmative by having recourſe to a miracle;

for.

for this would imply, that the whole courſe of nature was a ſeries of miracles, or in other words, that there are no miracles at all. The author ſuggeſted doubts concerning the agency of the devil in ſeveral of his ſermons; and he alleged, that ſeveral were aſcribed to the devil, in which this evil ſpirit had no concern. He was at length, viz. in 1691, perſuaded to publiſh his ſyſtem at large, in an elaborate work, entitled, "The World Bewitched." This work is divided into four books. The firſt contains an account of the opinions of the ancient and modern heathens concerning gods and demons, or ſpirits. In the ſecond book the author examines all the paſſages of the Holy Scripture, which mention either angels or the devil, and endeavours to make them agree with his opinion, that the devil has not the leaſt power in this world, and to ſhew that thoſe paſſages, which aſcribe ſeveral actions to good as well as bad ſpirits, or angels, muſt be explained in an allegorical manner. Accordingly, he denies that our firſt parents were tempted by the devil; alleging that this temptation is aſcribed to the devil, only becauſe it does not agree with the goodneſs of God, though Moſes does not mention the devil, and that the puniſhment mentioned by Moſes doth not ſuit the devil, but only the ſerpent. He alſo urges ſeveral objections againſt the literal ſenſe of our Saviour's temptation; and he maintains that thoſe poſſeſſed with evil ſpirits, which our Lord caſt out, were merely ſick or lunatic perſons whom he cured, and in whoſe ſickneſs the devil had no concern. (See DEMONIAC.) Bekker's work, though his ſyſtem was not new, occaſioned great commotion not only in all the United Provinces, but in various parts of Germany. The author, perſiſting in his opinions, was publicly depoſed from his paſtoral charge in 1692; but the magiſtrates of Amſterdam continued his ſalary till his death, which happened in 1698. Bekker not only retained his opinions after his depoſition, but ſtrenuouſly defended them againſt a multitude of adverſaries as long as he lived. He was a man of a warm imagination, of an active mind, and of a firm reſolute temper. His character was irreproachable; and he avowed to the laſt his full conviction of the truth of the Chriſtian religion. In his defences he exhibited a moderation which he did not experience from his antagoniſts. A ſatirical medal was ſtruck at his depoſition, which exhibited the devil, in the habit of a miniſter, riding upon an aſs, and holding a banner in his hand, as a token of the victory which he had gained in the ſynods. His opinions found ſeveral advocates; and he became the head of a ſect which was called after his name. Gen. Dict. Moſheim's Eccl. Hiſt. vol. 5. p. 632.

BEKKERANISM, or BEKKERIANISM, in *Eccleſiaſtical Hiſtory*, the ſyſtem or ſentiments of Balth. Bekker, who denied that ſpirits can act or operate on bodies. See the preceding article.

BEL, MATTHIAS, in *Biography*, a learned hiſtorian of Hungary, was born at Orſowa, in 1684; and after ſtudying divinity at the univerſity of Halle, he became firſt, viz. in 1708, rector of the evangelical ſchool at Neuſohl, and in 1714, rector of the ſchool at Preſburg. In 1719, he was choſen preacher by the German evangelical congregation in that city, and died ſenior miniſter in 1749. His two moſt valuable works are his "Apparatus ad hiſtoriam Hungariæ," and his "Notitia Hungariæ Novæ." The latter work was held in ſuch high eſtimation, that it procured for him from the emperor Charles VI. the appointment of imperial hiſtoriographer, and the honour of being admitted into the royal academy of ſciences at Berlin, and alſo into that of Peterſburgh. Pope Clement XII. alſo teſtified his approbation of it by conferring on the author his portrait and eight gold medals. The emperor, upon receiving the ſecond volume of the work, raiſed him to the rank of nobility, but this circumſtance Bel ſtudiouſly concealed. Among his other works are "Prodromus Hungariæ antiquæ et novæ." Norib. 1723, fol.; "Notitia Hungariæ novæ hiſtorio-geographica," Viennæ, 1735-1742, 4 vols. fol.; "Apparatus ad Hiſtoriam Hungariæ, ſive Collectio Miſcella Monumentorum, &c. dec. 1 & 2," Poſon. 1735-46, fol. He alſo tranſlated into the Bohemian language the Bible, and ſome other books.

BEL, CHARLES ANDREW, ſon of the former, was born at Preſburg in 1717, and ſtudied at Jena and Altdorf. In 1741, he became extraordinary profeſſor of philoſophy at Leipſic; and in 1756, he was appointed public profeſſor of poetry, and librarian to the univerſity, with the rank of counſellor of ſtate. He died ſuddenly in 1782. Among his writings are "De vera origine et epocha Hunnorum, Ararum, Hungarorum, in Pannonia," Lipſ. 1757, 4to. After the death of Menek, he was employed as editor of the Acta Eruditorum, and of the Leipſic literary gazette, which he conducted from the year 1754 to 1781.

BEL, JOHN-JAMES, was born at Bourdeaux, in 1693, and having purſued his ſtudies with great aſſiduity in the college of the fathers of the oratory, and made diſtinguiſhed acquirements in belles lettres, and alſo in metaphyſics and morals; he was admitted counſellor of parliament in 1720. After ſeveral viſits to Paris, he finally ſettled at Bourdeaux; and in 1737, he was choſen director of the academy: but the exceſs of his application to a variety of ſcientific and literary purſuits haſtened his death in 1738. To the academy of Bourdeaux he left the houſe in which it holds its ſittings, and his valuable library. Beſides ſeveral profeſſional works, M. Bel publiſhed "An Apology for Mr. Houdart de la Motte," 1724, 8vo. which is an ironical criticiſm on the works of that author, and particularly his tragedies; "An Examination of the tragedy of Romulus, by la Motte;" "A Diſſertation on the Abbé Dubos's opinion concerning the preference to be given to the perceptions of taſte above reaſoning, in judging of works of genius;" "Letters containing Obſervations on Voltaire's tragedy of Mariamne;" all which are inſerted, together with ſome other papers of M. Bel, in "Memoirs of Literature and Hiſtory," collected by father des Moletz of the oratory. He was alſo the author of the "Neological Dictionary," augmented by the abbé des Fontaines, and intended to expoſe the new words and affected phraſeology of ſeveral modern writers. Nouv. Dict. Hiſtor.

BEL, in *Botany*, the name of a plant, and alſo of its fruit, called by ſome the cucumis capparis, or caper-cucumber. Avicenna has given the moſt copious account of this plant, which is imperfectly deſcribed by others; and he ſays, that the fruit, which reſembled a caper, was uſed in medicine, and reſembled ginger in the fiery heat of its taſte.

BEL, *St.* in *Geography*, a town of France, in the department of the Rhone and Loire, on the Brevenn; 3½ leagues weſt of Lyons.

BEL, in *Mythology*. See BELUS.

BEL *and the* DRAGON, *Hiſtory of*, in *Biblical Hiſtory*, an apocryphal part of the book of Daniel, which, although it was annexed to this book, and formed the 14th and laſt chapter of it, was uniformly rejected by the Jews, and made no part of their canon of ſcripture. It occurs neither in the Hebrew or Chaldee text, nor in the Greek verſion of the Septuagint, but was taken out of the Greek verſion of Theodotion. Africanus, Euſebius, and Apollinarius, have rejected the narration, not only as uncanonical, but alſo as fabulous; and Jerom alſo concurs in their opinion. Origen maintains the truth of the hiſtory contained in the 13th (ſee SUSANNA), and 14th chapters, againſt Africanus, but does not aſſert it to be canonical. This hiſtory is alſo cited, as part

of the prophecy of Daniel, by Irenæus, Clement Alex., Tertullian, Origen, Cyprian, Didymus, Hilary, Baſil, Gregory Nazianzen, Ambroſe, and Auguſtin. Sulpitius Severus, and the author of the Synopſis of St. Athanaſius, alſo mention theſe hiſtories as part of the ſacred text; and Ruffinus upbraids Jerom for having cut off from Daniel the ſong of the three children, the hiſtory of Suſanna, and that of Bel and the Dragon. Againſt the truth of this latter hiſtory, allowing it to be apocryphal, it has been alleged, that the ancient title of the LXX. attributed it to Habakkuk, and that Daniel mentioned in this hiſtory was a prieſt; and that therefore he muſt have been another Daniel to whom this hiſtory belongs. To this argument it has been replied, that the character of prieſt is not given to Daniel in the verſion of Theodotion, and that the verſion attributed falſely to the LXX. is not exact. Againſt the hiſtory of the Dragon it has been urged that Habakkuk, who lived in the time of Manaſſes, was dead when it is ſuppoſed that he wrote theſe things, and was caught up by the ſpirit to carry proviſion to the prophet Daniel. To this objection it is anſwered, that there were two Habakkuks; one, who was the prophet in the time of Manaſſes, and of the tribe of Simeon; and another, mentioned in this paſſage of Daniel, of the tribe of Levi. Againſt this hiſtory it has alſo been objected, that it relates the confinement of Daniel in the lion's den to have laſted ſix days, whereas in chap. vi. v. 22 it is ſaid, that he had been confined only one night. The advocates of the hiſtory reply, that he was twice caſt into the lion's den; under Darius, becauſe he prayed to God againſt the king's commandment; and under Cyrus, on account of the dragon. Dupin's Canon. b. i. c. 3. § 21. See Apocrypha, and Daniel.

BELA, in *Geography*, a pretty large town of Upper Hungary, ſeated in a delightful plain, not far from the river Popper, but much reduced by frequent fires.

Bela, or Beyla, a town of Africa, in the kingdom of Sennaar, near the river Rhad, or Rahad, between Dender and Teawa, in the route from Sennaar to Gondar.

Bela-Benya, i.e. "the white mine," *Dilln*, formerly *Fejor-Benya*, a mean town of Lower Hungary, in the Schemnitz diſtrict, and gepanſchaft of Hont, whoſe mines being exhauſted, the inhabitants applied themſelves to tillage.

BELABRE, a town of France, in the department of the Indre, and chief place of a canton, in the diſtrict of Le Blanc en Berry, 2 leagues ſouth-eaſt of Le Blanc, and 8½ ſouth-weſt of Chateauroux. N. lat. 46° 33'. E. long. 1° 3'.

BELALCAçAN, a town of Spain, in the province of Andaluſia, on the frontiers of Eſtremadura, 9 leagues from Cordova.

BELAN. See Below.

BELANCE Island, in *Geography*, one of the ſmall iſlets or rocks which lie between the iſland of Uſhant and St. Matthew's point, at the entrance into the Breſt harbour.

BELASAMA, formed from *bel-if-ama*, the mouth of a river, in *Ancient Geography*, the name given by Ptolemy to the bay near Liverpool, at the mouth of the river Merſey.

BELASI, in *Geography*, a town of Germany in the Tyroleſe, 8 miles weſt of Bolzano.

BELATUCADRUS, or Belatucardus, the name of an ancient Britiſh idol, recorded in ſeveral old inſcriptions, and ſuppoſed by Selden (de Diis Syris) and Voſſius (de Orig. & Prog. Idol. l. 2. c. 17.) to be the ſame with Belenus, which ſee. Biſhop Lyttelton and profeſſor Ward ſuppoſed him to have been a local deity (ſee Archæologia, vol. i. p. 308.) with a ſpecial reference to Apollo, who was worſhipped, as they obſerve, by the Druids. Mr. Pegge, (Id. vol. iii. art. 14.) contends, that it is highly abſurd to look out for any other deity in Belatucardus, but the god Mars. This ingenious antiquary acknowledges, that he was a local deity, peculiar in this iſland to the Brigantes, but at the ſame time aſſerts, that he was equivalent to Mars, and that he was inveſted with the ſame powers as that god, and that he had not the leaſt concern with Apollo, or any relation to him. The opinion of Mr. Pegge is approved and confirmed by Mr. Gough. (Id. vol. x.) We may add, that it is rendered unqueſtionable by the inſcription recorded by Muratori (Inſcript. Theſ. 43. 1.) which is as follows: "Deo Marti, Belatucadro."

BELAY, on board of *Ship*, ſignifies the ſame as faſten. Thus they ſay, belay the ſheet or tack, that is, faſten it to the kevel, by winding it ſeveral times round a laſt, &c.

BELAYE, in *Geography*, a town of France, in the department of the Lot, and chief place of a canton, in the diſtrict of Lauzerte, one league ſouth-eaſt of Puy l'Eveque.

BELAYING-Cleats, in *Naval Language*, are pieces of wood, which have two arms, or horns, and are nailed through the middle to the maſts, or elſewhere, for the purpoſe of belaying ropes to them.

Belaying-Pins, are turned wooden pins, with a ſhoulder near the middle; the ſmall end is driven through the rough tree rails, or racks of thin plank made on purpoſe. Their uſe is for belaying ropes to them. Iron belaying pins are round, taper from the middle to each end, and are driven in the rails, or racks, to belay the ropes to, by taking ſeveral croſs turns about them.

BELBA, in *Geography*, a town of Egypt, on the coaſt of the Mediterranean, 19 miles eaſt of Tineh.

BELBEIS, a town of Egypt, about 35 miles north-eaſt of Cairo, and 45 north-weſt of Suez. N. lat. 30° 22'. E. long. 31° 55'.

BELBEK, a river of the Crimea, which falls into the Euxine.

BELBINA, in *Ancient Geography*, an iſland of Greece, in the Saronic gulf, near the promontory of Sanium, and oppoſite to the Scyllæan promontory; mentioned by Pliny, Strabo, &c.—Alſo, a town of the Peloponneſus, in Laconia, near which was a temple of Minerva.

BELBO, in *Geography*, a river of Italy, which riſes about 2 miles eaſt of Ceva, and runs into the Tanaro, ſix miles S.W. of Alexandria.

BELBUCH, a town of Germany, in the circle of Upper Saxony, in Pomerania, one mile N.E. of New Treptow.

Belbuch, and *Zeomebuch*, in *Mythology*, were regarded among the Vandals as the good and evil genii. The former nified the white god, and the latter the black god. They were objects of divine honours.

BELCA, in *Ancient Geography*, a place of ancient Gaul, between Brivodbrum and Genabum, where was an amphitheatre.

BELCAIRE, in *Geography*, a town of France, in the department of the Aude, and chief place of a canton, in the diſtrict of Quillan, 3½ leagues S. W. of Quillan.

BELCANIA, a town of Aſia, placed by Ptolemy in the greater Armenia.

BELCASTRO, a ſmall epiſcopal city of Naples, in the province of Calabria Ultra; 10 miles N. E. of St. Severina.

BELCHER, a townſhip of America, in the county of Hampſhire, and ſtate of Maſſachuſetts, containing 1485 inhabitants, who ſubſiſt chiefly by farming.

BELCHERS, a cluſter of iſlands in Hudſon's bay. N. lat. 56° 10'. W. long. 80° 33'.

BELCHIER, John, in *Biography*, a ſurgeon of eminence in London, was born at Kingſton on the Thames in 1706.

1706. After receiving a claſſical education at Eton, he became pupil to Mr. Cheſelden, by whom he was much eſteemed. In 1736, he was elected ſurgeon to Guy's hoſpital, and ſoon after fellow of the Royal Society. The following year, he ſent to the ſociety the caſe of a woman who died of a dropſy of the ovarium, attended with ſome remarkable circumſtances, and ſoon after, an account of the caſe of a man whoſe arm had been torn off at the ſhoulder, by one of the ropes of a mill. The circumſtance moſt deſerving attention in this caſe was, that only a ſmall quantity of blood was loſt by the accident, which Belchier very properly attributed to the great diſtenſion the arteries had ſuſtained before the limb was ſeparated from the body. The man recovered. His next, and laſt communication to the ſociety, was the reſult of a ſeries of experiments and obſervations on the effect produced on animals, by mixing madder with their food. After continuing this diet for a few days, on killing the animals the bones were found to be tinged with the madder, but on ſuffering ſome of them, that had been ſo fed, to live a few days longer, the colour induced by the madder became dilute and pale, and at length totally diſappeared; a proof, it was obſerved, that the bones are well ſupplied with abſorbents, as well as with blood veſſels. See Philoſophical Tranſactions, Nos. 423, 442, and 449. Belchier died in 1785, in the 80th year of his age, having for ſeveral years previouſly retired from buſineſs, and was buried in the chapel of Guy's hoſpital, to which he had been a zealous friend and patron. Gen. Biog. Dict.

BELCHING. See Ructation.

BELCHITE, in *Geography*, a ſmall town of Spain, in the country of Arragon, ſeated in a fruitful ſoil, on the river Almonazir; 8 leagues ſouth from Saragoſſa. N. lat. 41° 19′. W. long. 0° 30′.

BELCIANA, in *Ancient Geography*, a town of Aſia, in Aſſyria. Ptolemy.

BELDEK, in *Geography*, a town of Hungary, 15 miles ſouth of Zatmor.

BELDIRAN, a town of Aſiatic Turkey, in the province of Caramania, 28 miles ſouth of Cogni.

BELEBEV, or Belebeief, a town of Ruſſia, in the government of Ufa, on the rivulet falling into the Diema, 60 miles ſouth-weſt of Ufa. N. lat. 54°. E. long. 54° 14′. This is alſo the name of one of the nine diſtricts, comprehended by the province of Ufa.

BELEKIS, a town of Sclavonia, 10 miles north-weſt of Belgrade.

BELEM, a town of Portugal, in the province of Eſtremadura, or in the vicinity of Liſbon, on the north ſide of the Tagus, in which are a conſiderable monaſtery and a royal palace. In its magnificent church, which ſuddenly ſunk in 1756, many kings and princes of the blood have been interred. Below Belem is a ſquare tower called "Torre de Belem," fortified with cannon, which no veſſel muſt paſs till it has been viſited. Near this tower, which is near a league weſt from the city of Liſbon, in N. lat. 38° 40′. W. long. 9° 40′. are ſeveral batteries, and a ſmall irregular fort, commonly called San Giaõ, built on a rocky point, and covering the entrance of the harbour, and oppoſite to it is another tower called "torre velha," or old tower, ſtrengthened by a few cannon and ſoldiers.

Belem, a town of North America, in the country of New Navarre, 180 miles north-weſt of Cinaloa.

Belem, Bellem, or Belm, a town and diſtrict of Germany, in the circle of Weſtphalia, biſhopric of Oſnabruck, and prefecturate of Iburg; 3 miles eaſt of Oſnabruck.

Belem, or Para, a ſea-port town of South America, in the country of Brazil, ſeated at the north head of the river Guama, which falls into the river of the Amazons. See Para.

Belem *Cape*, a high ſteep point, on the coaſt of Gallicia, in Spain, about N.N.E. from cape Finiſterre, between which is the projecting point of cape de Toriane, bearing ſouth-weſt four leagues from Belem. The principal rock of this rugged point, appearing like a black tower, is called the Monk, or Munich.

BELEMNITA, in *Natural Hiſtory*, a ſpecies of Nautilus, in the *teſtacea* order of *vermes*, with an uniform, ſmooth, conic, and acute ſhell, frequent among the foſſils of Europe. See the next article.

BELEMNITE, or Thunderstone, *Pfeilſtein*, *Donnerſtein*, Germ. *Belemnite*, *Pierre de foudre*, *Dactyle*, Fr. *Belemnita*, *Lapis Lyncurius*, *Idæus Dactylus*, *Lapis Ceraunius*, Lat.

The belemnite is a foſſil, which has obtained its name from the Greek Βελος, an arrow, on account of its reſemblance to an arrow-head. Its lengthened conical or ſpindle ſhaped figure ſuggeſted a likeneſs to the finger, hence the name dactylus. The ignorant ſuperſtition of ſome of the ancients attributed the origin of this ſubſtance to the congealed urine of the Lynx, on account of its ſtrong ſmell when pounded or ſcraped; by others it was ſuppoſed to be one of the materials of the thunderbolt, and it has derived names from both theſe circumſtances.

The form of the belemnite is generally intermediate between a long cylinder and a very acute-angled cone; the apex is a plain rounded point; the baſe is ſomewhat concave: at a diſtance between the baſe and apex, varying in length from one-third to one-ſixth of the whole, the diameter of this foſſil begins to increaſe towards the baſe in a conſiderably greater ratio than it did from the apex: the moſt correct idea, therefore, of its figure, will be formed by imagining a truncated cone terminated by another much longer and more acute-angled, rounded off at the extremity inſtead of coming to a ſharp point. It is by no means common, however, to find belemnites thus perfect, being for the moſt part broken off at one extremity, and not unfrequently at both. Conſiderable variations are obſerved in the form of this foſſil: it is ſometimes expanded and ſomewhat flattened at the extremity, or is nearly cylindrical, or enlarged and rounded off at the apex, ſo as to reſemble a club. In the flattened varieties a longitudinal furrow on each ſide is occaſionally obſerved. The colour of the belemnite is generally browniſh yellow, with a tranſparency reſembling alabaſter. It uſually conſiſts of calcareous ſpar, mingled however with animal matter; for when expoſed to a red heat it gives out an odour like burnt horn: ſometimes it occurs converted into flint, at other times is found filled with pyrites, or even, according to Volkmann, (Sileſia Subterran. § 155.) with galena.

If a longitudinal ſection is made of a perfect belemnite, it will appear to be compoſed, like a cow's horn, of a number of elongated conical lamellæ inſerted one into the other, covering a core or alveolus, alſo of a conical ſhape, but extending never more than a third of the length from the baſe towards the apex. A croſs fracture of this foſſil beyond the alveolus exhibits a number of rays converging from the circumference towards the centre, and as many concentric circles as there are conical lamellæ.

The alveolus of the belemnite is a conical body, divided tranſverſely into cells by bony parietes reſembling watch glaſſes; the centre of each of which, according to Platt, Roſinus, Sage, &c. is perforated to receive a tube or ſiphunculus, which paſſes from the apex to the baſe of the alveolus, and thus communicates with all the cells, in the ſame manner as is obſervable in the nautilus, the ammonite, and orthoceratite:

tite: it is remarkable, however, that Deluc (Journal de Phyſiq. vol. lii. p. 360.) altogether denies the exiſtence of this perforation. Every paries in the alveolus ſerves as the baſe of a conoidal lamina; the number of theſe laſt, therefore, is equal to that of the cells of the alveolus.

It often happens that the alveolus of the belemnite is found detached from the other part of the foſſil, and in this ſtate it has been conſidered as a peculiar ſpecies of orthoceratite; while the conoidal caſe, deprived of this characteriſtic part, has been ſuppoſed to be a mere ſtalactite, or a petrified tooth of the grampus, or a ſpine of a ſpecies of echinus, or even of vegetable origin.

M. Deluc, denying the perforation of the alveolus, conſiders the belemnite as a bone belonging to an unknown animal analogous to the ſepia, or cuttle-fiſh, apparently, however, without much reaſon.

The belemnite has never been met with but in a foſſil ſtate; it occurs not unfrequently in marble, limeſtone, and chalk ſtrata, together with other marine remains; and detached fragments are often found in the gravel beds that cover or adjoin theſe ſtrata.

The fineſt Engliſh ſpecimens have been procured from the chalk pits of Oxfordſhire; the quarries of Meudon near Paris contain many perfect and beautiful varieties; but the largeſt ſpecies come from the Margraviate of Anſpach in Pruſſia. Philoſ. Tranſ. for 1764. Journ. de Phyſique, vols. li. lii. liii. Schröter's Lithologiſches real und Verballenikon, &c. vol. i.

BELENUS, or Belinus, in *Mythology*, a name which the Gauls gave to the ſun, which they alſo called *Mithra*; and as ſome ſuppoſe the ſame with the *Baal* of Scripture, and the *Belus* of the Aſſyrians.

Belenus, latinized by the Roman authors, according to Toland, (ubi infra) from "Beal" or "Bealan", was underſtood by the Gauls and their colonies to denote the ſun; and according to J. Capitolinus (Maximin. c. 22), and Herodian (l. 8. c. 3), he was the ſame deity with the Apollo of the Greeks and Romans. He was actually denominated Apollo in the inſcriptions found at Aquileia, where he was honoured with a peculiar worſhip, under the figure of a young man without beard, with rays about his head, and an open wide mouth for uttering oracles. Tertullian (Apolog. c. 23), informs us, that Belenus was the idol-deity of the Norici, and among the Illyrians, Vopiſcus ſays (Aurelian apud init.) his forms and ornaments were the ſame with thoſe of the Mithra of the Orientals. The ſun, indeed, ſeems to have been the moſt ancient and univerſal object of idolatrous worſhip; inſomuch that perhaps there never was any nation of idolaters which did not pay ſome kind of homage to this glorious luminary. Accordingly, he was worſhipped by the Gauls and ancient Britons with great devotion under the various appellations of Bel, Belinus, Apollo, Grannius, &c. names which in their language were expreſſive of the nature and properties of that viſible fountain of light and heat. To this illuſtrious worſhip, thoſe famous circles of ſtones, called cairns, or carns, of which there are not a few ſtill remaining, ſeem to have been chiefly dedicated; where the Druids kept the ſacred fire, the ſymbol of this divinity, and from whence, as they were ſeated on eminences, they had a full view of the heavenly bodies. The firſt day of May was, in the Druidical rites of worſhip, a great annual feſtival in honour of Belenus, or the ſun. On this day prodigious fires were kindled in all their ſacred places, and on the tops of all their cairns, and many ſacrifices were offered to that glorious luminary, which now began to ſhine upon them with great warmth and luſtre. Of this feſtival there are ſtill ſome veſtiges remaining, both in Ireland and in the highlands of Scotland, where the firſt of May, is called "Beltein," i. e. the fire of Bel or Belinus. Two ſuch fires, ſays Toland, were kindled near one another on May-eve in every village of the nation, as well throughout Gaul, as in Britain, Ireland, and the adjoining leſſer iſlands, between which fires the men and beaſts to be ſacrificed were to paſs; from whence came the proverb "between Bel's two fires," meaning a perſon in a great ſtrait, not knowing how to extricate himſelf. One of the fires was on the cairn; the other on the ground. On the eve of the firſt day of November there were alſo ſuch fires kindled, accompanied with ſacrifices and faſting. All the people of the country on this eve extinguiſhed their own fires entirely; and every maſter of a family was religiouſly obliged to take a portion of the conſecrated fire home, and to kindle the fire anew in his houſe, which for the enſuing year was to be proſperous. The Celtic nations alſo kindled other fires on Midſummer eve, which are ſtill continued, ſays Toland, by the Roman catholics of Ireland, making them in all their grounds, and carrying flaming brands about their corn-fields. This is done likewiſe in France, and in ſome of the Scottiſh iſles. Theſe Midſummer fires and ſacrifices were intended for obtaining a bleſſing on the fruits of the earth, now ready for gathering; as thoſe of the firſt of May, that they might proſperouſly grow; and thoſe of the laſt of October were a thankſgiving for finiſhing their harveſt. But in all of them regard was had to the ſeveral degrees of increaſe and decreaſe in the heat of the ſun. Toland's Hiſt. Druids in his Works, vol. i. p. 69, &c. Henry's Hiſt. vol. i. p. 156, &c.

BELERIUM, (Diod. Sic. l. v. c. 22,) or Bolerium, (Ptolem. l. ii. c. 3,) called alſo by Ptolemy "Antiveſtæum" in *Ancient Geography*, is the promontory formed by the moſt weſtern point of Britain, now known by the name of "Land's End."

BELESTA, or Belestat, in *Geography*, a town of France, in the department of the Aude, and chief place of a canton, in the diſtrict of Quillan, 10 miles weſt of Quillan.

BELETTE, in *Zoology*, a name under which Buffon deſcribes the common weaſel, *muſtella æſtiva* of Gmelin.

BELEZ, in *Geography*, a town of South America, in Terra Firma, and province of New Grenada.—Alſo, a river of Spain, which runs into the Mediterranean, between Barcelona and Tarragona.

BELFAST, a conſiderable town of Ireland, in the county of Antrim, and province of Ulſter, ſituate at the mouth of the river Lagan, which ſeparates it from the county of Down. The town, except a ſmall portion of it, is not elevated more than ſix feet above high water mark at ſpring tides. Belfaſt lough, or the bay of Carrickfergus, into which the Lagan flows, is a ſpacious æſtuary, a great part of which is left dry every tide, which is the caſe likewiſe with Strangford lough, another great æſtuary, the neareſt extremity of which is diſtant about 8 miles S. E. Between Belfaſt and Lough Neagh, which is about 12 miles weſt of it, there is a chain of mountains, the higheſt of which, called Devis, is about 1580 feet high. The roots of theſe mountains extend to the neighbourhood of the town. Mr. Arthur Young found them to conſiſt of very good loam to their ſummits, and complains of their being neglected. As tillage, however, is improving in that neighbourhood, it may be ſuppoſed that there is no longer cauſe for ſuch complaint. There was formerly a caſtle at Belfaſt, which ſeems to have been a poſt of importance, as it was twice taken and deſtroyed by the earl of Kildare, lord deputy, in 1503 and 1512. After the complete reduction of Ireland at the beginning of the 17th century, Belfaſt became the property of Sir Arthur Chicheſter, afterwards

lord deputy, and baron of Belfaſt, who exerted himſelf in the ſettlement of Ulſter. Through his influence it was made a borough, and ſent two members to the Iriſh parliament; and an Engliſh gentleman, who travelled through part of Ireland in 1635, and whoſe manuſcript journal is in the poſſeſſion of general Vallancey, mentions that lord Chicheſter had a ſtately palace at Belfaſt, which was the glory and beauty of the town, and which was his chief reſidence. Through the influence of this nobleman, the cuſtom-houſe was removed from Carrickfergus to Belfaſt by the earl of Strafford in 1638, for which a compenſation of 2000l. was paid to the corporation of Carrickfergus. In 1648, Belfaſt was taken poſſeſſion of by colonel (afterwards the celebrated general) Monk, for the parliament of England. So late as 1726, when Boate's Natural Hiſtory of Ireland was re-publiſhed by Dr. Molyneux, it was a ſmall place of little conſequence. But ſituated in the centre of a populous and induſtrious country, it has ſince become one of the moſt intereſting objects in Ireland to the political economiſt. The town is well-built, moſtly of brick, and the ſtreets are broad and ſtraight. The bridge over the Lagan is 2560 feet long, with 21 arches; it was built about the time of the revolution, at the joint expence of the counties of Antrim and Down, and coſt 12,000l. Eighteen of the arches are in the former, and three in the latter county. With regard to ſize it is the fifth, and with reſpect to commerce, is generally reckoned the third town in Ireland, being next to Dublin and Cork. Veſſels of 200 tons half loaded uſed to come to the quay, there being about ten feet water at ſpring tides; but now the water at the quays is from nine to thirteen feet deep according to the time of the moon, having been deepened by the exertions of the ballaſt corporation. Veſſels which cannot come to the quays lie two miles and a half below the town, where there is very good anchorage. The Weſt India trade was conſiderable before the late war, and has revived ſince the reſtoration of peace. The trade in pork and butter has increaſed very much of late years; and alſo the American trade. The export of linen both to England and America is very conſiderable. In 1775, the groſs cuſtom, according to Mr. Young, amounted only to 64,800l. including the exciſe upon tobacco and foreign ſpirits. In 1797, it amounted to 87,016l. 6s. 2d. In the following year it decreaſed on account of the diſturbed ſtate of the country, but it has ſince gradually riſen; and in the year ending 5th April 1802, amounted to 246,89cl. 9s. 4½d. The exciſe of Belfaſt in 1796, was only 9097l. 13s. 2½d. but previous to the ſtoppage of the diſtilleries it had riſen to 22,165l. 3s. 6d. excluſive of Carrickfergus and Templepatrick, which walks are included in the ſame diſtrict. The duty on licences in 1801, amounted to 4309l. Though the increaſe, as in other places, muſt be partly attributed to the increaſe of duties, yet the extenſion of trade muſt alſo have been conſiderable. The population of Belfaſt was taken at different periods by a gentleman who filled the office of high conſtable; but not officially. In 1782, the number of inhabitants appeared to be 13,105, and in 1791, 18320, excluſive of 1,208 in Ballymacarret, the ſuburbs on the Down ſide of the river Lagan. There were, in 1791, 695 looms, of which 522 were employed in the cotton manufacture, 129 in that of cambrick and linen, 28 of ſailcloth, and 16 of ſtockings. There are alſo manufactories of glaſs, ſugar, and earthen ware. The public buildings are not many; the linen-hall is large and commodious, and there is a good aſſembly-room over the Exchange. There is a barrack which contains about 800 men. The church is a handſome ſtructure, but is too ſmall for the pariſh. Other places of worſhip are, four Preſbyterian meeting-houſes, one Seceding, and one Methodiſt meeting-houſe, and one Roman Catholic chapel. The charitable inſtitutions are, a poor-houſe and infirmary, which maintains and clothes 300 of various ages, and is conducted on the ſame plan as the Dublin houſe of induſtry; a fever-hoſpital, a diſpenſary, a lying-in hoſpital, a charity-ſchool for boarding girls, a day-ſchool for boys and girls, a Sunday-ſchool, and a ſchool of induſtry for the blind; none of them very extenſive, but ſufficiently ſo for ſuch an induſtrious country. It is probable that the Hamburgh plan, deſcribed by Mr. Voght, from which ſuch unſpeakable benefit has been derived, would ſucceed better in Belfaſt than in any other town of Ireland, and from the public ſpirit and active diſpoſition of the inhabitants, it would, without doubt, be well attended to. In ſuch a town as Belfaſt, many commercial inſtitutions might be expected; and we accordingly find a chamber of commerce, a ballaſt office corporation, two inſurance offices, &c. There are alſo a library ſociety, under the title of the *Belfaſt Society for Promoting Knowledge:* and a literary ſociety, lately eſtabliſhed on a plan ſimilar to that of other ſocieties for philoſophical and literary purpoſes. An academy for the education of the higher claſs in this town, was founded by the inhabitants in 1786, and has been hitherto under the care of a preſbyterian miniſter, but the advantages of it are not confined to any ſect. Belfaſt is ſituated 80 miles north of Dublin, and ſends one member to the imperial legiſlature. W. long. 5° 49′. N. lat. 54° 43′. Variation W. Auguſt 8th, 1789, 11ʰ 15′ P. M. 26° 20′ Arthur Young's Tour. Dr. Beaufort's Memoir, &c. &c.

BELFAST, a townſhip and bay of America, in Hancock county, and diſtrict of Maine, both ſituate in the Waldo Patent, at the mouth of Penobſcot river, and on its weſtern ſide, 38 miles N. E. by E. from Hallowell, and 246 N. E. from Boſton. The town contains 245 inhabitants. The bay, on the north-weſtern part of which the town ſtands, runs up into the land by three ſhort arms. In the middle of it lies Iſleborough iſland, which forms two channels leading to the mouth of Penobſcot river.

BELFORD, a market town of Northumberland, England, is ſeated on the great poſt road from London to Edinburgh, at the diſtance of 322 miles from the former. This town, though ſmall, is particularly neat, and its houſes are ranged on the ridge of a hill, which commands a view of the north ſea. The church was built in 1700; near it are the ruins of an old chapel, and at a ſhort diſtance are the foſs and vallum of an ancient encampment. Here are a weekly market on Tueſdays, and two annual fairs. The number of houſes in the townſhip is 161, and of inhabitants 902.

About four miles eaſt from Belford, is Bamborough caſtle, the origin of which is attributed to king Ida, who began his reign about the year 559. The preſent remains are conſiderable, and appear to be wholly the relics of Norman architecture, though our hiſtorians are decidedly of opinion that they occupy the ſite of a Saxon fortreſs or palace. This was beſieged in the year 642, by Penda, the Pagan king of the Mercians, but without ſucceſs. In the year 710, king Ofred, on the death of Alfred his father, ſought refuge here, with Brithric, his tutor or guardian, and after a gallant defence, repulſed Edulph and his partizans. In the reign of Egbert, this caſtle was made the priſon of Kenulph, biſhop of Lindisfarm, who was confined here from 750 to 780. In many ſubſequent periods, it was the ſcene of repeated ſieges, and ſuffered ſucceſſively by the Danes, by the Normans, and by the Yorkiſts.

BELFORTE, a town of Italy, in the duchy of Parma, 19 miles S.S.W. of Parma.

BELFRY, Belfredus, is uſed by military writers of

the middle age for a fort of tower, erected by beſiegers to overlook and command the place beſieged.

They were all called *berfredi*, *berefredi*, *verfredi*, and *belfragia*. Their ſtructure and uſe are deſcribed in verſe by a poet of thoſe days.

Belfry originally denoted a high tower, whereon centinels were placed to watch the avenues of a place, and prevent ſurprize from parties of the enemies, or to give notice of fires by ringing a bell. Du-Cange.

In the cities of Flanders, where there is no belfry on purpoſe, the tower of the chief church ſerves the ſame end. The word belfry is compounded of the Teutonic "bell" and "freid," *peace*, becauſe the bells were hung for preſerving the peace.

Belfry, is alſo uſed for that part of a ſteeple wherein the bells were hung. This is ſometimes called by middle-aged writers *campanile*, *clocaria*, and *triſtegum*. Du-Cange. This is ſometimes uſed in *Heraldry* as a creſt.

Belfry, is more particularly uſed for the timber-work, which ſuſtains the bells in a ſteeple; or that wooden ſtructure, to which the bells in church-ſteeples are faſtened.

Belfry, *Great*, in *Ornithology*, the alarum thruſh of Latham, and turdus tinniens of Gmelin, le grand befroi of Buffon, is ſo called by this latter naturaliſt, from the ſingular ſound which it makes in the evenings and mornings, and which reſembles the din of an alarum bell. The ſucceſſion of ſounds is as rapid as the quick ſtrokes of a bell, and continues about an hour. See Turdus Tinniens. The "ſmall belfry," is the ſpeckled thruſh of Latham, and Turdus Lineatus of Gmelin, which ſee.

BELGÆ, in *Ancient Geography*, were Scythians or Goths, who, advancing from Aſia, drove the Cimbri or northern Celts before them; and at a long period preceding the Chriſtian æra ſeized on the north-weſt part of Gaul, where they acquired the provincial denomination of Belgæ; and from them the country which they inhabited obtained the name of Belgic Gaul. Writers are not agreed as to the etymology of this appellation. As they were a fierce, contentious, and warlike people, and diſpoſed to domineer over all their neighbours, according to the character which Cæſar (Comment. l. ii. c. 4,) has given of them, ſome have ſuppoſed that they were called "Belgæ" on that account; the word "Belga" in the old Teutonic ſignifying "fierce" and "quarrelſome." Others have ſuggeſted, that the term "Belgæ" is ſynonymous with the Celtic "Beligheis," and that it ſignifies perſons who inhabited the *high* or *northern* part. Others again have derived Belgæ from "Belgen" or "Velgen," ſignifying ſtranger. Some time after their ſettlement in Gaul, but at an unknown period, they penetrated into Britain; and accordingly when Cæſar firſt explored this iſland, he informs us (l. v. c. 10.) that the primitive inhabitants were driven into the interior parts, while the regions on the ſouth-eaſt were peopled by Belgic colonies. The Belgæ may, therefore, be juſtly regarded as the chief anceſtors of the Engliſh nation. On the continent, the Belgæ having taken poſſeſſion of part of Gaul, and being naturally a ferocious people, waged frequent wars with the Germans; ſo that theſe two nations continued in a ſtate of hoſtility and friendſhip, ſometimes invading each other's territories, and at other times aſſiſting each other againſt the Romans. In the time of Cæſar, the Belgæ, alarmed at the ſucceſs of the Romans in their expeditions againſt the Germans, formed a grand alliance with the Celtes, Germans, and Gauls, in order to drive them farther from their neighbourhood. Cæſar, according to his uſual manner, found means to ſow ſuch diſſenſions among them, that many of theſe allies ſubmitted to him; however, the Nervii, Attrebates, and Veromandui, ſtood firm, and though at length defeated, it was one of the deareſt victories which Cæſar had ever obtained; and, in conſequence of this defeat, the whole Belgic nation was compelled to ſubmit to the Roman yoke. The Belgæ of Britain were ſeated to the eaſt of the Durotriges, on the ſame coaſt, and inhabited the counties now called Hampſhire, Wiltſhire, and Somerſetſhire. When Cæſar invaded Britain, ſome part of this country was poſſeſſed by the Segontiaci, whoſe chief town was Wincheſter, called by the Britons "Caer-ſeguent," from the name of theſe, its ancient inhabitants. But theſe people ſeem to have been ſoon after ſubdued by and incorporated with the Belgæ, as they are never afterwards mentioned. As to the firſt introduction of the Belgæ into Britain, hiſtory is ſilent; but with reſpect to ſome few of the lateſt colonies who ſettled here not very long before the Roman invaſion, and who inhabited the ſouth parts of Britain, Cæſar informs us, (l. v. c. 10.) "that the ſea-coaſt of Britain is peopled with Belgians, drawn thither by the love of war and plunder." "Theſe laſt (he ſays) paſſing over from different parts, and ſettling in the country, ſtill retain the names of the ſeveral ſtates from whence they were deſcended." The lateſt of theſe Belgic colonies came into Britain only a few years before Cæſar's invaſion. This colony was conducted by Divitiacus, king of the Sueſſiones, one of the moſt powerful of the Belgic nations in Gaul; and having obtained a footing on the Britiſh coaſt, he continued to reign over the Belgæ in this iſland, as well as over his ancient ſubjects on the continent. In his continental territories, he was ſucceeded by Galba, and in his Britiſh dominions by another of his ſons, perhaps Segonax, who attempted to deſtroy Cæſar's fleet. Although the Segontiaci ſubmitted to Cæſar, we have no account of the ſubmiſſion of the Belgæ to that conqueror. The honour of ſubduing that Britiſh nation was reſerved to Veſpaſian, who, landing an army in theſe parts, A. D. 49, fought 32 battles, took more than 20 towns, ſubdued two very powerful nations, one of which was the Belgæ, and the iſle of Wight. After this time, the country of the Belgæ was much frequented by the Romans, who made in it many excellent military ways, and built ſeveral beautiful towns, which are mentioned by both Ptolemy and Antoninus. The moſt remarkable of theſe towns were Venta Belgarum, Wincheſter, famous for the imperial weavery which was there eſtabliſhed, and Aquæ Solis, Bath, even then renowned for its warm and ſalutary ſprings. The country of the Belgæ was included in the Roman province, called Flavia Cæſarienſis, and governed by the preſident of that province, and his inferior officers. Henry's Hiſt. vol. i. p. 246, &c.

BELGARD, or Belgrad, in *Geography*, a town of Germany, in the circle of Upper Saxony, and chief place of a circle to which it gives name, in the duchy of Pomerania, ſeated on the Perſante, and noted for its market for horſes. It was a place of ſome diſtinction as early as the 11th century, for its ſtrength and for the number and valour of its inhabitants; but it has ſuffered much by fire and by war; particularly by the 30 years' war. By the treaty of Weſtphalia, it devolved to the houſe of Brandenburgh. It has a caſtle and a provoſtſhip, and is the ſeat of a royal bailliage. N. lat. 54° 10'. E. long. 16° 51'.

BELGERN, a town of Germany, in the circle of Upper Saxony, and margraviate of Meiſſen, ſeated on the river Elbe, 36 miles N. W. of Dreſden, and 24 N. W. of Meiſſen.

BELGERS, a town of Aſiatic Turkey, in the province of Caramania, 78 miles weſt of Cogni.

BELGEVAN, a town of Aſia, in Tartary, in the kingdom of Bucharia, and province of Catland.

BELGICA, in *Conchology*, a ſpecies of Sabella, very briefly deſcribed by Gmelin, as having a conic ſhell "teſta conica,"

conica;" and is ſaid to be found on the ſhores of Holland.—Obſ. This is ſuppoſed by ſome to be the ſabella granulata of Linnæus, and tubiformis of Pennant; but it is by no means certain that even the two laſt are of the ſame ſpecies: we think they are not; and it may admit of equal doubt whether either of them be the ſpecies Gmelin deſcribes as belgica. The laſt mentioned author ſeems to be under no ſmall difficulty in this reſpect himſelf, for he entirely omits taking the ſlighteſt notice of either as ſpecies, or even amongſt his ſynonyms. Sabella tubiformis of Pennant is undoubtedly different from ſabella belgica of Gmelin, according to Klein and Martini, to which he refers. Vide Donov. Brit. Shells, pl. 133.

Belgica, in *Ornithology*, a ſpecies of Scolopax, with a very ſtraight bill, black at the tip: head, neck, and breaſt ferruginous: abdomen white; back, wings, tail, and legs black. Nozem. nederl Vogel. t. 27. A native of Holland, and feeds on worms, &c.

Belgica Gallia, in *Ancient Geography*, one of Cæſar's three diviſions of Gaul, or Gallia, the other two being Aquitania, and Celtica, or Gallia propria. Gallia Belgica was bounded by the ocean to the north, by the Sequani (Seine) and Matrona (Marne) to the weſt, by the Rhine to the eaſt, and to the ſouth by various limits, at different times. Cæſar appropriated the Sequani and the Helvetii to that part of Gallia Celtica which was afterwards called "Lugdunenſis." But Auguſtus, when he made a new partition of the provinces, transferred the Sequani and Helvetii to Gallia Belgica. According to the diſtribution of Ptolemy, Gallia comprehended four parts, viz. Aquitania, Lugdunenſis, Belgica, and Narbonnenſis. See Gallia. Mentelle, in the Encyclopedie Methodique, divides Gallia Belgica into Belgica prima, comprehending the Treviri, Mediomatrici, Verdunenſes, and Leuci; and Belgica ſecunda, including the Nervii, Morini, Ambiani, Bellovaci, Silvanectes, Vadicaſſes, Sueſſiones, Veromandui, Attrebates, Remi, and Catalauni. The capital of the Treveri, viz. Auguſta or Treveri, was the metropolis of Belgica prima. Belgica ſecunda contained a great number of cities, and comprehended Lorraine and Champagne; whilſt Belgica prima contained a portion of the iſle of France, Picardy, and Artois. Belgic Gaul comprehended thoſe provinces of the Netherlands now called the Belgic provinces, which were formerly ſubject to the houſe of Auſtria, but which have been recently annexed to the French dominions. See Netherlands.

Belgica, *Balchuyſen*, a village of Gallia Belgica, in the country of the Ubii, between the rivers Rhone and Roer, 8 miles from Marcomagum, according to the itinerary of Antonin, in Germania ſecunda, or Inferior, ſouth-weſt of Colonia Agrippina.

BELGINUM, Bingen, or Baldenau, a place of Germania prima, or Superior, a province of Gaul, at ſome diſtance to the eaſt of Auguſta Trevirorum.

BELGIUM, a canton of Gallia Belgica, from which it is diſtinguiſhed by Cæſar (l. v. c. 24,) as a part from the whole; to this canton he aſſigns the Bellovaci, to whom Hirtius (l. viii. c. 46 and 47,) adds the Attrebates. And as the Ambiani were ſeated between the Bellovaci, and Attrebates, theſe alſo muſt be included in Belgium, which muſt have extended to the ſea. Theſe three people, ſays Cellarius, were the proper and genuine Belgæ, all the reſt being adventitious, or foreigners. See Ambiani, Atrebatii, and Bellovaci.

BELGIUS, a river of Africa in Libya. Heſychius.

BELGNÆA, a town of Arabia Deſerta. Ptolemy.

BELGOROD, in *Geography*. See Bielgorod, and Akerman.

BELGRADE, Alba Græcorum, a town of European Turkey, the capital of Servia, ſeated on the ſide of a hill, at the conflux of the Save and the Danube. It was formerly a very ſtrong place, but is now deſtitute of fortifications, and it was accounted the barrier and key of Hungary, to which it was firſt annexed by the emperor Sigiſmund.

The number of inhabitants is now ſuppoſed to amount to about 25,000. The ſuburbs are extenſive, and it has a great reſort of Turkiſh, Jewiſh, Greek, Hungarian, Armenian, Auſtrian, and Sclavonian merchants. The ſtreets, in which the chief trade is carried on, are covered with wood, as a ſhelter from the ſun and rain; the ſhops are ſmall, and the commodities that are ſold are conveyed out of a window, as the buyers never enter them; the richeſt merchandize is expoſed to ſale in two bazars that croſs each other; and there are two exchanges conſtructed with ſtone, and ſupported by pillars. There are likewiſe at Belgrade a caravanſera, or public inn, and a college for young ſtudents. Its ſituation near the rivers renders it convenient for commerce; and as the Danube falls into the Black ſea, and affords a paſſage to Vienna, trade is eaſily extended to diſtant countries, ſo that Belgrade is a ſtaple town in theſe parts. The Armenians and Jews are employed as factors; the former have a church, and the latter a ſynagogue in this place. In the environs of Belgrade are ſeveral ſmall villages near one another, and almoſt all of them inhabited by Greeks. The fields preſent ſome degree of culture; and the whole adjacent country affords fine cluſter or ſtalk-fruited oaks (quercus racemoſa, Lamarck) whoſe wood is very hard and very fit for ſhip-building. Some few vineyards and gardens are to be ſeen in the vicinity of Belgrade. The aqueducts, conſtructed by the emperors of the eaſt for conveying water to Conſtantinople, attract admiration. See Aquæduct. N. lat. 45° 10'. E. long. 21° 12'.

The poſſeſſion of Belgrade has been repeatedly diſputed between the Auſtrians and Turks. In 1521, it was taken by the Turks, after having been attacked in vain by Amurath II. in the preceding century, but recovered by the Imperial army in 1688. In 1690, it fell again under the Turkiſh yoke, from which the Auſtrians unſucceſsfully attempted to regain it in 1693. By the treaty of Carlowitz in 1699, the Turks remained in poſſeſſion of it; but in 1716, it was beſieged by prince Eugene, and after a ſevere conteſt it was compelled to ſurrender to the Imperial arms.

Belgrade is chiefly famous in the hiſtory of military operations on account of the battle fought in its vicinity in the year 1717, the reſult of which was the laſt great victory obtained under the auſpices of the celebrated prince Eugene, and which decided the event of the war then depending between the German and Ottoman empires.

The Turks, notwithſtanding the loſſes they had ſuſtained during the campaign of 1716, determined to make the moſt vigorous efforts for the preſervation of their Hungarian acquiſitions. The Imperialiſts were equally deſirous of terminating the war by ſome important action. Prince Eugene, having concentrated the Auſtrian forces in the bannat, on the 15th of June effected the paſſage of the Danube in boats with 30,000 of his troops without the loſs of a man, in preſence of ſome Turkiſh corps ſtationed on the ſouthern bank, who, without attempting an oppoſition, threw themſelves into Belgrade. A bridge of boats was immediately conſtructed for the paſſage of the reſt of the army, the horſe, and artillery, and by the 19th of the ſame month, Belgrade was completely inveſted.

The firſt care of prince Eugene, who foreſaw that the Turks would venture a battle to relieve the place, was to fortify his camp in ſuch a manner as might enable him to cope

cope with an army much ſuperior in number to his own. He accordingly began to caſt up lines of circumvallation and contravallation, ſtrengthening them with entrenchments, redoubts, and other field works of the neceſſary deſcription. Within theſe lines the army encamped to the ſouth of Belgrade; its front towards the open country, its left reſting upon the Danube; its right extending towards the Save. A bridge of boats was thrown acroſs the latter river, and, as well as that already conſtructed on the Danube, ſecured by ſtrong *têtes de pont*. The line of contravallation, looking towards Semedria, conſiſted of a ditch, ſixteen feet wide, of proportionable depth, and defended by a ſtrong parapet. The proper openings were left for the troops to iſſue and form in order of battle without confuſion, covered in front by ravelins and redans; and upon the right, a large *fleche*, or redoubt, was erected for the purpoſe of commanding a hollow ground, which the Turks might otherwiſe have found ſerviceable in their approaches. The field pieces of all the different battalions, planted at regular diſtances along the front of the contravallation, ſecured it from any ſudden inſult. As, however, the army was not ſufficiently numerous to occupy the whole extent of ground between the two rivers, croſs entrenchments were formed, connecting the principal lines on the right and left, and ſtill preſerving a communication with the different bridges.

As the Turkiſh garriſon conſiſted of between twenty and thirty thouſand regular troops, and had alſo a ſtrong flotilla on the Danube, prince Eugene found it abſolutely neceſſary to maintain two flying camps: one of ſeveral thouſand men at Semlin, to keep up a communication with Peterwaradin, from whence the Imperialiſts derived their ſupplies of proviſions, under Count de Hauben; and another of five battalions and ſome cavalry to cover the head of the bridge over the Danube. Four ſhips of war protected the navigation of that river, and watched the motions of the Turkiſh flotilla. But a violent ſtorm which happened on the 13th of July, had nearly rendered abortive the projects of the beſiegers. The bridges of the Danube and Save were broken by the force of the tempeſt. Several veſſels, detached from the reſt, were carried floating at random down the ſtream, and the Turks took advantage of this accident to make a ſally acroſs the Save, and attack the redoubt which covered the head of the bridge. The gallant defence of a captain and 64 men, who alone garriſoned the poſt, preſerved it, together with that part of the bridge which remained on the north ſide of the river, from falling into the hands of the enemy. To prevent ſuch ſorties in future, the camp of Semlin was ſtrongly reinforced, and the command entruſted to count Martigny. More ſerious operations commenced; and during the night of the 18th, trenches were opened againſt Belgrade to the north of the Save by 1,200 pioneers, covered by a large detachment under general Marſigli. The Turks, however, the following morning, opened a dreadful fire upon them from all the batteries of the place, the flotilla on the Danube, and the iſlands in that river, and making a ſortie with 4000 men in boats, aſſaulted ſo furiouſly the guard of the trenches, that if prince Eugene had not animated the troops by his perſonal preſence and bravery, in repulſing the attack, a total defeat muſt have enſued. As it was, general Marſigli, with twenty other officers of note, and 400 ſoldiers, periſhed in this affair. It became neceſſary to augment the guard of the trenches to nine battalions, and conſtruct new lines. In ſix days a complete chain of works was eſtabliſhed from the bridge along the Save to its influx with the Danube, and from thence aſcending the courſe of the latter river to the camp of Semlin, defended with redoubts, and well provided with artillery: inſomuch, that from the moment of their completion, the garriſon attempted no farther ſallies.

On the 23d of July, the cannonade and bombardment commenced from all the Auſtrian batteries, with dreadful effect, and by the 30th, Belgrade reſembled, towards the water, a heap of ruins. But the excellent ſtate of their fortifications on the ſide of the beſieging camp, and expectations of approaching ſuccours, animated the garriſon to maintain a moſt vigorous reſiſtance. Their expectations were not deluſive. The grand vizier, having drained the Turkiſh provinces of ſoldiers to complete his army, had already began his march, and on the 28th his advanced parties appeared in ſight, and began to ſkirmiſh with the Auſtrian out-poſts. The number of theſe marauders daily increaſed, and on the laſt of July, the vizir with his whole army arrived in preſence of the Imperialiſts. But inſtead of attacking prince Eugene as the latter expected, he encamped upon the heights above the Auſtrian camp with all his forces, ſupporting his right flank by the Danube, and ſtretching his left towards the Save. The following days were ſpent in preparing batteries, throwing up entrenchments, and making approaches againſt the works of the Imperialiſts, as if they had literally been a town beſieged. Eugene found himſelf compelled, by this mode of attack, to adopt new diſpoſitions. He inſtituted additional artillery on his own lines, defended all the avenues with chevaux de frize, mined the ground before the *fleche* already mentioned, and called in part of his troops from the oppoſite bank of the Save. Nevertheleſs, the Turks, purſuing their projected plan of operations, puſhed their approaches in ſpite of the dreadful havock which the Auſtrian bombs and grenades inceſſantly made among them to within muſket ſhot of the contravallation. Their army amounted to upwards of 200,000 men. Their works were mounted with 140 pieces of cannon and mortars. The garriſon, who now ſuſtained ſome reſpite from the fire of the Auſtrian batteries, directed their own upon the tents of the beſiegers, and thus ſituated, between two hoſtile armies, who from their ſituation commanded more or leſs every part of his poſition, Eugene found himſelf enfiladed by the fire of upwards of 250 pieces of artillery. His ſituation became every day more precarious. The dyſentery, which for the laſt month had done great miſchief in his camp, now raged to ſuch a degree that hundreds were buried in a day. A mortality prevailed among the horſes, in conſequence of which half of the cavalry were diſmounted; and an army which, at the opening of the campaign, amounted to above 80,000 men, could not now muſter 60,000 effective. Though no immediate ſcarcity of proviſions or ammunition was experienced, yet the diſappointment of the expectations prince Eugene had conceived, that the Turks would be obliged to retire for want of proviſions, obliged him to determine without delay on ſome deciſive meaſure; eſpecially as the vizier had occupied an eminence adjoining the Save, with a conſiderable body of troops, and might, by ſending 20 or 30,000 men acroſs the river, have rendered a retreat, in caſe of defeat, impracticable to the Auſtrians. Under theſe circumſtances, it was reſolved, in a general council of war held on the 15th of Auguſt, to be beforehand with the enemy, by making a deciſive attack on their camp. The detachments beyond the Save were immediately called in, except about 1,400 foot, and 300 horſe. Seven regiments of cavalry and ten battalions, with all the diſmounted horſe and dragoons, were left in the lines to obſerve the garriſon. Eleven regiments of cavalry, commanded by field marſhal count Palfi, and general count Merci, compoſed two lines on the right, and marched out before midnight. The left wing, conſiſting of 12 regiments

ments, marched out at the ſame time, commanded by general Montecuculi and Martigny. The infantry, under prince Alexander of Wirtemberg, in chief, was drawn up in the centre; the firſt line of 22 battalions, conducted by count Maximilian of Staremberg, and count Harrach; the ſecond, of 18 battalions, by the prince of Bevern. The corps de reſerve, with which marſhal Seckendorf remained in the lines, ready to act as occaſion ſhould require, was compoſed of nine battalions. The effective force of the two lines, on whom the ſucceſs of the day in a great meaſure depended, did not amount to more than 40,000 men; yet, notwithſtanding this immenſe inferiority, the confidence of the ſoldiers in their commander was ſuch, that they received the orders to prepare for action with the greateſt chearfulneſs, and marched out, as if inſpired with a certainty of victory.

At one in the morning the Imperialiſts, favoured by a thick fog, quitted their trenches: the right advancing towards the *fleche*, which was aſſigned as its point of formation, and the left over the open ground adjoining the Danube. Two hours were ſpent in making the neceſſary preparatory movements; but the fog, which had hitherto favoured the Imperialiſts, increaſed to ſuch a degree as to become productive of ſerious inconvenience. The right wing, miſſing its way, ſtumbled, inſtead of the *fleche*, upon one of the Turkiſh advanced works. The ſurpriſe was equal on both ſides; but a diſcharge which immediately opened upon the Auſtrian cavalry from the guard of the trenches, ſpread the alarm throughout the whole of the grand vizier's army. His troops haſtily ruſhed from every part of the camp towards the ſcene of action, and in a few minutes count Palfi became hotly engaged. The Auſtrians, formed in a hurry, and their battalions, through fear of loſing the ſupport of the cavalry, inclining ſucceſſively to the right flank, a wide vacancy was left in the centre, and afforded the Turks an advantage of which they did not fail to profit. Meantime, the combat, once engaged on the right, quickly commenced on the oppoſite flank. Prince Eugene had intended to begin the attack with both wings at the ſame time; but convinced by the heavy firing he heard towards the Save, that Palfi had already began the battle, he was himſelf obliged to come to blows, before the battalions of his left wing were completely formed. It was now between four and five o'clock in the morning. The fog continued ſo thick as to prevent the combatants from diſcerning each other till they arrived almoſt cloſe to the muzzles of their adverſaries pieces; and owing to this obſcurity ſeveral ſmall detachments of Auſtrians, whom a deſire to ſignalize themſelves carried unawares into the thickeſt of the enemy, were entirely cut off. The aſſailants nevertheleſs gained ground. As the darkneſs obliged them to march with their firelocks always preſented, the fire they poured in, the moment they perceived their enemies, was ſo cloſe, well directed, and did ſuch prodigious execution, that the Turkiſh battalions, as they advanced in ſucceſſion, were broken, diſmayed, and precipitated headlong into their trenches, where the bayonet and ſabre made dreadful havoc among them. The cavalry were not equally ſucceſsful; the broken nature of the ground obliged them to perform frequent evolutions in order to find ſome paſſages of eaſier acceſs, and the Turks, who lined the trenches, galled them with ſevere and inceſſant firings. The centre of the enemy's army too, finding nothing to oppoſe them, threw ſeveral battalions into the void ſpace between the flanks of the Imperialiſts, and completely intercepting all communication, opened a heavy fire to right and left upon the divided forces. The battle, under the preſent circumſtances, ſeemed irrecoverably loſt, but the fog, at this critical moment clearing up, diſcovered to prince Eugene the diſpoſition of both armies, and his own perilous ſituation. The advance of the ſecond line prevented his total defeat. The prince of Bevern, who commanded it, marched up to the Turks, whoſe ſucceſs had thrown them into diſorder, and charged with ſuch fury, that the infidels, unable to ſuſtain the ſhock, fled in diſorder, and were purſued up to their very trenches, leaving the ſpace where they had been defeated covered with their dead. This ſucceſs gave a new turn to affairs. No time was loſt in filling up the interval that had been ſo unwarily left, and in forming the two wings of the Imperialiſts for a new effort. The impatience of the ſoldiers to engage prognoſticated ſucceſs. The right began the attack; carried with irreſiſtible impetuoſity the batteries whoſe fire they had hitherto ſuſtained, and turned the cannon againſt the entrenchments which protected the Turkiſh camp. The left experienced more oppoſition. The enemy had their principal forces on that ſide, and theſe, reinforced by ſeveral corps whom the ſucceſs of count Palfi had driven from the right, conſtituted an immenſe ſuperiority. The janizaries defended themſelves with great bravery, and repulſed the Auſtrians in their firſt attack; but theſe rallying, returned to the charge, beat the Turks from their outermoſt entrenchment, and puſhing their advantage, advanced regularly up to the ſecond, without firing a muſket till they came within ten paces of the enemy. This work was carried in leſs time than the firſt: the Turkiſh entrenchments were forced one after another, as well as ſeveral *coupures* with which their camp was defended; and notwithſtanding reſiſtance was attempted at each of them, and the Auſtrians experienced every where a terrible fire, yet the courage and conduct of prince Eugene ſurmounted every obſtacle, and obliged victory, after a ſtruggle of ſix hours, to declare in his favour. The laſt ſerious ſtand made by the infidels, was at a grand battery mounted with 18 pieces of cannon, and defended by 20,000 janizaries, ſuſtained by 10,000 ſpahis, the braveſt troops in the Turkiſh army. It was neceſſary to halt and form the troops anew for this perilous attempt; but when the word to charge was given, they ruſhed forward with an impetus nothing was capable of reſiſting. The Imperial grenadiers, in defiance of the fire from the battery, bore down all oppoſition, mounted through the embraſures, and drove the Turks from their guns; while the reſt of the army made ſuch ſlaughter, that the bodies of the ſlain roſe in heaps round the redoubt. The routed forces, driven on all ſides from their entrenchments, retired into the plain, as if to form once more for the defence of their camp; but obſerving the Imperialiſts, after having gained the heights, advancing towards them in good order, they betook themſelves to flight in every direction, leaving their camp, baggage, and ammunition, at the mercy of the conquerors. The victory was complete by 9 o'clock in the morning. The plunder of the infidels' camp, which reſembled a large city, was given to the ſoldiers.

This battle, fought on the 16th of Auguſt 1717, coſt the Turks 10,000 of their beſt troops killed in the action, and 3,000 in the purſuit. About 5,000 were wounded, and nearly the ſame number made priſoners. In the Turkiſh camp and lines were found 131 pieces of braſs cannon, 30 mortars, and an immenſe quantity of powder, bullets, bombs, and grenadoes. There were alſo taken 52 colours, 9 horſetails, and other military trophies. The loſs on the German ſide, by reaſon of the fog, was not in proportion to the length of the fight. Their killed amounted to nearly 3,000 men, among whom were the generals count Hauben and Dalberg; and about 4,500 were wounded. Of the latter, however, only about 2,000 recovered. In conſequence of this great victory,

victory, Belgrade ſurrendered on the 19th; the garriſon ſtill conſiſting of more than 25,000 men, being allowed to march out with all their effects. Its fortifications towards the land were in a moſt excellent ſtate, and more than 400 pieces of cannon and mortars found on the works in the arſenals, and on board the flotilla on the Danube.

Belgrade, which the peace of Paſſarowitz left in poſſeſſion of the Auſtrians, was unſucceſsfully attacked by the Turks in 1739; but by the treaty concluded that year under the mediation of France, was reſtored to the Porte. Its fortifications were, however, previouſly demoliſhed. In 1789, it was beſieged (Sept. 12.) by an Auſtrian army under marſhal Laudohn, who in his approaches made uſe of the old lines of circumvallation conſtructed by prince Eugene, and which the Turks, from an unaccountable negligence, had neglected to fill up. The marſhal, aſſiſted by a numerous and well-ſerved train of artillery, proceeded with ſuch rapidity in his attacks, that after all the ſuburbs and outworks had been carried ſword in hand, the garriſon, apprehenſive of a ſtorm, ſurrendered (Oct. 8.) upon honourable terms. Immenſe ſtores, with about 300 pieces of artillery, were found in the place. Belgrade was, however, anew given up to the Turks in 1791, at the peace of Siſtova, ſince which time it has continued quietly in their poſſeſſion.

Belgrade, a townſhip of America, in the county of Lincoln and diſtrict of Maine, incorporated in 1796; formerly called Waſhington-plantation. It lies weſt of Sidney, and between Androſcoggin and Kennebeck rivers.

BELGRADO, a town of the Venetian ſtates of Italy, in Friuli, ſituate near the river Tagliamento. N. lat. 46°. E. long. 13° 51′.

BELHAVEN, the former name of Alexandria, in Fairfax county, Virginia. See Alexandria.

BELIA, in *Entomology*, a ſpecies of Papilio, with entire white wings; the lower ones yellow, and ſlightly faſciated with grey beneath. A native of Barbary. Fabricius.

Belia, in *Ancient Geography*, a town of Hiſpania Tarragonenſis, is the country of the Hedetani (Ptol.), eaſt of Bilbilis, and nearly ſouth-eaſt of Cæſar-Auguſta (D'Anville); now *Belchite*, which ſee.

BELIAL, formed of בלי, *non, nothing*, and יעל, denoting in Hiphil, to *profit*, q.d. unprofitable; in *Scripture Hiſtory*, ſignifies a wicked, worthleſs perſon, who is reſolved to endure no ſubjection. Thus the inhabitants of Gibeah, who abuſed the Levite's wife, are ſtigmatiſed by the name of Belial. (Judges, xix. 22.) Hophni and Phineas, Eli's ſons, are called ſons of Belial (1 Sam. ii. 12.) on account of the ſeveral crimes they had committed, and their indecorous behaviour in the temple of the Lord. Sometimes, ſays Calmet, the name Belial is uſed to denote the devil. To this purpoſe, he cites 2 Cor. vi. 15. where the apoſtle Paul ſays, "What concord hath Chriſt with Belial?" whence it appears, as he ſuppoſes, that in the apoſtle's time, the Jews, under the name of Belial, commonly underſtood the devil in the places where this term occurs in the Old Teſtament. Others are of opinion, that the heathen demons might be called "Belial," either becauſe they were of no uſe, or becauſe ſo much wickedneſs entered into the idea which the Pagans entertained of them. However, it has been ſuggeſted, that there may be no reference to the heathen gods at all, whether they were deified ghoſts or not; the word Belial being often applied to living men; and it being the general deſign of the apoſtle in this place to diſſuade Chriſtians from ſuffering themſelves to be drawn into any thing criminal by the heathens. Grot. in loc. Farmer's Demoniacs, p. 201.

The learned Bryant (Analyſis Anc. Mythol. vol. ii. p. 163.) conſiders Belial as the title of the chief Syrian god, called Bel and Baal, and rendered by the Greeks Βελιαρ, beliar. Hence, Clemens Alex. (l. v. p. 680.) inſtead of ſaying, what agreement can there be between Chriſt and Belial, ſays, Τις δε συμφωνησις χριστω προς βελιαρ. This Belial, or Beliar, was the ſame as Belorus and Oſiris, who were worſhipped under the ſymbol of a ſerpent. Hence Heſychius explains the term Beliar by a ſerpent.

BELIAS, in *Ancient Geography*, a river of Aſia, which ſprung in Davana, and diſcharged itſelf into the Euphrates. Ammian. Marcell.

BELICA, an epiſcopal town of the Gauls, in the fifth Lugdunenſis.

BELICENA, a town of Spain, in Grenada, 11 leagues from Grenada.

BELICI, a river of Sicily, which empties itſelf into the ſea near Bigini, in the Val de Mazara. It reſembles (ſays Swinburne, vol. iii. p. 374.) the Mole in Surry in ſize and colour; and winds very agreeably between high banks overgrown with elms, willows, and tamariſks. The vale on both ſides is wide and well laid out in corn-fields, and paſtures crowded with horſes and horned cattle.

BELIDA. See Bleeda.

BELIDES, in *Antiquity*. See Danaides.

BELIDOR, Bernard Forest de, in *Biography*, a French mathematician and engineer, was born in Catalonia, about the year 1698, and became profeſſor-royal at the artillery ſchool of la Fere, and provincial commiſſary of artillery. By various exploits, he firſt diſcovered that the proportion of gun-powder in the loading of cannon might be reduced to two-thirds of the quantity, without leſſening its effect; but as he communicated this economical idea to cardinal Fleury, without previouſly conſulting the grand-maſter of artillery, he loſt both his places. Upon this the prince of Conti took him to Italy, and by his patronage, Belidor was again brought into notice at court. Marſhal Belleiſle, the war-miniſter, appointed him inſpector of artillery, and allotted to him apartments at the arſenal of Paris, in which he died, Sept. 8, 1761. Belidor was choſen an aſſociate of the academy of ſciences in 1751; and was the author of ſeveral uſeful works on civil and military architecture, hydraulics, fortification, and engineering: viz. "Sommaire d'un cours d'Architecture Militaire, civile et hydraulique," 1720, 12mo.; "Nouveau cours de Mathematiques, &c." 1725, 4to.; "La Science des Ingenieurs," 1729, 4to.; "Le Bombardier Francois," 1734, 4to.; "Architecture Hydraulique," 1737—1761, 4 vols. 4to.; "Dictionnaire portatif de l'Ingenieur," 8vo.; and "Traité des Fortifications," 4 vols. 4to. Several of his pieces are alſo inſerted in the memoirs of the academy of ſciences for the years 1737, 1750, 1753, and 1756. Nouv. Dict. Hiſtor. Hutton's Math. Dict.

BELIEF, in its general and natural ſenſe, denotes a perſuaſion, or a ſtrong aſſent of the mind to the truth of any propoſition. In which ſenſe, belief has no relation to any particular kind of means or arguments, but may be produced by any means whatever.—Thus we are ſaid to believe our ſenſes, to believe our reaſon, to believe a witneſs, &c. And hence, in rhetoric, all ſorts of proofs, from whatever topics deduced, are called πιστεις, becauſe apt to produce belief, or perſuaſion touching the matter in hand.

Belief, in its more reſtrained and technical ſenſe, invented by the ſchoolmen, denotes that kind of aſſent which is grounded only on the authority or teſtimony of ſome perſon

ſon or perſons, aſſerting or atteſting the truth of any matter propoſed. In this ſenſe belief ſtands oppoſed to knowledge and ſcience. We do not ſay we believe that ſnow is white, or that the whole is equal to its parts; but we ſee and know them to be ſo: that the three angles of a triangle are equal to two right angles, or that all motion is naturally rectilinear, are not ſaid to be things credible, but ſcientifical; and the comprehenſion of ſuch truths is not belief, but ſcience. But when a thing propounded to us is neither apparent to our ſenſe, nor evident to our underſtanding; neither certainly to be collected from any clear and neceſſary connection with the cauſe from whence it proceeds, nor with the effects which it naturally produces; nor is taken up upon any real arguments, or relation thereof to other acknowledged truths: and yet, notwithſtanding, appears as true, not by a manifeſtation, but by an atteſtation of the truth, and moves us to aſſent, not of itſelf, but in virtue of a teſtimony given to it—this is ſaid to be properly credible: and an aſſent to this is the proper notion of belief or faith.

A judicious writer (Price's Review of the principal queſtions in Morals, p. 158) is of opinion, that all the general grounds of belief or aſſent, may be comprehended under the three following heads: viz. 1ſt. Immediate conſciouſneſs (which ſee), or feeling; whence we acquire the knowledge of our own exiſtence, and of the ſeveral operations, paſſions, and ſenſations of our own minds; and to this head may be referred the information we derive from our powers of recollection and memory; 2dly, Intuition (which ſee); and to this we owe our belief of all ſelf-evident truths, our ideas of the general, abſtract affections and relations of things, our moral ideas, and whatſoever elſe we diſcover, without making uſe of any proceſs of reaſoning; and 3dly, Argumentation or Induction. See theſe articles. See alſo Assent and Faith.

BELIENE, in *Geography*, a village of Egypt, depending on the grand ſcheik, and agreeably ſituated between two canals; 12 miles ſouth of Girgé.

BELIEVERS, in *Eccleſiaſtical Hiſtory*, an appellation given towards the cloſe of the firſt century to thoſe Chriſtians who had been admitted into the church by baptiſm, and inſtructed in all the myſteries of religion: they had alſo acceſs to all the parts of divine worſhip, and were authoriſed to vote in the eccleſiaſtical aſſemblies. They were thus called in contradiſtinction to the *catechumens*, who had not been baptized, and were debarred from theſe privileges.

BELILLA, in *Botany*. See Mussænda.

BELIM, in *Geography*. See Belem and Para.

BELINA, a town of European Turkey, in Boſnia, about midway between Banjaluka and Belgrade.

BELION, a name given to a river of Luſitania, called alſo Limias, Limæus, Lethe, and the river Oblivion, in *Ancient Geography*, was the boundary of the expedition of Deciſmus Brutus. His ſoldiers, when they arrived at this river, refuſed, from motives of ſuperſtition, to croſs it; upon which he ſnatched an enſign out of the hand of the bearer, and paſſed over, by which his army was encouraged to follow (Livy). He was the firſt Roman who ever proceeded ſo far, and ventured to croſs. The appellation, according to Strabo, took its riſe from a ſedition that occurred in a military expedition between the Celtici and Turduli after croſſing this river, in which the general was ſlain, ſo that they remained diſperſed there; and from this circumſtance it was called the river of Lethe, or Oblivion. (Cellarius.) It is now called "El Lima," and runs weſtward into the Atlantic, to the ſouth of the Minho.

BELISAME. See Belasama.

BELISAMA, or Belizana, in *Mythology*, a name given by the Gauls to their Minerva, or to the goddeſs who was the inventreſs of the arts. She was repreſented with a helmet adorned with a plume, clothed in a tunic, without ſleeves, and covered with a mantle called "peplum." Her attitude, with her head leaning on her right hand, was that of a perſon in a profound reverie. Human victims were ſacrificed on her altars.

BELISARIUS, in *Biography*, the *Africanus* of New Rome, was born, and probably educated, among the Thracian peaſants; and advanced from the humble ſtation of one of the private guards of Juſtinian, then general of the Roman forces, and afterwards emperor, in which he had ſerved with valour and reputation, to diſtinguiſhed military command. Under the new title of General of the Eaſt, he encountered the Perſian army near the fortreſs of Dara, on the confines of Perſia, with a much inferior force, both as to the number and quality of his troops, and obtained a deciſive victory. In the next campaign, A. D. 530, he haſtened from Dara to the relief of Syria, which was invaded by the Perſians; and though he was defeated in an engagement which the impatience of his troops had precipitated, he ſaved his army from the conſequences of their own raſhneſs, and the victory of the Perſian commander was ſo dearly purchaſed, that it was ſoon followed by peace. Beliſarius, on his return to Conſtantinople, rendered eſſential ſervice to the emperor Juſtinian, by quelling a dangerous ſedition. In 533, the ſupreme command of the fleet and army, deſtined for the African war, was delegated to Beliſarius, with an unlimited power of acting according to his own diſcretion, as if the emperor himſelf were preſent. After a voyage of three months, in which he had repeated opportunities of exerciſing his talents as a commander, he diſembarked his troops on the African coaſt. Immediately upon their landing an inſtance of pillage occurred, which gave him occaſion for inculcating the maxims of juſtice, moderation, and genuine policy. "When I firſt accepted the commiſſion of ſubduing Africa, I depended much leſs" ſaid the general, "on the numbers, or even the bravery of my troops, than upon the friendly diſpoſition of the natives, and their immortal hatred to the Vandals. You alone can deprive me of this hope: if you continue to extort by rapine, what might be purchaſed for a little money, ſuch acts of violence will reconcile theſe implacable enemies, and unite them in a juſt and holy league againſt the invaders of their country." His exhortations, accompanied by rigid diſcipline, produced the moſt ſalutary effect. The inhabitants, inſtead of deſerting their houſes, or hiding their corn, ſupplied the Romans with a fair and liberal market; the civil officers of the province continued to exerciſe their functions in the name of Juſtinian; and the clergy, from motives of conſcience and intereſt, aſſiduouſly laboured to promote the cauſe of a catholic emperor. In his progreſs towards Carthage, he defeated, with great ſlaughter, the formidable army collected by Gelimer, and entruſted to the conduct of his brother and nephew, and reduced the king himſelf to the neceſſity of ſeeking his ſafety by a precipitate flight.

Beliſarius, having taken poſſeſſion of the city, reſtored, with incredible diſpatch, its walls and ditches, which the heedleſsneſs and indolence of the Vandals had ſuffered to decay. The defeat of Zano, the brother of Gelimer, and the puſillanimous flight of the king himſelf, terminated the conqueſt of Africa in the manner already related under the article Africa, which ſee. Beliſarius, on his return to Conſtantinople in 534, obtained a ſplendid triumph, and was created ſole conſul for the enſuing year. The day of his inauguration reſembled the pomp of a ſecond triumph; his

curule chair was borne aloft on the ſhoulders of captive Vandals; and the ſpoils of war, gold cups, and rich girdles, were profuſely ſcattered among the populace. His moſt diſtinguiſhed recompence, however, conſiſted in the faithful execution of a treaty, for which he had pledged his honour to the king of the Vandals, who received from the emperor an ample eſtate in the province of Galatia, whither he retired with his family and friends to a life of peace, of affluence, and perhaps of content.

The next object to which the attention of Beliſarius was directed was that of terminating the dominions of the Oſtrogoths in Italy. With this view he invaded Sicily A. D. 535, and having laid ſiege to Palermo, which was ſoon reduced, and which was the only place where he met with any reſiſtance, he ſoon after entered Syracuſe in triumph. In the ſpring of the following year he was diverted from the proſecution of his deſigns by a dangerous revolt of the African forces, which demanded his preſence at Carthage. By an eaſy victory he would have reſtored the peace of Africa; if he had not been haſtily recalled to Sicily, for the purpoſe of appeaſing a ſedition which had broken out in his own camp. Having effected this object, and ſufficiently garriſoned Palermo and Syracuſe, he embarked his troops at Meſſina, A. D. 537, and landed them, without reſiſtance, on the oppoſite ſhores of Rhegium. From Rhegium to Naples, his fleet and army, almoſt always in view of each other, advanced near 300 miles along the ſea-coaſt; and he received the ſubmiſſion of the inhabitants of the ſeveral countries of Bruttium, Lucania, and Campania, through which he paſſed. The capture of Naples, to which he laid ſiege both by ſea and land, was for ſome time delayed; and he had reconciled himſelf to the diſgrace of abandoning it, that he might march, before the winter ſeaſon, againſt Rome and the Gothic king. But in the moment of anxious ſuſpenſe a ſtratagem occurred of introducing, by means of the dry channel of an aqueduct, a file of armed ſoldiers into the heart of the city, who gained admittance to their companions, by whom the walls were ſcaled on all ſides and the gates burſt open. Beliſarius, having ſucceeded in this enterpriſe, reſtrained the cruelty and ſacrilege of the Huns; and, for this purpoſe, he appeared alone in the ſtreets and churches of Naples, and exerted himſelf in moderating the calamities of the inhabitants. "The gold and ſilver," he repeatedly exclaimed, "are the juſt rewards of your valour. But ſpare the inhabitants; they are Chriſtians, they are ſupplicants, they are now your fellow ſubjects. Reſtore the children to their parents, the wives to their huſbands; and ſhew them, by your generoſity, of what friends they have obſtinately deprived themſelves." The city was thus ſaved by the virtue and authority of the conqueror. From Naples, Beliſarius proceeded to Rome; which, on his approach, was evacuated by the Gothic garriſon, and which, after ſixty years' ſervitude, was delivered from the yoke of the Barbarians, and ſurrendered, without oppoſition, Dec. 10, A. D. 536. The Gothic chief, who was himſelf a trophy of the victory, was ſent with the keys of Rome to the throne of the emperor Juſtinian. In the following ſpring Vitiges, who had been elected by the Goths as the ſucceſſor of the feeble and depoſed Theodatus, collected an army of 150,000 men, and attempted to recover the capital. On the approach of the Barbarians, Beliſarius ſallied forth to ſurvey their camp; but being ſurrounded by the enemy, he extricated himſelf by ſingular exertions of ſtrength and valour. When the whole army of the Goths, having paſſed the Tiber, formed the ſiege of the city, which was continued above a year, before their final departure, Beliſarius, aided by his wife Antonina, his conſtant companion in every expedition, made many efforts for the relief of its diſtreſſed inhabitants, and for repulſing the beſiegers, which at length, in concurrence with a force ſent by the emperor, were crowned with ſucceſs; ſo that Rome was reſcued from the hoſtile attacks of the Gothic army, which raiſed the ſiege, and, after attempting the recovery of Rimini, took ſhelter within the walls of Ravenna. Upon the arrival of an army from Conſtantinople, under the command of Narſes, a diſſenſion aroſe between the two generals, whoſe reſpective authority was not accurately defined; but Beliſarius was appointed, by the emperor's ſpecial commiſſion, to the ſupreme command. He incurred, however, conſiderable odium by the haſty execution of Conſtantine, governor of Spoleto, who had committed an act of robbery; and in conſequence of this meaſure, the two armies ſeparated, and Narſes was exhorted by the leaders of the diſcontented faction to aſſume an independent and ſupreme command. Beliſarius, by his prudence and perſeverance, regained his reputation and influence, and procured the recal of Narſes, and the eſtabliſhment of military ſubordination. In the interval of diſcord, the Goths, aided by the Franks, captured Milan, with circumſtances of aggravated cruelty. In 1539, the deſtruction of Milan was ſucceeded by the invaſion of Theodebert of Auſtraſia, the moſt powerful and warlike of the Merovingian kings, who, beſides the ſuccour which he afforded to the Goths, invaded the plains of Italy with an army of 100,000 barbarians, and marked his way by ruin and ſlaughter. The clamours of his conquering army, diminiſhed by famine and diſeaſe, at length induced Theodebert to liſten with reſpect to the mild exhortations of Beliſarius; who, as ſoon as he was delivered from his foreign and domeſtic enemies, ſeriouſly employed his forces in the final reduction of Italy. Having reduced Oſimo and Fæſulæ, he proceeded to inveſt Ravenna; and whilſt he was engaged in the blockade of this city, he received from Juſtinian a treaty of peace, which he had actually ſigned without deigning to aſk his counſel and concurrence. By this diſgraceful and precarious treaty, Italy and the Gothic treaſure were divided, and the provinces beyond the Po were left with the legal title to Vitiges. Beliſarius rejected the treaty of partition, and declared his firm reſolution of leading Vitiges in chains to the feet of Juſtinian. Upon this the Goths retired with doubt and diſmay, and perceiving their own diſtreſſed and perilous ſtate, offered their arms, their treaſures, and the fortifications of Ravenna to Beliſarius, if he would diſclaim the authority of a maſter, accept their choice, and aſſume, as he had deſerved, the kingdom of Italy. The Roman general, ſeeming to acquieſce in their propoſal, ſtipulated the ſurrender of Ravenna at an appointed day; and in December 1539, he entered the city without oppoſition, ſecured the royal treaſures, and placed Vitiges under a guard in the royal palace. The ſubmiſſion of the capital was followed by that of the towns and villages in Italy; and the independent Goths, who ſtill remained in arms at Pavia and Verona, were ambitious only to become the ſubjects of Beliſarius. But his inflexible loyalty rejected, except as the ſubſtitute of Juſtinian, their oaths of allegiance; nor was he offended by the reproach of their deputies, that he rather choſe to be a ſlave than a king. Juſtinian, liſtening to the ſuggeſtions of envy and jealouſy, recalled Beliſarius; who obeyed the ſummons, and departed for Conſtantinople, carrying with him the treaſures of Ravenna, and the perſons of Vitiges, his wife, and chief nobles. The emperor received him with ſeeming cordiality, but without granting him the well-earned honours of a ſecond triumph. Beliſarius, however, was the object of univerſal admiration and applauſe among the people; and by the number of ſol-

diers in his private pay, and the attachment of the army, whoſe affection he ſecured by his juſtice and liberality, he might well be reckoned the ſecond perſon in the empire. To the huſbandmen he was endeared by the peace and plenty which they enjoyed under the ſhadow of his ſtandard. Such had been the rigid diſcipline of his camp, that the country, inſtead of being injured by the march of the Roman armies, had been enriched by them; and not ſo much as an apple was gathered from a tree, nor could a path be traced in the corn fields. As to his perſonal conduct, he was ſober and chaſte to ſuch a degree, that, in the licence of a military life, none could boaſt that they had ſeen him intoxicated with wine, and that he was never ſuſpected of violating the laws of conjugal fidelity. "The ſpectator and hiſtorian of his exploits," ſays Gibbon, "has obſerved, that amidſt the perils of war, he was daring without raſhneſs, prudent without fear, ſlow or rapid according to the exigencies of the moment; that in the deepeſt diſtreſs he was animated by real or apparent hope; but that he was modeſt and humble in the moſt proſperous fortune. By theſe virtues he equalled or excelled the ancient maſters of the military art. Victory, by ſea and land, attended his arms. He ſubdued Africa, Italy, and the adjacent iſlands; led away captives the ſucceſſors of Genſeric and Theodoric; filled Conſtantinople with the ſpoils of their palaces; and in the ſpace of ſix years recovered half the provinces of the weſtern empire. In his fame and merit, in wealth and power, he remained, without a rival, the firſt of the Roman ſubjects; the voice of envy could only magnify his dangerous importance; and the emperor might applaud his own diſcerning ſpirit, which had diſcovered and raiſed the genius of Beliſarius." Nevertheleſs, the fame, and even the virtue of Beliſarius, were polluted by the luſt and cruelty of his wife Antonina. This profligate woman was the daughter of a theatrical proſtitute; and in the various ſituations of the fortune of her parents, ſhe became the companion, the enemy, the ſervant, and the favourite of the empreſs Theodora. Before her marriage with Beliſarius, ſhe had one huſband and many lovers; and after their connubial union, ſhe contrived to gratify her licentious paſſions, and to impoſe on the credulity of her huſband, whom ſhe diſhonoured, and whom by her influence ſhe inſtigated to tranſactions that ſix an indelible ſtain on his memory.

When Syria was invaded by Choſroes king of Perſia, in the year 540, and Antioch, its rich capital, deſtroyed, Beliſarius, the conqueror of Italy, was appointed to the defence of the eaſt. Accordingly, in the year 541, he encamped beyond the Euphrates, within ſix miles of Niſibis, in order to reſtrain the progreſs of the Perſian monarch on the coaſt of the Euxine. Having ſucceeded, without the ſupport which he had reaſon to expect, in forcing Choſroes to return with loſs and precipitation, he was recalled, at the cloſe of the campaign, to Conſtantinople, by an ungrateful court; but the dangers of the enſuing ſpring reſtored his confidence and command; and the hero, almoſt alone, was diſpatched with the ſpeed of poſt-horſes, to repel by his name and preſence the invaſion of Syria. On the banks of the Euphrates his firm attitude reſtrained Choſroes from advancing towards Paleſtine, and compelled him to repaſs the river: thus accompliſhing his purpoſe by a ſafe and bloodleſs victory, more glorious than his African and Gothic triumphs, in which neither fortune, nor the valour of his ſoldiers, can ſubtract any part of the general's renown. But the danger threatened to Italy by the rapid conqueſts of Totila, who had been advanced to the Gothic throne, required the preſence of Beliſarius; and accordingly he was again recalled from the eaſt, and in 544, he arrived at the port of Ravenna, with an inconſiderable number of ill-provided recruits. Thus ſupported, he was unable to impede the progreſs of Totila, and to prevent his laying ſiege even to Rome. When the city was reduced to extreme diſtreſs by the want of proviſions, the ſupply of which had been long obſtructed by the beſieging army, Beliſarius made a bold attempt for its relief. But his enterpriſe for this purpoſe having failed, Rome was obliged to ſubmit to the Gothic yoke; and Beliſarius could only prevail by his interpoſition to prevent its threatened deſtruction. Totila, having demoliſhed its walls, and removed moſt of its inhabitants, marched into the ſouth of Italy; upon which Beliſarius took poſſeſſion of it, and haſtily fortified himſelf within its circuit; ſo that he was able thrice to repulſe the Gothic army which Totila brought againſt it. But whilſt he was engaged in its defence, he was commanded by the emperor to leave a ſufficient garriſon at Rome, and to tranſport himſelf into Lucania, in order to ſuppreſs a revolt which had taken place in that province. In this warfare he was baſely vanquiſhed by the delay, diſobedience, and cowardice of his officers; and having repoſed in his winter-quarters at Crotona, he was obliged by the rapid march of the Goths to make his eſcape to the coaſt of Sicily. At length Antonina, who had been ſent to Conſtantinople to ſolicit ſuccours, obtained, after the death of the empreſs, permiſſion for Beliſarius to return. Accordingly, after failing to deliver Italy from the Goths, and wandering like a fugitive along the coaſt, without daring to march into the country, or to accept the bold and repeated challenge of Totila, he was recalled in September 548. The ſubſequent ſucceſs of Narſes in recovering Italy, threw a ſhade over the military reputation of Beliſarius; though about 10 years afterwards he diſtinguiſhed himſelf by ſaving the capital from an incurſion of the Bulgarians, who had advanced to its long walls, about 40 miles from the city, and occaſioned an univerſal alarm. The enemy were put to flight by the military veteran at the head of a tumultuary band; though it was neceſſary to purchaſe their return into their own country by a heavy ranſom. This was the laſt exploit of Beliſarius; and his remaining days were doomed to misfortune and diſgrace. The jealouſy of the emperor, increaſing with his years, led him to ſuſpect Beliſarius of being concerned in a conſpiracy againſt his crown and his life; and the veteran general, after forty years' ſervice, and on incompetent teſtimony, was judged guilty, Dec. 5, A.D. 562. His life, indeed, was ſpared, but his fortunes were ſequeſtered, and he was guarded for ſeveral months, as a priſoner, in his own houſe. At length, July 19, A.D. 564, his innocence was acknowledged; his freedom and honour were reſtored; and death, which might be haſtened by reſentment and grief, removed him from the world about eight months after his deliverance, March 13, A.D. 565. "The name of Beliſarius," ſays Gibbon, "can never die; but inſtead of the funeral, the monuments, the ſtatues, ſo juſtly due to his memory, I only read, that his treaſures, the ſpoils of the Goths and Vandals, were immediately confiſcated by the emperor. Some decent portion, however, was reſerved for the uſe of his widow; and as Antonina had much to repent, ſhe devoted the laſt remains of her life and fortune to the foundation of a convent. Such is the ſimple and genuine narrative of the fall of Beliſarius and the ingratitude of Juſtinian. That he was deprived of his eyes, and reduced by envy to beg his bread, *Give a penny to Beliſarius the general*, is a fiction of later times, which has obtained credit, or rather favour, as a ſtrange example of the viciſſitudes of fortune."

The ſource of this idle fable may be derived from a miſcellaneous work of the twelfth century, the Chiliads of John Tzetzes, a monk, who relates the blindneſs and beggary of Beliſarius

Beliſarius in ſen vulgar or political verſes. (Vid. Corp. Poet. Græc. tom. ii. p. 311.)

" Εκπωμα ξυλινον κραζων εβοα τω μιλιω
Βελισαριω οβολον δοϊς τω τρατηλαϊη
Ον τυχη μεν εδυξασει, αποτυφλοι δ'ο φθονος."

This moral or romantic tale was imported into Italy with the language and manuſcripts of Greece; repeated before the end of the fifteenth century by Crinitus, Pontanus, and Volaterranus; attacked by Alicat for the honour of the law, and defended by Baronius for the honour of the church. Yet Tzetzes himſelf had read in other chronicles, that Beliſarius did not loſe his ſight, and that he recovered his fame and fortunes. Gibbon's Hiſt. Decl. and Fall of the Rom. Emp. vol. vii.

The ſtatue in the villa Borgheſe, at Rome, in a ſitting poſture, with an open hand ſupplicating alms, is commonly attributed to Beliſarius; but it may be aſcribed with greater propriety to Auguſtus, repreſented under the character of a mendicant, propitiating the anger of Nemeſis. Suetonius (in Aug. c. 91.) informs us, that on a certain day every year, he humbled himſelf to the condition of a beggar, extending his open hand, and ſoliciting alms from the people. Winkelmann. tom. iii. p. 266.

BELISSO, in *Ancient Geography*, a town of Spain, near Auguſta Aſturica. Itin. Antonin.

BELITANI, a people of Spain, according to Pliny.

BELITZ, in *Geography*, a town of Germany, in a prefecturate of the ſame name, in the circle of Zauch, and country of Middle-Mark of Brandenburg, ſeated on the river Niepelitz, or Belitz, which has repeatedly ſuffered from fire. It is defended by old ramparts and ditches, and has a manufacture of cloth; 28 miles ſouth-weſt of Berlin, and 12 ſouth-weſt of Potzdam.

BELITZY, a town and diſtrict of the Ruſſian empire, in the government of Mohilef, ſeated on a rivulet falling into the Soſh.

BELKANI, a town of Aſiatic Turkey, in the province of Natolia, 14 miles north of Satalia.

BELKIN, a town of Egypt, 45 miles ſouth-weſt of Damietta, and 54 ſouth-weſt of Cairo.

BELKOVA, a river of Ruſſia, in the government of Archangel, which runs into the Frozen ſea. N. lat. 68° 30'. E. long. 58° 34'.

BELL, a popular machine, ranked by muſicians among the number of muſical inſtruments of percuſſion. The muſic of bells is altogether melody; but the pleaſure ariſing from it conſiſts in the variety of interchanges, and the various ſucceſſions and general predominance of the conſonances in the ſounds produced.

The parts of a bell are the body or *barrel*, the *clapper* within ſide, and the ear or *cannon*, whereby it is hung to a large beam of wood.—Its uſual matter is a kind of compound metal, called *bell-metal*. The thickneſs of its edges is uſually $\frac{1}{5}$ of the diameter, and its height twelve times its thickneſs. The bell-founders have a diapaſon, or bell-ſcale, with which they meaſure the ſize, thickneſs, weight, and tone of their bells. For the method of caſting bells, ſee FOUNDERY.

The ſound of a bell ariſes from a vibratory motion of the parts thereof, much like that of a muſical chord. The ſtroke of the clapper, it is evident, muſt change the figure of the bell, and of round make it oval; but the metal having a great degree of elaſticity, that part which the ſtroke drove fartheſt from the centre will fly back again, and this even ſomewhat nearer to the centre than before; ſo that the two points, which before were the extremes of the longer diameter, now become thoſe of the ſhorter. Thus, the circumference of the bell undergoes alternate changes of figure, and by means thereof gives that tremulous motion to the air, in which ſound conſiſts.

M. Perrault maintains, that the ſound of the ſame bell or chord, is a compound of the ſound of the ſeveral parts thereof; ſo that where the parts are homogeneous, and the dimenſions of the figure uniform, there is ſuch a perfect mixture of all theſe ſounds, as conſtitutes one uniform, ſmooth, even ſound: and the contrary circumſtances produce harſhneſs. This he proves from the bell's differing in tune according to the part you ſtrike; and yet ſtrike it any where, there is a motion of all the parts. He therefore conſiders bells as compoſed of an infinite number of rings; which, according to their different dimenſions, have different tones, as chords of different lengths have; and when ſtruck, the vibrations of the parts immediately ſtruck determine the tone; being ſupported by a ſufficient number of conſonant tones in the other parts. Mr. Hawkſbee, and others, have found by experiment, that the ſound of a bell ſtruck under water, is a fourth deeper than in the air: though Merſennus ſays, it is of the ſame pitch in both elements. This writer has treated largely of the different metals of which bells are formed, of their figure, craſſitude, and degrees of ponderoſity, as they reſpect each other in a given ſeries.

Bells are obſerved to be heard farther, placed on plains, than on hills; and ſtill farther, in valleys, than on plains: the reaſon of which it will not be difficult to aſſign, if it be conſidered, that the higher the ſonorous body is, the rarer is its medium: conſequently the leſs impulſe it receives, and the leſs proper vehicle it has to convey it to a diſtance. There is a curious obſervation in a paper of M. Reaumur's in the Memoirs of the Paris Academy, relating to the ſhape moſt proper for bells, to give them the loudeſt and cleareſt ſound. He obſerves, that as pots, and other veſſels more immediately neceſſary for the ſervice of life, were doubtleſs made before bells, it probably happened, that the obſerving theſe veſſels to have a ſound when ſtruck, gave occaſion to making bells, intended only for ſound, in that form: but that it does not appear that this is the moſt eligible figure; for lead, a metal which is, in its common ſtate, not at all ſonorous, yet becomes greatly ſo on being caſt into a particular form, and that very different from the common ſhape of bells. In melting lead for the common occaſions of caſting in ſmall quantities, it is uſually done in an iron ladle; and as the whole is ſeldom poured out, the remainder, which falls to the bottom of the ladle, cools into a maſs of the ſhape of that bottom. This is conſequently a ſegment of a ſphere, thickeſt in the middle, and thinner towards the edges: nor is the ladle any neceſſary part of the operation, ſince if a maſs of lead be caſt in that form in a mould of earth or ſand, in any of theſe caſes it is found to be very ſonorous. Now, if this ſhape alone can give ſound to a metal which in other forms is perfectly mute, how much more muſt it neceſſarily give it to other metals naturally ſonorous in whatever form. It ſhould ſeem that bells would much better perform their office in this than any other form, and that it muſt particularly be a thing of great advantage to the ſmall bells of common houſe-clocks, which are required to have a ſhrill note, and yet are not allowed any great ſize. M. Reaumur very judiciouſly obſerves, that if our fore-fathers had opportunities of being acquainted with the ſound of metals in this ſhape, we ſhould probably have had all our bells at preſent of this form. Mem. Acad. Par. 1726.

With regard to the origin of bells, thoſe of a ſmall ſize are very ancient; but thoſe of a large bulk, hung in towers and hung by ropes, were introduced at a much later period. Among the Jews, it was ordained by Moſes, that the lower part of the blue robe, which was worn by the high prieſt in

religious ceremonies, ſhould be adorned with pomegranates and gold bells intermixed at equal diſtances. (See Exodus, xxviii. 33, 34.) The kings of Perſia are ſaid to have had the hem of their robes adorned, like that of the Jewiſh high-prieſts, with pomegranates and gold bells. The Arabian princeſſes wear on their legs large hollow gold rings, filled with ſmall flints, which ſound like bells, when they walk; and theſe, with ſimilar appurtenances, give notice that the miſtreſs of the houſe is paſſing, ſo that the ſervants of the family may behave with reſpect, and ſtrangers may retire to avoid ſeeing the perſon who advances. Calmet ſuppoſes, that it was with ſome ſuch deſign of giving notice that the high prieſt was paſſing, that he wore little bells at the hem of his robe; and it was alſo a kind of public notice that he was about to enter into the ſanctuary. In the court of the king of Perſia, no one entered the apartments without ſome warning; and thus the high prieſt, when he entered the ſanctuary, deſired permiſſion to enter by the ſound of his bells, and in ſo doing he eſcaped the puniſhment of death annexed to an indecent intruſion. The prophet Zachary (ch. xiv. 20.) ſpeaks of bells of the horſes, which were probably hung to the bridles or foreheads of war-horſes, that they might thus be accuſtomed to noiſe. Calmet.

Among the Greeks, thoſe who went the nightly watch rounds in camps or garriſons, carried with them a little bell, which they rang at each centry-box to keep the ſoldiers appointed to watch awake. A bell-man alſo walked in funeral proceſſions, at a diſtance before the corpſe, not only to keep off the crowd, but to advertiſe the flamen dialis to keep out of the way, leaſt he ſhould be polluted by the ſight, or by the funeral muſic. The prieſt of Proſerpine at Athens, called "hierophantus," rung a bell to call the people to ſacrifice. The hour of bathing, at Rome, was announced by the ſound of a bell, and hence it has been ſuppoſed they were uſed to mark the hours of devotion, and ſummon people to church. Servants in the houſes of great men were called up in a morning by the ſound of bells. Zonaras informs us, that bells were hung with whips on the triumphal chariots of their victorious generals, in order to remind them that they were ſtill amenable to public juſtice. Bells were affixed to the necks of criminals going to execution, to warn perſons to avoid ſo ill an omen as the ſight of the executioner or condemned criminal, who was devoted and about to be ſacrificed to the "dii manes." To this ſuperſtition ſome perſons have attributed the cuſtom in England of ringing pariſh bells, while a malefactor is on his way to the gallows; though others have generally ſuppoſed it was intended as a ſignal to all who heard it, admoniſhing them to pray for the paſſing ſoul. Phædrus mentions bells annexed to the necks of brutes: "Celſa cervice eminens, clarumque, collo jactans tintinnabulum." Taking theſe bells away was conſtrued by the civil law to be theft; and if the beaſt was thus loſt, the perſon who took away the bells was to make ſatisfaction. Sheep had them tied about their necks, to frighten away wolves, or rather by way of amulet, or to direct ſhepherds where to find their flocks; and ſince the practice of bleſſing them has been introduced, they have been thought to preſerve animals from epidemical diſorders.

The uſes of bells are ſummed up in the Latin diſtich:

"Laudo Deum verum, plebem voco, congrego clerum,
Defunctos ploro, peſtem fugo, feſta decoro."

To the ſame purpoſe is the following inſcription on bells, mentioned by Weever, in his "Funeral Monuments," p. 122.

"Funera plango, fulgura frango, ſabbata pango,
Excito lentos, diſſipo ventos, paco cruentos."

The firſt bells are ſaid to have been made about the year 400, at Nola, in Campania, whereof St. Paulinus was made biſhop in 409; at leaſt it is aſſerted, he was the firſt who brought them into uſe in the church. Before his time Chriſtians made uſe of rattles, "ſacra ligna," to call the congregation together; no bells being allowed by government to a proſcribed ſect. Hence, it is added, they had their Latin names, *Nolæ*, firſt uſed by Quinctilian, and *Campanæ*, a term which was adopted in the time of St. Jerom. But others ſay, they take theſe names, not from their being invented in Campania, but becauſe it was here the manner of hanging and balancing them in ſteeples, now in uſe, was firſt practiſed; at leaſt, that they were hung on the model of a ſort of balance invented or uſed in Campania. For in Latin writers we find *Campana ſtatera*, for a *ſteel-yard*; and in the Greek καμπανίζειν, for *ponderare*, to weigh. At firſt they were called *ſaints*; and hence are derived a *toc-ſaint*, or *tocſin*.

Polydore Virgil aſcribes the invention of church bells to pope Sabinian, St. Gregory's ſucceſſor; but this is a miſtake; for St. Jerom, contemporary with Paulinus, makes mention of one. Pope Sabinian did not invent bells; but he was the firſt who appointed the canonical hours to be diſtinguiſhed by them.

We even find mention made of bells in Ovid, Tibullus, Martial, Statius, Manilius, and the Greek authors, under the appellations of *tintinnabula*, and *ſounding braſs*. Suetonius, Dion, Strabo, Polybius, Joſephus, and others, mention them under the names of *petaſus*, *tintinnabulum*, *æramentum*, *crotalum*, *ſignum*, &c. But theſe appear to have been no more than baubles, and not like the huge bells in uſe among us.

Hieronymus Magius, who has a treatiſe on bells (written when in chains in Turkey, and which is accounted very remarkable, purely from his memory, without the aſſiſtance of any books), makes large bells a modern invention. Indeed, we do not hear of any before the ſixth century, when they were applied to eccleſiaſtical purpoſes in ſome of the monaſtic ſocieties of Caledonia, as they were in thoſe of Northumbria before the concluſion of the 17th century; and they ſeem to have been uſed from the firſt erection of pariſh churches in this kingdom. In 1610, we are told, Lupus, biſhop of Orleans, being at Sens, then beſieged by the army of Clotharius, frighted away the beſiegers by ringing the bells of St. Stephen's. The firſt large bells in England are mentioned by Bede, towards the latter end of that century, or about the year 670. They ſeem to have been pretty common in the year 816. Ingulphus mentions that Turketulus, abbot of Croyland, who died about the year 870, gave a great bell to the church of that abbey, which he named Guthlac, and afterwards ſix others, all which rang together: and not long after this time, Kinſeus, archbiſhop of York, built a tower of ſtone to the church of St. John at Beverly, and placed in it two great bells, and at the ſame time provided that other churches in his dioceſe ſhould be furniſhed with bells. J. Stubbz. Act. Pont. Ebor. fol. 1700. Mention is alſo made by St. Aldhelm, and William of Malmeſbury, of bells given by St. Dunſtan to the churches in the weſt. See Spelm. Gloſſ. voc. *Campana*; and Bingham's Ant. Chriſt. Church, book viii. ch. vii. § 15.

The Greeks are uſually ſaid to have been unacquainted with bells till the ninth century, or about the year 865, when their conſtruction was firſt taught them by a Venetian.

Indeed it is not true, that the uſe of bells was entirely unknown in the ancient eaſtern churches, and that they called the people to church, as at preſent, with wooden mallets.

mallets. Leo Allatius, in his Diſſertation on the Greek temples, proves the contrary from ſeveral ancient writers. It is his opinion that bells firſt began to be diſuſed among them, after the taking of Conſtantinople by the Turks; who, it ſeems, prohibited them, leſt their ſound ſhould diſturb the repoſe of ſouls, which, according to them, wandered in the air. He adds, that they ſtill retain the uſe of bells in places remote from the intercourſe of the Turks; particularly, very ancient ones in mount Athos. F. Simon thinks the Turks rather prohibited the Chriſtians the uſe of bells out of political than religious reaſons; inaſmuch as the ringing of bells might ſerve as a ſignal for the execution of revolts, &c. The city of Bourdeaux was deprived of its bells for rebellion; and when it was offered to have them reſtored, the people refuſed it, after having taſted the eaſe and conveniency of being freed "from the conſtant din and jangling of bells."

Matthew Paris obſerves, that anciently the uſe of bells was prohibited in the time of mourning; though, at preſent, they make one of the principal ceremonies of mourning. Mabillon adds, that it was an ancient cuſtom to ring the bells for perſons about to expire, to advertiſe the people to pray for them; whence our paſſing-bells. The paſſing-bell anciently ſerved two purpoſes: one of which was engaging the prayers of all good people for departing ſouls; and the other was, driving away the evil ſpirits which haunted the bed and houſe, and which were ready to ſeize their prey, or to terrify and moleſt the ſoul in its paſſage; but by the ringing of this bell, it is ſaid they were kept at a diſtance. To this circumſtance we may probably aſcribe the high price demanded for tolling the largeſt bell of the church; which being louder, and heard at a greater diſtance, might keep theſe evil ſpirits more remote, and alſo procure for the dying man a greater number of prayers.

Lobineau obſerves, that the cuſtom of ringing bells at the approach of thunder is of ſome antiquity; but that the deſign was not ſo much to ſhake the air, and ſo diſſipate the thunder, as to call the people to church, to pray that the pariſh might be preſerved from miſchief by it.

Whatever occaſion ſome catholics may have given for the reproach, that they attribute to bells the power of driving away demons, and diſpelling ſtorms; it is certain the ancient canons of the church only aſcribe this power very remotely to bells. Their meaning ſeems to be this: Satan fears and flies from the bells, becauſe he knows that bells ſummoned good people to church to pray, and he dreads their prayers. It was therefore to prayer, occaſioned by the ringing of bells, and not to the bells, that ſuch good effects were aſcribed.

The cuſtom of chriſtening or bleſſing bells is very ancient. The charge of baptizing bells, alleged by proteſtants againſt the Roman catholics, has been denied by the latter; but they allow that they bleſs bells with certain ceremonies as they do all other church utenſils; and that one of the ceremonies is the giving of a name to the bell, in order to diſtinguiſh it from others, or in honour of ſome ſaint. It ſeems reaſonable, therefore, to acquit them of the blame of proſtituting baptiſm in this caſe, and to charge them merely with conſecration and benediction. Before bells were hung, they were waſhed, croſſed, bleſſed, and named by the biſhop. This is what ſome proteſtants have called baptizing of them; but others ſay, it might be denominated the luſtration of them, reſembling the luſtration of trumpets among the Romans. Cardinal Bona obſerves (Rer. Liturg. l. ii. c. 22.), that the name of ſome ſaint is given to a bell at the time of its conſecration, that the people may think themſelves ſummoned to divine ſervice by the voice of the ſaint whoſe name the bell bears. Some ſay that this cuſtom was introduced by pope John XIII. who occupied the pontifical chair from 965 to 972, and who firſt conſecrated a bell in the Lateran church, and gave it the name of John the Baptiſt. But it is evidently of an older ſtanding; there being an expreſs prohibition of the practice in a capitular of Charlemagne in 789: "ut clocæ non baptizentur." See Hoſpinian de Origine Templorum, p. 113. where there is a particular account of all the ridiculous ceremonies practiſed about bells. See Dr. Franklin's Obſervations on conſecrated Bells, and the Form in conſecrating them, Experiments, Obſervations, &c. p. 487. ed. 1769.

Nankin, a city of China, was anciently famous for the largeneſs of its bells; but their enormous weight having brought down the tower in which they were hung, the whole building fell to ruin, and the bells have ever ſince been diſregarded. One of theſe bells is near twelve Engliſh feet high, the diameter ſeven and a half, and its circumference twenty-three; its figure almoſt cylindric, except for a ſwelling in the middle, and the thickneſs of the metal about the edges, ſeven inches. From the dimenſions of this bell, its weight is computed at 50,000 pounds, which is more than double the weight of that at Erfurt, ſaid by father Kircher to be the greateſt bell in the world. Theſe bells were caſt by the firſt emperor of the preceding dynaſty, above three hundred years ago. They have each their name, the hauger. *tchoui*, the eater *che*, the ſleeper *choui*, the will *fi*. Father le Compte adds, that there are ſeven other bells in Pekin, caſt in the reign of Youlo, each of which weighs 120,000 pounds. But the ſounds even of their biggeſt bells are very poor; being ſtruck with a wooden inſtead of an iron clapper.

The Egyptians have none but wooden bells, except one brought by the Franks into the monaſtery of St. Anthony.

In the churches of Ruſſia their bells are numerous, and diſtinguiſhed by their enormous ſize. They are hung, particularly at Moſcow, in belfreys or ſteeples detached from the churches, with gilt or ſilver cupolas or croſſes; and they do not ſwing like our bells, but are fixed immoveably to the beams, and rung by a rope tied to the clapper, and pulled ſideways. One of theſe bells in the belfrey of St. Jvan's church at Moſcow, weighs 127,836 Engliſh pounds. It has always been eſteemed a meritorious act of religion to preſent a church with bells, and the piety of the donor has been eſtimated by their magnitude. According to this mode of eſtimation, Boris Godunof, who gave a bell of 288,000 pounds to the cathedral of Moſcow, was the moſt pious ſovereign of Ruſſia, until he was ſurpaſſed by the empreſs Anne, at whoſe expence a bell was caſt, weighing 432,000 pounds, which exceeds in ſize every bell in the known world. Its dimenſions, as aſcertained by Mr. Cox (Travels in Ruſſia, vol. i. p. 322.), are as follow: the height is 19 feet, the circumference at the bottom 63 feet 11 inches, and its greateſt thickneſs 23 inches. The beam to which this vaſt machine was faſtened, being accidentally burnt by a fire in 1737, the bell fell down, and a fragment was broken off towards the bottom, which left an aperture large enough to admit two perſons a-breaſt without ſtooping.

The ringing or ſtriking of the bells, though it forms no part of divine worſhip, as ſome writers have aſſerted, ſerves, however, by the number of ſtrokes, to inform any perſon without the church what part of the religious ſervice is beginning within it. Thus, ſeveral ſtrokes are ſtruck juſt before the maſs; and this is called "blagoveſt," i. e. the agreeable ſound, as a ſummons to the praiſes of God. Before the commencement of the liturgy, it ſounds three; and in the middle of it, a few ſtrokes are given to the bell, to let the people without know that the hymn to the holy virgin is

now beginning to be ſung. All perſons, on hearing this, throw aſide their work, bow, and croſs themſelves, repeating ſilently the verſe then ſinging in the church. In the ſame manner is regulated the ſtated number of ſtrokes at the ſeveral periods of the veſpers and the matins. On ſome holidays they are ſounded through the whole day. Tooke's Hiſt. of Ruſſia, vol. i. p. 128.

The ſame writer alſo informs us, that ringing the bells, on church and court holidays, is a ſpecies of exercife of which the Ruſſians are very fond: but they produce nothing like harmony from them. The ſole excellency conſiſts in ſtriking the clapper the oftenеſt.

For further particulars relating to bells, ſee CHANGES in a given number of bells, TINTINNALOGIA, CARILLONS, and RING.

BELL *Bay*, in *Geography*, a harbour on the ſouth-weſt coaſt of Eaſt Greenland, to the north of Horn Sound.

BELL *Sound*, is ſituated on the weſt coaſt of Spitzbergen, in the Icy ſea. N. lat. 77° 12'. E. long. 12° 40'.

BELL, *bearing the*. See RACING.

BELLS, *foundery of*. See FOUNDERY.

BELL, *diving*. See DIVING.

BELLS, *electrical*, are uſed in a variety of entertaining experiments by electricians. The apparatus, which is originally of German invention, conſiſts of three ſmall bells ſuſpended from a narrow plate of metal (*Plate*, *Electricity*,) the two outermoſt by chains, and that in the middle, from which a chain paſſes to the floor, by a ſilken ſtring. Two ſmall nobs of braſs are alſo hung by ſilken ſtrings, one on each ſide of the bell in the middle, which ſerve for clappers. When this apparatus is connected with an electrified conductor, the outermoſt bells ſuſpended by the chains will be charged, attract the clappers, and be ſtruck by them. The clappers becoming electrified likewiſe, will be repelled by theſe bells, and attracted by the middle bell; and diſcharge themſelves upon it by means of the chain extending to the floor. After this, they will be again attracted by the outermoſt bells, and thus, by ſtriking the bells alternately, occaſion a ringing, which may be continued at pleaſure. Flaſhes of light will be ſeen in the dark between the bells and the clappers; and if the electrification be ſtrong, the diſcharge will be made without actual contact, and the ringing will ceaſe. An apparatus of this kind, connected with one of the conductors that are erected for ſecuring buildings from lightning, will ſerve to give notice of the approach and paſſage of an electrical cloud.

BELL-*glaſs*, in *Chemiſtry*, a convenient veſſel for many chemical operations, particularly upon gaſeous bodies. It has the advantage of not being eaſily overthrown, and is readily manageable by the knob of glaſs at the top. When uſed it is always inverted or ſtanding with the open end downwards. See *Plates* in *Chemiſtry*.

Chemical bells are a ſort of receptacles chiefly uſed in preparing the oil or ſpirit of ſulphur, for gathering and condenſing fumes into a liquor.

BELL, in *Building*, is uſed to denote the body of the Corinthian and Compoſite capital, by reaſon of its reſemblance to the figure of a bell inverted. In this ſenſe, bell is the ſame with what we otherwiſe call *vaſe* and *tambour*, ſometimes alſo *corbeil*. The naked of the bell is always to be even and perpendicular with the bottom of the flutings of the column.

BELL *flower*, in *Botany*. See CAMPANULA.

BELLS, *hair*, in *Botany*. See HYACINTH.

BELL-*metal*, an important alloy, compoſed principally of copper and zinc. See COPPER.

BELL-*animal*, in *Zoology*, a name given by ſome of the early writers on microſcopical diſcoveries, to creatures of the Hydra genus. The bodies of theſe animals are ſhaped like bells, and they have very long and ſlender tails, by which they faſten themſelves to the roots of little plants. They are uſually found in great numbers together, in a ſort of cluſters or bunches; and all of the ſame bunch have always the ſame motion, very frequently contracting themſelves, and afterwards expanding all together to the full length of their tails. They uſually contract inſtantaneouſly; but are more ſlow in the expanding themſelves again. Baker's Microſ. p. 90. See HYDRA.

BELL-*muſchus*, in *Botany*, a name given by ſome authors to the plant called *hamia moſchata*, and moſch-ſeed.

BELL-*pepper*. See CAPSICUM.

BELL-*polype*, in *Zoology*, is the name applied to one particular ſpecies, the extremities of whoſe branches reſemble bells, and which is now called *Vorticella Umbellaria*.

BELL-*weed*, an Engliſh name uſed by ſome authors for the JACEA-*nigra*, or common knap-weed, called alſo by many Engliſh writers *Matſelon*.

BELLA, STEFANO DE LA, in *Biography*, an eminent engraver, was born at Florence in 1610, and after having been for ſome time employed in the buſineſs of his father, who was a goldſmith, applied to the ſtudy of engraving, and became the diſciple of Canta Gallina. At firſt he imitated the manner of Callot, who had been a diſciple of the ſame maſter; but acquiring a facility in handling the point, he adopted a manner of his own, which is ſaid to have ſurpaſſed, in freedom and ſpirit, that of Callot. At Paris, whither he removed in 1642, he formed an acquaintance with Iſrael Silveſtre, and was much employed by Henriete, the uncle of Silveſtre. Upon his return to Florence, he obtained a penſion from the grand duke, and was appointed to inſtruct the prince Coſmus, his ſon, in the art of deſign. But being habitually ſubject to violent pains in the head, they at length terminated his life in 1664. The free and maſterly etchings of this excellent artiſt are well known; and his diſtinguiſhing excellence conſiſts in the freedom of his point, and the lightneſs and elegance of his figures. He drew correctly, and with great taſte; and his works diſplay much genius and great fertility of invention. Their ſlightneſs is compenſated by their fire and animation. He is ſaid to have engraved 1400 plates; among which are, "Six Views of Livourne;" ſeveral ſets of "Shipping;" "A Holy Family;" ſeveral "Madonas;" a "View of Pont-neuf" at Paris;" "St. Proſper," a ſcarce print; five ſmall ovals, in which is repreſented "Death carrying away perſons of various ages;" "Death mounted on the ſkeleton of a horſe;" "Parnaſſus;" and the "Rock," both ſcarce; "Animals;" "Beggars;" and various ſets of "Hunting;" "Shipping;" "Landſcapes;" "Ornaments," &c. Strutt.

BELLA POLLA, or TERRA POLLA, in *Geography*, a ſmall high iſland, reſembling two iſlands with lofty round hills, 10 leagues N. E. by N. from cape Angelo, and 4 leagues N. N. W. from Grava iſland; ſituate on the coaſt of the Morea in the Archipelago.

BELLA, in *Entomology*, a ſpecies of PHALÆNA (*bombyx*,) found in North America. The wings, are yellow, with ſix rows of black dots: poſterior wings red, with black tips. *Linn. Muſ. Lud. Ulr.*

BELLAC, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Upper Vienne, ſeated on the Vircon. It derives its name from an old fortified caſtle, erected in the 10th century, and contains about 2500 inhabitants. N. lat. 46° 7'. E. long. 0° 57'.

BELLADAC, a town of Aſia, in the province of Diarbekir, 45 miles weſt of Rabba.

BELLADONNA *lily*, in *Botany*. See AMARYLLIS.

Belladonna, a name given by the Italians to the *deadly nightſhade*, becauſe the ladies make a coſmetic of the juice, or diſtilled water, which they uſe to make their complexion fair and white. Ray.

Others derive the name from the intoxicating quality of this plant: "Quod inſomnis pulchras oſtendat virgines feminaſque." Bod. Comment. in Theophraſt. 1078. See Atropa.

Belladonna, in *Entomology*; *Papilio Cardui*, is deſcribed under this name in the Fauna Succica. Linn. i. n. 778.

BELLAIRE, in *Geography*, a poſt town of America, near the centre of Harford county in Maryland, and the chief town of the county. It contains a court-houſe and gaol, and has but few inhabitants. Diſtant from Harford 6 miles, N. W. 22 N. E. from Baltimore, and 86 W. S. W. from Philadelphia.

BELLANO, a town of Italy, in the Milaneſe, 17 miles north of Como. It is ſituated at the foot of a lofty precipice; rent from top to bottom by a chaſm, through which a furious torrent forces its way. A bridge is thrown acroſs the chaſm, from which the ſpectator looks down into a deep gulf, and an aqueduct is conducted along the ſteep ſides of the rock.

BELLARGUS, in *Entomology*, a ſpecies of Papilio (Pleb. rur.) deſcribed by Eſper; and is *Papilio Adonis*, Gmel, &c.

BELLARMIN, Robert, in *Biography*, a cardinal of Rome, and one of the moſt famous controverſial writers of his time, was born at Monte Pulciano, a town of Tuſcany, in 1542, and entered into the ſociety of the Jeſuits in 1560. He was ordained prieſt by Janſenius in 1569, and in the following year advanced to the theological chair in the univerſity of Louvain. Having remained ſeven years in the Low Countries, he returned to Italy, and in 1576, began to read lectures at Rome on controverſial ſubjects; and having been honoured by three ſucceſſive popes with important commiſſions, he was, in 1598, nominated to the cardinalate by Clement VIII. with this diſtinguiſhing eulogium: "We chooſe him becauſe the church of God does not poſſeſs his equal in learning." In 1602, he was created archbiſhop of Capua; and it is ſuppoſed he would have been raiſed to the papal chair, if he had not been a jeſuit. In about four years he reſigned his archbiſhopric, upon being recalled to Rome by pope Paul III. and here he continued his ſervices to the church, till the year 1621, when he retired from the Vatican to a houſe of his order, in which he died the ſame year, at the age of 79. When he was viſited in his laſt illneſs by pope Gregory XV. he expreſſed his profound veneration for the pontiff, as Chriſt's vicar on earth, by ſaluting him on his entrance with the words of the centurion to Chriſt: "Lord, I am not worthy that thou ſhouldeſt come under my roof." On the day of his funeral it was neceſſary to keep off the populace by a military guard, as they preſſed on, either to touch his body or to procure ſome relic of his garments, as if he had been a ſaint.

Bellarmin was a very ſtrenuous defender of the catholic religion againſt the reformers; and for ſome years his arguments were ſelected by proteſtant divines as ſpecial objects of refutation. His famous work is "A Body of Controverſy," written in Latin, and frequently reprinted; of which the beſt edition is that of Prague in 1721, 4 vols. folio. The ſtyle of this work, without pretending to purity or elegance, is perſpicuous, preciſe, and free from ſcholaſtic barbariſm. His manner is diſtinct and methodical; and his ſtatements of the opinions and objections of his adverſaries are ſo fair and ſo forcible, that it has been queſtioned by ſome of his own party, whether his works were not likely to do more harm than good. In his proofs and refutations, however, he is very copious; and diſplays an extent of learning in ſcriptural criticiſm, in the commentaries of fathers and councils, and in the doctrine and practice of the church in all ages, becoming a controverſialiſt, who determines every point by authority, and not by reaſoning. With reſpect to the doctrines of predeſtination and efficacious grace, he is more an Auguſtinian than a Jeſuit; nor does he adopt that lax morality which was inculcated by ſome of his own order. Beſides this principal work, he wrote "A Commentary on the Pſalms;" "Sermons;" "A Treatiſe on Eccleſiaſtical Hiſtories;" "A Treatiſe on the Temporal Authority of the Pope," againſt Barclay; "The Groans of the Dove;" "On the Obligations of Biſhops;" and "A Hebrew Grammar." Some of his works, and particularly his book on the temporal authority of the pope, raiſed adverſaries againſt him in his own communion, whilſt his declaration of the right of the pontiffs to depoſe princes, cauſed it to be condemned by the parliament of Paris; his aſſertion of the indirect power of the popes in temporal matters, ſo offended the court of Rome, that Sixtus V. cauſed it to be inſcribed in the Index of the Inquiſition. Some Proteſtants, by exceſs of zeal, injured their own cauſe; they circulated unfounded and malignant calumnies againſt his morals, &c. Joſeph Scaliger has even aſſerted, that he did not believe a word of the doctrines he defended; whereas it is moſt probable that he inclined to ſuperſtition in faith, and to ſcrupuloſity in practice. At his death he bequeathed one half of his ſoul to the Virgin Mary, and the other half to Jeſus Chriſt; and, it is ſaid, that he would not allow the vermin that infeſted his body to be moleſted; under the plea, that theſe animals had no other paradiſe than their preſent exiſtence, of which it was cruel to deprive them. His right to canonization was ſtrongly urged; and the popes were prevented from allowing his claim merely by the fear of giving offence to thoſe ſovereigns whoſe temporal rights he had oppoſed. Gen. Dict. Nouv. Dict. Hiſt. Moſheim. Eccl. Hiſt. vol. iv. p. 221, &c.

BELLAS, in *Geography*, a ſmall town of Portugal, in Eſtremadura, containing about 1240 inhabitants.

BELLATOR, in *Entomology*, a ſpecies of Cimex (Spinoſus). It is brown above, beneath yelloviſh: antennæ black annulated with white. Gmelin. A native of Cayenne. This is *Coreus Bellator* of Fabricius.

BELLATRIX, in *Aſtronomy*, a ruddy, glittering ſtar of the ſecond magnitude, in the left ſhoulder of Orion.

It takes its name from *bellum*, as being anciently ſuppoſed to have great influence in kindling wars, and forming warriors.

BELLAY, William du, in *Biography*, a French general, ſignalized himſelf in the ſervice of Francis I. by his valour as an officer, and by his talents as a negotiator. He was aſſiduous and ſucceſsful in his efforts for inducing ſome of the univerſities of France to pronounce judgment in favour of the divorce of king Henry VIII. from his queen Catharine; and he was employed in ſeveral embaſſies to Germany for the purpoſe of conciliating the princes of the Proteſtant league, and evading their objections againſt the king his maſter's ſeverity in puniſhing heretics. Bellay was eminently diſtinguiſhed for his addreſs in penetrating, by his ſpies and intrigues, into the deſigns of the enemy; and he ſucceeded in Piedmont, whither he was ſent in quality of viceroy, in taking ſeveral towns from the Imperialiſts. Being deſirous of communicating in perſon ſome important intelligence to the king, and being very infirm, he ordered a litter for his conveyance; but having paſſed the mountains of Tarara, betwixt Lyons and Roan, he was under a neceſſity of ſtopping at St. Zaphorin

Zaphorin, where he died January 10th 1543. He was buried in the church of Mans, and a noble monument was erected to his memory. He was the author of several works; of which the principal was "The Hiſtory of his own Times," in Latin and French, which he divided into ogdoades, or different parts, each conſiſting of eight books. Of this work ſome few fragments only remain, preſerved by his brother Martin Du Bellay, in his "Memoirs from 1513 to 1543." They are written in a ſimple and lively manner, but are ſomewhat partial in favour of Francis I.

Bellay was one of the firſt French writers who expreſſed a doubt of the miraculous facts recorded of Joan of Arc. Gen. Dict.

Bellay, *John du*, a cardinal, younger brother of the preceding, was born in 1492; and having made conſiderable proficiency in literature, was highly eſteemed by Francis I. By him he was employed in ſeveral embaſſies, particularly in negociating a reconciliation between Henry VIII. of England and the ſee of Rome; and he was advanced by him to ſeveral conſiderable preferments. Bellay, in the buſineſs of king Henry, viſited the pope at Rome, where he continued, and in 1535, he was made cardinal by Paul III. As ſoon as he received intelligence of the hoſtile deſigns of Charles V. he returned to France, and reſiſted that prince's invaſion of Provence in 1536, as the lieutenant-general of Francis, with as much military vigour as prudence, and he exerted himſelf in putting the metropolis, and other places in Picardy and Champagne in a formidable ſtate of defence. After the death of Francis I. his credit declined by the intrigues of the cardinal of Lorraine, and retiring to Rome, he reſigned his preferments in France, and was made biſhop of Oſtia. He was ſo much reſpected by his brother cardinals, that they had thoughts of raiſing him to the pontificate, when he died in 1560 at Rome, aged 68 years. Bellay was diſtinguiſhed as a patron of literature; and by his advice, in concurrence with that of Budæus, Francis I. founded the royal college in 1529. He was an elegant writer, both in Latin and in French. In the Latin language he wrote ſome harangues, and an apology for Francis I. and in the latter three books of poems, conſiſting of elegies, odes, and epigrams, publiſhed by R. Stephens, in 1546. Gen. Dict.

Bellay, *Joachim du*, a French poet, was born at Lire in Anjou, about the year 1524; and amidſt various domeſtic misfortunes, which marked his earlier years, he directed his attention to the ſtudy of the ancient and modern poets. At length his own performances in verſe made him known at court, and he became the delight of Francis I. Henry II. and Margaret queen of Navarre. He was characterifed by the appellation of the "French Ovid," which ſeemed to have not improperly been beſtowed upon him, on account, partly, of the ſweetneſs and facility of his muſe, and partly of the licentiouſneſs of ſome of his pieces. In the ſonnet he particularly excelled, and a rank has been aſſigned to him as a poet next to that of Ronſard. He followed his relation the cardinal to Rome; and on returning with him to France as his agent, he loſt his favour in conſequence of charges of irreligion and immorality that were alleged againſt him. But another relation, who was biſhop of Paris, gave him a canonry in his church in 1555, and he had the proſpect of further preferment; but was carried off by an apoplexy, January 1, 1561. His French poems were publiſhed in 1561, and his Latin ones in 1569. Nouv. Dict. Hiſt.

BELLE de Nuit, in *Botany*, a name which the French give to the flower of the Jalap.

Belle *bay*, in *Geography*, a harbour on the N. E. part of the great bay, called Fortune bay, on the ſouth coaſt of the iſland of Newfoundland, in the Atlantic ocean. Alſo, another bay on the N. W. ſide of the ſame iſland, 6 or 8 leagues N. W. from the bay of Iſles, and about as much S. W. from the ſmall bay of Higournachet.

Belle *Dune*, *La*, or *Handſome Town*, a long projecting barren point, on the ſouth ſide of Chaleur bay in North America, about 8 leagues N. N. W. of Nipiſiguit, where temporary cod and herring fiſheries are carried on by different people; no trade being eſtabliſhed at the place.

Belle *iſle*, *Belleiſle-en-Mer*, or *Belliſle*, an iſland in the bay of Biſcay, near the W. coaſt of France; about 9 miles long, and from 2 to 4 broad, ſurrounded by ſteep rocks, which, together with the fortifications, render the conqueſt of it difficult. It was taken by the Engliſh in 1761, but reſtored at the peace in 1763. The ſoil is various, rocky, with ſalt marſhes, and ſome fertile grounds. Beſides Palais, the capital, it contains three other ſmall towns, and about twenty villages. N. lat. 47° 17′ 30″. W. long. 3° 6′ 30″.—Alſo, a ſmall iſland of France, in the river Loire, in the department of the Mayenne, half a league weſt of St. Mathurin.—Alſo, an iſland on the eaſt ſide of the northern part of Newfoundland, eaſt of Canada-head between 50° 42′. and 50° 50′. N. lat. and between 55° 39′. and 55° 46′. W. long.—Alſo, an iſland of North America, at the mouth of the ſtraits of this name, between the country of the Eſquimaux, or New Britain, and the north end of Newfoundland. The iſland is about 7 leagues in circuit, and lies 16 miles from the neareſt land on the coaſt of Labrador, or New Britain. On the north-weſt ſide it has a harbour for fiſhing veſſels, or ſmall craft, called "Lark harbour;" and, on the E. point, it has another ſmall harbour or cove, which will admit ſhallops. The narrow channel betwixt Newfoundland and the coaſt of Labrador, called the "Straits of Belle Iſle," receive ſeveral rivers from the coaſt of Labrador. Theſe ſtraits lead into the gulf of St. Lawrence from the N. E. and are diſtant 5 leagues N. from Newfoundland. The north point of the iſland is in N. lat. 51° 57′. and the ſouth point in N. lat. 51° 48′. and W. long. 55° 40′.—Alſo, an iſland of Ireland in lough Erne, in the county of Fermanagh, 6 miles S. E. of Enniſkillen.

Belle *iſle en Terre*, a town of France, in the department of the Northern coaſt, and chief place of a canton, in the diſtrict of Guingamp. Seated on an iſland in the river Guer; 3 leagues weſt of Guingamp.

Belle *plaine*, a valley of Piedmont, in the Alps, ſituate partly in the county of Nice, partly in the county of Tenda, a few miles N. W. of Saorgio.

Belleforest, *Francis du*, in *Biography*, was born at a village called Sarzan, in the province of Guienne in 1530, and after an early education in the court of Navarre, was ſent to ſtudy the law at Toulouſe. But employing himſelf in writing panegyrics in bad verſes, on all the nobleſſe in and about Toulouſe, by whom he was rewarded with praiſe and entertainment, he removed to the capital; and by attention and induſtry attained to ſome reputation in the reigns of Charles IX. and Henry III. ſo that he gained the poſt of hiſtoriographer-royal, which he afterwards loſt for want of paying due regard to fact in his productions. He is ſaid to have compoſed more than 50 works on different ſubjects, during a life of 53 years, as he died at Paris in 1583. It is related of him, that there was neither tongue nor ſcience which he did not profane. His moſt fertile topic was hiſtory; and he publiſhed compilations of "Tragical Hiſtories;" and "Wonderful Hiſtories." The only two works worth recording are, "The Hiſtory of the nine Kings of France, of the Name of Charles," folio; and "The Annals of general Hiſtory of France,"

France," Par. 1600, 2 vols. folio, in which laſt work are ſeveral curious facts, intermixed with fables, and therefore having no authority. Gen. Dict. Nouv. Dict. Hiſt.

BELLEGARDE, John-Baptist Morvande, uſually called the "Abbé," was born of a family of rank in the dioceſe of Nantes, in 1648, and entered into the ſociety of the Jeſuits. His taſte and ſtyle were formed by father Bouhours, under whom he ranked as a diſciple. Attached to the principles of Deſcartes, which were oppoſed by them, he abandoned the ſociety of Jeſuits, after continuing in it 16 or 17 years, and taking prieſt's orders; and entered into the world, preaching occaſionally with applauſe, but devoting himſelf chiefly to the profeſſion of an author. Under this character he wrote many books, and ſupported himſelf chiefly by the profits accruing from them, diſtributing to the poor every thing that exceeded a bare maintenance. Some time before his death he deſiſted from his literary labours, ſold his books, and retired to the community of St. Francis de Sales at Paris, eſtabliſhed for the ſupport of poor prieſts, and here he died in 1734. His voluminous publications conſiſt chiefly of tranſlations from the works of St. John Chryſoſtom, St. Baſil, St. Gregory Nazianzus, St. Ambroſe, Thomas à Kempis, &c. and alſo from Ovid, Virgil, and other profane writers. His ſtyle is pure and elegant; but he often miſtakes the ſenſe of his author, eſpecially of the Greek fathers. The ſubjects of his original works are, in general, morals, and matters of taſte. Thoſe that have been moſt favourably received are, "Reflections on Ridicule;" "Reflections on what may pleaſe and diſpleaſe in the commerce of the world;" and "Reflections on Elegance and Politeneſs of Style." Theſe, and ſome other pieces, form a collection of 14 ſmall volumes. Nouv. Dict. Hiſt.

Bellegarde, in *Geography*, a fortified town of France, in the department of the Aveiron; it was taken by the Spaniards in 1674, and retaken the following year by marſhal Schomberg. After the peace of Nimeguen, Louis XIV. built a regular fortreſs with five baſtions to defend the Pyrenees; 5 leagues S. of Perpignan.—Alſo, a town of France in the department of the Loiret, and chief place of a canton, in the diſtrict of Bois-Commun, 3 miles ſouth-eaſt of Bois-Commun.—Alſo, a town of France in the department of the Creuſe, and chief place of a canton, in the diſtrict of Aubuſſon; 2 leagues eaſt of Aubuſſon.

BELLELAY, a ſmall town or village of Germany, in the circle of the Upper Rhine, and biſhopric of Bale, with a rich abbey of Benedictines. It is diſtant about 20 miles from Porentru, in a ſolitary but unpleaſant ſituation, ſurrounded by mountains and ſheltered by foreſts. In this place is inſtituted a military academy for young nobility and gentry.

BELLEM. See Belem.

BELLEN, a town of Swiſſerland, in the canton of Schweitz; 9 miles N. E. of Zug.

BELLENAVE, a town of France, in the department of the Allier, and chief place of a canton in the diſtrict of Gannat, 3 leagues N. W. of Gannat.

BELLENCOMBRE, a town of France in the department of the Lower Seine, and chief place of a canton, in the diſtrict of Neufchatel; 3 leagues weſt of Neufchatel, and 5 S. S. E. of Dieppe.

BELLENDEN, William, (*Bellendenus*, Lat.) in *Biography*, a man of extenſive reading and refined taſte, was born in Scotland, and flouriſhed in the beginning of the 17th century. He was profeſſor of the Belles Lettres in the univerſity of Paris in 1602, and continued for a conſiderable time in that capital, even after he was made maſter of the pleas or requeſts to king James I. of England. At Paris he publiſhed, in 1608, his "Cicero Princeps," containing a body of extracts from Cicero's writings, relative to the maxims of monarchical government, and the duties of a prince. This work he dedicated to Henry, prince of Wales, and he prefixed to it a treatiſe "De Proceſſu et Scriptoribus Rei politicæ," in which there is a rich vein of maſculine ſenſe and fervent piety. The origin of our errors in religion, and of our defects in policy and morals, is traced out with conſiderable accuracy and learning. But while the author condemns the monſtrous tenets of ancient idolatry, and the groſs corruptions of philoſophy, he beſtows many juſt encomiums on the wiſdom and the patriotiſm of ſome ancient legiſlators. In 1612, the author publiſhed a work ſimilar to the former, under the title of "Cicero Conſul, Senator Senatuſque Romanus;" on the nature of the conſular office, and the conſtitution of the Roman ſenate. Encouraged by the reception given by the public to theſe works, he conceived the plan of a third work, "De Statu priſci Orbis," which was to contain a hiſtory of the projects of government and philoſophy from the Antediluvian times to their various degrees of improvement under the Hebrews, Greeks, and Romans. This work was dedicated to Charles, prince of Scotland and Wales; but when he had proceeded ſo far as to print a few copies of this work, in the year 1615, it was ſuggeſted to him, that his three treatiſes, "De Statu Principis;" "De Statu Reipublicæ;" and "De Statu Orbis," being on ſimilar and connected ſubjects, might be united in one work; accordingly they were republiſhed in this form under the title of "Bellendenus de Statu," in 1616. Bellenden afterwards projected a more extenſive work "De Tribus Luminibus Romanorum," in which Seneca and Pliny were to be joined to Cicero: but death prevented the execution of his whole plan. He was an elegant writer, and a man of extenſive knowledge and ſound judgment. His Latin ſtyle is formed upon that of Cicero; and he embraces every opportunity of interweaving the moſt choice and proper phraſeology from the Roman orator, even whilſt he is expreſſing his own ſentiments, ſo that it is not always eaſy to diſtinguiſh ſentences cited from Cicero from his own language. The book "De Statu," was reprinted in London in 1787, 8vo. by an anonymous editor (ſuppoſed to be the learned Dr. Parr) with a Latin preface by the editor, relating to the politics and public characters of that period, and beautiful engravings of Mr. Burke, lord North, and Mr. Fox, to whom the three treatiſes are reſpectively dedicated. To preſerve the memory of every compoſition which flowed from the pen of Bellendenus, the editor has inſerted an epithalamium on the marriage of Charles I. and a "panegyricum carmen" on the embaſſy to Spain. Theſe verſes were found in the Britiſh Muſeum.

The editor owns his firm conviction that Dr. Middleton, in his celebrated hiſtory of Cicero, was much indebted to the writings of Bellendenus, although he has never mentioned his name. Pref. to Bellendenus de Statu. Monthly Review, vol. lxxv. p. 491, &c. vol. lxxvii. p. 504, &c.

BELLEREAU, in *Geography*, a town of France, in the department of the Meurte, and chief place of a canton, in the diſtrict of Pont-a-Mouſſon; 2 leagues S.E. of Pont-a-Mouſſon.

BELLEROPHON, in *Fabulous Hiſtory*, the ſon of Glaucus, king of Ephyrax or Corinth, was contemporary with Jaſon. Under a charge of homicide, as ſome ſay, on his own brother, he was forced to retire to the court of Prætus, king of Argos, where he was accuſed by Sthenobæa, or as Homer ſays, Antæa, the wife of Prætus, of an attempt upon her chaſtity. For this inſult Prætus ſent him to Jobates, his father-in-law, king of Lycia, with private inſtructions to put him

him to death. Jobates demurring againſt the execution of theſe orders, employed him in ſeveral dangerous expeditions againſt the Solymi, and againſt the Amazons, from which he returned victorious. Having thus ingratiated himſelf with Jobates, he obtained his daughter in marriage, and a ſettlement in a fertile part of Lycia, where he reigned and brought up his family. From Homer's account, which repreſents him as "hated by the gods, and wandering in the Aleian plain, a prey to melancholy, and avoiding all commerce with men," he ſeems to have become inſane, and to have died in that ſtate. To his various exploits Homer and other writers have annexed the ſtory of his killing the triform monſter called the Chimæra, by the aſſiſtance of the flying horſe Pegaſus, granted him by Minerva and trained for his uſe. Of the numerous conjectures that have been offered for the explication of this fable, we ſhall only mention that of Bochart, (Phaleg. l. i. c. 6.) who ſuggeſts, that in his expedition againſt the Solymi, he overcame them, and alſo their three gods, which they painted on their enſigns, in the ſeveral forms of a lion, a goat, and a dragon; and which he probably joined together on his own, in memory of his conqueſt; and this gave birth to the fable of his killing the monſter Chimæra. Homer. Iliad. vi. Anc. Univ. Hiſt. vol. v. p. 97, &c.

BELLES LETTRES, conſidered as ſynonymous with *polite literature*, however vaguely and indefinitely theſe terms have been often uſed, properly comprehend thoſe ſubjects that relate to man as a being endowed with ſenſes of taſte and imagination, which were intended to embelliſh his mind, and to ſupply him with rational and uſeful entertainment. In this reſtricted ſenſe they include the origin, ſtructure, and various kinds of language, or grammar, univerſal and particular, criticiſm, rhetoric in its whole extent of compoſition, ſtyle, and elocution; hiſtory, in its ſeveral departments, ancient and modern, general and ſpecial, and all the different kinds of poetry. In the diſtribution of the Lyceum of Arts, eſtabliſhed at Paris in 1792, the belles lettres comprehend general grammar, languages, rhetoric, geography, hiſtory, antiquities, and numiſmatography; whereas, thoſe parts of learning that are of a more grave, ſublime, or abſtruſe kind, and that are more immediately the objects of the underſtanding, ſuch as logic, metaphyſics, ethics, and the various branches of the mathematics and natural philoſophy, are uſually referred, by way of diſtinction, to the claſs of ſciences. This diſtinction, however, is not rigidly obſerved, even by Rollin and others, who profeſſedly treat of the belles lettres. In their confined and appropriate meaning, they open a field of inveſtigation peculiar to themſelves. Their province comprehends every thing that relates to beauty, harmony, grandeur, and elegance; every thing that can ſoothe the mind, gratify the fancy, or move the affections. They preſent human nature under a different aſpect from that which it aſſumes, when viewed by other ſciences. They bring to light various ſprings of action, which, without their aid, might have paſſed unobſerved; and which, though of a delicate nature, frequently exert a powerful influence on ſeveral departments of human life. Such ſtudies have alſo this peculiar advantage, that they exerciſe our reaſon without fatiguing it. They lead to enquiries acute, but not painful; profound, but not dry or abſtruſe. They ſtrew flowers in the path of ſcience; and while they keep the mind bent, in ſome degree, and active, they relieve it at the ſame time from that more toilſome labour to which it muſt ſubmit in the acquiſition of neceſſary erudition, or the inveſtigation of abſtract truth. Beſides, the ſtudy of polite literature furniſhes an agreeable amuſement for thoſe intervals of leiſure which occur in every man's life; and thus prevents his being a burden to himſelf, or recurring to the indulgence of pernicious paſſions, and the purſuit of licentious pleaſures. The ſatisfactions which this ſtudy imparts, occupy a kind of middle ſtation between thoſe of mere ſenſe and thoſe of pure intellect: they refreſh the mind after the toils of intellect, and the labours of abſtract ſtudy; and they gradually raiſe it above the attachments of ſenſe, and prepare it for the enjoyments of virtue. Of thoſe, whoſe minds in early life incline to polite literature, good hopes may be entertained, as this liberal and elegant turn is favourable to many virtues; whereas, to be entirely void of reliſh for eloquence, poetry, or any of the fine arts, is an unpromiſing ſymptom of youth, and furniſhes ſuſpicions of their being prone to low gratifications, or deſtined to drudge in the more vulgar and illiberal purſuits of life. A cultivated taſte increaſes ſenſibility to all the tender and humane paſſions, by giving them frequent exerciſe, while it tends to weaken the more violent and fierce emotions:

"——Ingenuas didiciſſe fideliter artes,
Emollit mores, nec ſinit eſſe feros."
"Theſe poliſh'd arts have humaniz'd mankind,
Soften'd the rude, and calm'd the boiſt'rous mind."

The elevated ſentiments, and high examples which poetry, eloquence, and hiſtory, are often bringing under our view, naturally tend to nouriſh in our minds public ſpirit, the love of glory, contempt of external fortune, and the admiration of what is truly illuſtrious and great. Although it ſhould not be ſaid that the improvement of taſte and virtue are the ſame, or that they may be always expected to co-exiſt in an equal degree; yet it muſt be allowed, that the exerciſe of taſte is, in its native tendency, moral and purifying. From reading the moſt admired productions of genius, in poetry or in proſe, almoſt every one riſes with ſome good impreſſions left on his mind; and though theſe may not always be durable, they are at leaſt to be ranked among the means of diſpoſing the heart to virtue. Indeed, without poſſeſſing the virtuous affections in a ſtrong degree, no man can attain eminence in the ſublime parts of eloquence. He muſt feel what a good man feels, if he expects greatly to move, or to intereſt mankind. They are the ardent ſentiments of honour, virtue, magnanimity, and public ſpirit, that only can kindle that fire of genius, and call up into the mind thoſe high ideas, which attract the admiration of ages; and if this ſpirit be neceſſary to produce the moſt diſtinguiſhed efforts of eloquence, it muſt be neceſſary alſo to our reliſhing them with proper taſte and feeling. Blair's Lectures on Rhetoric, and Belles Lettres, vol. i. lect. i. Rollin's Method of Treating and Studying the Belles Lettres, vol. i. p. 3, &c. M. de Roſenſtein's Oration, delivered before the Swediſh Academy, tranſlated by N. G. Agander.

BELLESME, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Orne, containing about 2,500 inhabitants, and diſtant 3 leagues ſouth from Mortagne.

BELLEVSEVRE, a town of France, in the department of the Saone and Loire, and chief place of a canton, in the diſtrict of Louhans, 4½ leagues diſtant N. N. E. from Louhans.

BELLEVILLE, a town of France, in the department of Paris, and chief place of a canton, in the diſtrict of St. Denis, half a league eaſt of Paris.—Alſo, a town of France, in the department of the Rhone and Loire, and chief place of a canton, in the diſtrict of Villefranche, 2½ leagues north of Villefranche.—Alſo, a town of France, in the department of Vendée, and chief place of a canton, in the diſtrict of La Roche-ſur-Yon, one league north of La Roche.

BELLEVOIS, in *Biography*, a painter of ſea-pieces, known

known through all parts of Europe as a good painter, died in 1684. His ſubjects are views of havens, ſea-ports, ſhores, calms, and ſtorms at ſea; but in his calms he ſhews his peculiar excellence. His touch is light, and his colouring clear, the perſpective of his ſea-ports and buildings is true, and has an agreeable effect; his ſkies are generally bright, and judiciouſly managed, and his colouring is tranſparent. His figures are indifferent, and without much expreſſion. His pictures occur in public ſales, and ſome of his beſt ſtyle fetch a tolerable price. Pilkington.

BELLEY, Lat. Belica, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Ain, before the revolution the capital of Le Bugey, and ſee of a biſhop, ſeated among hills and ſmall eminences, about 2 miles from the Rhone, and twelve miles eaſt of Lyons. N. lat. 45° 45′. E. long. 5° 35′.

BELLGROVE, a town of America, in Bergen county, New Jerſey, on the road to Albany, within half a mile of the line that ſeparates New York from New Jerſey, which extends from Delaware river to that of Hudſon; diſtant 24 miles N. by W. from the city of New York.

BELLI, in *Modern Hiſtory*, the name of a ſociety or ſect among the Negroes of Africa, in the interior kingdoms of Sierra Leona, which is properly a ſchool or ſeminary for the education of children, renewable every 25th year by order of the king, who is viſitor or ſuperior of the college. Here the young men learn to dance, fight, fiſh, hunt, and above all, to chant a certain hymn, which, in the language of the college, they call "bellidong," or the praiſes of belli: theſe ſongs conſiſt only of a repetition of the ſame lewd expreſſions, enforced by the moſt indecent and laſcivious poſtures. When a young negro is become an adept in this practice, he is admitted a fellow of the college, deemed to be qualified for all employments, temporal and ſpiritual, and entitled to a number of important privileges.

BELLICA *columna*, in *Antiquity*, a column near the temple of Bellona, from which the conſuls or feciales caſt javelins towards the enemy's country, by way of declaration of war.

BELLICOSUS, in *Entomology*, a ſpecies of Cimex, (*oblongus*,) that inhabits Africa. It is of a brown colour: poſterior thighs arched and dentated; and four ſpines on the abdomen. Fabricius. Gmelin.

BELLICULI or Bellirici *Marini*, among *Naturaliſts*, denote a ſpecies of ſea-ſhells of an umbilical figure, ſometimes of a white colour, ſpotted with yellow; and ſometimes of a yellow, ſtreaked with black lines, after the ſnail faſhion.

BELLIDIASTRUM, in *Botany*. See Doronicum.

BELLIDIOIDES. See Chrysanthemum.

BELLIEVRE, Pompone Da, in *Biography*, chancellor of France, was born at Lyons in 1529, ſtudied at Toulouſe and Padua, and in 1575, became ſuperintendant of the finances, and in 1579 preſident of the parliament of Paris. Having been employed in ſeveral important embaſſies by Charles IX. and Henry III. and IV. he was created chancellor by the latter in 1599, as a recompence for his ſervices at the peace of Vervin. In the execution of his office he was enlightened, inflexible, inclined to auſterity, and, by the warmth of his temper, to occaſional precipitance. He was diſtinguiſhed by his learning and eloquence, as well as by his talents for buſineſs. In 1604, he loſt the ſeals, but continued in the poſts of chancellor and preſident of the council; however, he uſed to ſay, regretting his loſs, "that a chancellor without the ſeals was a body without ſoul." He died in 1607; and ſeveral eulogies were beſtowed on his memory, in honour of the regard which he always teſtified to learning and its profeſſors. The grandſon of the former was diſtinguiſhed, in the reigns of Lous XIV. and XV. by his legal and diplomatic talents; and was founder of the general hoſpital at Paris. Nouv. Dict. Hiſt.

BELLIMO, in *Modern Hiſtory*, a mode of trial, or a kind of purgation, practiſed by the Negroes in the interior countries of Africa, when perſons are accuſed of murder or theft, and conſiſting of a compoſition of certain herbs or barks of trees, which they oblige the accuſed to hold in his hand, under a full perſuaſion, that, if he be guilty, bliſters will immediately riſe upon the ſkin. Sometimes the bellimo conſiſts in obliging the accuſed to ſwallow a large glaſs of a liquor compoſed from the bark of the neno and quoni trees, which the negroes believe to be virulently poiſonous. The innocent immediately reject it by vomit; but the guilty ſhew a froth about the mouth, and are accordingly judged worthy of death.

BELLING *of hops*, denotes their opening and expanding to their cuſtomary ſhape, ſuppoſed to bear ſome relation to that of a bell. Hops blow towards the end of July, and bell the latter end of Auguſt or the beginning of September.

BELLINGHAM, in *Geography*, a ſmall town of Northumberland, England. It has a market on Tueſday, one fair annually, and is 300 miles north of London. In 1780, this town was nearly conſumed by fire, and its houſes now only amount to 70, and inhabitants to 337. About four miles to the ſouth is the village of Wark, where are the keep and ſome ruins of an ancient caſtle.

Bellingham, a ſmall farming townſhip of America, in Norfolk county, Maſſachuſetts, containing 735 inhabitants, 20 miles N. from Providence, and 34 S. from Boſton.

BELLINI, Laurence, in *Biography*, a learned and ingenious phyſician, was born at Florence, in 1643. He had the advantage of being educated under Manchetti, Redi, and Borelli, and profited ſo well by their inſtructions, that he was made profeſſor in mathematics and philoſophy at Piſa, when he was only twenty years of age. He was alſo no mean proficient in oratory, poetry, and muſic, but propoſing to practiſe medicine, he was ſoon advanced to the chair of profeſſor in anatomy, a poſt he continued to fill with reputation for near thirty years. He was one of the principal ſupporters of the medico-mathematic ſchool, who attempted to explain the functions of the body, the cauſes of diſeaſes, and the operations of medicines on mechanical principles. In this he was followed by Archibald Pitcairne, who read his works at the ſchools in Edinburgh during the life-time of Bellini, and dedicated one of his own works to him. When he was fifty years of age, he was called to Florence, by Coſmo III. who appointed him his phyſician, and about the ſame time, on the recommendation of Lanciſi, he was made honorary, or conſulting phyſician to pope Clement XI. but having more imagination than judgment, and endeavouring to ſquare his practice to his theory, he was generally unſucceſsful in his treatment of diſeaſes, and thus ſoon forfeited the favour, Haller ſays, both of his prince and the public. In his anatomical reſearches he was more ſucceſsful, as he was the firſt who accurately deſcribed the nervous papillæ of the tongue, and diſcovered them to be the organ of taſte, of which he gave an account in his "Gulbus Organum noviſſimé Deprehenſum;" Bonon. 1665, 16to.; and he had before, viz. in 1662, publiſhed "De Structura Renum," Florent. 4to. which had been well received, as containing additional information on the anatomy of that organ. Theſe works have been frequently reprinted, though now, from the great improvements that have been made in anatomy, but little noticed. In 1683, he publiſhed "De Urinis et Pulſibus;" "De Miſſione Sanguinis;" "De Morbis Ca-

pitis et Pectoris;" being, in fact, diſtinct treatiſes on thoſe ſubjects, 4to. Bonon. This is a work of much reſearch and obſervation, though often obſcure and too theoretical. It was much celebrated in its time; and Boerhaave, who publiſhed an edition of it in 1717, accompanied it with a commendatory preface. For the titles of the remainder of Bellini's productions, ſee Haller's Bib. Med. et Anatom. He died in 1704. Gen. Biog.

Bellini, Gentile, a painter of hiſtory and portrait, was born at Venice in 1421, and inſtructed by his father Giacomo, who was himſelf an artiſt in the art of painting, both in diſtemper and in oil. He was employed by the doge to paint the hall of the great council, and he executed ſeveral conſiderable works for others of the nobility. His reputation reaching to the Ottoman court, he was invited by Mahomet II. to Conſtantinople, where he was honourably entertained, and employed in painting the portrait of the emperor, and in various other performances. It is ſaid, however, that the emperor ordered the head of a ſlave to be cut off in the preſence of Bellini, in order to convince him of the incorrectneſs of a picture which he had painted, of the decollation of St. John the Baptiſt; but the ſight affected his mind to ſuch a degree, that he was never eaſy till he obtained leave to return to his own country. Mahomet, before his departure, put a gold chain about his neck, and diſmiſſed him with letters of recommendation to the ſenate of Venice, which procured for him a penſion for life, and an admiſſion into the order of St. Mark. Vaſari mentions a ſea-fight, painted by this maſter, which had extraordinary merit. He died in 1501. Pilkington.

Bellini, Giovanni, the brother of the former, was born at Venice in 1422, and ſurpaſſed both his father and brother in every branch of painting. He is accounted the founder of the Venetian ſchool, by introducing the practice of painting in oil, which had been communicated to his father by Domenico and Andrea del Caſtagno, as ſome ſay; or which, according to De Piles, he obtained from Antonio of Meſſina: and by teaching his ſcholars to paint after nature, the ſchool of Giovanni produced two memorable diſciples, Titian, and Giorgione, who brought the art of colouring to its higheſt perfection; and Giovanni himſelf, by obſerving the works of theſe famous artiſts, improved his own manner very conſiderably; ſo that in his latter pictures the colouring is much better, and the airs of his heads are noble, although his deſign is ſomewhat gothic, and his attitudes not well choſen. He died in 1512. Pilkington.

BELLINO, St. in *Geography*, a town of Italy, in the Poleſino di Rovigno, 10 miles W.S.W. of Rovigno.

BELLINZONE, or Bellenz, one of the Italian bailliages of Swiſſerland, on the eaſt ſide of the river Teſino, north of the lake Maggiore, or lake of Locarno, and on the confines of the Milaneſe, which, together with the two bailliages of Riviera or Poleſi, and Val di Blenzo, Bregno or Brenna, comprehend 110 ſquare geographical miles, and 33,000 inhabitants, and before the French revolution belonged to the cantons of Uri, Schweitz, and Underwalden. In the 15th century, this country belonged to the counts of Sax, who ſold it in 1422 to the original cantons; but Philip Maria, duke of Milan, oppoſing this ſale or exchange, exerted himſelf to prevent from falling into their hands a town like Bellinzone, ſo important from its ſituation and natural ſtrength, to check their inroads and cover his dominions. Having therefore taken poſſeſſion of it by force of arms, a body of 8000 Swiſs paſſed the Alps. The force of both nations met; the Italians were led on by Carmagnola; a bloody battle enſued, of which both ſides claimed the victory: but the Swiſs retired with a ſtandard taken from the enemy, and they remained maſters of the town. In 1500, however, the three cantons obtained what they long contended for; the inhabitants of Bellinzone, vexed by the frequent changes in the Milaneſe, ſubmitted to them. The French, when they had conquered the duchy, in vain reclaimed it; the Swiſs retained poſſeſſion; and the ſeven Italian bailliages, and this amongſt the reſt, were formally ceded to them by Maximilian Sforza, in gratitude for their having reinſtated him in the ducal ſeat. It was likewiſe made an article of the perpetual peace concluded between Francis I. king of France, and the cantons. The bailiff remains in office two years; he is nominated alternately by the three cantons, and is generally removed from Riviera the pooreſt, to Bellinzone, the moſt lucrative of the three governments. An appeal lies from his deciſion to the ſyndicate, and from that court to the three cantons: in eccleſiaſtical affairs, the inhabitants are cognizable to the biſhop of Como, excepting three pariſhes. The inhabitants are catholics; and moſt of the natives underſtand Italian, but the language is a corrupt German. After the French revolution, Bellinzone, according to the diviſion of 1798, became a diſtinct department or canton, including the bailliages of Bellinzone, Riviera, and Val Leventina, of which the chief town was Bellinzone. By the conſtitution of 1801, the Italian bailliages formed the 17th department or canton of Swiſſerland, and was empowered to ſend five repreſentatives to the diet. The riches of this diſtrict conſiſt in its paſtures and cattle; the deficiency of corn is ſupplied by the Milaneſe; and the plain near Bellinzone produces good wine.

Bellinzone, or Bellinz, Lat. *Bilitio*, *Bilitiona*, *Beltiona*, or *Berinzona*, the capital of the above bailliage or department, is a beautiful town, ſituate at the foot of mount Cenero, on a delightful plain on the eaſt ſide of the Teſino, a little below its junction with the Moeſa or Muſa, and about 5¾ Britiſh miles above the northern extremity of the lake Maggiore. The town is encircled with ancient walls and battlements in good repair; on the right are ſeen the majeſtic ruins of an ancient caſtle, and on the left, ſeparately embоſomed in trees, are the caſtles of the bailiffs of the three regent cantons, Uri, Schweitz, and Underwalden. The interior of Bellinzone is far from correſponding with its external beauty and ſituation; the ſtreets being narrow, and the houſes ill built. It is, however, rich in fine churches, dedicated to St. Peter, St. Stephen, St. Blaiſe, and St. Rock; and it has numerous convents of Auguſtines, Urſulines, and Recollects. There is alſo a convent, or ſeminary, called the "Reſidence," lately founded for the education of youth. The valley that lies between this town and the lake is level, and laid waſte by numerous torrents: the road runs along the ſides of the hills through continued vineyards bounded on the weſt, and alſo on the eaſt, by ridges which are clothed to their ſummits with woods of cheſnuts and walnut trees, half concealing frequent ſpires and numerous hamlets. N. lat. 46° 4′. E. long. 8° 43′.

BELLIS, formed from *bellus*, pretty or handſome, Eng. *daiſy*, Fr. *paquerette*, in *Botany*. Lin. gen. n. 962. Reich. 1042. Schreb. 1300. Tournef. 280. Juſſ. 183. Gærtn. t. 168. Claſs and order, *ſyngeneſia polygamia ſuperflua*. Nat. Ord. *Compoſitæ Diſcoideæ. Corymbiferæ*. Juſſ. Gen. Char. *Cal.* common, hemiſpheric, upright; leaflets ten to twenty in a double row, lanceolate, equal. *Cor.* compound radiate; corollules hermaphrodite, tubular, numerous in the diſk; female ligulate, more in number than the leaves of the calyx in the ray:—proper of the hermaphrodite funnel-form, five-cleft; of the female ligulate, lanceolate, ſcarcely three-toothed.

toothed. *Stam.* of the hermaphrodite filaments five, capillary, very short; anthers cylindric, tubular. *Pist.* germ ovate; of the hermaphrodite, style simple, stigma emarginate; of the female, style filiform; stigmas two, patulous. *Per.* none. *Calyx* unchanged. *Seeds* solitary, obovate, compressed; down none. *Rec.* naked, conical.

Ess. Char. *Cal.* hemispheric, with equal scales. *Seeds* ovate, with no down. *Rec.* naked, conical.

Species, 1. B. *perennis*, perennial or common daisy. Lin. Spec. 1248. Hudson. Angl. 370. Wither. Arr. 733. Hull. 184. Relh. 320. Sibth. 256. Abbot. 184. Curt. Lond. fasc. 1. 62. Fl. Dan. t. 503. Mor. Hist. s. 6. t. 8. f. 29. Petiv. Brit. t. 19. f. 2. Ger. 510. 4. Park. Theat. 530. 11. Raii Hist. 349. 2. Smith. 372. B. sylvestris minor. Raii Syn. 184. Ger. em. 636. Fuchs. Hist. 147. B. minor. Matth. Valgr. v. 2. 263. Primula veris. Trag. Hist. 161. *β.* B. hortensis, double or garden daisy. Mill. Dict. n. 3. Curtis Magaz. t. 228. Raii Hist. 350. n. 4. *γ.* B. fistulosa, quilled daisy. *δ.* B. prolifera, proliferous or hen and chicken daisy. "Scape naked." The common daisy is sufficiently distinguished by its creeping, ramose, and long fibred root; by its radical, depressed, obovate, crenate, and pilose leaves; by its erect, simple, single-flowered, round, and naked scapes; by its beautiful flower, with a conic, golden disk, and white, or more frequently reddish ray; by its linear-obovate, plane, emarginate, very numerous, patent floscule rays; by its compressed, hairy seeds; and by its conic, acute, punctated, concave receptacle. Smith. Flor. Brit. v. 2. 898. A native of most parts of Europe in meadows and pastures; flowering almost all the year, and shutting up close every night and in wet weather. The taste of the leaves is somewhat acrid, but in some countries used as a pot-herb. The roots have a penetrating pungency. It is ungrateful to cattle, and even to geese. It occupies a large share of pasture lands, to the exclusion of grass and profitable herbs. It has been much recommended for fresh wounds externally, and against inflammatory disorders internally; but it is now totally out of use. The varieties of the garden daisy are double-white, red, white, and red-striped, variegated, scarlet and pied; double quilled, or with fistular florets; double cock's-comb shaped, white red and speckled; proliferous, childing or hen and chicken daisy. 2. B. *annua*, annual daisy. Lin. Spec. 1249. Syst. 770. "Stem somewhat leafy." A low annual plant, seldom rising more than three inches high, with an upright stalk having leaves on the lower part, and its upper part naked, supporting a single flower like that of the common daisy, but smaller. A native of Sicily, Spain, about Montpellier, Verona, and Nice. Cultivated in 1759 by Miller.

Propagation and Culture. The garden daisies flower in April and May, and make a pretty variety when intermixed with plants of the same growth; they should be planted in a shady border and a loamy soil without dung, on which they may be preserved without varying, provided the roots are transplanted, and parted every autumn. They should be kept clean from weeds. They were formerly planted for edgings to borders; but for this purpose they are unfit, because, when fully exposed to the sun, they frequently die in large patches. Mr. Curtis, however, thinks they appear to most advantage as edgings to borders, as they serve to enliven them, and to add greatly to the gaiety of the garden. He recommends the roots to be taken up in the last week of September, or the first in October, to be divided into single plants, and to be planted three inches apart in a trench, spreading out the fibres, and pressing the earth closely round them, as they will thus not be subject to be drawn out of the ground by worms. Such edgings should be replanted every autumn; otherwise they will spread too wide. Martyn's Miller's Dict. According to Mr. Curtis, the plants that remain undisturbed in the same spot, will recur to their natural state, and become single; but Mr. Miller says that he never observed them to do so.

Bellis. See Anthemis, Aster, Athanasia, Bellium, Calendula, Chrysanthemum, Cotula, Doronicum, Eclipta, Osmites, and Saponaria.

Bellis *major*. See Chrysanthemum.

Bellis *cærulea*. See Globularia.

Bellis, in *Natural History*, a species of Hydra, resembling the calyx of a flower, warted; tentacula retractile, and variegated. This is *actinia bellis* of Solander and Ellis; and is found on the coast of Cornwall.

Bellis, a species of Vorticella, of a simple hemispherical form, with a contractile margin. Müll. Hist. Verm. Found in stagnant ditch water; somewhat resembles the flower of a daisy, but small, yellowish; peduncle long, pellucid, very thin, bifid at the end; moves with a rotatory motion.

BELLISLE, in *Geography*. See Belle *Isle*.

BELLIUM, in *Botany*. Lin. gen. Reich. n. 1043. Schreb. 1301. Juss. 182. Class and order, *syngenesia polygamia superflua*. Nat. Ord. *Compositæ Discoideæ. Corymbiferæ*. Juss. Gen. Char. *Cal.* common simple, with very many, equal, boat-shaped leaflets. *Cor.* compound radiated; in the ray female ten or twelve; in the disk hermaphrodite very many:—proper of the hermaphrodite funnel-shaped, quadrifid, erect; of the females elliptic, emarginate, ligulate. *Stam.* in the hermaphrodite filaments four, short; anther cylindric. *Pist.* in the hermaphrodite germ turbinate; style filiform; stigma bifid, oblong; in the females germ turbinate; style very short; stigma bifid, minute. *Per.* none. *Calyx* unchanged. *Seeds* turbinate; crown chaffy, eight-leaved, rounded; down with eight simple awns. *Rec.* naked, conic. *Obs.* Different from *Bellis* and *Pectis*, on account of the down and five-cleft corollules.

Ess. Char. *Cal.* with equal leaflets. *Seeds* conic, with a chaffy eight-leaved crown, and awned down. *Recept.* naked.

Species, 1. B. *bellidioides*. Lin. Syst. 770. B. droseræfolia. Gouan. illust. 69. 2. B. annua minima. Triumf. Obs. t. 82. B. maritima min. &c. Bocc. Mus. 149. t. 167. "Scapes naked, filiform." This has the habit of a daisy, but differs essentially from it in having a down to the seed. A native of Italy, about Rome, and in the island of Majorca. 2. B. *minutum*. Linn. Syst. 770. Pectis minuta. Linn. Spec. 1250. Schreb. Act. Upsal. Nov. 1. 84. t. 5. f. 2. Bellis cretica fontana omnium minima. Tournef. cor. 37. Vaill. Act. 547. "Stem leafy." One of the minutest of plants; stem capillary, an inch long; the whole plant smooth and ascending; examined with a glass it appears to have hairs scattered over it. A native of the Levant. Introduced in 1722 by M. Richard.

BELLO, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Basilicata; 2 miles S.S.E. of Muro.

BELLOI, Peter Laurence Buyrette du, in *Biography*, a French dramatic writer, was born at St. Flour, in Auvergne, in 1727, and educated for the bar at Paris. But quitting the profession for which he was designed, he left his country, and went to Russia in the capacity of an actor. After having exercised his literary talents in the composition of various fugitive pieces, he returned to Paris in 1758, and brought on the stage, first his "Titus," and next his "Zelmire." But his tragedy of the "Siege of Calais," exhibited in 1765, was the most popular, and contributed in the greatest degree to establish his reputation. For this performance the king presented him with a gold medal

medal and a conſiderable pecuniary reward; and the magiſtrates of the town ſent him the freedom of the town in a gold box, and placed his portrait in the hall among their principal benefactors. Voltaire alſo wrote a complimentary letter to the author, though after Belloi's death he retracted his praiſes. This piece was ſucceeded by his "Bayard," "Peter the Cruel," and "Gabrielle de Vergy." But the failure of the ſecond of theſe haſtened his death in 1755, to the regret of numerous friends, who were attached to him by the goodneſs of his heart. As a dramatic writer his diſtinguiſhing excellence conſiſted in his knowledge of ſtage effect, and of the method of producing it by new and uncommon ſituations: but in purſuing theſe he quitted the true and natural pathetic, and aided in degrading the modern theatre. His verſification is often negligent, and his ſtyle hard and inflated. Mr. Gaillard of the French academy, publiſhed a collection of his works in 6 vols. 8vo. 1779, with a life of the author prefixed. Nouv. Dict. Hiſt.

BELLON, or Belland, in *Medicine*, a diſtemper very common in Derbyſhire and other counties, where they ſmelt lead ore, to which beaſts, and even poultry, as well as men, are ſubject; and for this reaſon a certain ſpace round the ſmelting-houſes is called bellon-ground, where it is dangerous for any animal to feed. This diſorder is attended with languors, weakneſs, and intolerable pains, ſenſation of gripings in the belly, and generally coſtiveneſs. It frequently proves fatal.

The method of cure which has been found moſt ſucceſsful in this diſtemper, is, to give *cremor*, or cryſtals of tartar, in ſmall doſes, and to repeat them frequently, as two or three times a day.

BELLONA, in *Mythology*, the goddeſs of war, ſiſter or wife to Mars.

Hyginus (fab. 274.) ſays, that Bellona was the inventreſs of the needle, called in Greek βελονη, and hence her name has been fancifully derived. Others, with greater probability, deduce it *a bello*, war; and Bryant (Anal. Anc. Mythol. vol. i. p. 45.) ſuppoſes it to be formed from Bel-on, a compound of Bel, Bal, or Baal, the original Babyloniſh title appropriated to the ſun. This goddeſs was of a ſavage diſpoſition, and delighted in ſlaughter and blood; and ſhe was not only repreſented as the attendant of Mars, who prepared his chariot and horſes for war, but as taking pleaſure in ſharing his dangers. She is commonly repreſented in an attitude expreſſive of fury and diſtraction, her hair being compoſed of ſnakes clotted with gore, and her garments ſtained with blood. She is generally exhibited driving the chariot of Mars, with a bloody whip in her hand, and ſometimes as holding a lighted torch or brand, and at other times a trumpet. Bellona had a temple at Rome, near the Porta Carmentalis, in which the ſenate gave audience to ambaſſadors; and before it ſtood the pillar or column of war, againſt which a lance was thrown whenever war was declared. She was alſo worſhipped at two places called Comana, one of which was in Cappadocia, and the other in the kingdom of Pontus; and Camden obſerves, that in the time of Severus, there was a temple of Bellona in the city of York. Poets and artiſts have often confounded Bellona with Pallas.

Bellona, in *Entomology*. Under this name Cramer deſcribes *papilio bruſſolis* of Fabricius. The ſpecies *bellona* of Fabricius and Gmelin is a native of North America, has dentated ſulvous wings, ſpotted with black; poſterior ones, beneath ſilvery at the tip, with ſix ocellar ſulvous ſpots. A variety of it β is figured by Cramer under the trivial name of *hegeſia*.

BELLONARII, in *Antiquity*, prieſts of Bellona, the goddeſs of war and battles.

The Bellonarii cut and mangled their bodies with knives and daggers in a cruel manner, to pacify the deity. In this they are ſingular, that they offered their own blood, not that of other creatures, in ſacrifice. In the fury and enthuſiaſm with which they were ſeized on theſe occaſions, they ran about raging, uttering prophecies, and foretelling blood and ſlaughter, devaſtations of cities, revolutions of ſtate, and the like; whence Martial calls them "turba entheata Bellonæ." Lactant. Inſt. lib. i. cap. i. Lucian. lib. i. Tertul. Apol. cap. 9. Minut. Felix. p. 298. In after-times they ſeem to have abated much of their zeal and tranſport, and to have turned the whole into a kind of farce, contenting themſelves with making ſigns and appearances of cutting and wounds. Lampridius tells us, the emperor Commodus, out of a ſpirit of cruelty, turned the farce again into a tragedy, obliging them actually to cut and mangle their bodies. Lamp. in Commod. cap. 9.

The Bellonarii celebrated feaſts on the eve of the nones of June, and the ninth of the calends of April, on which occaſion they chewed a plant called Bellonaria, which produced a kind of fury, and diſpoſed them to mangle their bodies in the manner which characteriſed theſe feaſts.

BELLONIA, ſo called by Plumier, after the name of M. Bellon, a phyſician of Caen, in *Botany*. Lin. gen. 226. Reich. 242. Schreb. 298. Plum. 31. Juſſ. 200. Claſs and Order, *pentandria monogynia*. Nat. Ord. *Rubiaceæ*. Juſſ. Gen. Char. *Cal.* perianth, one-leaſed, ſuperior, ſemiquinquefid, permanent; diviſions lanceolate, acute. *Cor.* monopetalous, wheel-ſhaped; tube very ſhort; border flat, ſemiquinquefid, obtuſe, large. *Stam.* filaments five, ſubulate, erect, very ſhort; anthers erect, converging, ſhort. *Piſt.* germ inferior; ſtyle ſubulate, ſtraight, longer than the ſtamens; ſtigma acute. *Per.* capſule turbinate-ovate, wrapped up in the calyx, and beaked with its converging diviſions, one-celled. *Seeds* numerous, roundiſh, ſmall.

Eſſ. Char. *Cor.* wheel-ſhaped. *Capſ.* one-celled, inferior many-ſeeded, beaked with the calyx.

Species, 1. B. *aſpera*. Lin. Spec. 244. Plum. gen. 19 ic. 47. Swartz. Prodrom. 42. 2. Obſ. 69. "Leaves ovate-ſerrate, flowers corymbed terminating." A ſhrub ten or twelve feet high, from which iſſue many lateral branches. This ſpecies is ſaid to reſt wholly upon the authority of Plumier. Mr. Miller ſays, that it is very common in ſeveral of the warm iſlands of America, whence he has received the ſeeds. 2. B. *ſpinoſa*. Swartz. Prodr. 42. "Thorny; leaves ovate, angular, tooth-ſerrate, peduncles axillary, one-flowered."

Propagation and Culture. It is propagated by ſeeds, which ſhould be ſown early in the ſpring, in a pot filled with light freſh earth, and plunged into a hot-bed of tanner's bark, and frequently watered. When the plants are come up half an inch high, they ſhould be tranſplanted into pots filled with light freſh earth, and plunged again into the hot-bed, watered and ſhaded till they have taken root; then air ſhould be admitted to them every day in warm weather, and they ſhould be frequently watered. When the plants have filled theſe pots with their roots, they ſhould be carefully ſhaken out of them, and their roots trimmed, and put into larger pots filled with light freſh earth, and put into the hot-bed again. In warm weather freſh air ſhould be admitted to them every day; but in autumn they muſt be plunged into the bark-ſtove, and treated like other tender exotic plants. Theſe plants will ſometimes flower in the ſecond year, but they rarely produce good ſeeds in this climate. Nevertheleſs, they may be propagated by cuttings in the ſummer months, provided they are planted in light earth on a moderate hot-bed, and carefully watered

watered and ſhaded till they have taken root. They muſt be conſtantly kept in the ſtove, and have a large ſhare of free air in warm weather; but if they are ſet abroad, they will not thrive in this climate. Martyn's Miller's Dict.

BELLORI, John Peter, in *Biography*, a celebrated antiquary, was a native of Rome, and derived from his uncle Francis Angeloni, under whoſe care he was placed, his taſte for antiquities. He was appointed by Chriſtina, queen of Sweden, the keeper of her library and cabinet of curioſities; and by pope Clement X. antiquary of Rome. He died in 1696, above 80 years of age. His valuable cabinet was afterwards annexed to that of the king of Pruſſia at Berlin. Of his various works, relating to his favourite purſuits, the principal are the following: viz. "Notæ in Numiſmata, tum Epheſiæ tum aliarum urbium, apibus inſignita," 1658, 4to.; "Fragmenta Veſtigii veteris Romæ," 1673, fol.; "La Colonna Trajana," fol.; "Le Pitture Antiche del Sepolcro de' Naſonii," 1680, fol.; "Le Antiche lucerni ſepolcrali figurate," 1691, fol.; "Gli antichi ſepolcri, overo Mauſolei Romani & Etruſchi," 1699, fol.; "Veteres Arcus Auguſtorum," 1690, fol.; "Vite de Pittori, Scultori, et Architelli Moderni," 1692, 4to.; "Imagines veterum Philoſophorum," 1685, fol. Several treatiſes of this author are inſerted in the 7th volume of Gronovius's Greek Antiquities. He alſo reprinted, in 1685, with large additions, Angeloni's "Hiſtoria Auguſta," illuſtrated by Medals. Moreri. Gen. Biog.

BELLOSTE, Augustin, a ſurgeon of eminence in his time, inventor of a mercurial compoſition, called after his time, "Belloſte's pill," by which he is ſuppoſed to have acquired a conſiderable fortune. After practiſing ſeveral years at Paris, where he was born in 1654, and as an army ſurgeon, he was invited to Sardinia, and made principal ſurgeon to the queen's mother, and continued to reſide at Turin to the time of his death, which happened July 15th, 1730. The work by which he is principally known, is his "Chirurgien de l'Hoſpital," publiſhed 1695. It has paſſed through numerous editions, and been tranſlated into all the European languages. In 1725, he publiſhed a continuation of it, under the title of "La ſuite du Chirurgien de l'Hoſpital." Among other uſeful obſervations, he recommends piercing carious bones, with the view of accelerating exfoliation, a practice adviſed by Celſus, though long diſcontinued. He reproves the cuſtom of frequently removing the dreſſings of wounds, as tending to retard the cure. The work has much merit, though now little noticed, being ſuperſeded by later publications. Haller Bib. Med. Pract. et Chir.

BELLOTTI, Pietro, a painter of hiſtory and portrait, was born at Venice, in 1625, and learned the art of colouring from Michael Foraboſco, whoſe diſciple he was. As a portrait painter, he attained the firſt rank, but was leſs eminent in the compoſition of his hiſtorical ſubjects. In the imitation of nature he was peculiarly happy; the colouring of his portraits appears to be real fleſh, and the variety in the airs of his heads is inconceivable; in all his attitudes there is much grace, and the diſpoſition of his figures is natural and becoming. He died in 1700. Pilkington.

BELLOVACI, in *Ancient Geography*, a people of Gaul, compriſed in the nation of the Belgæ, and ſeated ſouth of the Ambiani. Their country was particularly diſtinguiſhed by the name of Belgium, and correſponded to the modern Beauvais; their chief city was called by the Latins Cæſaromagus; and Cæſar ſpeaks with commendation of their valour and their number.

BELLOWING, among *Sportſmen*, is uſed for the noiſe which roes make in rutting-time.

BELLOWS, a machine uſed to give a briſk agitation to the air, by enlarging and contracting its capacity, and thus expiring and inſpiring the air by turns.

This machine is uſed in chambers and kitchens, in forges, furnaces, and founderies, for blowing up the fire; and it is annexed to organs and other pneumatic inſtruments, in order to ſupply them with a due degree of air. They are conſtructed of various forms, and furniſhed with different kinds of apparatus for giving them motion, and for diſcharging their air, according to the purpoſes which they are intended to ſerve. However, they are in general compoſed of two flat boards, ſometimes of an oval and ſometimes of a triangular figure; between theſe boards are placed two or more hoops, bent ſo as to ſuit their figure; on the edges of the boards is nailed a piece of leather, broad in the middle and narrow at the ends, which unite them together, and it is alſo affixed to the hoops of the boards, that the leather may the more eaſily open and fold again; to the undermoſt board is faſtened a pipe of iron, braſs, or copper; and within is a valve, which covers the holes in the under board ſo as to keep in the air. Strabo informs us (Geog. l. viii. vol. i. p. 464.), from an old hiſtorian, that Anacharſis, the Scythian philoſopher, who lived in the time of Solon, about 600 years before Chriſt, invented the bellows, as well as the anchor and potter's wheel; but this account is very doubtful, as Pliny, Seneca, Diogenes Laertius, and Suidas, who likewiſe ſpeak of the inventions aſcribed to that philoſopher, mention only the two laſt, and not the bellows. It appears, however, that they were known in ancient times to the Greeks; and Virgil mentions them in the following paſſage (Georg. iv. 170):

"—— Alii taurinis follibus auras
Accipiunt, redduntque."——

Upon which it may be remarked, that bull's leather is unfit for bellows, and ox and cow's leather only can be uſed for that purpoſe; but accuracy, in the deſcription of a mechanical engine, is not to be expected in a poet. In more modern times, wooden bellows have been introduced in metallurgic operations, inſtead of thoſe of leather. The latter require careful management; the repairs of them are expenſive; and they ſeldom laſt more than ſix or ſeven years. When thin leather is employed, it ſuffers a great deal of air to eſcape through it; and this evil muſt be guarded againſt by continually beſmearing it with train oil, or other fat ſubſtances; and this is even neceſſary when thick leather is uſed, to prevent it from cracking in the folds. Whenever they are repaired, it is neceſſary again to ſoften the leather with oil, and this occaſions a conſiderable loſs of time. To obviate theſe, and ſimilar inconveniences, and with a view to ſome peculiar advantages, wooden bellows have been invented in modern times, of which we ſhall give ſome account in the ſequel of this article. In the oldeſt ſmelting-houſes, the bellows were moved by a handle, like thoſe of the ſmith's forge, or by the preſſure of the foot upon a treadle, or by other means, requiring the ſtrength of men. But ſince the force of water has been employed to move them, the quantity of ore run down has not only been far greater, but the ſeparation of the metal more complete; inſomuch, that great part of the iron now prepared at ſome conſiderable works, particularly in the county of Glouceſter, has been no other than what had been left in the flags of cinders, for want of ſufficient force of air.

The action and effect of bellows of every kind, whether leathern or wooden, wrought by water or men, depend on this, that the air which enters them, and which they contain when raiſed, is again compreſſed into a narrower ſpace when they are cloſed. And as the air, like all other fluids, flows to that place where it meets the leaſt reſiſtance, it muſt

of

of conſequence fly out of the pipe or aperture with a velocity proportional to the force by which it is compreſſed, and muſt therefore blow ſtronger or weaker, as the velocity with which the top and bottom of the bellows meet is greater or leſſer. The blaſt alſo will laſt in proportion to the quantity of air that was drawn into the bellows through the valve or wind-clap.

The action of bellows bears a near affinity to that of the lungs; and what we call blowing in the latter, affords a pertinent illuſtration of what is called reſpiring in the former. Accordingly, bellows have been employed in reſtoring ſuſpended animation; and Dr. Hooke found, by renewing the interrupted action of the lungs by blowing air into them, by cutting away the ribs and diaphragm, and pericardium, &c. and laying the thorax of a dog bare, and having cut off the aſpera arteria below the epiglottis, and bound it on the noſe of a bellows, that as he blowed the dog recovered, and as he ceaſed, became convulſive: and thus the animal remained alternately alive and dead above the ſpace of an hour. See the methods of recovering ſuſpended animation, under the article DROWNING.

The bellows of ſmiths and founders, whether ſingle or double, are wrought by means of a rocker, with a ſtring or chain faſtened to it, and pulled by the workman. The bellows-pipe is fitted into that of the tewel. One of the boards is fixed, ſo as not to play at all. By drawing down the handle of the rocker, the moveable board riſes, and by means of a weight on the top of the upper board, ſinks again.

The bellows of the Chineſe ſmiths is of a very ſimple kind, and is compoſed of a ſquare pipe of wood ABCDE (*Plate* XIII. *Pneumatics, fig.* 107.) with a ſquare board G, which exactly fits it, moved by the handle FG. At the farther end is the blaſt pipe HK, and on each ſide of it a valve in the end of the ſquare pipe, opening inwards. The piſton is ſufficiently tight for their purpoſes without any leathering.

The bellows of forges and furnaces of mines uſually receive their motion from the wheels of a water-mill, or in our large furnaces they are worked by a ſteam-engine. Others, as the bellows of enamellers, are wrought by means of one or more ſteps or treadles under the workman's feet.

The bellows of an organ are ſix feet long, and four broad; each having an aperture of four inches, that the valve may play eaſy. There ſhould likewiſe be a valve at the noſe of the bellows, that one may not take the air from the other. To blow an organ of ſixteen feet, there are required four pair of theſe bellows.

The bellows of organs are wrought by a man called the blower; and, in ſmall organs, by the foot of the player. See ORGAN.

The method of conſtructing wooden bellows for the purpoſes of metallurgy, was an important and uſeful invention, for which we are indebted to the Germans. This is expreſsly affirmed by Grignon in his "Memoires ſur l'art de fabriquer le fer," Paris, 1775; and in the time of Becher, they were to be found in Germany, but not in England. Genſſanne, in his "Traité de la fonte des mines parle feu du charbon de terre," Paris 1770, erroneouſly aſcribes the invention to the Swiſs; being probably led into this error in conſequence of a Swiſs having firſt made known theſe bellows in France. The name of the real inventor, however, has not been aſcertained. From a catalogue of machines given to the magiſtrates of Nuremberg in 1550, by an artiſt, called Hans Lobſinger, Doppelmayer concludes, that he underſtood the art of making ſmall and large bellows without leather, and entirely of wood, which could be uſed in ſmelting-houſes and for organs, and likewiſe copper bellows, that always emitted a like degree of wind. As Lobſinger made organs, Beckman (Hiſt. Inventions, vol. i. p. 109.) ſuggeſts, that this invention might occur to him; but he has not been able to learn in what it actually conſiſted, or whether it might not die with him. Agricola, who died in 1555, makes no mention of wooden bellows. Samuel Reyher, formerly profeſſor at Kiel, in the improved edition of his diſſertation on air, printed there in 1669, reprinted with additions at Hamburgh, in 1725, and entitled "De Pneumatica, ſive de Aere et Aerometria," informs us, that "about 80 years ago a new kind of bellows, which ought to be called the pneumatic cheſts, was invented in the village of Schmalebuche, in the principality of Cobourg, in Franconia," by two brothers, Martin and Nicholas Schelhorn, who were millers in that village. Theſe brothers kept the invention ſecret, but not ſo concealed as to elude conjecture. Reyher relates, how he himſelf formed an idea of it. Schluter, who has given a complete deſcription and figure of theſe bellows in his "Unterricht von Hütten-Werken," Brunſwick, 1738, fol. aſcribes the invention of them to a biſhop of Bamberg; and according to his account, they were employed ſo early as the year 1620, in the foreſt of Hartz, to which they were firſt brought by ſome perſons from Bamberg. "What Calvor ſays (according to Beckman, ubi ſupra) reſpecting the introduction of theſe bellows into the foreſt of Hartz, is much more probable; that in 1621 Lewis Pfannenſchmid, from Thuringia, ſettled at Oſtfeld near Goſlar, and begun to make wooden bellows. The bellows-makers of that place conſpired therefore againſt him, and ſwore they would put him to death; but he was protected by the government. He would diſcloſe his art to no one but his ſon, who, as well as his grandſon, a few years ago had the making of all the bellows in the foreſt." From Germany, the art of making theſe bellows was introduced into ſome parts of France, and into Sweden, and became general through various parts of Europe. This kind of bellows conſiſts of two boxes placed upon one another; the uppermoſt of which may be moved up and down upon the lower one, in the ſame manner as the lid of a ſnuff-box, which has a hinge, moves up and down, when it is opened or ſhut: but the ſides of the uppermoſt box are ſo broad as to contain the lower one between them, when it is raiſed to its utmoſt extent. Both boxes are bound together, at the ſmalleſt end, where the pipe is, by a ſtrong iron bolt. It may be readily comprehended, that when both boxes fit each other exactly, and the upper one is raiſed over the under one, which is at reſt, the ſpace contained by both will be enlarged; and conſequently more air will ruſh in through the valve in the bottom of the lower one; and when the upper box is again forced down, this air will be expelled through the pipe. The only difficulty is to prevent the air, which forces its way in, from eſcaping any where elſe than through the pipe; for it is not to be expected, that the boxes will fit each other ſo cloſely as entirely to prevent the air from making its way between them. This difficulty, however, is obviated by the following ſimple and ingenious method. On the inner ſides of the uppermoſt box there are placed moveable ſlips of wood, which, by means of metal ſprings, are preſſed to the ſides of the other box, and fill up the ſpace between them. As theſe long ſlips of wood might not be ſufficiently pliable to ſuffer themſelves to be preſſed cloſe enough; and as, though planed perfectly ſtraight at firſt, they would, in time, become warped in various directions, inciſions are made in them acroſs their whole length, at the diſtance of from 15 to 18 inches from each other, ſo as to leave only a ſmall ſpace in their thickneſs, by which means they acquire ſufficient pliability to be every where preſſed cloſe enough to the ſides. This deſcription may be illuſ-

illuſtrated by a figure, (ſee *Plate* XIII. *Pneumatics*, *fig.* 108.) in which the outer box ABCPFE has its top and two ſides flat or ſtraight, and the end BAE*e* formed into an arched or cylindrical ſurface, of which the line FP at the other end is the axis. This box is open below, and receives within it the ſhallow box KHGNML (*fig.* 109.) which exactly fills it. The line FP of the one coincides with FP of the other, and along this line is a ſet of hinges on which the upper box turns, as it riſes and ſinks. The lower box is faſtened to a frame fixed in the ground. A pipe OQ proceeds from the end of it, and terminates at the furnace, in a ſmall pipe called the "tewer," or "tuyere." This lower box is open above, and has in its bottom two large valves V, V, opening inwards. (See *fig.* 110.) The conducting pipe is ſometimes furniſhed with a valve opening outwards, to prevent burning coals from being ſucked into the bellows, when the upper box is drawn up. The joint along PF is made tight by thin leather nailed along it. The ſides and ends of the fixed box are made to fit the ſides and curved end of the upper box, ſo that this laſt can be raiſed and lowered round the joint FP without ſenſible friction, and yet without ſuffering much air to eſcape; but as this would not be ſufficiently air-tight by reaſon of the ſhrinking and warping of the wood, a further contrivance is adopted. A ſlender lath of wood, divided into ſeveral joints, and covered on the outer edge with very ſoft leather, is laid along the upper edges of the ſides and ends of the lower box. This lath is ſo broad, that when its inner edge is even with the inſide of the box, its outer edge projects about an inch. It is kept in this poſition by a number of ſteel wires, which are driven into the bottom of the box, and ſtand up, touching the ſides, as repreſented in *fig.* 111, where *a b c* are the wires, and *c* the lath, projecting over the outſide of the box. By this contrivance, the laths are preſſed cloſe to the ſides and curved end of the moveable box, and the ſpring wires yield to all their inequalities. A bar of wood RS (*fig.* 108.) is fixed to the upper board, by which it is either raiſed by machinery, to ſink again by its own weight, having an additional load on it, or it is forced downward by a crank or wiper of the machinery, and afterwards raiſed. The operation, in this caſe, is exactly ſimilar to that of blowing with the chamber bellows. When the board is lifted up, the air enters by the valves V, V, (*fig.* 110.) and is expelled at the pipe OQ, by depreſſing the boards. Theſe bellows are made of a very great ſize, AD (*fig.* 108.) being 16 feet, AB 5 feet, and the circular end alſo 5 feet. The riſe, however, is but about 3 or 3½ feet. They expel at each ſtroke about 90 cubic feet of air, and make about 8 ſtrokes per minute. The advantages of theſe wooden bellows are very conſiderable. When they are made of clean fir wood without knots, they will laſt 30 or 40 years, and even longer, though continually kept in action 46 or 48 weeks every year. Some have ſaid, that, when properly made, they will laſt a century. The effect produced by them is ſtronger, as well as more uniform, and can be moderated according to circumſtances. They are worked alſo with greater facility. The ſlips of wood on their ſides are apt to be damaged; but they can ſoon and eaſily be repaired. Every three or four months, however, the outer ſides only of the inner box, and the bolt which keeps the boxes together, muſt be ſmeared with oil. If we calculate the price of ſuch bellows, and the yearly expence, they will, according to Grignon's account (ubi ſupra) be only a fifth part of thoſe of the old leather bellows. They have, indeed, their defects, though they are leſs expenſive and more durable than thoſe of leather; for it is ſcarcely poſſible to make the junctures ſo tight as to allow no exit to the compreſſed air, and the friction muſt neceſſarily be very great. Some, therefore, have had recourſe to water, for performing the office of the lower board of the bellows. A bellows on this principle is deſcribed by Mr. Treiwald, engineer to his Swediſh majeſty, in the Philoſophical Tranſactions, under the name of a "water-bellows." Of bellows of wood we have one preſerved in the repoſitory of the Royal Society; and Dr. Plot deſcribes another, that was uſed at the copper-works at Ellaſton in Staffordſhire. Nat. Hiſt. Staff. ch. iv. § 18. Such are the bellows in general uſe on the continent. In this kingdom, a different, and a preferable form is adopted; for an account of which, and other contrivances for animating the large fires of furnaces, &c. ſee BLOWING MACHINE. See alſo FURNACE.

BELLOWS, *Apodopnic*, ſo called by the inventor M. Gorcy, phyſician to the military hoſpital at Neufbriſack, and denoting "reſtorer of reſpiration," an inſtrument uſed for inflating the lungs. It is deſcribed in the "Journal de Medicine" for June 1789; and conſiſts of a double pair of bellows BCLM (*Plate* XIII. *Pneumatics*, *fig.* 112.) the two different parts of which have no communication with each other. In the lower ſide BM is an aperture A for a valve, conſtructed on the principles of thoſe of Mr. Nairne's air-pump. It conſiſts of a rim of copper, cloſed at one end by a plate of the ſame metal, in which plate are ſeven ſmall holes placed at equal diſtances. This plate is covered with a piece of ſilk coated with elaſtic gum, in which are ſix tranſverſe inciſions of two or three lines in length. Each inciſion is ſo made as to be ſituated between two of the holes, and at an equal diſtance from each, as repreſented at D, (*fig.* 113). The ſilk muſt be made very ſecure, by a thread paſſing ſeveral times round the rim. It is obvious, that a ſtream of air applied to that ſide of the plate which is oppoſite the ſilk, will paſs through the holes, and, lifting up the ſilk, eſcape through the inciſions. On the contrary, a ſtream of air applied to the other ſide will preſs the ſilk upon the plate, and thus cloſe the holes, ſo that it will be impoſſible for it to paſs through them. This valve opens internally, ſo as to admit the air from without. At B is another valve, upon the ſame conſtruction, but opening in a contrary direction, thus permitting the air to eſcape out of the lower part into the tube EF, but preventing its entrance. At C is another valve, opening internally to admit the air from the tube EF; and at D there is a fourth, opening externally to diſcharge the air from the upper part. The flexible tube EF, ſcrewed on at the end CB, being introduced into one of the noſtrils, whilſt the mouth and the other noſtril are cloſed by an aſſiſtant, if we ſeparate the two handles L, M, which were cloſe together at the introduction of the tube, it is evident, that the air in the lungs will ruſh into the upper part through the valve C, whilſt the external air will fill the lower part through the valve A. The two handles being again brought into contact, the atmoſpheric air will be forced into the lungs through the valve B, and at the ſame time the air in the upper part will be diſcharged at the valve D. Thus, by the alternate play of the double bellows, the lungs will be alternately filled and emptied as in reſpiration. In uſing the inſtrument, care ſhould be taken not to be too violent; as the more perfectly the natural motion of reſpiration is imitated, the better. To prevent any ſubſtances from without injuring the valves A, D, (*fig.* 112.) the rim is made with a ſcrew B, (*fig.* 114.) in order to receive a cap A, A, (*fig.* 114.) full of ſmall holes. This ſcrew has alſo another uſe. If dephlogiſticated air be preferred, a bladder filled with it (*fig.* 115.) may, by means of the ſcrew A, be faſtened to the valve A, (*fig.* 112.); and to prevent waſte, as this air may ſerve ſeveral times, a flexible tube may be ſcrewed in the valve D, (*fig.* 112.) communicating with the bladder by means of the opening *d*, (*fig.* 115). Thus it may be employed as often

often as the operator thinks proper. There is a handle K to the partition in the middle, in order that, if it be at any time neceſſary to uſe either of the diviſions alone, the other may be confined from acting. *c*, *b*, (*fig.* 116.) repreſent the two valves to be applied at the end of the inſtrument CB, (*fig.* 112.); and (*fig.* 117.) is a ſection of the end CB, ſhewing the valves in their proper places. It is proper to add, that the capacity of the inſtrument ſhould be proportioned to the quantity of air received into the lungs by inſpiration, which Dr. Goodwin has aſcertained to be twelve cubical inches, or ſomewhat more. Each diviſion of the inſtrument, therefore, ſhould be capable of containing that quantity. (See Analytical Review, vol. iv. p. 437.) Roulland preſented, and deſcribed at a meeting of the Lyceum of Arts at Paris, in 1797, the model of a pair of bellows, conſtructed on this plan, intended to reſtore life to perſons drowned and in a ſwoon, by drawing out the vitiated air ſeated in their lungs, and replacing it with ordinary air, or even with oxygene, or vital air, if neceſſary: at the ſame time producing the motion of the lungs, independently of the concurrence of the patient, to the very inſtant when his ſtrength ſhall return. The experiment was ſubmitted to public inſpection; a bladder being made up to repreſent the lungs.

Bellows, *Bone*, φυσητηρες οστινοι, occur in Herodotus for thoſe applied by the Scythians to the genitals of mares, in order to diſtend the uterus, and, by this compreſſion, make them yield a greater quantity of milk.

Bellows, *Heſſian*, a contrivance for driving air into a mine for the reſpiration of the miners. This was improved by M. Papin, who changed its cylindrical into a ſpiral form; and with this, by working it only with his foot, he could produce a wind to raiſe a weight of two pounds.

Bellows, *Hydroſtatic*. See Hydrostatic.

Bellows, or *Trumpet-fiſh*, in *Ichthyology*, a name given by Ray, Willughby, &c. to the ſpecies of Centriscus, Scolopax. Gmelin.

Bellows *Rocks*, in *Geography*, rocks that lie in the Atlantic, near the weſt coaſt of Ireland, and county of Galway. N. lat. 53° 19′. W. long. 10° 4′.

BELLS, *Canterbury*, and *Coventry*, in *Botany*. See Campanula.

Bells, *Hair*. See Hyacinthus.

Bells *Mill*, in *Geography*, a ſettlement in North Carolina, near the Moravian ſettlements, at the ſource of Deep river, the north-weſternmoſt branch of the north-weſt branch of Cape Fear, and about 50 miles weſt of Hillſborough.

Bells, in *Heraldry*, are repreſented as round, when fixed to the legs of a hawk; in which caſe the hawk is ſaid to be *belled*.

BELLUÆ, in *Zoology*, a name of the ſixth order of animals in the Linnæan ſyſtem, including the genera of the *equus*, or *horſe*, the *hippopotamus*, the *tapir*, and *ſus*. Theſe have obtuſe truncated fore teeth, and hooked feet.

BELLUCCI, Antonio, in *Biography*, a painter of portrait and hiſtory, was born at Venice in 1654, and manifeſting an early inclination to painting, became the diſciple of Dominico Deſinico, from whoſe inſtructions he acquired a good manner of handling and colouring, an elegant taſte of hiſtorical compoſition, and an expertneſs in painting portraits with grace and reſemblance. Having eſtabliſhed, by a variety of performances, his reputation for invention, elegance and ſpirit, he was invited by the emperor Joſeph to his court, and appointed his principal painter. But after remaining ſome years at Vienna, he entered into the ſervice of the prince Palatine, in which he long lived, much reſpected for his perſonal accompliſhments as well as for his excellence in his profeſſion. Pilkington.

BELLUDGE, in *Geography*, a tribe of Arabs, inhabiting that part of Perſia, which lies on the coaſt of the entrance into the Perſian gulf, between Minau and cape Jaſke. They are maſters of ſeveral veſſels, and carry on a conſiderable trade with Baſſora, and even venture as far as the coaſts of India. Theſe Arabs are Sunnites; and unity of religious ſentiments has occaſioned their joining the party of the Afghans in the late revolutions of Perſia. Some geographers repreſent theſe Belludges as inhabiting all along the Perſian coaſt to the mouth of the Indus, and have deſcribed them as a warlike people addicted to piracy. Niebuhr is not able to aſcertain whether they are to be conſidered as independent, or as tributary to Perſia. He thinks it probable, however, that they acknowledge no ſovereign authority but that of their own ſcheiks.

BELLUGA, in *Ichthyology*. See Beluga.

BELLULA Bos, a name given by Paulus Jovius to that ſpecies of Raja called by the old Greek and Latin writers *bos marinus*; the ſame kind which Linnæus, and other later naturaliſts, name ſpecifically Oxyrinchus.

BELLUNESE, in *Geography*, a ſmall mountainous territory of Italy, but rich in iron mines, forms a part of the marquiſate of Treviſo, and belongs to the republic of Venice. It is bounded on the north by the Cadorin and part of Friuli, on the eaſt by a large foreſt, which ſeparates it from Friuli, on the ſouth by the Treviſan and Feltrin, and on the weſt by the biſhopric of Trent.

BELLUNO, the capital of the Belluneſe, and ſee of a biſhop, ſuffragan of the archbiſhop of Udina, ſeated on the Piava, between the town Cadore and Treviſo; 43 miles N. of Venice, and 48 E. of Trent. N. lat. 46° 10′. E. long 12° 15′.

BELLY, in a general ſenſe, denotes the whole abdomen, or that region of the body contained between the *ſeptum tranſverſum*, the *hypochondria*, and *pubes*.

Belly is alſo uſed, in a more confined ſenſe, for the inteſtines alone, as containing the *faeces*. In this ſenſe we ſpeak of the looſeneſs or coſtiveneſs of the belly, &c.

Belly is alſo ſometimes uſed for a pregnant woman. In this ſenſe we are to underſtand the phraſe among *Civil Lawyers*, to put the belly in poſſeſſion of an eſtate.

Belly, is alſo uſed in ſpeaking of the bodies of animals; is ſynonymous with abdomen, and may be ſeparately conſidered. It is variouſly characteriſed, according to their food and habits. In thoſe which feed on vegetables, it is in general capacious, and hanging low; in the carnivorous, light, and drawn up at the flanks. In a horſe, a barrel-ſhaped or cylindrical belly is moſt admired; if hanging low, he is ſaid to be cow-bellied; if too much contracted, he is ſaid to be tucked up at the flanks. Graſs, too much water, broken wind, and in mares the gravid uterus, occaſion the belly to relax and become pendulous; dry food, as oats, beans, and hay, &c. and alſo acute pain, contract the volume of the belly. The ſlow moving ruminant animals, as oxen, &c. have the belly the moſt capacious and pendulous of all quadrupeds. This increaſed volume of the inteſtines and ſtomach appears to be deſigned for the purpoſe of enlarging the ſurface for digeſtion and chyliſication, and extracting more completely all the nutritious particles, ſo that a leſſer quantity of food will ſuffice: this circumſtance is particularly remarkable in the ſheep, which can fatten on the ſhorteſt graſs, and almoſt barren glebe.

In the abdomen of the horſe, and other graminivorous quadrupeds, whilſt its vaſt ſurface expoſes it more to be acted upon by changes of weather, as cold, rain, wind, &c. than in the carnivorous animals, ſo it has appeared to us to be alſo provided with a thinner and leſs fatty membrane, or meſ-

ſentery

ſentery, to cover the inteſtines from their influence. Hence appears to be a cauſe for the frequent indigeſtions in theſe animals, often ſpeedily terminating in death, to which their capacity alſo greatly contributes by receiving too large a quantity of food at once. See the article GRIPES *of Horſes*.

The abdomen of the horſe and ox, and other quadrupeds of this deſcription, from its vaſt ſize, hangs below the patella or knee, which occaſions the thigh of the horſe to be moſtly overlooked or taken for ſome other part; the patella or ſtifle being the real termination of the thigh in theſe animals.

In the horſe, the volume of the abdomen is formed by the vaſt magnitude and length of the inteſtines, and a ſingle ſtomach not very large; in the cow, on the contrary, the ſwelling bulk of the abdomen is occaſioned by four large ſtomachs, and the inteſtinal canal is proportionably ſmall and ſhort. The ſheep with four ſtomachs poſſeſſes alſo a vaſt length of inteſtine.

BELLY *of a Muſcle*, in *Anatomy*, denotes the body thereof, as contradiſtinguiſhed from the two extremities, or tendons. From the conditions of this, muſcles are divided into monogaſtric, or ſingle-bellied; and digaſtric, or double-bellied. Phil. Tranſ. N° 258.

Lower will have all the muſcles to be digaſtric, or double-bellied; in which he is ſeconded by Hoffman and others.

BELLY-*ach-weed*, a name given in America to a ſpecies of the JATROPHA.

BELLY, *Dragon's*, *venter draconis*, is uſed by ſome *Aſtronomers* to denote the point in a planet's orbit, wherein it has its greateſt latitude, or is fartheſt diſtant from the ecliptic; more frequently called its limit.

BELMONT, in *Geography*, a town of France, in the department of the Rhone and Loire, and chief place of a canton, in the diſtrict of Roanne, 14 miles north-eaſt of Roanne.—Alſo, a town of France, in the department of the Aveyron, and chief place of a canton, in the diſtrict of St. Afrique, containing about 3000 inhabitants, 9 leagues eaſt of Alby.

BELMONTE, a town of Italy, in the kingdom of Naples, and province of Calabria citra, having a caſtle on an eminence near the ſea, 11 miles W.S.W. of Coſenza. N. lat. 39° 20′. E. long. 16° 50′.—Alſo, a ſmall town of Portugal, in the province of Beira, and juriſdiction of Corrigaõ de Caſtello Branco, containing about 1140 inhabitants, two churches, and a diſtrict of two pariſhes.

BELO, or BELON, in *Ancient Geography*. See BÆLON.

BELOAR, a name given by ſome to a ſtone, otherwiſe called WIDURIS.

BELOMANCY, BELOMANTIA, a kind of divination by means of arrows, practiſed in the Eaſt, but chiefly among the Arabians, among whom it continued till Mahometaniſm prevailed, which abſolutely forbids it. The word is of Greek origin; compounded of βέλος, *arrow*, and μαντεια, *divination*. Belomancy has been performed in different ways; one was, to mark a parcel of arrows, and put eleven, or more of them, into a bag; theſe were afterwards drawn out; and according as they were marked, or not, they judged of future events. Theſe arrows reſembled thoſe with which they caſt lots, being without heads or feathers, and were kept in the temple of ſome idol, in whoſe preſence they were conſulted. Seven ſuch arrows were kept in the temple of Mecca. Another way was to have three arrows, upon one of which was written, "My lord hath commanded me;" on another, "My lord hath forbidden me;" and upon the third, nothing at all. Theſe were put into a quiver, out of which they drew one of the three at random; if it happened to be that with the firſt inſcription, the thing they conſulted about was to be done; if it chanced to be that with the ſecond inſcription, it was let alone; and if it proved to be that without inſcription, they drew over again. Theſe divining arrows were generally conſulted before any thing of moment was undertaken; as when a man was about to marry, or to go a journey, or the like.

Belomancy is an ancient practice, and probably that which Ezekiel mentions, chap. xxi. ver. 21. At leaſt St. Jerom underſtands it ſo, and obſerves, that the practice was frequent among the Aſſyrians and Babylonians. Something like it is alſo mentioned in Heſea, chap. iv. only that ſtaves are there mentioned inſtead of arrows, which is rather rhabdomancy than belomancy. Grotius, as well as Jerom, confounds the two together, and ſhews that they prevailed much among the Magi, Chaldæans, and Scythians, whence they paſſed to the Sclavonians, and thence to the Germans, who, as Tacitus obſerves, made uſe of belomancy.

BELON, PETER, in *Biography*, born in the province of Maine about the year 1518, was an induſtrious and ingenious naturaliſt, eſteemed for his learning and talents by Henry II. and Charles IX. of France, and patroniſed by the cardinal de Tournon, at whoſe expence he travelled over Italy and Greece, a great part of Germany, France, England, Paleſtine, and Egypt, collecting and examining every where the plants, animals, and minerals proper to the places through which he journeyed. On his return, he publiſhed, in ſucceſſion, the reſults of his obſervations and inquiries. The principal of his works are, "Les Obſervations de pluſieurs ſingularités, et choſes memorables trouvées en Grece, en Aſie, Judee, Egypte, Arabie, &c." Paris, 1553, 4to.; an excellent work, Haller ſays, and the firſt of the kind that had been publiſhed from actual obſervation; no one before him having travelled ſo extenſively for the purpoſe of improving natural hiſtory. It has been frequently reprinted, and a Latin verſion of it given by Cluſius, in 1589. "De arboribus coniferis, reſiniferis, aliiſque nonnullis ſempiternâ fronde virentibus, &c." Paris, 1558. The deſcriptions are in general juſt; the engravings indifferent. He had ſeen the true cedar of Lebanon. He alſo gave a treatiſe "On the Method of embalming practiſed by the ancients;" "On the Defects in Agriculture;" "On the Management of Gardens," and recommends the introduction of many foreign trees into them, pointing out thoſe moſt congenial to the climate of France;" "On Birds;" and "On Fiſhes; with their figures. More he had done; but he was ſtabbed by a robber in 1563, being only about 45 years of age. Haller. Bib. Botan.

BELONE, in *Ichthyology*, a ſpecies of ESOX, having both jaws long and ſubulate. Linn. This is *acus piſcis* of Salvian; *acus vulgaris*, Ray; and *ſea-pike*, or *gar-fiſh*, of the Engliſh. It is ſometimes called alſo the *ſea-needle*.

The ſea-pike inhabits all great ſeas, and was known both to the Greeks and Romans. It keeps in deep water part of the year, and viſits our coaſts in immenſe ſhoals in the beginning of the ſummer, juſt before the mackerel make their appearance. The length of this fiſh is uſually from a foot and a half to three feet; but if the relation of Renard may be depended upon, they are found of the length of eight feet in the eaſtern parts of the world. A fiſh of this ſpecies has been taken in the Mediterranean, on the coaſt of Liſbon, weighing fourteen pounds. In ſome countries the fiſhery for the ſea-pike is very conſiderable; in England they are not much eſteemed, although the fleſh is ſcarcely inferior to that of the mackerel. The bone of the back, when the fiſh is boiled, is of a bright green colour, from

which many people conclude, though very unjuſtly, that it cannot be a wholeſome food.

All the upper part of the back and head of this fiſh is of a beautiful green colour; ſides and belly ſilvery. The number of rays in the dorſal fin are about ſixteen; pectoral thirteen; ventral eight; anal twenty-two; and in the tail twenty-two; but theſe are liable to vary in number, as in other fiſhes.

BELOW, or Belan, in *Geography*, a river of England, which runs into the Eden, 2 miles north of Kirkby Stephen, in the county of Weſtmoreland.

BELOZERO. See Biélo-Ozero.

BELPBERG, a mountain of Swiſſerland, about 7 or 8 miles from Bern, being part of the chain of the Alps; the ſtrata of which are full of different ſpecies of chamites, oſtracites, globoſites, ſplenites, ſtrombites, and other ſimilar petrifactions.

BELPECH, a town of France, in the department of the Aude, and chief place of a canton, in the diſtrict of Caſtelnaudary, 3¾ miles ſouth-weſt of Caſtelnaudary. N. lat. 43° 12′. E. long. 1° 39′.

BELPRE, a poſt town and ſmall ſettlement of America, in the territory north-weſt of the Ohio, on the north-weſt bank of Ohio river, between the Hockhocking and Muſkingum rivers, and oppoſite the mouth of the little Kanhaway; about 14 miles below Marietta, and 480 miles S.W. by W. from Philadelphia.

BELSHAZZAR, in *Scripture Hiſtory*. See Babylonia.

BELSINUM, in *Ancient Geography*, a town of Hiſpania Tarragonenſis, in the country of the Celtiberians. Ptolemy.

BELSUNCE, Henry-Francis-Xavier de, in *Biography*, denominated, by way of honourable diſtinction, "the good biſhop of Marſeilles," was the ſon of the marquis of Belſunce, a nobleman of Guienne. After quitting the ſociety of the Jeſuits, into which he firſt entered, he was in 1709 nominated to the biſhopric of Marſeilles; where he diſtinguiſhed himſelf by his fortitude and charity, during the dreadful plague which afflicted that city in 1720 and 1721. Such was the effect produced by his attention and liberality on occaſion of this calamity, ſuch the attachment cemented between him and his dioceſans, by their gratitude and his own ſympathy, that he declined accepting the biſhopric of Laon, to which are annexed a peerage and a dukedom, which was offered to him by the king in 1723. He died in 1755. Nouv. Dict. Hiſt.

BELT, Baltheus, and among the ancient and middle age writers, *zona*, *cingulum*, *reminiculum*, *rinca*, or *ringa*, and *baldrellus*, in *Armour*, a kind of military girdle, in which a ſword or ſome other weapon is commonly hung.

That the belt, or girdle, formed a material part of the Hebrew armour, may be gathered from the expreſſions ſo frequently repeated in the ſacred ſcriptures. *The Almighty girding himſelf*, imported not only his giving notable diſplays of power, but his readineſs to act; and his girding others expreſſed the ability he had beſtowed upon them to perform magnificent exploits.

The belts of the Hebrew ſoldiers, with which they girded on their arms, went not about their ſhoulders but their loins, and were ſuppoſed to ſtrengthen them. (See Neh. iv. 18. Ezek. xxiii. 15.) They were generally valuable, eſpecially thoſe of commanders, and were ſometimes given as rewards to ſoldiers. Jonathan preſented his to David (1 Sam. xviii. 4.); and Joab tells the perſon, who had ſeen Abſalom hanging from the tree, that if he had ſmitten him to the ground, he would have given him ten ſhekels of ſilver and a *girdle*.

The Greeks called it ζωνη, or ζωμα, and they thought it ſo eſſential to a warrior, that ζωννυσθαι became a general term for clothing themſelves in armour. Whence Agamemon is deſcribed by Homer

"Ατρειδης δε βοησεν, ιδε ζωννυσθαι ανωγεν;"

and which no doubt occaſioned Pauſanias to ſuppoſe that ζωνη had a reference to the whole armour. So Herodotus, relating the flight of Xerxes to Athens, deſcribes him, when arrived at Abdera, and believing himſelf free from danger, λυειν την ζωνην, *to have diſarmed himſelf*. (Urania. cxx.)

Among the Greeks, the belt was worn very differently from the manner already deſcribed, and reached even to the thigh, whence Homer's hero, (Odyſſ. λ.)

——"φασγανον οξυ ερυσαμενος παρα μηρου,"

and Virgil's Æneas (l. x. l. 86.)

——"ocyus enſem
Eripit a femore."

Foot ſoldiers, we are told, wore their ſwords on the left; horſemen, on the right ſide. Joſephus, deſcribing the downfal of Jeruſalem (l. iii.), expreſsly mentions horſemen with their ſwords on the right. But whether this was conſtantly the caſe, or frequently varied, as Lipſius has obſerved of the Roman ſword, cannot eaſily be determined.

Herodotus, mentioning the military habits of the Perſians, ſays, they had daggers ſuſpended to the right thigh by a belt.

Beger has given a buſt of Scipio, copied by Montfaucon (vol. iv. pl. vi. f. 4.), which has an embroidered belt hanging from the right; while a ſoldier on the arch of Conſtantine is repreſented in ſcale armour, with a belt ſuſpended from the left ſhoulder. Montfaucon, vol. iv. pl. xx. f. 2.

In our own country, like thoſe of ancient times, it was frequently ornamented in the richeſt ſtyle; and it is worthy of obſervation, that in ſome of the moſt magnificent illuminations of our ancient manuſcripts, even in the ſame picture, the ſword is repreſented as indiſcriminately belted on the right ſide or the left. In later ages, the belt was given to a perſon when he was raiſed to knighthood; whence it has alſo been uſed as a badge of the knightly order.

Belt is alſo a denomination applied to a ſort of bandages in uſe among ſurgeons, &c. Thus we meet with quickſilver belts, uſed for the itch. A later writer deſcribes a belt for keeping the belly tight, and diſcharging the water in the operation of tapping. Medic. Eſſ. Edinb. tom. i. p. 218.

Belt, or Beltis, in *Eccleſiaſtical Writers of the Middle Age*, denotes a ſort of ſtring of beads.

Belt is alſo a frequent diſeaſe in ſheep, cured by cutting their tails off, and laying the fore bare; then caſting mould on it, and applying tar and gooſe-greaſe.

BEL-TEIN, in *Mythology*, a ſuperſtitious cuſtom, formerly obſerved in Scotland and Ireland; and according to Dr. Ledwich, on the authority of Wormius, in Scandinavia. Dr. O'Brien, in his Iriſh Dictionary, explains it *ignis Beli Dei Aſiatici*; and mentions, that on the firſt of May the Druids were uſed to light large fires on the ſummits of hills, into which they drove four-footed beaſts, uſing at the ſame time certain ceremonies, to expiate the ſins of the people. This pagan ceremony of lighting theſe fires in honour of Belus, or the ſun, gave its name to the month of May, which is called *Beal-tine*, and May-day *la Bealtine*. On this day all the inhabitants of Ireland quenched their fires, and kindled them again out of ſome part of the ſacred fire. That celebrated Iriſh antiquarian, general Vallancey, infers from the name of this cuſtom, that it was derived from the Perſian-Scythians, or Phœnicians, by whom the ſun was worſhipped under the ſame name of Belus, or Bel, and on the tops of hills alſo, as appears from the *high places* mentioned in ſcripture.

ſcripture. In Gaul alſo there are traces of the ſame ſuppoſed deity being worſhipped under the name Belinus. The Iriſh ſtill preſerve the cuſtom; and to this day, in many places, fires are lighted on the firſt of May in the milking yards, which the men, women, and children paſs through or leap over, and the cattle are driven through the flames of the burning ſtraw. In the weſtern iſles of Scotland, Mr. Martin found a like ceremony called by the ſame name; and Mr. Pennant thus particularly deſcribes it. "It is a kind of rural ſacrifice, performed by the herdſmen of every village on the firſt of May. They cut a ſquare trench on the ground, leaving a turf in the middle; on that they make a fire of wood, on which they dreſs a large caudle of eggs, butter, oatmeal, and milk; and bring, beſides the ingredients of the caudle, plenty of beer and whiſkey; for each of the company muſt contribute ſomething. The rites begin with ſpilling ſome of the caudle on the ground by way of libation: on that every one takes a cake of oatmeal, upon which are raiſed nine ſquare knobs, each dedicated to ſome particular being, the ſuppoſed preſerver of their flocks and herds, or to ſome particular animal, the real deſtroyer of them. Each perſon then turns his face to the fire, breaks off a knob, and flinging it over his ſhoulder, ſays, *This I give to thee, preſerve thou my horſes; this to thee, preſerve thou my ſheep;* and ſo on. After that, they uſe the ſame ceremony to the noxious animals: *This I give to thee, O fox! ſpare thou my lambs; this to thee, O hooded crow! this to thee, O eagle!* When the ceremony is over, they dine on the caudle; and after the feaſt is finiſhed, what is left is hid by two perſons deputed for the purpoſe; but on the next Sunday they reaſſemble, and finiſh the reliques of the firſt entertainment." That fire was adored in Ireland, is ſufficiently proved from this celebrated feſtival, independently of other circumſtances; but whether it can be urged in proof of the colonization of Ireland by the ſouthern Scythians or Perſians, is not equally clear. Dr. Ledwich ſays, that fire was adored by the Celtes and Northern Scythians, and mentions from Wormius the manner of kindling it. On the other hand, the name bears a ſtriking reſemblance to that of the Aſiatic deity; and the early naval expeditions of the Phœnicians render its having been communicated by them leſs improbable. The writer of this article has not, however, yet met with any account of a ſimilar practice amongſt the nations in the ſouth of Aſia, or with any attempt to explain the name from thoſe languages which are undoubtedly of Celtic origin. The circumſtance, indeed, of all languages having had one common ſource, leſſens the force of thoſe arguments which are derived from a reſemblance in words denoting the ſame thing; and yet great ſtreſs is laid on ſuch reſemblance in the arguments for the Perſian colonization of Ireland. Collectanea de rebus Hibernicis paſſim. Pennant's Tour in Scotland, vol. iii. O'Brien's Iriſh Dictionary. Ledwich's Antiquities of Ireland. See BELINUS.

BELTS, *Faſciæ*, in *Aſtronomy*, two zones or girdles ſurrounding Jupiter's body, more lucid than the reſt, and terminated by parallel lines; being ſometimes broader, and ſometimes narrower, nor conſtantly taking up the ſame places in his diſk. Dark ſpots have been frequently obſerved on Jupiter's belts. Caſſini has alſo diſcovered a permanent one in the moſt northern part of the moſt ſouthern belt: by this he has determined the length of Jupiter's day, that is, the time of his revolution on his axis, which is finiſhed in nine hours and fifty-ſix minutes. Phil. Tranſ. N° 10. and vol. lxiii. part i. N° 11. p. 73. Some aſtronomers take the belts to be ſeas, which alternately cover and leave bare large countries of the planet; and that the ſpots are gulfs in thoſe ſeas, perhaps as big as our ocean, and ſometimes full, ſometimes dry. M. Azout rather imagined the ſpots to be protuberances of the belts. Hiſt. Acad. Sc. 1708. 1692. Phil. Tranſ. N° 34. 1. 15. But other aſtronomers take the ſpots, which are tranſparent and moveable, for the ſhadows of Jupiter's ſatellites. The belts of Jupiter were firſt obſerved, and deſcribed by Huygens in his Syſt. Saturnin. p. 7. See JUPITER.

Caſſini alſo ſpeaks of belts of Saturn; being three dark, ſtraight, parallel bands, or *faſciæ*, on the diſk of that planet. Saturn's belts do not appear to be inherent on his globe, as thoſe of Jupiter's are; but rather to be large dark rings at a diſtance from the planet, and ſurrounding his body. Some imagine them to be clouds in his atmoſphere. The middlemoſt ſeems to be the ſhadow of Saturn's ring. Hiſt. Acad. Sc. 1715. See SATURN.

BELTS, in *Geography* and *Navigation*, denote certain ſtraits near the Sound, through which ſhips paſs from the Baltic to the German ocean. They belong to the king of Denmark, who exacts a toll, varying in its amount, and in ſome circumſtances attending the collection of it, from all ſhips that paſs through them, as well as the Sound. (See SOUND.) They are divided into the *greater* and the *leſſer*. The *greater belt* forms a communication between the Scaggerack or Cattegat ſea and the Baltic, ſeparating the iſlands of Zealand and Funen. The *leſſer* or *little belt* forms a communication between the Cattegat and Baltic, and ſeparates the iſle of Funen from the continent. The paſſage from Aſſens to Arroe Sound, in the duchy of Sleſwick, acroſs the little belt, is 9 miles.

BELTURBET, a market and poſt town of Ireland, in the county of Cavan, ſituate on the river Erne, 81 Iriſh miles north-weſt of Dublin. It has a navigation through Lough Erne to Bellech, within three miles of Ballyſhannon, where it is interrupted by conſiderable falls. The navigation from Lough Erne is open to the town, with water enough in winter, and by reducing a few flats might be made completely ſo in all ſeaſons. No place indeed can be better ſituated for trade or for improvement; the beautiful expanſion of water and picturesque views are highly engaging, and the land is a ſound limeſtone. Yet the market is indifferently ſupplied, which may in great meaſure be attributed to the cuſtoms being taken in kind, without any lawful ſtandard or meaſure, ſo that it is more advantageous for the buyers and ſellers to go to other markets. Theſe cuſtoms are individual property, and ſet for 100l. per annum.

The town was regularly divided into compartments, termed homeſteads; each of which contains 36 ſquare yards, to which is annexed a proportionate quantity of bog. Every houſholder has alſo a right to graze on an extenſive common belonging to the town, which was given by the Laneſborough family, to which it formerly belonged, and which ſeems to have ſpared no expence for its improvement. Another grant of two hundred acres has become the property of the burgeſſes, who divided it, and have tranſmitted it down in their reſpective families. There are ſome neat houſes, eſpecially thoſe lately erected on the part now belonging to lord Farnham; but in general they are mean and thatched. There are an excellent flour-mill, a brewery, diſtillery, and malt-houſes in the town; and ſome yarn is brought to market, but no webs. Cultivation is improved in the neighbourhood; but is yet very defective. The manures uſed are aſhes, marl, and dung; though there is good limeſtone, and much of the ſoil conſiſts of deep clays which could be ſo well reclaimed with lime, yet this is never uſed, but ſent by the lake to the county of Fermanagh. In the church-yard is the veſtige of a great fortification, incloſing an extenſive plot of ground, the baſtions and ſaliant angles

of which are yet perfect; they were admirably planned and of great ſtrength. Belturbet was a borough town, and, previous to the union, ſent two members to parliament.

BELTZ, or Belz, a palatinate of that part of Poland which was formerly called Little, or Red Ruſſia, and which included three diſtricts, viz. Buſk, Horodla, and Hrabowice. Its capital, bearing the ſame name, is a large town, ſeated among marſhes in the confines of Volhynia. N. lat. 50° 15′. E. long. 23° 50′.

Beltz, a town of Croatia, 12 miles S. S. W. of Varaſdin.

BELVEDERE, or Belvidere, a town of European Turkey, and capital of a province of the ſame name, in the Morea, which province lies on the weſtern coaſt, and is the richeſt and moſt fertile in the Morea. From this province the raiſins called "Belvederes," derive their name. The town lies 20 miles ſouth of Chiarenza. N. lat. 38° 5′. E. long. 22° 0′.

BELVEDERE, in *Architecture*. See Belvidere.

BELVEZ, a town of France, and principal place of a diſtrict, in the department of the Dordogne, 9½ leagues S. S. E. of Perigueux. N. lat. 44° 46. E. long. 0° 54′.

BELUGA, in *Zoology*, the name of Delphinus Leucas in Pennant's Quadrupeds.

Beluga *ſtone*, in *Natural Hiſtory*, the name of a calculus or ſtone, found in the beluga fiſh. This ſtone is found in fiſh of both ſexes, but moſt frequently in the male; and in thoſe of all ages and ſizes. It occurs, however, but ſeldom; whence it is inferred, that theſe ſtones are no natural part of the fiſh, but mere morbid concretions, like the bezoar ſtones in the animals which produce them, or like the ſtone in human bladders. It is of various ſhapes and ſizes; but its moſt uſual figure is either globular or oval. It is of a yellowiſh-white colour, and of a ſmooth and naturally poliſhed ſurface, and in ſize it is between a pigeon's egg and that of a gooſe. It is uſually compact, ponderous, and ſolid, not friable, but requiring a ſtrong blow to break it; however, it yields eaſily to the ſaw, which defaces its internal ſtructure, that is naturally very elegant and regular. It conſiſts of ſeveral concentric coats, adhering firmly to one another, and formed about a nucleus, which generally appears to be ſome heterogeneous ſubſtance. It differs from all other ſtones of the ſame kind in its radiated ſtructure, as it is compoſed of a number of regular and even ſtriæ proceeding from the centre to the circumference, and repreſenting, both in colour and form, the flakes of the "terra foliata tartari," or the ſtriated ſpiculæ of antimony. If the ſtone be ſcraped to powder and ſprinkled upon a hot iron, it gives a faint urinous ſmell, and calcines into a light, inſipid, greyiſh earth. The people about the Volga hold it in high eſtimation, and aſcribe to it great virtues. They ſay, it promotes delivery; and they give it in caſes of the ſtone, and diſorders of the urinary parts, in doſes of from 10 grains to a dram. Phil. Tranſ. vol. xliv. p. 2. n. 4.

BELVIDERE, or Belvedere, in *Architecture*. This word meaning *beautiful view* is uſed in Italy, to denote thoſe edifices built for the purpoſe of enjoying a fine proſpect: theſe are of two kinds, either detached buildings, or little cupolas (or, to uſe the expreſſive Engliſh term, *look-outs*.) raiſed on the tops of houſes which terminate them ornamentally, and where one may enjoy the freſhneſs of the evening and the beauties of nature.

Almoſt all the houſes in Rome have belvederes of the laſt kind, the others generally belong to the palaces and pleaſure grounds of the great. The moſt celebrated and remarkable of all is the Belvedere of the Vatican. This large edifice was originally built by Bramante, detached from the pontifical palace, to which it has ſince been united by two long galleries. It commands the view of the rich champaign, which ſurrounds the town on this ſide; the chain of the Apennines forms the magnificent diſtance of the picture, while the foreground is occupied by the city itſelf, which is ſeen in its whole extent. It is from thence that one may ſay with Martial:

"Hinc ſeptem dominos videre montes
Et totum licet eſtimare Romam."

Belvederes are common in France; they are generally ſingle ſaloons open to the air, or encloſed with doors and windows. They are, however, ſometimes compoſed of various apartments, veſtibules, ſaloons, cabinets, &c. ſuch is the Belvedere in the menagerie of Seaux. When, however, theſe buildings are at a conſiderable diſtance from the manſion, and contain ſeveral apartments for the purpoſe of entertainment, they are called *Trianons*.

In England, though the name of Belvedere is not uſed, it may be properly applied to many of our garden-buildings. The old manſions were very commonly gloomy both in ſituation and in conſtruction, but they generally poſſeſſed a *ſummer-houſe*, which was built in an elevated and agreeable part of the garden, where in the moſt genial months of the year the family might enjoy the air, the proſpect, and the ſocial pleaſures, without the ceremony of the drawing-room. In our modern villas the beauties of ſituation are conſulted, and every idea of gloom is baniſhed by the long windows, the ſaſh-doors, and the wide extended lawn; the ſubſtantial ſummer-houſe is, therefore, unneceſſary; but of the temples, cottages, objects which adorn the modern grounds, while ſome are merely the ornaments of the landſcape, others very exactly anſwer the deſcription of the Belvedere.

Belvidere, or *Belvedere*, in *Botany*. See Scoparia.

Belvidere, in *Geography*, a new townſhip of America, in Franklin county, and ſtate of Vermont.—Alſo, a village in New Jerſey, in the Suſſex county, on the Delaware river, and at the mouth of Pequeſt river, 11 miles above Eaſton, in Pennſylvania.

BELVIS, a ſmall town of Spain, in Eſtremadura, with a caſtle, ſeated between two mountains.

BELULCUM, a ſurgical inſtrument of various figures, contrived for extracting darts, arrows, or the like, from wounds. Hence alſo the denomination *belulcum; quaſi το βελος ελκων*.

BELUNUM, in *Ancient Geography*, a town of Italy in Rhætia, and the country of the Veneti, now *Belluno*.

BELUR, in *Geography*, the general name given to the Alpine region, which divides the ſouthern parts of the ancient Scythia, or Great Bucharia, from Little Bucharia, lying in about N. lat. 37°. and E. long. 71°. between Kotlan to the north, and Kilan to the ſouth, and Badakſhan in Great Bucharia on the weſt, and Balſiſtan, or Little Thibet, on the ſouth-eaſt. Strahlenberg has introduced a town of the ſame name into his map, but its exiſtence is dubious. Rennel places it at the foot of the mountain, in N. lat. 37°. and E. long. 71°. He has alſo marked a lake near it, from whence flows the Amu, which, after its junction with ſeveral others, proceeds to Badakſhan.

Belur *Tag*, denoting, in the Mungl language, "the dark or cloudy mountains," part of that ridge of mountains which, in a nearly meridional courſe, terminates Great Bucharia on the eaſt, and divides it from Little Bucharia. Theſe mountains are covered with perpetual ſnow. They form a chain, ſuppoſed to be the ancient Imaus, which proceeds nearly north and ſouth, and is continued by the mountains of Alakor Alak Oola, on the north of Little Bucharia, which join the Bogdo, and on the ſouth is more intimately connected with the Hindooh Koh than with the northern ridges of Thibet. Thoſe who live at the foot of theſe mountains gather a great quantity of gold and ſilver duſt in the

ſpring,

ſpring, which is brought down by torrents when the ſnow melts.

Belus, in *Entomology*, a ſpecies of Papilio, that inhabits Surinam. The wings are greeniſh; inner margin of the poſterior pair rather pale; beneath brown, with red lunar marks. Fabricius and Jabloński.

Belus, in *Ancient Geography*, a town of Spain, ſituate near the columns of Hercules. Steph. Byz. This was probably the ſame with Belo or Belon.

Belus, now *Kardanah*, a river of Phœnicia, which flowed at the diſtance of two ſtadia ſouth from Ptolemais. It had its ſource in mount Carmel, about 4 miles to the eaſt of the Kiſhon, in the lake called by Pliny Cendevia. The ſand of this river and its vicinity was peculiarly excellent, according to Strabo, for the manufacture of glaſs; and here, according to Pliny, the manufacture of glaſs was firſt diſcovered.

Belus, in *Ancient Hiſtory* and *Mythology*, is ſuppoſed by ſome to have been the Pul of ſcripture; and the founder of the Aſſyrian monarchy; and they add, that he left his kingdom to his ſon Ninus, or Tiglath-Pileſer, who cauſed him to be worſhipped after his death, and erected to his honour the famous tower of Babel, or Belus, in the city of Babylon. Others conceive Belus to have been the Nimrod of Scripture, and more ancient than the Aſſyrian kingdom. (See Assyria and Babylon). The tower of Belus was afterwards uſed by the Chaldeans as an aſtronomical obſervatory; and it is ſaid, that Belus himſelf promoted the ſtudy of aſtronomy, in order to encourage that faith in aſtrological predictions, which he knew how to apply to political purpoſes. Hence, as Belus was honoured with a place among the divinities, ſome have traced the origin of thoſe fables that are found concerning him in the Grecian mythology, to this circumſtance.

Belus, conſidered as the founder of the Aſſyrian and Babylonian empires, became the principal object of veneration and worſhip among the later Babylonians, Phœnicians, and others, over whom the deſcendants of his family extended the dominion he had founded. Accordingly, a temple was erected to him in the city of Babylon, and alſo a tower; though it is not improbable, that the honour of this temple and tower was meant to be divided between him and the true God. This building (ſee Babylon) conſiſted of eight towers raiſed above one another; and in the apartments was placed a magnificent bed, with a golden table near it, but without any image; nor was any perſon ſuffered to lie here in the night, except a particular woman, who, as the prieſts reported, was preferred by the god to all others. In this place, according to their account, he uſed to come and repoſe himſelf; ſo that they muſt have regarded him as the ſupreme god, who either could not be repreſented, or not bear the preſumption in them of attempting his reſemblance. Beneath this there was another temple, in which was a gigantic image of Jupiter or Belus, made of ſolid gold, with a table and a throne of the ſame metal. This Jupiter, ſuppoſed to be the great Pul, or Belus, by being placed below the great and ſupreme god, ſeems to have implied, that Belus, or Pul, divided the empire of the univerſe with him, and that as the former was the god of heaven, the other was at leaſt delegated god on earth, and inveſted with all power by the immediate appointment of the inviſible ruler of all things. Some have ſuppoſed, that the Babylonians, by their ſuperior deity, meant the ſun, which was undoubtedly a very ancient and a very general object of worſhip; and the appellation Belus itſelf might be ſynonymous with that of Baal, which denoted god or lord. (See Baal.) In the Babylonian temple there were alſo two altars, one of gold, of a moderate ſize, and another much larger: on the former were ſacrificed none but ſucking victims, and on the other none but thoſe that were full grown. The former ſeemed to have been devoted to the ſupreme god; and the other to his ſubordinate, Jupiter. They had alſo ſacrifices that were offered to both. Upon the whole, it ſeems not improbable, that by Bel, Baal, or Belus, the Babylonians underſtood either the ſun or their deified founder Pul; but whether they transformed him into the ſun, or kept the worſhip of this luminary, and that of their hero diſtinct, ſo as never to confound them together, is a queſtion not eaſily decided. For a deſcription of the temple of Belus, ſee Herodotus, lib. i. ſee alſo Babylon.

BELUTTA, in *Botany*. See Celosia and Crinum.

BELY Bogue, in *Mythology*. See *Bely* Bogue.

BELZICA, in *Geography*, a town of Poland, in the palatinate of Lublin, 14 miles S. W. of Lublin.

BELZIG, a town of Germany, in the circle of Upper Saxony, and electorate of Saxony, ſeated on the Welſe; 30 miles E. of Magdeburg. The prefecturate of which this is the chief town bears the ſame name.

BEMA, *βημα*, in *Antiquity*, denotes a ſtep or pace.

The bema made a kind of itinerary meaſure among the Greeks, whoſe length was equivalent to one cubit, and two thirds, or ten palms.

Whence alſo the term *βηματιζειν*, *to meaſure a road*.

Bema, in *Eccleſiaſtical Writers*, denotes the altar-part, or ſanctuary, in the ancient churches. In which ſenſe, bema made the third or innermoſt part of the church, anſwering to the chancel among us.

Bema was alſo uſed for the biſhop's chair, ſeat, or throne, placed in the ſanctuary. It was called bema, from the ſteps by which it was to be aſcended.

Bema was alſo uſed for the reader's deſk.

This in the Greek church was denominated *βημα γνωσεως*, in the Latin church ambo.

Bema is more peculiarly uſed for the *Manichees'* altar, which was in a different place from that of the catholics.

Bema was alſo a denomination given by this ſect to the anniverſary of the day when *Manes* was killed, which with them was a ſolemn feaſt, and a day of rejoicing.

One of the chief ceremonies of the feaſt conſiſted in ſetting out and adorning their bema, or altar, with great magnificence.

BEMBEA, or Bembi, in *Geography*, a province of the kingdom of Angola in Africa, which is divided into Higher and Lower, extending on one ſide along the ſea, and on the other dividing the kingdom of Angola from the other foreign ſtates on the ſouth. The country is populous, and abounds with large and ſmall cattle, with the fat of which the inhabitants anoint their heads and bodies; and they alſo clothe themſelves with the hides, coarſely dreſſed. They are addicted to the ſame idolatrous ſuperſtitions with other parts of the kingdom, but ſpeak a quite different language. The great river Lutano, or San Franciſco, waters and fertilizes moſt part of this province; but ſwarms with crocodiles, ſea-horſes, and monſtrous ſerpents, which not only deſtroy much of its fiſh, but do great miſchief to the adjacent grounds.

BEMBER, a town of Hindoſtan, in the direct road from Lahore to Caſhmere; at the diſtance of 33 Acbaree coſſes (each coſs being 4757 yards,) on a bearing of N. a little W. from Lahore. N. lat. 33°. E. long. 73° 30′.

BEMBEX, in *Entomology*, one of the Fabrician genera of Piezata, and forming, in the Linnæan ſyſtem, a ſection in the Vespa genus; they are diſtinguiſhed by having the tongue inflected, and five cleft; lip advanced, mouth involved. See Vespa.

BEMBO,

BEMBO, Peter, *Cardinal*, in *Biography*, an eminent reſtorer of literature, was the ſon of Bernardo Bembo, a Venetian nobleman, and born at Venice in 1470. Having ſtudied Latin and polite literature, in his early youth, under Urticio, he went to Meſſina in 1492, to purſue the ſtudy of the Greek language, under Conſtantine Laſcaris. At Padua, whither he removed in 1495, he received inſtructions in philoſophy from Nicholas Leonico Tomeo. Upon his father's ſettlement at Ferrara in 1498, he had an opportunity of forming an intimate friendſhip with Leoniceno, Tebaldeo, Sadoleto, and Hercules Strozzi, and he ſoon afterwards began to diſtinguiſh himſelf as a writer. His "Azolani," which were diſcourſes on love, written in the Italian language, and ſo named from the caſtle of Azoli, where they were compoſed, became very popular throughout Italy. At this time he was alſo one of the principal ornaments of the academy, founded by Aldus Manutius in his native city. In 1512 he viſited Rome, and was well received by pope Julius II. and by his ſucceſſor Leo X. he was appointed ſecretary, with an ample ſalary. Although, in conformity to the licentiouſneſs of the papal court at this time, he kept a miſtreſs, by whom he had three children, he diſcharged the duties of his office to the pope's ſatisfaction, and was employed by him in various important embaſſies. In 1520, he removed to Padua, for the recovery of his health, where, upon the death of the pope, he fixed his reſidence, paſſing a tranquil life in the proſecution of his ſtudies, and in the converſation of men of letters. To his houſe, which was richly furniſhed with books and MSS. a ſelect collection of medals and antiquities, and a botanical garden, men of ſcience reſorted as to a literary academy. In 1539, he was nominated to the dignity of cardinal by pope Paul III. which with ſome reluctance he accepted, and he then removed to Rome. He was previouſly ordained prieſt; and, it is ſaid, that he altogether changed his mode of life, and ſedulouſly devoted himſelf to the duties of his eccleſiaſtical functions. Although he was nominated to the biſhopric of Gubbio in 1541, and in 1544 tranſlated to that of Bergamo, he reſided at Rome, and was much honoured by the pope, as well as reſpected by perſons of the firſt character in the court. He died Jan. 18, 1547, and was buried in the Dominican church, called St. Maria Alla Minerva. As a writer of Italian verſe, cardinal Bembo formed himſelf upon the model of Petrarch, and contributed to reform and poliſh the poetry of his own country. His proſe compoſitions are written with elegance and purity of expreſſion, but without any diſtinguiſhing traces of genius. In his Latin ſtyle, he was "Ciceronian," to the extreme of affectation; and on this account he was cenſured and ridiculed for applying the terms "heros" to Chriſt, and "dea" to the Virgin Mary; and for uſing "perſuaſio" for faith, and for denoting Leo's election by "deorum immortalium beneficiis." Like many others of the Italian literati of that age, he ſeems to have thought lightly of his religious creed; and to have been more afraid of tranſgreſſing with regard to his Latinity than with reſpect to the decorum which religion required. To this purpoſe, he diſſuaded a friend from reading St. Paul's epiſtles, leſt he ſhould injure his ſtyle; and it is ſaid that he would never read the briefs or breviary for fear of corrupting his own Latinity. Nevertheleſs his own epiſtles have been charged with groſs faults, and even ſoleciſms. Some compoſitions of his early days were licentious and obſcene. His "Hiſtory of Venice," written in claſſical Latin, in 12 books, was undertaken in 1530, by the order of the council of ten, and is more admired for elegance of diction than for profundity and accuracy. His principal works are, "Epiſtolæ, nomine Leonis pont. Max. lib. xvi." Venet. 1536; "Epiſt. Familiarum," lib. vi. Venet. 1552; "Le Rime," comprehending his poetical verſes, in one volume, Rom. and Venet. 1548; "Le Proſe," held in high eſtimation by the Italians, in alluſion to which Apoſtolo Zeno ſays, that "Bembo was the firſt who explained to his countrymen the mechaniſm and conſtruction of their native language." "Hiſtoria Rerum Venetarum, lib. xii." Venet. 1551. All his works, both in Italian and Latin, were collected and publiſhed in 4 vols. fol. Venice, 1729. Gen. Dict. Gen. Biog.

BEMBRIDGE Point, in *Geography*, lies at the eaſtern extremity of the iſle of Wight, in N. lat. 50° 40′ 15″. and W. long. 1° 4′ 45″, and is well known to ſeamen as a ledge that runs more than two miles into the ſea, E. N. E.

BEM-CURINI, in *Botany*. See Justicia.

BEMELS, in *Geography*, a town of the Netherlands, in the duchy of Luxemburg, ſeated on the eaſt ſide of the Moſelle: 2 miles N. E. of Graven Macheren.

BEMICARY Point and Bay, are ſituate between Dry and Milk river, about N. W. by W. from the pitch of Portland, the ſouthern extremity of the iſland of Jamaica. The point or eaſtern limit of the bay is in N. lat. 17° 55′. and W. long 77° 17′.

BEMILUCIUS, in *Mythology*, a ſurname of Jupiter, repreſented young and beardleſs.

BEMINSTER, or Beaminster, in *Geography*, a town of conſiderable antiquity in the county of Dorſet, England. It is ſeated on the ſmall river Birt, which riſes near the town, and running ſouthward falls into the Britiſh channel at Bridport harbour. This manor, and two others connected with it, belong to two of the prebends of Saliſbury cathedral. Though of remote origin, Beminſter does not contain any particular object of antiquity, and its chapel, a handſome large pile of building, is dependent on the pariſh church of Netherbury, which is nearly two miles diſtant. The town is large and reſpectable, having many manufacturers ſettled in it, and moſt of its inhabitants employed in making ſail-cloth, locks, copper goods, leather, &c.; and ſome of theſe trades are greatly facilitated by the water of the river Birt, and the machinery operated on by it. Beminſter has ſuffered repeatedly and materially by fire, and the deſtructive ſword of civil war. Theſe two were united on the 14th of April 1644, when prince Maurice was quartered in the town, but forced to quit it on that day, as the enemy had fired it in five places. From the report of a perſon who viſited it ſoon after, we are informed it was "the pityfulleſt ſpectacle that man can behold, hardly a houſe left not conſumed by fire. There were ſevenſcore and four dwelling-houſes, beſides barns and ſtables burnt," and the loſs ſuſtained was eſtimated at above twenty-one thouſand pounds. The inhabitants ſoon afterwards received from the parliament 2000l. with which, and other ſums, they rebuilt the town; but in June 1664, it was again conſumed, when the loſs amounted to nearly 10,000l. In March 1781, another fire occured here, and in a few hours upwards of fifty dwelling-houſes, with ſeveral barns, ſtables, outbuildings, &c. were reduced to ruins. In ſpite of theſe calamitous events, Beminſter is now a populous and flouriſhing town, conſiſting of 337 houſes, and 2140 inhabitants. Its principal public buildings are the chapel, a free-ſchool, an alms-houſe, and a market-houſe. The firſt ſtands on high ground at the ſouthern ſide of the town, and conſiſts of a body, two aiſles, a chancel, a chantry, and a high tower. On the weſtern front of the latter are ſome emblematical ſtatues in niches. Within the chapel are ſome handſome monuments to the Strodes, and other families. The free-ſchool was founded by Mrs. Frances Tucker, in 1684, for the education of twenty of the pooreſt boys of the town. The Rev. Samuel Hood, father of the lords Hood and Bridport, was maſter of this ſchool in 1777.

The

The alms-houſe was built and amply endowed by Sir John Strode of Parnham, knt.

In this town are one annual fair, a weekly market on Thurſday, and two annual public ſales for cattle, cheeſe, &c.

About one mile ſouth of Beminſter is Parnham, an ancient manſion belonging to Sir William Oylander, bart. At Eaſt-Axnoller, in this neighbourhood, is a hill of the ſame name, whence iſſue three ſprings, which are the ſources of the rivers Axe, Birl, and Simene. Hutchins's Hiſtory of Dorſetſhire, vol. i.

BEMMEL, William Van, in *Biography*, a painter of landſcapes, was born at Utrecht in 1630, and after having been a diſciple of Herman Sachtleven, viſited Rome for the improvement of his taſte and knowledge. His colouring is lively and natural, but ſometimes inclining too much to green; his figures, ſuch as boats, barges, and other veſſels, introduced on the rivers or ſtationed near the banks, are well deſigned, and touched with ſpirit. The lights and ſhadows of his landſcapes are diſtributed with ſingular ſkill, and his ſkies are uſually clear, warm, and natural. He died in 1703. Pilkington.

BEMNASIR, in *Geography*, a town of Perſia, in the province of Kerman; 140 miles S. E. of Sirgian.

BEMOL, Fr. B-molle, *Ital.* in Guido's Scale of *Muſic*, implies B flat, the 4th of the key of F natural, and the molle hexachord.

In early times of counterpoint, before tranſpoſed keys were uſed, i. e. keys different from the authentic and plagal modes, (ſee Ecclesiastical Modes), the 4th of a major key, deſcending, and 6th of a minor key, were underſtood to be flat, and the 7th, aſcending, ſharp, without being marked. And though two of the modes are in the key of D minor, and two in F major, all which require one flat at the clef, and two in E minor, and two in G major, each requiring a ſharp at the clef, they were left to the divination of the finger, without characters of indication. See Hexachord and Mode.

The Abbé Feyton, in ſpeaking of theſe myſteries, muſt be allowed to have exerciſed ſcience and ingenuity, yet, it is to be feared, that the young ſtudent will be more puzzled and perplexed than enlightened by his ſubtilities in this article.

BEM-Posta, in *Geography*, a ſmall town of Portugal in the province of Tras-los-Montes, containing about 400 inhabitants.

BEN, Been, or Behen, *Oil of*, is a fine inodorous and inſipid fixed oil, procured from the Ben nut, (Glans Unguentarius, Balanos Murepſiki) the fruit of the Guilandina *Moringa*.

The oil of Ben is prepared in the Levant, in Egypt, Syria, and alſo in Italy, by expreſſion of the nut. Geoffroy gives the quantity of oil procured to be 30½ ounces from about 8 pounds of the nut. The oil is valuable on account of its great purity, and freedom from ſmell and taſte; hence it may be kept for a long time without altering, or becoming in any degree rancid and acrimonious. On this account it is not diſpoſed to become drying, like ſo many of the other fixed oils. It is uſed very largely in perfumery as a baſis or vehicle into which the art of the perfumer is able to infuſe the fine fragrant ſcent of various delicate flowers, that do not of themſelves retain a ſufficient baſis in which to fix their ſcent. Thus a great proportion of the oily eſſences of the ſhops are only perfumed oil of ben, and the ſcenting matter (which is probably a very minute quantity of eſſential oil) may be again ſeparated from the oil of ben, by means of alcohol. The method of preparing this perfumed oil we have deſcribed under the article Aroma.

The unalterability of this oil would render it the moſt valuable ſubſtance for cerates or liniments in pharmacy, were it ſufficiently common. It is actually employed for this purpoſe in many parts of Italy.

Ben *Dubb*, in *Geography*, a mountain of Ireland, ſituate partly in King's county, and partly in the county of Tipperary; 16 miles weſt of Kilkenny.

Ben *Cruachan*, a ſolitary mountain of Scotland, in Argyleſhire, the elevation of which is 3300 feet above the ſea.

Ben *Levagh*, a mountain of Ireland, in the county of Galway; 4 miles S. W. of Roſs.

Ben *Laures*, *Ben Ledy*, *Ben Lomond*, *Ben More*, *Ben Verlich*. See Grampian *Hills*.

Ben *Nevis*, or Benevis, a mountain of Scotland in the Highlands, reckoned to be the higheſt mountain in Great Britain, being eſtimated at 4370 feet above the level of the ſea, and yet not much above the quarter of the height of Mount Blanc. It is ſituated in the pariſh of Kilmalie, Inverneſsſhire. This extraordinary mountain has never been ſufficiently inveſtigated by any mineralogiſt; but Mr. Williams ſays, that it conſiſts moſtly of porphyry "of a reddiſh caſt, in which the pale roſe, the blueiſh, and yelloviſh white colours are finely blended, and ſhaded through the body of the ſtone." Many ſpecimens of green porphyry are alſo intermixed, with angular ſpecks of white quartz. A red granite alſo prevails, which contains a vein of lead ore impregnated with ſilver. On the north-eaſt ſide this mountain preſents a precipice nearly perpendicular, and of a prodigious height, being by ſome accounts 1500 feet. The view from the ſummit is grand, exhibiting moſt of the weſtern iſlands, from the paps of Jura to the hills of Cullen in Skey; on the eaſt it extends to Ben Lawres in Perthſhire, and the river Neſs; and the extent of view is about 80 miles. The ſuperior half of the mountain is almoſt deſtitute of vegetation. The ſummit is flat, with a gentle acclivity. Snow remains in the crevices throughout the year; but here are no glaciers, nor other magnificent Alpine features. Drumalban, the "Dorſum Britanniæ," of the old writers, ſeems to be Ben Nevis, with the high deſert moor of Ranaal, extending 20 miles to the eaſt of that mountain. To the north-weſt of Ben-nevis is the long mountain of Corriarok, near fort Auguſtus, over which a military road has been formed in a zigzag direction. Near the foot of this mountain ariſes the rapid river Spey, and various other ſtreams, all running to the weſt. Sinclair's Account of Scotland, vol. viii. Williams's Natural Hiſtory of the Mineral Kingdom.

Ben *Wevis*, a mountain of Scotland in the Highlands, on the weſt of Roſsſhire, eſtimated at 3720 feet in height.

Several other mountains of Scotland are diſtinguiſhed by the appellation *Ben*, in conjunction with ſome other word.

BENABARRI, or Benavarri, a valley, and a place of the ſame name, ſeated among the Pyrenees in the province of Aragon, in Spain, on the frontiers of Catalonia. N. lat. 41° 55'. E. long. 0° 40'.

BENAC, a town of France, in the department of the Ille and Villaine, and chief place of a canton in the diſtrict of Redon; 8¼ leagues S. of Rennes.

BEN-ALI, a populous town of Egypt, between Monfalût and Aſſiût, or Sioût. Theſe three places, with Girgé, conſtitute the chief marts of the trade of Upper Egypt.

BENAMENIL, a town of France, in the department of the Meurte, and chief place of a canton in the diſtrict of Luneville; 2½ leagues eaſt of Luneville.

BENARES, a ſoubah or province of Hindoſtan, bounded on the north and north-weſt by Oude, on the eaſt by Bahar, and on the ſouth and weſt by Allahabad. This diſtrict is about 120 miles long, and 100 broad; and contains, with its dependencies, 12,761 ſquare Britiſh miles; its ſoil is fertile, and

the country populous. The Zemindary of Benares, which includes alſo the circars of Gazypour and Chunar, conſtituted a part of the dominions of Oude, until the year 1775, when its tribute or quit-rent of 24 lacks, ſince increaſed to 40, was transferred to the Engliſh, on occaſion of the ceſſion of the province to the India Company. This Zemindary, lately in the hands of Cheet Sing, occupies the principal part of the ſpace between Bahar and Oude, ſo that only a ſmall part of the territory of the latter touches Bahar on the north-weſt. In 1786 the clear revenue of Benares amounted to 380,000l. Almoſt in every village of this province, which is in a very proſperous ſtate, a perſon is employed in teaching the youth to read and write; and they have a ſingular method of teaching reading and writing at the ſame time. The boys are collected upon a ſmooth flat of ſand, and with a finger or a ſmall reed form the letters there, which they pronounce at the ſame time. As often as the ſpace before each ſcholar is filled up with writing, it is effaced, and prepared for a new leſſon: thus the expence of pens, ink, paper, and even a houſe is avoided. The education at Benares is chiefly inſtituted for the Brahmins.

Benares, the chief city of the forementioned diſtrict, is very rich, and the moſt completely built of any. It occupies the north bank of the Ganges, and is diſtant from Calcutta by the road, about 460 miles, and by Moorſhedabad 565 miles. Its ancient name was Kaſi; but there are no notices concerning it in the works of the ancient geographers. If it had exiſted during the time of the Syrian ambaſſadors, Pliny would have noticed it, as he has done Methora or Matura, and Cliſobara, which lay near the Jumnah river. This city is about ſix miles long and four wide; and may be viewed in its utmoſt extent from the tops of the Minarets of the moſque, erected by Aurungzebe on the foundation of an ancient Hindoo temple, and lately repaired by Mr. Haſtings. It abounds in coſtly ſtructures; but Mr. Forſter, in his "Journey from Bengal to England," ſays, that the irregular and compreſſed manner which has been invariably adopted in forming the ſtreets, deſtroys the effect which ſymmetry and arrangement would have beſtowed on a city, entitled, from its valuable buildings, to a preference of any capital, ſeen by him in India; and it is alſo very injurious to the ſalubrity of the town. At Benares the number of Europeans is very ſmall; a judge, regiſter, collector, with a few civil ſervants, conſtitute the whole of the company's eſtabliſhment there; and a few private merchants and planters make up the whole ſociety. Of natives, however, the number is great; and many of the bankers are the principal creditors of the India company, and poſſeſs immenſe fortunes. The poor in Benares are ſtill more numerous, owing to the crowd of pilgrims, who come from all parts to viſit ſo ſacred a place. Mr. Hodges, in his "Travels in India," informs us, that in examining one of the temples of Benares, he was ſurprized to find moſt of the ornamental parts of Grecian architecture in a building erected on the plains of Hindoſtan. Benares has been from time immemorial the Athens of India, the reſidence of the moſt learned Brahmins, and the ſeat both of ſcience and literature. Here, it is probable, whatever remains of the ancient aſtronomical knowledge and diſcoveries of the Brahmins is ſtill preſerved. M. Bernier (Voy. ii. p. 148.) ſaw, in the year 1668, a large hall in this city filled with the works of the Indian philoſophers, phyſicians, and poets. Sir Robert Chambers has deſcribed the obſervatory at Benares, which he viſited in 1772. (See Observatory). He has more lately diſcovered in this city the "Surya Siddhanta," on the principles of which the whole Indian aſtronomy is founded. Several conſiderable extracts of this work have been tranſlated by Samuel Davis, Eſq. to whom this valuable work was communicated. It is compoſed in the Sanſkreet language, and profeſſes to be a divine revelation, communicated to mankind more than two millions of years ago, towards the cloſe of the Sutty or Satya Jogue, the firſt of the four fabulous ages, into which the Hindoo mythologiſts divide the period during which they ſuppoſe the world to have exiſted. It appears from what is already known of this book, that independently of the fiction and romance which are blended in the account of its origin, it contains a very rational and elaborate ſyſtem of aſtronomical calculation, and ſeveral rules and tables, for the calculation of eclipſes, &c. which ſeem very much to favour the hypotheſis adopted by M. Bailly, Dr. Robertſon, and others, that aſcribes a very high antiquity to the aſtronomy of the Brahmins. In the rules contained in this work is included a ſyſtem of trigonometry, founded on certain geometrical theorems, with which, though unknown to Ptolemy and the Greek geometricians, modern mathematicians are well acquainted. For an account of the aſtronomical computations of the Hindoos, by Samuel Davis, Eſq. ſee Aſiatic Reſearches, vol. ii p. 225, &c. 8vo. and for remarks on the aſtronomy of the Brahmins, and for an account of the principles on which the Hindoo ſyſtem of trigonometry is founded, by profeſſor Playfair, ſee Edinb. Tranſ. vol. ii. p. 135. It appears, however, from an elaborate diſſertation on the antiquity of the Surya Siddhanta, by Mr. J. Bentley, publiſhed in the Aſiatic Reſearches, vol. vi. p. 540, &c. that the ſyſtem, ſo eagerly applauded and referred by the above-mentioned writers to ſuch remote antiquity, cannot be of a greater age than 731 years; or that it was compoſed about A. D. 1068.

Notwithſtanding the ſcience and literature that have been cultivated by the Brahmins at Benares, we diſcover traces of ſuperſtition, and even of inhumanity, in ſome of their cuſtoms, which, it is hoped, the interference of the court of juſtice, eſtabliſhed there in 1783, will gradually reſtrain and reform. As the perſon of a Brahmin is inviolate, no atonement can expiate the crime of occaſioning his death. Hence originated a practice, which was formerly frequent at Benares, and which in its effects approaches the neareſt to our caption, or arreſt. The Brahmin, who adopts this expedient, in order to procure redreſs, proceeds, armed with a dagger or poiſon, to the door of his adverſary's houſe; where he deliberately ſets himſelf down, and threatens to commit ſuicide, if the offender ſhould attempt to paſs or moleſt him. He faſts with inflexible rigour, to which the other party likewiſe ſubmits, and perſeveres in his reſolution until ſatisfaction is obtained. This practice, called ſitting in "Dherna," is not confined to the male Brahmins only; for an inſtance occurred at Benares in 1789, of a widow's recurring to this expedient, in order to obtain, in a litigation with her brother-in-law, that juſtice, which neither the award of arbitration nor the deciſion of the court had granted her. Both faſted pertinaciouſly during thirteen days, when, worn out with hunger, her antagoniſt at laſt yielded the conteſt. Another inſtance occurred in 1794. An inhabitant of a diſtrict in the province of Benares ſat in Dherna before the houſe of ſome Rajepoots, for the purpoſe of obtaining the payment of "Birt," or a charitable ſubſiſtence, to which he had a claim; and in this ſituation deſtroyed himſelf by ſwallowing poiſon. Some of the relations of the deceaſed retained his corpſe for two days before the houſe of the Rajepoots, who were thus compelled to forego taking ſuſtenance, in order to induce them to ſettle the Birt on the heirs of the deceaſed Brahmin. This practice is not ſpecifically pointed out by the ſhaſter, but depends merely on the ſanction of uſage. Another practice of the Brahmins, equally

equally ſingular, and more cruel, is called erecting a "Koor." Having conſtructed a circular pile of wood, and placed upon it a cow, or an old woman, they prepare to conſume the whole together. The object of this practice is to intimidate the officers of government, or others, from urging importunate demands, or levying grievous exactions, as the effect of the ſacrifice is ſuppoſed to involve in great guilt the perſon whoſe conduct obliges the conſtructor of the Koor to adopt this expedient. The only caſe of ſetting up a Koor, that occurred for many years, happened near Benares in 1788; but the ſacrifice was prevented by the timely interpoſition of authority. There are a few inſtances of ſtill more atrocious acts, by which the Brahmins ſeek to repel injuries, or to wreak their feeble vengeance; as by murdering, with mutual conſent, their neareſt and moſt beloved relations, from a perſuaſion that horror of the deed will redound on the head of their oppreſſor. Sir John Shore (*ubi infra*) relates three ſhocking caſes of that nature, which, ſo late as the years 1791 and 1793, came under his cognizance in the province of Benares. It further appears by Sir John Shore's report, that a whole tribe of Hindoos, denominated "Rajekoomars," and reſident on the frontiers of Juanpore, a diſtrict of the province of Benares, adjoining to the country of Oude, have been long accuſtomed to the ſavage practice of cauſing mothers to ſtarve to death their female offſpring; and that the only reaſon aſſigned for this inhuman cuſtom was the great expence of procuring ſuitable matches for their daughters, if they ſuffered them to grow up. Meaſures have been taken and rigidly enforced for aboliſhing this barbarous practice, to which, however, there are ſome few exceptions; as certain families among the Rajekoomars allow, at leaſt, one female child to be reared, and one village furniſhes a complete exception to the general cuſtom. Among the ſuperſtitions prevailing in the province of Benares, we may mention the following circumſtance relating to the ſugar-cane. If any of the old cane remains unemployed in the new plantation, the proprietor repairs to the ſpot previouſly to the 25th of Jeyte, or 11th of June, and having ſacrificed to Nagbele, the tutelar deity of that plant, he carefully ſets fire to the whole; it being firmly believed by the "ryots," or huſbandmen, that if a ſingle cane ſhould flower after that term, it would portend the moſt dreadful calamities to themſelves and their families. We ſhall here add, that faith in charms, amulets, ſorcery, faſcination, and aſtrology, ſtill prevails in the eaſt. See Soontaars. Aſiatic Reſearches, vol. iv. p. 329, &c. 8vo. The Hindoo obſervatory at Benares is ſituated in N. lat. 25° 18′ 36″. E. long. 83° 10′.

BENARU, a town of Perſia, in the province of Fariſtan, 108 miles S. S. E. of Schiras.

BENARVILLE, a town of France, in the department of the Lower Seine, 5 leagues N. E. of Montivilliers.

BENASCHI, John Baptist, in *Biography*, a painter and engraver, was born in Piedmont, A. D. 1636, and became a diſciple of Pietro del Po. He imitated the works of Lanfranchi ſo ſucceſsfully, that his pictures have been miſtaken for the performances of that maſter. He is repreſented as a man of great genius, and the freedom and facility, which appear in his pictures, are highly commended. He died at Rome in 1690. He etched for his amuſement "A holy family," from Dominicus Cerini, his intimate friend. Strutt.

BENATKY, or Benatek, in *Geography*, a ſmall town of Bohemia, with a citadel, in the circle of Boleſlaw, ſeated on the Iſſer, 22 miles N. E. of Prague.

BENAVARRI. See Benabarri.

BENAVENTE, a town of Spain, in the country of Leon, ſeated on the Eſla, and containing about 4000 inhabitants; 13 leagues S. of Leon.

BENAVIDIO, Marcus Mantua Benavidius, in *Biography*, a celebrated civilian, was born at Padua in 1490, and taught the civil and canon law in his native city for 60 years, with high reputation. He there received the honour of knighthood, viz. from the emperors Charles V. and Ferdinand I. and from pope Pius IV. He died in 1582, and was the author of ſeveral works in his own profeſſion; among which are "Collectanea ſuper jus Cæſareum;" "Obſervationum Legalium," lib. x. and "De Illuſtribus Juriſconſultis." Moreri.

BENBECULA, in *Geography*, is the name of one of thoſe iſlands of Scotland called the Hebrides. It lies between the iſles of N. and S. Uiſt, from the laſt of which it is ſeparated by a narrow channel, nearly dry at low water. This iſland is rather flat, and meaſures only about nine miles in tranſverſe diameter. Its ſoil is ſandy and barren; but the quantity of ſea weed conſtantly driven on ſhore, is appropriated to meliorate ſome portions of the land. In one part of the iſland is an ancient fort called Elvine Nean Ruarie, and ſeveral ſtone monuments are found in different parts of it. It has a harbour for ſmall fiſhing veſſels, and ſeveral freſh water lakes, ſtored with fiſh and fowl.

BENBRICK, a mountain of Scotland, in the county of Perth; 12 miles N. N. W. of Crieff.

BENBALBEN, mountains of Ireland, in the county of Sligo; 7 miles N. of Sligo.

BENCH. See Banc, Bank, &c.

Bench, *Amicable*. See Amicable.

Bench, *King's*. See Court *of King's Bench*.

Bench, *free*. See Free-*bench*.

Bench *iſland*, in *Geography*, lies within the ſouth-eaſt point of what is called South-eaſt bay, in the ſouthern part of New Zealand.

Bench-*widow*. See Widow.

BENCHERS, in the *Inns of Court*, the ſenior members of the houſe, who have the government and direction thereof; and out of whom is yearly choſen a treaſurer, &c.

BENCOOLEN, in *Geography*, a ſea-port town and fort on the ſouth-weſt coaſt of the iſland of Sumatra, where the Engliſh have a ſettlement and a factory. This is one of the four Engliſh preſidentſhips, or governments, to which all the other factories are ſubordinate; the other three are Madras, Bengal, and Bombay. Bencoolen, which is about 2 miles in compaſs, is known at ſea by a high ſlender mountain, called the "Sugar Loaf," and riſing 20 miles beyond it in the country. Before the town lies an iſland, within which the ſhips uſually ride, and with this, the point of Sillebar, extending 2 or 3 leagues ſouthward of it, forms a large and commodious bay. A convenient river on its north-weſt ſide brings the pepper, of which the trade of the town chiefly conſiſts, from the inland country: but it is ſhipped with inconvenience, on account of a dangerous bar at the mouth of the river. It is principally inhabited by natives, who build their houſes on pillars of bamboo wood. The Engliſh, Portugueſe, and Chineſe, have each a ſeparate quarter. The adjacent country is mountainous and woody, and there are many volcanos in the iſland. As the town ſtands upon a moraſs, the air is loaded with vapours, and the mountains are covered with thick clouds, that produce lightning, thunder, and rain. The climate of Bencoolen has proved more ſickly and fatal than that of any of the other Britiſh ſettlements, not only to the Engliſh, but to all who have been accuſtomed to live in a pure air. In 1763, upon the ceſſion of Manilla to the Spaniards, and the reſtoration of Bencoolen to the Engliſh, many Chineſe merchants, with

their families, quitted Manilla in order to ſettle under the Engliſh government at this place; but the air of this country proved ſo fatal, that moſt of thoſe Chineſe and their families died ſoon after their arrival. Many Engliſh have alſo fallen a ſacrifice to the intemperature of this climate; and, indeed, few of them ſurvived until they built a fort on a dry elevated ſituation, at the diſtance of about 3 miles from the town. This is called "Fort Marlborough," where, during the rage of ſickneſs at Bencoolen, the garriſon is ſometimes very healthy. Tame buffaloes may here be had in great plenty; but fiſh and poultry are ſcarce and dear. The ſoil is a fertile clay, producing high graſs; but near the ſea it is a moraſs. N. lat. 3° 49′ 3″. E. long. 102°. See SUMATRA.

BEND, a town of Perſia, in the province of Farſiſtan, 100 miles N. E. of Schiras.

BEND *Dexter*, in *Heraldry*. The bend was a ſaſh worn acroſs the ſhoulder from the Italian la benda; it is one of the nine ordinaries in heraldry, and occupies one-third part of the eſcutcheon when charged, and one-fifth when plain; it conſiſts of two equal lines drawn diagonally from the dexter chief to the ſiniſter baſe of the ſhield. This ordinary hath more ſubdiviſions or diminutives than any of the others, viz. the bendlet, gortier, cottiſe, and ribbon, none of which diminutives can properly be charged.

BEND *Siniſter*, denotes lines drawn diagonally from the ſiniſter chief, to the dexter baſe of the ſhield; it hath not the ſame diminutives as thoſe of the bend dexter; but according to ſome heraldic writers, is ſubdivided into a ſcrafe, or ſcarf, which is in breadth half that of the bend ſiniſter; and a batton, or fiſſure, as Upton and Holme call it, containing half the breadth of the ſcarf. Here, however, ariſes an objection to the admitting the batton to be a diminutive of the bend ſiniſter, or as any part of one of the ordinaries. According to many years practice, the batton doth not touch the extremities of the ſhield, nor the extremities of the quarter where the paternal arms are placed, as all the ordinaries and their diminutives conſtantly do; but on the contrary, is couped, that is, cut ſhort, and ſo borne as a mark of illegitimacy, and not as an ordinary or charge, or any part of the coat: for, although ſome inſtances are to be met with of ancient arms, where a batton ſiniſter is paſſed from the ſiniſter chief to the dexter baſe, over all; and others, where it paſſes from corner to corner, over the paternal quarter, and not over the other quarters; yet, in every one of thoſe inſtances, the batton is uſed as a mark of baſtardy, and not either as an ordinary or charge. Hence, therefore, we may fairly conclude, that the batton is not to be deemed as any part diminutive of the bend, but as a mark of illegitimacy; which mark or batton when granted by princes to their illegitimate children, may be of metal or fur, or both; but, when granted to any under their degree, muſt be of colour only.

BENDA, in *Architecture*. See FASCIA.

BENDA, *Francis*, in *Biography*, concert-maſter to the late Frederick II. king of Pruſſia, from the year 1738 to the time of his death. He was one of the moſt touching and expreſſive players on the violin in Europe, during the laſt century. He was a native of Alt Benatky in Bohemia 1709, and a choriſter at Prague and Dreſden, till he loſt his treble voice. There is a very natural and amuſing life of this excellent muſician, compoſed from his own materials, by M. Hiller of Leipſig; but as we have no room for ſtories of mere amuſement, we muſt adhere to matters of fact.

It was not, till he was diſmiſſed as a ſinger, that he ſeriouſly applied to the fiddle to procure him a ſubſiſtence; but he knew not when or under what maſter; but remembered that, as ſoon as he was able, he joined a company of ſtrolling Jews, in playing dances about the country; in which, however, there was a blind Hebrew of the name of Löbel, who, in his way, was an extraordinary player. He drew a good tone from his inſtrument, and compoſed his own pieces, which were wild, but pretty: ſome of his dances went up to A in *altiſſimo*: however, he played them with the utmoſt purity and neatneſs.

The performance of this man excited in Benda ſo much emulation, that he redoubled his diligence in trying to equal him; and not to be inferior in any part of his trade, he compoſed dances for his own hand, which were far from eaſy. He often ſpeaks of his obligations to the old Jew for ſtimulating him to excel on the violin.

It has often excited our wonder, that in the principal capitals of Europe, wherever there is a ſynagogue, we generally found a vocal performer or two, who ſung in the Italian manner, and in exquiſite taſte, though the reſt of the ſinging in the ſervice of religion, was to the laſt degree incoherent, rude, and barbarous. Where it was acquired, or by what kind dæmon this taſte was inſpired excluſively, is not eaſy to conjecture; but ſo it was at Paris, Amſterdam, Milan, Venice, Rome, and Naples; and we have had inſtances at home of exquiſite Hebrew ſinging in our own country.

After various adventures, our young violiniſt entered into the band of count Uhlefeld at Vienna, with whom he had frequently the advantage of hearing the famous Franciſchello, who taught the count, and of playing trios with this great muſician and his ſcholar.

Franciſchello was the moſt exquiſite performer on the baſe-viol of his time. Geminiani related of him, that in accompanying Nicolini, at Rome, in a cantata compoſed by Aleſſandro Scarlatti, for the violoncello, the author, who was at the harpſichord, would not believe that a mortal could play ſo divinely; but ſaid, that it was an angel who had aſſumed the figure of Franciſchello; ſo far did his performance ſurpaſs all that Scarlatti had conceived in compoſing the cantata, or imagined poſſible for man to expreſs.

At length, Benda was invited by Quantz, the German flute maſter to the late Frederick II. king of Pruſſia, during the time when he was only prince of Pruſſia, and reſided at Ruppin, before his acceſſion to the throne.

It was by ſtealth, that this prince indulged his paſſion for muſic, during the life of his father, the late king, who had forbidden him, not only to ſtudy and practiſe muſic, but to hear it. M. Quantz told us afterwards, that it was the late queen-mother, who at this time encouraged the prince in his favourite amuſement, and who engaged muſicians for his ſervice; but ſo neceſſary was ſecrecy in all theſe negociations, that if the king his father had diſcovered that he was diſobeyed, all theſe ſons of Apollo would have incurred the danger of being hanged. The prince frequently took occaſion to meet his muſicians a hunting, and had his concerts either in a foreſt or cavern.

Benda ſtill, in 1772, led the king of Pruſſia's band at the opera, and at his concerts; and could boaſt of having had the honour of accompanying his majeſty, during the 40 years which he had been in his ſervice, in near 50,000 different concerts. What an excellent economiſt of time muſt his late Pruſſian majeſty have been; who, though his own miniſter, could ſpare two hours every day, when he was not in the field, for muſic!

When we heard the admirable Benda perform, it was an excellent compoſition of his own, which he played *con ſordino*; his hand, he ſaid, wanted force ſufficient to play without. The gout had long enfeebled his fingers, and age, perhaps, ſtill more. There were, however, fine remains of a great hand, though he was probably always more remarkable

able for feeling than force. His ſtyle was ſo truly *cantabile*, that ſcarce a paſſage could be found in his compoſitions, which it would not have been in the power of the human voice to ſing; and when he was at his beſt, he was ſo very affecting a player, ſo truly pathetic in an *adagio*, that ſeveral able profeſſors declared that he frequently drew tears from them in performing one. How he acquired this ſtyle of writing and playing, may be of ſome uſe to muſical ſtudents to trace and develope. His ſtyle was not that of Tartini, Somis, Veracini, nor that of the head of any one ſchool or muſical ſect, of which we have the leaſt knowledge: it was his own, and formed from that model which ſhould be ever ſtudied by all inſtrumental performers, *good ſinging*.

BENDALA, in *Geography*, a town of Africa, lying between the confines of Dar-fur and Wara, the capital of Bergoo. It is inhabited by the ſlaves of the ſultan of Bergoo. The people are idolaters.

BENDALI, a town of Perſia, in the province of Kerman, 140 miles S. of Sirgian.

BENDARMALANKA, a town of Hindoſtan, in the circar of Rajamundry, ſituate between the branches of the river Bain, at their outlet into the ocean, 50 miles S. of Rajamundry, 50 N. E. of Maſulipatam, and 358 miles N.E. of Madras. N. lat. 16° 30′. E. long. 82° 30′.

BENDEIRG, a mountain of Scotland, in the county of Perth, 7 miles N. of Blair Athol.

BENDER, formerly called *Tizine*, and denoting in the Turkiſh language "a paſs," a fortified town of European Turkey, in Beſſarabia, ſeated on the Dnieſter. It is celebrated as the place of retreat and reſidence of Charles XII. of Sweden, when he put himſelf under the protection of the Turks, after being defeated by the Ruſſians at the battle of Pultowa in 1709; but upon refuſing to leave their territory, he was attacked, taken priſoner, and removed to Adrianople, where, after a year's confinement, he returned ſecretly to his own dominions. It was beſieged by the Ruſſians in 1770, and after a reſiſtance of nearly three months, ſurrendered to Panin, the Ruſſian general; and the capture of this fortreſs was ſucceeded by the ſubmiſſion of the Tartars of Budziak and Otchakof to the Ruſſian ſceptre. The ſiege which Bender, in 1770, ſuſtained from the Ruſſians was remarkable, on account of the deſperate defence made by the garriſon, the carnage which attended its reduction, and the adoption on the part of the beſiegers, of that dreadful inſtrument of modern warfare, the globe of compreſſion. The Ruſſian army, commanded by count Panin, opened their trenches on both ſides of the river, the 30th July, after which, a furious cannonade and bombardment were begun from all quarters, and vigorouſly returned from the town. The garriſon and inhabitants defended themſelves, with the utmoſt bravery: in ſixteen days they made ſeven ſorties, with little advantage, but great loſs on both ſides, and held out for more than two months with unabated courage, even when the defeat of the main army by the Ruſſian general Romanzow ſeemed to deprive them of every hope of relief. The beſiegers in the mean time puſhed forward their mines (See MINE) with induſtry, particularly one of an improved conſtruction lately invented by a French engineer, and which has been ſince denominated the globe of compreſſion. In this labyrinth of mines, interwoven and incloſed one within another, it was maintained, that a certain quantity of gunpowder would cauſe a greater exploſion, and throw up a greater portion of earth than in any other method. The globe of compreſſion being brought to perfection, was charged with the amazing quantity of 16,000lb. of powder, and the garriſon continuing obſtinately to refuſe every propoſal of ſurrender, count Panin prepared for a general aſſault to take place on the night of the 27th of Sept. The firing of the mine was to be the ſignal of attack, and it was hoped, that beſides ruining the outworks, it might make a breach in ſome of the principal walls of the town, and bury the defenders in the ruins. The Ruſſians themſelves were apprehenſive of the conſequences, as it was not eaſy to define how far the effects of ſuch an enormous maſs of powder might extend, and the troops deſtined to make the aſſault in that quarter were ſtationed at a conſiderable diſtance. In fact, the globe of compreſſion, which was blown up at 10 o'clock at night, with a moſt horrible concuſſion, ſhook the whole adjacent country, and, amidſt the aſtoniſhment and confuſion excited by this dreadful phenomenon, the attack began in three places with great fury. Nothing could reſtrain the impetuoſity of the Ruſſian ſoldiers, who puſhed forward at the main point of aſſault. The double ditches before the glacis were paſſed and filled up; the double row of paliſadoes before the covered way deſtroyed; the main ditch ſurmounted, and all the outworks carried in ſucceſſion. The body of the place could not oppoſe an effectual reſiſtance to enemies who had already overcome ſuch difficulties: the Ruſſians got over the walls in every quarter, and a new and dreadful conteſt commenced in the dark, as well among the fortifications, as in the ſtreets, lanes, and paſſages, and from the houſes. The deſperate reſiſtance of the garriſon and inhabitants, obliged the Ruſſians to ſet fire to the town, which they did in ſeveral places at the ſame time, but the conteſt nevertheleſs continued, amidſt the ruins and the blazing houſes, for the whole of the night, nor ſeemed decided, but by the almoſt total extermination of the Turks. At eight in the morning, the ſeraſkier, with moſt of thoſe that ſurvived, retired to the citadel, which the flames had already reached. A ſelect body of 1500 cavalry and 500 infantry, attempting to cut their way through the beſiegers, were ſurrounded and cut off to a man. As for the ſeraſkier, after demanding in vain an honourable capitulation, the fury of the flames, which had now reached every part of the citadel, obliged him to ſurrender with his followers, as priſoners of war. The fire raged for three days, and could not be reſtrained till it had conſumed the whole city. The total number of priſoners, including the inhabitants of all ages, amounted to 11,749, of whom 5,554 were janiſaries and ſpahis, with their commanders, beſides the ſeraſkier and two baſhas. The reſidue of a population of 30,000 ſouls, of whom one half were ſoldiers, periſhed in the ſtorm. The Ruſſians found in the place a vaſt quantity of arms, bombs, grenades, gun-powder, and other military ſtores, beſides above 200 pieces of braſs cannon, and 85 mortars. They alſo took 4 horſe-tails, 14 batons of command, and 40 pair of colours.

Bender, hardly recovered from this blow, was again taken, but not till after a long ſiege, by prince Potemkin, in November 1789. It was, however, reſtored to Turkey by the ſubſequent treaty of peace in 1792. Bender is reckoned to contain between 10 and 12,000 inhabitants; and its governor is a baſhaw. It is diſtant 100 miles W. of Otchakof or Oczakow, and as many miles S. E. of Jaſſy. N. lat. 47°. E. long. 29° 20′.

BENDER-*Abaſſi*. See GOMBROON.

BENDER-*Congo*. See CONGO.

BENDER-*Delem*, a town of Perſia, in the province of Farſiſtan, on the north coaſt of the Perſian gulf; 130 miles W. of Schiras.

BENDER *du Ser*, a town of Perſia, in the province of Kerman, 160 miles S. of Sirgian.

BENDER *Ibrahim*, a town of Perſia, at the mouth of the river Ibrahim, in the Perſian gulf.

Bender *Maſſin*, or *Benjar-Maſſin*, the capital of a kingdom of the ſame name in the ſouthern part of the iſland of Borneo, poſſeſſing a good harbour, formed by the river Benjar, flowing from the centre of the country almoſt due ſouth. S. lat. 2° 40′. E. long. 113° 50′.

Bender *Rickar*, a town of Perſia, on the north coaſt of the Perſian gulf, in the province of Farſiſtan; 160 miles S.S.W. of Schiras.

Bender *Rigk*, a city of Perſia, in the province of Kerman, on the north-eaſt coaſt of the Perſian gulf. It is encompaſſed with walls in an indifferent ſtate, and lies north from Abuſchæhr or Buſheer. The petty ſtate, of which this is the capital, comprehends ſeveral other places in Kermeſir, which render its ſovereign in ſome meaſure dependent upon Kerim Khan. The Arabs of this principality are chiefly addicted to a ſea-faring life; the Perſians inhabiting its back parts are huſbandmen. The reigning family of Bender Rigk is of the Arabian tribe of Beni Saab, and proceeds originally from Oman; but the grandfather of one of its princes, having become a Schiite, and married a Perſian lady, this family is no longer reckoned by the Arabs among their genuine nobility. A late reigning prince of Bender Rigk, Mir Mahenna, was notorious through the country for his vices and cruelties, as one of the moſt execrable tyrants that ever exiſted. He cauſed his ſervants to murder his father in his own preſence, becauſe the old man had a predilection for his eldeſt ſon. He killed his mother, becauſe ſhe reproached him for his crimes. He cauſed his brother, and ſixteen other relations, to be aſſaſſinated, that he might eſtabliſh himſelf in the undiſturbed poſſeſſion of the throne. He drowned two of his ſiſters, becauſe a neighbouring prince had aſked one of them in marriage. He expoſes all the children that happen to be born to him. In 1765, this deteſtable monſter was under the age of thirty years. After having been twice captured by Kerim Khan, he recovered his liberty, and immediately upon his return to his own dominions began to pillage the caravans which travelled between Schiras and Abuſchæhr, and to practiſe piracy. Kerim Khan laid unſucceſsful ſiege to his capital; and when he ſent in 1765, to demand payment of the tribute due for his poſſeſſions in Kermeſir, Mir Mahenna mal-treated the officer deputed for this purpoſe, and cauſed his beard to be ſhaven. Upon which Kerim Khan ſent againſt him a powerful army, which conquered Bender Rigk and all its territories. Mir Mahenna, however, had previouſly retired with all his troops, and ſome of his ſubjects, into a deſart iſle called Khoueri, where he waited till the Perſian army retired from his country. As ſoon as they were gone, he left the iſland, expelled the garriſon from Bender Rigk, and regained poſſeſſion of his dominions. The tyrant had abandoned himſelf to drunkenneſs; and had begun to exerciſe ſuch cruelties upon his troops, that he cut off the noſes and ears of ſome of the principal officers; and yet ſo attached to him were his ſoldiers, that, in the period of his exile, he took the iſle of Karek from the Dutch. Bender Rigk is diſtant 132 miles W. S. W. from Schiras. N. lat. 29° 26′. E. long. 51° 20′.

BENDIDIA, βενδίδια, in *Antiquity*, ſolemn feaſts held by the Athenians on the twenty-firſt day of the month Thargelion, in honour of the goddeſs Diana. The word is formed of βένδις, a denomination of Diana, according to Strabo, or of the moon, according to Suidas, which amounts to the ſame. The bendidia were held in the Piræus, and bore ſome reſemblance to the bacchanalia.

BENDING, in a general ſenſe, denotes the reduction of a ſtraight body into a curve, or giving it a crooked form. M. Bernouilli has a diſcourſe on the bending of ſprings, or elaſtic bodies. (See Spring.) M. Amontons gives ſeveral experiments concerning the bending of ropes. (See Rope.) The friction of a rope bent, or wound round an immoveable cylinder, is ſufficient, with a very ſmall power, to ſuſtain very great weights. Mem. Acad. Sc. 1703. 1705. 1699. Divers methods have been contrived for bending timber, in order to ſupply crooked planks, and pieces for building ſhips. M. Daleſme ingeniouſly enough propoſed to have the young trees bent, while growing in the foreſt. The method of bending planks by a ſand-heat, now uſed in the king's yards at Deptford, was invented by captain Cumberland. Phil. Tranſ. N° 371. p. 75.

The bending of boards, and other pieces of timber for curved works in joinery, is effected by holding them to the fire, then giving them the figure required, and keeping them in this figure by tools for the purpoſe.

A method has been lately invented and practiſed for bending pieces of timber, ſo as to make the wheels of carriages without joints. See Wheels.

The uſe of ſteaming wood for the purpoſe of bending it is evidently to ſupple it, ſo as to make it capable of being brought the more eaſily into the form required, as well as to adapt it for retaining that form, after the preſſure by which it was originally reduced to that figure has been removed By means of ſteaming, heat and moiſture are applied to it. If it has already moiſture enough, as in the caſe of green wood, heating in any other way, without the application of ſteam, may be ſufficient; or the effect may be produced by heating and wetting at the ſame time. Theſe modes of ſuppling by heat and moiſture, have been practiſed from time immemorial in Ruſſia, and applied to wheels, and ſome other ſorts of wood-work. In England theſe, or ſimilar modes, have been applied for a long time in the dock-yards, and alſo, under a patent granted to Meſſrs. Jacob and Viny, but now expired, in the conſtruction of wheels; and by Mr. Bevan, under a patent ſtill in force, to circular wooden faſhes, ſoffits, fan-lights, door-mouldings, and hand-rails for ſtairs; and, without patent, by cabinet and chair-makers in general. When the thickneſs required, compared with the ſharpneſs of the curvature, is ſuch as to render it impracticable to bend the piece entire, it may be divided for this purpoſe into different thickneſſes, in the manner propoſed by Mr. Samuel Bentham, under a patent obtained in 1793, for methods of working wood, metals, &c. with very little, if any, loſs of ſtrength; and if the ſtrata are connected by proper faſtenings, with a degree of ſtrength far ſuperior to what a piece of the ſame dimenſions would poſſeſs, if grain-cut. In this mode, curvature may be given to the wood-work of all ſorts of engines, and of carriages of all ſorts; to all timbers deſigned for receiving a curved ſhape and employed in buildings; and to any of the timbers, that may be uſed in the conſtruction of boats or veſſels, not excepting ſhips of the largeſt claſs. Thus, it is ſaid, a very conſiderable ſaving with reſpect to quantity and value might be obtained, whilſt at the ſame time the ſtrength would be augmented.

In the operation of bending, care ſhould be taken that as faſt as you force any piece to adapt itſelf to the curvature of the mould to which you are bending it, you apply a preſſure, by means of ſcrews or wedges, &c. to that part, and along the whole piece, particularly at its ſharpeſt convexities; ſo that the piece may not only be kept to its proper curvature, but the exterior fibres be prevented from ſtarting out. In forming ſhip-ribs of all ſhapes and ſizes, ſo as to ſuperſede the uſe of crooked-grown timber, where that which is ſtraight would be cheaper, Mr. Bentham propoſes to uſe one or other of the two following methods, which, he ſays, would effectually anſwer the purpoſe. Firſt, having

having formed a mould or block to the ſhape of the rib in queſtion, comprehending the whole of its extent from top to top-ſide, that is, on both ſides of the keel, bend the component parts of the rib, according to the ſhape of the block, and faſten them together; then, to confine the whole rib in its curvature, apply ſtays or croſs-bars, in thoſe parts where the form would be moſt apt to change, and to convey the rib, together with its ſtays, till it has been ſufficiently confined to its curvature, by the connection given to it with the planks, beams, and other parts of the ſhip. Or, ſecondly, you may form the ſhell of the ſhip firſt, without timbers, beginning to build as it were by the planks, uſing only a ſet of temporary moulds or falſe ribs, to determine the poſition of, and give a temporary ſupport to, the planks. When this is done, inſert the timbers afterwards, preſſing and binding the component parts ſucceſſively into their places and removing the falſe ribs, in proportion as the real ones are put together and ſecured. Or, thirdly, inſtead of the falſe ribs, you may inſert a ſufficient number of real ribs, put together as in the firſt method; and then proceed with the planks and the reſt of the ribs, as in the ſecond method. As to bending, it may, in this caſe, be performed with or without the aſſiſtance of ſteaming, and with or without the uſe of the expedient of dividing into thicknefſes according as the degree of curvature may require. In clinker-work built boats, the ribs have been ſometimes inſerted by bending them to the planks, but this is only done in boats of the ſlighteſt claſs. See SHIP.

BENDING, in the *Sea Language*, denotes faſtening one rope to another, or to different objects, and faſtening a ſail to its yard.—They ſay, *bend the cable*, when it is to be made faſt to the ring of the anchor.—To *bend two cables*, ſignifies to tie them together with a knot, which though leſs ſure than ſplicing, is ſooner done. To *unbend the cable*, is to looſen it from the ring of the anchor; which is done when a ſhip is deſigned to be long at ſea. To *bend a main ſail*, is to make it faſt to its proper yard or ſtay.

BENDLET, in *Heraldry*, is the firſt diminutive of the bend, and poſſeſſes one half of the breadth of the bend.

BENDOAN, in *Geography*, a ſmall iſland, 5 leagues S. W. from cape St. Martin's, on the coaſt of Spain, in the Mediterranean, which lies to the ſouth of weſt from Yvica iſland. It is north-eaſt from Altea, and forms the limit of the bay of Calp, or Carpi, of which the mount ſo called is the ſouth-weſt limit.

BENDORAN, a mountain of Scotland, in the county of Argyle.

BENDORF, a town of Germany, in the circle of Weſtphalia, and county of Sayn, and in a prefecturate of the ſame name, ſeated not far from the Rhine, into which the river Sayn empties itſelf at this place. It is inhabited by Roman catholics and Lutherans, each of whom enjoy the public exerciſe of their religion; 5 miles N. of Coblentz.

BENDORF *Road*, lies on the weſt coaſt of Ireland, and is the eaſternmoſt of the roads between Ballyſhannon and the iſland of Murry, or Eniſmurry, as Bundat is the more weſtern. In both, ſhips may ride with ſafety.

BENDS, in a ſhip, are the ſame with *wailes*, or *wales*, which are the outermoſt timbers of a ſhip, on which men ſet their feet in climbing up.

They are reckoned from the water, the *firſt*, *ſecond*, and *third bend*: they help much to ſtrengthen the ſhip, and have the beams, knees, and foothooks bolted into them.

BENDS denote alſo the ſmall ropes uſed to confine the clinch of a cable. For a *common or ſheet bend*, paſs the end of a rope through the bight of another rope, then round and underneath the ſtanding part; but, to prevent its jambing, paſs it round again under the ſtanding part. The ſheet of a ſail has the end paſſed up through the clue, then round the clue, and underneath the ſtanding part. The rope of a buoy is paſſed as a ſheet, and has the end ſtopped. Bends of a cable-clinch are paſſed as a ſeizing. For a *carrick bend*, lay the end of a rope, or hawſer, acroſs its ſtanding part; then take the end of another rope, or hawſer, and lay it under the firſt ſtanding part, at the croſs, and over the end; then through the bight, under the ſtanding part; then over its own ſtanding part, and underneath the bight again: it is often uſed in haſte to form a greater length, or to warp or tow with. For a *fiſherman's bend*, take a round turn with the end of a rope, or hawſer, through the ring of an anchor, &c. and a half hitch through both parts, and another half hitch round the ſtanding part; then ſtop the end. *Hawſer bend* is a hitch, with a throat and end ſeizing made on one end, and the end of another hawſer reeved through the bight, and hitched with a throat and end ſeizing. *Temporary bend* is commonly made to reeve through large blocks, thus: lay three fathoms of the end of two hawſers together, and put on a round ſeizing in the middle; then reverſe the ends to each ſtanding part, and put on a throat ſeizing between each end and the middle, and a round ſeizing on each end. See *Plate* of *Ship-Rigging*.

BEND-WAYS, or *in Bend*, in *Heraldry*, is ſuch charges as are placed ſo as to occupy that part of the eſcutcheon to which the bend is allotted; or ſuch as are placed obliquely, reſembling a bend.

BENDY, a term uſed in *Heraldry*, when the eſcutcheon is divided bendways into an equal number of partitions: the field may be bendy of eight, ten, twelve, or more.

Barry-BENDY. See BARRY.

Counert-BENDY. See COUNTER.

Paly-BENDY. See PALY.

BENE. See *De Bene Eſſe*.

BENE, in *Geography*, a town of Italy, in the principality of Piedmont, and diſtrict of Mondovi, defended by an ancient caſtle, and containing about 4000 inhabitants; 28 miles ſouth of Turin.

BENEAPED, in the *Sea Language*, is ſaid of a ſhip, when the water does not flow high enough to bring her off the ground, out of the dock, or over the bar.

BENECARLO, BENECALON, or BENICARDO, in *Geography*, lies north-weſt from Peniſcola point, on the coaſt of Valentia, in Spain, in the Mediterranean, ſeated on a bay to the north-eaſt of the gulf of Valentia. It has no good road; ſo that ſhips uſually lie at Peniſcola.

BENEDETTO, in *Biography*. See CASTIGLIONE.

BENEDETTO, ST., a town of Italy, in the duchy of Mantua, 15 miles S.S.E. of Mantua.—Alſo, a town of Italy, in the marquiſate of Gorzegno, 12 miles eaſt of Bene.

BENEDICITE, in *Eccleſiaſtical Hiſtory*, is a name given to the hymn, or ſong of the three children in the fiery furnace; by reaſon of its beginning with the words, "benedicite omnia opera Dominum." The uſe of the benedicite is very ancient; it appearing to have been ſung in all the Chriſtian churches as early as St. Chryſoſtom's time.

BENEDICT, ST. in *Biography*, founder of the monaſtic order of Benedictins, was born in the province of Nurſia, in Italy, about the year 480. After having been educated at Rome, he retired, at the age of fourteen, to Sublaco, about 40 miles from that city, where he ſecluded himſelf from the world in a cavern for ſeveral years, till at length he was diſcovered by the monks of a neighbouring monaſtery, and choſen for their abbot. Diſſatisfied, however, with their manners, he withdrew from their ſociety to his ſolitude,

ſolitude, and by means of the multitude of perſons that aſſociated with him, he was enabled to build twelve monaſteries, and to place in each of them twelve monks. In 528 or 529, he retired to Monte Caſſino, and having cut down the grove ſacred to Apollo, built a monaſtery, and founded his order. Being ſummoned to the council at Rome by pope Boniface II. he was carried, by his own deſire, at the approach of death, into the oratory of St. John the Baptiſt, where, during his attention to the ſervice, he expired, in the year 542 or 543, according to Cave, or, according to others, in 547. His extraordinary miracles are recorded in the "Dialogues" of St. Gregory the Great; and by the church of Rome, he is honoured as a ſaint. The only genuine work of St. Benedict, according to Dupin, is the "Regula Monachorum;" but other works have been aſcribed to him, and they are publiſhed together in the 9th volume of the "Bibliotheca Patrum." Cave's Hiſt. Lit. t. i. p. 512. Dupin. Eccl. Hiſt. vol. iii. p. 44.

Benedict, abbot of Aniane in Languedoc, was born in 751, and educated at the court of king Pepin. Having ſerved this prince and his ſucceſſor Charlemagne, he retired to a monaſtery in Languedoc, where he diſtinguiſhed himſelf by his mortifications. He afterwards built a hermitage on the rivulet called Anian, which in proceſs of time became a conſiderable monaſtery. Lewis the Meek employed this monk in reforming the monaſteries, firſt in Aquitaine, and afterwards through the whole kingdom of France, and in reſtoring, by new and ſalutary laws, the monaſtic diſcipline which had been neglected and fallen into decay. In 817, he preſided in the council of Aix-la-Chapelle, and ſubjected, by the authority of the emperor, all the monks to the rule of Benedict of Monte Caſſino, preſcribed to them all one uniform mode of living, and thus united the various orders into one general body or ſociety. Hence he was regarded as the ſecond father of the weſtern monks. He died in 821. His collection of rules for the eaſtern and weſtern monks, intitled, "Codex Regularum," and his concordance of monaſtic rules, and alſo a collection of homilies of the fathers, were publiſhed by Holſtenius at Rome. This abbot has been beatified by the church of Rome. Moreri. Moſheim's Eccl. Hiſt. vol. ii. p. 310.

Benedict, Biscop, an Engliſh abbot of the ſeventh century, was born of a noble family among the Engliſh Saxons, and in the 25th year of his age devoted himſelf wholly to religion. Accordingly, in 653, he took a journey, in order to acquaint himſelf with the eccleſiaſtical diſcipline, and on his return he laboured to eſtabliſh it in Britain. Upon his return from a ſecond journey to Rome, in the courſe of which he received the tonſure, he aſſumed the government of the monaſtery of Canterbury, to which he had been elected during his abſence. After a third journey to Rome, whence he brought back a large collection of valuable books, he reſorted to the court of Egfrid, king of Northumberland, who had ſucceeded Oſwy. On a tract of land, given to him by that prince, he erected a monaſtery, which, from its ſituation on the river Were, was called "Weremouth;" in which he is ſaid to have placed 300 Benedictin monks. The church of this convent was built of ſtone by artificers fetched from France, in 674; and both the church and convent were dedicated to St. Peter. From a fourth excurſion to Rome, in 678, he returned laden with books, relics of the apoſtles and martyrs, images, and pictures. In 682, he built another monaſtery on the banks of the Tyne, four miles from Newcaſtle, called "Girwy," or "Jarron," and dedicated to St. Paul. Soon after this eſtabliſhment, he took a fifth journey to Rome, and came back enriched with a further ſupply of eccleſiaſtical ornaments. Soon after his return he was ſeized with a palſy; and at length cloſed his life in a truly Chriſtian and exemplary manner, in the year 690, and was buried in his monaſtery of Weremouth. He wrote ſome works on monaſtic diſcipline and the church ritual. He was a celebrated ſinger; and in one of his expeditions to Rome, brought with him a chantor, who introduced the Roman method of ſinging maſs. Biog. Brit.

Benedict, abbot of Peterborough, in the twelfth century, was educated at Oxford, and became a monk in the monaſtery of Canterbury, and afterwards prior. By the influence of Henry II. he was elected abbot of Peterborough in 1177. He aſſiſted at the coronation of Richard III. in 1189, and was advanced to be keeper of the great ſeal in 1191. But death deprived him of this dignity in 1193. Biſhop Nicholſon ſays, that he died in 1200. Beſides his "Life and Miracles of Archbiſhop Becket," characteriſed by Leland as an elegant performance, but treated by Bale as a mere heap of lies and forgeries, he compoſed a "Hiſtory of Henry II. and Richard I. from 1170 to 1192," which, ſays Dr. Henry, hath been much and juſtly eſteemed by many of our greateſt antiquaries, as containing one of the beſt accounts of the tranſactions of thoſe times. A beautiful edition of this work was publiſhed at Oxford, in 2 vols. by Mr. Hearne, A. D. 1735. Henry's Hiſt. vol. vi. p. 143.

Benedict, Alexander, one of the early cultivators and reſtorers of anatomy, was born at Verona, about the middle of the 14th century. After travelling over various parts of Greece, he returned to Italy, and was appointed teacher of anatomy at Padua, where his lectures were numerouſly attended. In 1497, he publiſhed "Anatomicen, ſive hiſtoriam corporis humani." The firſt edition was dedicated to the emperor Maximilian, with whom he appears to have been in great favour. It is principally copied from Galen, but with ſome obſervations from his own practice. He is the firſt, Haller ſays, that deſcribed the concretions called gallſtones. The language uſed by Benedict, is much purer than is found in any of the earlier anatomical writers. "De omnium a vertice ad plantam morborum ſignis, cauſis, &c." fol. 1500, taken principally from Galen, Paulus Ægin. & Oribaſius, whoſe works he appears to have read in their own language. He alſo wrote. "De Peſtilentia," "De Medici Officio," and other ſmaller pieces. The whole of his works were collected, and publiſhed under the title of "Opera Omnia," fol. Venet. 1533. Haller. Bib. Anat. Eloy. Dict. Hiſt.

Benedict, a name aſſumed by ſeveral of the popes. The firſt of this name, called by the Greeks *Bonoſus*, was advanced to the pontifical chair in 574, at the period when the Lombards overran Italy, and fixed their ſeat in it under Alboin; and he is ſaid to have died after four years, in conſequence of the grief occaſioned by their ravages. *Benedict* II. was elected in 683, and diſtinguiſhed by his learning and virtues. He died in 685, and obtained the honour of canonization. *Benedict* III. was advanced to the pontificate in 855, and by the firmneſs of the Roman clergy, ſupported on the papal throne in oppoſition to Anaſtaſius, which he occupied with mildneſs, piety, and charity. In his time, Ethelwolf, king of the weſt Saxons, viſited Rome with his ſon Alfred. Two epiſtles of this pope are extant. *Benedict* IV. was raiſed to the papal chair about the year 900; and died with a good character in 903. *Benedict* V. was elected pope in 964, and although he was a man of extraordinary learning and ſanctity, he was ſtripped of the pontifical and prieſtly dignity by the authority of the emperor Otho, and ſentenced to exile; upon which he retired to Hamburgh, where he

died

died in 965 or 966. *Benedict* VI. was elevated to the papacy in 972; and being ſeized by a faction which attacked the Lateran palace, he was impriſoned in the caſtle of St. Angelo, where he was either ſtrangled or famiſhed in 974. *Benedict* VII. was elected in 975, and after a prudent government of nine years, died in 984. *Benedict* VIII. was made pope in 1012, but diſplaced by Gregory an anti-pope, and afterwards reſtored. Under his pontificate Henry, king of Germany, marched to Rome; and Benedict crowned him emperor under the title of Henry II., and his queen Cunegunda, empreſs. In 1016, this pope, collecting his dependents, defeated the Saracens, who made a deſcent at Luna in Tuſcany, and put them all to the ſword. He alſo waged war with the Greeks, who ravaged Puglia. In 1019, the emperor beſtowed on him and his ſucceſſors the newly erected ſee of Bamberg. He died, after having approved himſelf a great friend to the monks, and zealous for the order and diſcipline of the church, in 1024. *Benedict* IX. ſucceeded his uncle John XIX. in 1033, in his 18th year; was expelled from his ſee on account of his vices, but reſtored by the emperor Conrad; and after a life of various expulſions and reſtorations, ſold or reſigned the pontificate in 1045. He reſumed it, however, occaſionally under ſucceeding pontificates, and finiſhed his ſcandalous career in 1054. *Benedict* X. was elected to the popedom by a party in 1058, and after holding the ſee nine months and twenty days, depoſed and excommunicated. *Benedict* XI. was the ſon of a ſhepherd, or of a notary, at Trevigi, in the ſtate of Venice, became a ſchoolmaſter, general of the Dominicans, and cardinal biſhop, firſt of Sabina, and afterwards of Oſtia, and ſucceeded pope Boniface VIII. in 1303. He exerted himſelf by various efforts for the good of the church, but death terminated his labours on the ninth month of his pontificate, A. D. 1304. This pope conducted himſelf with moderation, and behaved with ſingular reſpect to his mother and relations; but would not ſuffer any interference on their part in public affairs. He wrote commentaries on the books of Job, the Pſalms, St. Matthew, and the Revelations, as well as a ritual, and ſome ſermons. *Benedict* XII. was the ſon of a miller in the county of Foix, and after ſeveral ſubordinate eccleſiaſtical promotions, was advanced to the papal ſee in 1334. He was ſkilful in law and theology, and diſtinguiſhed by his probity, but little verſed in politics. Wiſhing to reſtore the apoſtolic ſee to Italy, but obliged by the circumſtances of the times to remain at Avignon, he laid the foundation of a magnificent and ſtrongly fortified palace, which, however, he did not live to finiſh. He obſerved a laudable caution in the creation of cardinals, and the appointment of benefices; and he exerciſed ſingular ſelf-denial with reſpect to his own relations, obſerving, that "James Fournier (his family name) has relations, but pope Benedict none." As he was induſtrious and active in reſtoring diſcipline and morals among ſeveral religious orders that were become corrupt, he incurred the ill-will and calumny of the monks. During his efforts for reconciling the kings of England and France, he was ſeized with an illneſs, which terminated his life in 1342. Among his printed works are his "Decretum de animabus ſeparatis," and his "Conſtitutions for the reforms of various religious orders." He left alſo ſermons for the chief feſtivals of the year, commentaries on the Pſalms, letters, and poems. *Benedict* XIII. was of a noble family, being the eldeſt ſon of the duke of Gravina, in the kingdom of Naples, and born at Rome in 1649. Againſt the views and wiſhes of his family, he took the habit of the Dominican order in 1667, and applied with diligence to the ſtudies and duties of his office, preferring the humble life of a monk to that of a ſuperior ſtation. However, by the alliance of his family with that of the pope Clement X. he was promoted, againſt his inclination, to the cardinalate in 1672; and after ſeveral ſucceſſive advancements to different ſees, in which he maintained the character of an exemplary paſtor, he was elected to the papacy in 1724, and conſtrained to accept it againſt his own remonſtrances. In the exerciſe of his office, he laboured inceſſantly in repreſſing the luxury of the pontifical court, and in correcting the licentiouſneſs of the clergy; but he was thwarted in his projects by the Jeſuits, on account of his attachment to the Dominican doctrine concerning grace and predeſtination, which leſs reſembled theirs than that of the Janſeniſts. His well-meant attempt to unite all Chriſtian ſaints in one church and faith, manifeſted a greater degree of charity, than of diſcernment and knowledge of the world. Avoiding all the pomp connected with his high ſtation, and reſtricting the expences of his own table to 6d. per day, in the diſuſe of wine and animal food, he lived in the Vatican like a monk in his cloiſter. Nevertheleſs, the doors of his palace were always open to the poor, and he was ever ready to hear their complaints, and to the utmoſt of his power to relieve their diſtreſs. Diveſting himſelf of all the marks of ſovereignty, and wiſhing even to diſmiſs his guards, he frequently went out in the evening in the moſt private manner, for the purpoſe of viſiting the ſick. He cloſed his pontificate of ſix years, in 1740, at the age of 80 years. His ſermons, poems, and other writings, together with his bulls, were publiſhed at Rome in 3 vols. fol. in 1728. *Benedict* XIV. was deſcended of the noble family of Lambertini, at Bologna, and born in that city in 1675. After ſeveral previous promotions, he received a cardinal's hat in 1728; and from the archbiſhopric of Bologna, to which he was nominated by Clement XII. in 1731, he was advanced in 1740 to the papal ſee. Poſſeſſing a gaiety of temper, united with profound learning, an elegant taſte, liberal ſentiments, and great goodneſs of heart, he was ſingularly amiable; and as he diminiſhed the number of feſtivals, aboliſhed idle ceremonies, and manifeſted a diſlike of ſuperſtitious practices and pious frauds, he was calumniated by ſome of his enemies as a "proteſtant pope." As a munificent patron of literature, he founded academies at Rome, beſtowed benefactions on that of Bologna, correſponded with, and rewarded learned men at home and abroad, cauſed a meridian line to be drawn, reared from the duſt the celebrated Egyptian obeliſk, called that of Seſoſtris, and adorned Rome with various other monuments of antiquity. Fond of the pleaſures of literary retirement, and of occaſionally enjoying the mirth of the lower claſſes, his averſion to buſineſs was invincible, and he frequently lamented the drudgery and fatigue of his official ſituation. Attached to life, he dreaded the ſymptoms of diſſolution; and, as it were, confiding in the prayers of the Jeſuits for his life, he would not conſent to ſign the bull for the reform of their order in Portugal, till he was abſolutely given over. On the king of Portugal he conferred the title of "his moſt faithful majeſty." He governed the church with great mildneſs, and manifeſted on all occaſions a ſtrong deſire of conciliating thoſe differences with regard to doctrine by which it was divided. After a pontificate of 28 years, he died in 1758, at the age of 83 years. His works have been publiſhed at Rome in 12 vols. 4to.; and they diſplay a greater degree of profeſſional knowledge and of application, than his levity and facetious diſpoſition would lead one to expect. Bower's Hiſt. of the Popes. Moſheim's Eccl. Hiſt. Nouv. Dict. Hiſt.

BENEDICT, ST. in *Geography*, a town of Hungary, ſeated on the Gran, with a fortified caſtle; 30 miles north of Gran.

BENEDICT, a town of America, in Charles county, Maryland,

ryland, on Patuxent river; oppoſite Mackall's ferry; 30 miles ſouth-eaſt from the Federal city.

BENEDICTINS, or Benedictin *Order*, in *Eccleſiaſtical Hiſtory*, is an order of monks, who profeſs to follow the rule of St. Benedict, which he formed only for the Cenobites, or for thoſe who live in a monaſtery under the direction of an abbot.

Having given inſtructions as to the qualifications and duty of the abbot, he proceeds to recommend to the monks obedience, ſilence, and humility; to note the hours for divine ſervice by day and night, as well as the order and manner of performing it; and to ſpecify the puniſhments that were to be inflicted on offenders. Theſe puniſhments were to be excommunication, or a ſeparation from the fellowſhip of the brethren, at table or at prayers; the chaſtiſement of the more diſorderly with rods; and expulſion from the monaſtery. He further ſtates the mode of their admiſſion, the dreſs they were to wear, and the labour in which they were to be employed. From his rule, which is ſtill extant, we learn that it was not his intention to impoſe it upon all the monaſtic ſocieties; for he expreſsly excludes the anachorets, who, having learned the exerciſes of a monaſtic life in a convent, retired ſeparately into deſerts, the Sarabaites, who live two or three together in a cell, and the Gyrovagi, who removed from one monaſtery to another without fixing anywhere. It was his purpoſe to form an order, whoſe diſcipline ſhould be milder, their eſtabliſhment more ſolid, and their manners more regular, than thoſe of other monaſtic bodies; and whoſe members, during the courſe of a holy and peaceful life, were to divide their time between prayer, reading, the education of youth, and other pious and learned labours. However, in proceſs of time, the followers of this celebrated eccleſiaſtic degenerated very lamentably from the piety of their founder, and loſt ſight of the duties of their ſtation, and the great end of their eſtabliſhment. Having acquired immenſe riches from the devout liberality of the benevolent, they ſunk into luxury, intemperance, and ſloth, abandoned themſelves to all ſorts of vices, extended their zeal and attention to worldly affairs, took part in political cabals and court factions, made a vaſt augmentation of ſuperfluous rites and ceremonies in their order, to blind the multitude, and ſupply the place of their expiring virtue; and among other meritorious enterpriſes, laboured moſt ardently to ſwell the arrogance, by enlarging the power and authority of the Roman pontiff.

This new order made a very rapid progreſs in the weſt, and, in a ſhort interval of time, arrived at the moſt flouriſhing ſtate. In Gaul, its intereſts were promoted by Maurus; in Sicily and Sardinia, by Placidus; in England, by Auguſtin and Mellitus; in Italy, and other countries, by Gregory the Great, who himſelf is reported to have been for ſome time a member of this ſociety; and in Germany it was afterwards received by the inſtrumentality of Boniface. This ſudden and amazing progreſs of the new order was aſcribed by the Benedictins to the wiſdom and ſanctity of their diſcipline, and to the miracles wrought by their founder and his followers. But upon a more attentive view, the impartial obſerver will be convinced, that the protection of the Roman pontiffs, to the advancement of whoſe grandeur and authority the Benedictins were moſt ſervilely devoted, contributed much more to the luſtre and influence of their order than any circumſtances, nay, than all other conſiderations united together.

The Benedictins are thoſe properly called *monachi, monks;* the other orders are better denominated *friers*, or *religious*. In the canon law, the Benedictins are called *Black Monks;* being diſtinguiſhed from the other orders by the colour of their habit, and not by the name of their patriarch St. Benedict. Among us they were formerly alſo denominated *Black Friers*. The Benedictins wear a looſe black gown, with large wide ſleeves, and a capuche on their heads, ending in a point behind. The liſt of ſaints of the Benedictin order is very ample; but they are accuſed by Baronius, and many other writers, of putting many in the liſt who were never of the order. For ſix hundred years after the erection of the Benedictin order, moſt of the European monks were followers of this rule: whatever other names they went by, Carthuſians, Ciſtercians, Grandimonteuſes, Premonſtratenſes, Cluniacs, &c. they were but different branches of the Benedictins, till about the year 1220, when the Dominicans and Franciſcans took new rules. Hoſpinian reckons no leſs than twenty-three religious orders that ſprang from this one. According to the Benedictin computation, there have been of this order 24 popes, 200 cardinals, 7000 archbiſhops, 15,000 biſhops, 15,700 abbots, 4000 ſaints, 40,000 confeſſors, above 3000 martyrs and apoſtles, who have converted 30 provinces to the Chriſtian faith, beſides emperors, kings, &c. This order has produced a great number of eminent writers and learned men.

The Benedictins, though but one order, are divided into ſeveral congregations, which have their peculiar cuſtoms and obſervances different from the reſt. Each of theſe is ſubdivided into provinces, which have their general chapters. This order is ſaid to have been brought into England about the year 596. The Engliſh congregation, which had ſubſiſted from the time of the miſſion of St. Auſtin, was deſtroyed under Henry VIII. and by degrees reduced to one ſingle man, father Buckley; who, in 1607, procured a reeſtabliſhment of the congregation, at Doway, in the Netherlands, where it ſtill ſubſiſts in a kind of dependency on that of St. Valladolid in Spain. At the general chapters they chuſe provincials, with their aſſiſtants, for each of the provinces of Canterbury and York, who have juriſdiction over the miſſionaries employed therein. They are governed by a preſident-general, and three definitors, choſen every three years. At their admiſſion they make a fourth vow, viz. that they will go to the miſſion in England, and return when their ſuperiors think fit.

Benedictin *Nuns*, are religious women, who embrace the rule of St. Benedict.

BENEDICTION, in a general ſenſe, the act of bleſſing, or giving praiſe to God, or returning thanks for his favours. Hence alſo benediction is ſtill applied to the act of ſaying grace before or after meals. Neither the ancient Jews, nor Chriſtians, ever eat without a ſhort prayer. The Jews are obliged to rehearſe a hundred benedictions per day; of which, eighty are to be ſpoken in the morning. Vitring. de Synag. Vet. lib. iii. Rabbi Nehemiah Baruch, in 1688, publiſhed a diſcourſe on the manner wherein the ſacerdotal benediction is to be pronounced. In the ſynagogue of Ferrara, it is rather ſung than ſpoken. Among the ancient Jews, as well as Chriſtians, benedictions were attended with the impoſition of hands; and Chriſtians, in proceſs of time, added the ſign of the croſs, which was made with the ſame hand, elevated or extended. Hence, in the Romiſh church, benediction was uſed to denote the ſign of the croſs, made by a biſhop or prelate, from an idea that it conferred ſome grace on the people. The cuſtom of receiving benediction by bowing the head before the biſhops, is very ancient, and was ſo univerſal, that emperors themſelves did not decline this mark of ſubmiſſion. Under the name benediction the Hebrews alſo frequently underſtand the preſents which friends make to one another, in all probability becauſe they are generally attended with bleſſings

and

and compliments, both from thoſe who give and thoſe who receive them.

Benediction, *Nuptial*, the external ceremony performed by the prieſt in the office of matrimony. The nuptial benediction is not eſſential to, but the confirmation of a marriage in the civil law.

Benediction, *beatic*, *benedictio beatica*, is the *viaticum* given to dying perſons. The pope begins all his bulls with this form: "Salutem et apoſtolicam benedictionem."

Benediction, *regular*, that conferred by abbots on their monks, or by a ſenior monk on a junior.

Benedictione *privari*, to be deprived of benediction, was a kind of puniſhment inflicted on monks, whereby, when the reſt received the abbot's bleſſing, the offenders were diſmiſſed without it.

Benediction is alſo uſed for an eccleſiaſtical ceremony, whereby a thing is rendered ſacred or venerable. In this ſenſe benediction differs from conſecration, as in the latter unction is applied, which is not in the former. Thus the chalice is conſecrated, and the pix bleſſed, as the former, not the latter, is anointed; though in the common uſage theſe two words are applied promiſcuouſly. The ſpirit of piety, or rather of ſuperſtition, has introduced into the Romiſh church benedictions for almoſt every thing. We read of forms of benedictions for wax-candles, for boughs, for aſhes, for church-veſſels, and ornaments; for flags or enſigns, arms, firſt-fruits, houſes, ſhips, paſchal eggs, *cilicium*, or the hair-cloth of penitents, church-yards, horſes, mules, &c. which are ſprinkled with holy water.

Benediction *of Arms*, was a ſort of public conſecration of the weapons and enſigns, before the entering on a war, by a *formula* of words, and ceremonies appointed for that purpoſe.

BENEDICTIONALIS Liber, an ancient church book, containing the forms of the divers ſorts of benedictions given by biſhops, prieſts, &c. Such was the benedictionalis liber of Gregory the Great, deſcribed by Lambecius.

BENEDICTUM, an epithet formerly given to lenient or gentle operating medicines, more eſpecially rhubarb. In this ſenſe we find, in ſome diſpenſatory writers, *benedictum laxativum* uſed for lenitive electary. Though in others, *benedicta laxativa*, or the *bleſſed laxative*, denotes another eaſy purge, made up of turbith, diagrydium, ſpurges, hermodactyls, aniſe-ſeeds, fennel-ſeeds, ſal gemmæ, and honey. Schroder alſo gives the appellation *aqua benedicta* to his emetic; and Mynſicht does the ſame to his *aqua ſerpylli*, or water of wild thyme. Some have called the philoſopher's ſtone *lapis benedictus*.

Benedictum Vinum. See Vinum.

BENEDICTUS Carduus. See Thistle.

BENEDITTO Sacco. See San Benito.

BENEFACA, in *Geography*, a town of Spain, in the province of Valencia, 10 leagues from Valencia.

BENEFICE, Beneficium, in the *Feudal Syſtem*, is a term applied to thoſe portions of land which the kings and chieftains beſtowed on their adherents. As long as they had no fixed property in land, they could only beſtow an horſe, a ſuit of armour, or ſuch like recompences, on thoſe who in peace or war were attached to their perſons, and devoted to their ſervice. But upon their ſettling in the countries which they conquered, and when the value of property came to be underſtood among them, they conferred upon their followers the more ſubſtantial recompence of land. Accordingly the term benefice was the primitive name, and moſt ſimple form of the feudal poſſeſſions. Theſe grants were called "beneficia," becauſe they were gratuitous donations; and they were alſo called "honores," becauſe they were regarded as marks of diſtinction. What were the ſervices originally exacted in return for theſe "beneficia," cannot be determined with abſolute preciſion; becauſe there are no records ſo ancient. M. de Monteſquieu (Sp. of Laws, b. iii. c. 3 & 16.) conſiders theſe "beneficia" as fiefs, which originally ſubjected thoſe who held them to military tenure. M. de Mably (Obſerv. ſur l'Hiſtoire de France, i. 356.) contends, that ſuch as held them were at firſt ſubjected to no other ſervice than what was incumbent on every free man. But when it is conſidered, that allodial property ſubjected thoſe who poſſeſſed it to ſerve the community, it is reaſonable to conclude, that "beneficia" ſubjected ſuch as held them to perſonal ſervice and fidelity to him from whom they received theſe lands. They were granted originally only during pleaſure. (See Monteſq. ubi ſupra, and Du-Cange voc. *Beneficium* and *Feudum*.) But the poſſeſſion of benefices did not continue long in this ſtate. A precarious tenure during pleaſure was not ſufficient to ſatisfy thoſe who held it, and to attach them to their ſuperior lord; and, therefore, they ſoon obtained the confirmation of their benefices during life. (Du-Cange Gloſſ. voc. *Beneficium*.) After this it was eaſy to obtain or extort charters rendering "beneficia" hereditary, firſt in the direct line, then in the collateral, and at laſt in the female line. Leg. Longob. lib. iii. tit. viii. Du-Cange.

It is not eaſy to aſcertain the preciſe period when each of theſe changes took place. M. de Mably (ubi ſupra, tom. i. p. 103—160. 429.) conjectures, with ſome probability, that Charles Martel firſt introduced the practice of granting "beneficia" for life; and that Louis le Debonnaire was among the firſt who rendered them hereditary. Mabillon, however, (De Re Diplomatica, l. vi. p. 353.) has publiſhed a placitum of Louis le Debonnaire, A. D. 860, by which it appears, that he ſtill continued to grant ſome "beneficia" only during life. And in 889, Odo, king of France, granted lands to Ricabodo "fideli ſuo jure beneficiario et fructuario," during his own life; and if he ſhould die, and a ſon were born to him, that right was to continue during the life of his ſon. This was an intermediate ſtep between fiefs merely during life, and fiefs hereditary to perpetuity. While "beneficia" continued under their firſt form, and were held only during pleaſure, he who granted them not only exerciſed the "dominium," or prerogative of ſuperior lord, but he retained the property, giving his vaſſal only the uſufruct. But under the latter form, when they became hereditary, although feudal lawyers continued to define a "beneficium" agreeably to its original nature, the property was in effect taken out of the hands of the ſuperior lord, and lodged in thoſe of the vaſſal. At length the word "feudum" came to be ſubſtituted in the room of "beneficium;" but Muratori obſerves (Antiq. Med. Ævi, v. i. p. 594), that no inſtance of this kind occurs in any authentic charter previous to the eleventh century: and Dr. Robertſon (Hiſt. Ch. v. vol. i. p. 269) informs us, that a charter of king Robert of France, A. D. 1008, is the earlieſt deed in which he has met with the word "feudum."

Benefice, *Beneficium*, in an *Eccleſiaſtical ſenſe*, a church endowed with a revenue for the performance of divine ſervice; or the revenue itſelf, aſſigned to an eccleſiaſtical perſon for life, in return for his performing the ſervice of the church.

All church preferments, except biſhoprics, are called *benefices*; but they muſt be given for life, not for years, or at will: and all benefices are, by the canoniſts, ſometimes called *dignities*. But we now ordinarily diſtinguiſh between benefice and dignity, by applying the word *dignity* to biſhop-

ries, deanries, archdeaconries, and prebends; and benefice to parſonages, vicarages, and donatives.

There is an obvious reference in the term benefice to the feudal ſyſtem, which was incorporated in all the governments of Europe. As the lands of all private proprietors were holden of the prince, and becauſe they were originally gratuitous donations, denominated "*beneficia*," the pope aſſumed the privilege of a feudal lord, and claimed the authority of diſtributing the preferments of the church at pleaſure, which commenced firſt in Italy, and gradually extended itſelf to England; and hence the care of the ſouls of a pariſh came to be called a benefice. Blackſtone's Comm. vol. iv. p. 106.

Hence, doubtleſs, came the term benefice to be applied to church livings; for, beſide that the eccleſiaſtics held for life like the ſoldiers, the riches of the church aroſe from the beneficence of princes.

In all Chriſtian churches, the benefices of the clergy are a ſort of freeholds, which they enjoy, not during pleaſure, but during life or good behaviour. If they held them by a more precarious tenure, and were liable to be turned out upon every ſlight diſobligation either of the ſovereign or of his miniſters, it would perhaps be impoſſible for them to maintain their authority with the people, who would then conſider them as mercenary dependents upon the court, in the ſincerity of whoſe inſtructions they could no longer have any confidence.

As to the origin of eccleſiaſtical benefices, it is hard to determine when the revenues of the church were firſt divided: it is certain that, till the fourth century, all the revenues were in the hands of the biſhops, who diſtributed them by their œconomy; they conſiſted principally in alms, and voluntary contributions. As the church came to have lands, parts thereof were aſſigned for the ſubſiſtence of the clerks, and called benefices; of which we find ſome traces in the fifth and ſixth century: but then there does not appear to have been any certain partition, nor any preciſe quota allotted to each particular; but the allotments were abſolutely diſcretional till about the twelfth century.

At firſt, each was contented with a ſingle benefice, but pluralities were by degrees introduced on pretence of equity: for a ſingle benefice being ſometimes ſcarce thought a competency, the prieſt was allowed two; as his quality or occaſions increaſed, ſo the number of benefices that were to ſupport him were increaſed too. Hence ſome, affecting to equal princes in quality, pretend to revenues anſwerable to it.

The canoniſts diſtinguiſh three ways of vacating a benefice, viz. *de jure*, *de facto*, and *by the ſentence of a judge*. A benefice is vacated "de jure," when the perſon enjoying it is guilty of certain crimes, expreſſed in laws, as hereſy, ſimony, &c. A benefice is vacated "de facto," as well as "de jure," by the natural death, or the reſignation of the incumbent: which reſignation may be either expreſs or tacit; as when he engages in a ſtate, &c. inconſiſtent with it; as among the Romaniſts, by marrying, entering a religious order, or the like. A benefice becomes vacant "by the ſentence of a judge," by way of puniſhment for certain crimes, as concubinage, perjury, ſorcery, &c. See DEGRADATION.

Benefices are divided by the canoniſts into *ſimple* and *ſacerdotal*. In the firſt there is no obligation but to read prayers, ſing, &c.: ſuch are canonries, chaplainſhips, chantries, &c. The ſecond are charged with the cure of ſouls, or the direction and guidance of conſciences: ſuch are the vicarages, rectories, &c.

The Romaniſts, again, diſtinguiſh benefices into *regular* and *ſecular*. *Regular* or *titular* benefices are thoſe held by a religious, or a regular, who has made profeſſion of ſome religious order: ſuch are abbeys, priories conventual, &c. Or rather, regular benefice is that which cannot be conferred on any but a religious; either by its foundation, by the inſtitution of ſome ſuperior, or by preſcription. For preſcription, forty years poſſeſſion by a religious makes the benefice regular. *Secular* benefices are thoſe which are only to be given to ſecular prieſts, i. e. to ſuch as live in the world, and are not engaged in any monaſtic order. All benefices are reputed ſecular, till the contrary is made appear. They are called "ſecular benefices," becauſe held by ſeculars; of which kind are almoſt all cures. Some benefices, regular in themſelves, have been ſecularized by the pope's bull.

A BENEFICE *in commendam*, is that, the direction and management whereof, upon a vacancy, is given or recommended to an eccleſiaſtic for a certain time, till it may be conveniently provided for. See COMMENDAM.

BENEFICE, *Poſſeſſion of a*. See POSSESSION.

BENEFICIARII, in *Roman Antiquity*, denote ſoldiers who attended the chief officers of the army, being exempted from other duty. Beneficiarii were alſo ſoldiers diſcharged from the military ſervice or duty, and provided with "beneficia" to ſubſiſt on. Theſe were probably the ſame with the former, and both might be compriſed in the ſame definition. They were old experienced ſoldiers, who having ſerved out their legal time, or received a diſcharge, as a particular mark of honour, were invited again to the ſervice, where they were held in great eſteem, exempted from all military drudgery, and appointed to guard the ſtandard, &c. Theſe, when thus recalled to ſervice, were alſo denominated *evocati*; and before their recall, *emeriti*.

BENEFICIARII was alſo uſed for thoſe raiſed to a higher rank by the favour of the tribunes, or other magiſtrates. The word "beneficiarius" frequently occurs in the Roman inſcriptions found in Britain, where *conſulis* is always joined with it; but beſides *beneficiarius conſulis*, we find in Gruter *beneficiarius tribuni*, *pretorii*, *legati*, *præfecti*, *proconſuls*, &c.

BENEFICIARY, in a general ſenſe, ſomething that relates to benefices.

BENEFICIARY, *beneficiarius*, is more particularly uſed for a beneficed perſon, or him who receives and enjoys one or more benefices.

BENEFICIARY is more particularly uſed among *Roman Writers*, for a perſon exempt from public offices. In which ſenſe, beneficiarii ſtand contradiſtinguiſhed from *municipes*. It alſo denotes, in *Middle Age Writers*, a feudatory or vaſſal: and it is alſo uſed for a clerk or officer, who kept the account of the *beneficia*, and made the writings neceſſary for it. The ſame denomination was likewiſe given to the officers who collected the rents and duties belonging to the *fiſcus*.

BENEFICIO. See DEPRIVATION *à Beneficio*.

BENEFICIO, *Suſpenſio à*. See SUSPENSION.

BENEFICIO *primo eccleſiaſtico habendo*. See PRIMO.

BENEFIELD, SEBASTIAN, in *Biography*, an eminent Engliſh divine, was born at Preſtonbury, in Glouceſterſhire, in 1559, and educated at the univerſity of Oxford, where he occupied the chair of Margaret profeſſor of divinity for 14 years with great reputation. Towards the cloſe of his life he retired to his rectory of Meyſey-Hampton, near Fairford, in his native county, and there died in 1630. Dr. Benefield was ſo eminent a ſcholar, diſputant and divine, and particularly ſo well verſed in the fathers and ſchoolmen, that he had not his equal in the univerſity. In his theological opinions he was a rigid Calviniſt; and in his general conduct he was remarkable for ſtrictneſs of life and ſincerity.

His works, conſiſting of commentaries on the 1ſt, 2d, and 3d chapters of Amos, ſermons and lectures in divinity, are now ſunk into oblivion.

BENEFIT, is uſed for a privilege granted to ſome perſon, as of an immunity, or the like.

Benefit *of Clergy*. See Clergy.

BENENAIM, Benenath, Benenasch, or Benenat, in *Aſtronomy*, the outermoſt ſtar, of the ſecond magnitude, in the tail of the *Urſa major*.

This is ſometimes alſo called *alalioth*.

BENENCASA, Count, a Venetian nobleman, born in 1745, not more diſtinguiſhed by his birth than talents, taſte, and knowledge in literature, is confeſſed, by M. Laborde, in his "Eſſai ſur la Muſique," in 4 vols. 4to. publiſhed at Paris in 1780, to have furniſhed him with the chief part of his information concerning the poets, compoſers, muſicians, and authors of Italy; and for enriching his reſearches. M. Laborde acknowledges with gratitude his obligations. See vol. iii. of "Eſſai ſur la Muſ." where there are many articles concerning Italian compoſers and ſingers with which count Beneneaſa has furniſhed the editor, that breathe the true ſpirit of taſte, ſenſibility, and knowledge. This acknowledgement had eſcaped us in the firſt peruſal of M. Laberde's work; but we always thought the articles concerning the Italian compoſers and ſingers in this work, of a different colour from the reſt of the book: more liberal, more enthuſiaſtic for genius and talents, and a taſte more diſcriminative and refined, than either that of M. Laborde, or his guide, the Abbé Rouſſer.

When the account of the commemoration of Handel was writing, the editor being very deſirous to know what judicious foreigners thought of thoſe exhibitions, particularly Italians, accuſtomed to good muſic in their churches, as well as theatres, he applied to count Benencaſa, who was then in London, and had been preſent at the performance of the Meſſiah in Weſtminſter-abbey, for information concerning the comparative grandeur and excellence of the band, with any other which he had heard, or of which hiſtory or tradition had preſerved the memory in his own country. As they had not time for a full diſcuſſion of the ſubject, when it was firſt propoſed, *vivâ voce*, ſignor Benencaſa was ſo obliging as to honour him with his opinion in a letter, which, before his departure from England, he entreated his permiſſion to publiſh, and it will not only ſerve as an honourable record of this ſtupendous exhibition, but muſt have been the more flattering to the projectors of the plan, as the count is an excellent judge of muſic; having heard, read, meditated, and written on the ſubject, with a degree of feeling and intelligence, that is equally honourable to himſelf and the art. For this letter, ſee the commemoration of Handel, p. 115.

BENEPLACITO, Ital. a muſical term, implying at pleaſure; equivalent to *ad libitum*, *al ſuo piacere*; which ſee.

BENERMOID, in *Geography*, a mountain of Scotland, in the county of Sutherland.

BENESCHAU, a town of Sileſia, in the province of Oppau, 8 miles eaſt of Troppau.

BENESSOW, a town of Bohemia, in the circle of Kaurzim, in which fairs are held.

Benessow, *Benſen*, *Penſen*, or *Panzen*, a town of Bohemia, in the circle of Leutmeritz, 6 miles S. S. W. of Kamnitz; famous for the manufacture of the beſt paper that is made in Bohemia.

BENET, a town of France, in the department of Vendeé, and chief place of a canton, in the diſtrict of Fontenay le Comte, 3½ leagues ſouth-eaſt of Fontenay.

Benet *Cape*, a bay, lying on the ſouth ſide of the weſtern peninſula of the iſland of St. Domingo, and forming with the line to Petit Goave on the north ſide, the narroweſt part or iſthmus. N. lat. 18° 20′. W. long. 72° 47′. The cape is the weſt point of the bay, and cape Jacquemel the eaſt point, nearly eaſt and weſt from each other.

BENETTO, a river in the iſland of Ceylon, 2 miles ſouth from Barberain iſland, having on the ſouth ſide a ſmall fort upon a hill, under which is a good road in 15 fathoms.

BENEVEN, a mountain of Scotland, in the county of Inverneſs, 21 miles eaſt of Fort William. See Ben-*Nevis*.

BENEVENTE, a town of France, in the department of the Creuſe, and chief place of a canton, in the diſtrict of Bourganeuf; 10 miles N.N.W of Bourganeuf.—Alſo, a town of Spain, in the province of Leon, ſeated on the river Eſla. N. lat. 42° 4′. W. long. 5° 5′.

BENEVENTO, a city of Italy, in the kingdom of Naples, in a duchy of the ſame name, comprehending, beſides the city, a diſtrict of ſome miles. This capital of the Principatro Ultra, or principality of Benevento, and ſee of an archbiſhop belonging to the pope, is ſituated at the point of a hill, between two narrow vallies, in one of which runs the river Sabato, and in the other the Calore, near the confluence of theſe two ſtreams. N lat. 41° 6′. E. long. 14° 57′.

One of the entrances into the city, is through the arch of Trajan, now called the "Porta Aurea," which is in tolerable preſervation, and one of the moſt magnificent remains of Roman grandeur out of Rome. The architecture and ſculpture are both ſingularly beautiful. This elegant monument was erected in the year of Chriſt 114, about the commencement of the Parthian war, and after the ſubmiſſion of Decebalus had entitled Trajan to the name of Dacicus. The order is compoſite; the materials, white marble; the height, 60 palms; length, 37½; and depth, 24. It conſiſts of a ſingle arch, the ſpace of which is 20 palms, and the height 35. On each ſide of it, two fluted columns, upon a joint pedeſtal, ſupport an entablement and an attic. The intercolumniations and frize are covered with baſſo-relievos, repreſenting the battles and triumph of the Dacian war. In the attic is the inſcription. As the ſixth year of Trajan's conſulate, marked on this arch, is alſo to be ſeen on all the military columns erected by him along his new road to Brunduſium, it is probable, the arch was built to commemorate ſo beneficial an undertaking. No city in Italy, Rome excepted, can boaſt of ſo many remains of ancient ſculpture, as are to be found in Benevento. Scarcely a wall is built of any thing but altars, tombs, columns, and remains of entablatures. The moſt conſiderable are in the upper town, ſuppoſed by Swinburne (Travels in the two Sicilies, vol. ii. p. 336.) to be the ſite of the old one.

The cathedral is a clumſy edifice, in a ſtyle of Gothic, or rather Lombard, architecture. This church, dedicated to the Virgin Mary, was built in the ſixth century, enlarged in the eleventh, and altered conſiderably in the thirteenth, when archbiſhop Roger adorned it with a new front. In the court ſtands a ſmall Egyptian obeliſk, of red granite, crowded with hieroglyphics. In the adjoining ſquare, are a fountain, and a very indifferent ſtatue of Benedict XIII., long archbiſhop of Benevento.

The writers of the Benedictine hiſtory fix its origin in the years immediately ſucceeding the Trojan war, and claim Diomed, the Etolian chief, as its founder. Others aſſign it to the Samnites, who made it one of their chief towns, whither they frequently reſorted for refuge, when worſted by the Romans. In their time, its name was "Maleventum," of uncertain etomology, but after the conqueſt of Samnium, changed.

changed by the Romans into "Beneventum," in order to introduce their colony under fortunate auſpices. Near this place, in the 479th year of Rome, Pyrrhus was defeated by Curius Dentatus. In the war againſt Hannibal, Beneventum ſignalized its attachment to Rome, by liberal tenders of ſuccour, and by real ſervices. Its reception of Gracchus after his defeat of Hanno, is extolled by Livy, and from the gratitude of the ſenate, many ſolid advantages accrued to the Beneventines. However, it ſhared the devaſtations of the Roman empire, attending the irruption of the northern nations. When the Lombards invaded Italy, they fixed the ſeat of their empire at Pavia, and ſent a detachment to take poſſeſſion of the ſouthern provinces. In 571, Zotto was appointed duke of Benevento, as a feudatory to the king of Lombardy, and ſeems to have confined his government to the city alone, from which he occaſionally ſallied forth to ſeek for booty. The ſecond duke, called Arechis, conquered almoſt the whole country that now conſtitutes the kingdom of Naples. Upon the fall of Deſiderius, laſt king of the Lombards, the ſtate of Benevento was not materially affected. Arechis the ſecond kept poſſeſſion, and availing himſelf of this favourable conjuncture, aſſerted his independence; threw off all feudal ſubmiſſion; aſſumed the title of prince; and coined money with his own image upon it; a prerogative exerciſed by none of his predeceſſors, as dukes of Benevento. Afterwards, when Radelchis and Siconulph aſpired to the principality, each of them invited the Saracens to his aid. For the termination of theſe fatal diſſenſions, the dominions of theſe competitors were divided into two diſtinct ſovereignties. In 851, Radelchis reigned as prince at Benevento; and his adverſary fixed his court, with the ſame title at Salerno. From this treaty of partition, the ruin of the Lombards became inevitable; and the erection of Capua into a third principality was another deſtructive operation. From this time the inroads of the Saracens, and the attacks of the eaſtern and weſtern emperors, together with anarchy and animoſity at home, reduced the Lombards to ſuch wretchedneſs, that they were able to make a very feeble reſiſtance to the Norman arms. Benevento, however, was chiefly governed by its own dukes and ſovereigns, till in the year 1053, the emperor Henry III. transferred it conditionally to pope Leo IX. From the year 1054, to this day, the Roman ſee, with ſome ſhort interruptions of poſſeſſion, has exerciſed temporal dominion over this city. In a plain near the city a bloody battle was fought in 1266, when Charles of Anjou defeated and killed Mainfroy, his competitor for the ſovereignty of the two Sicilies. In 1703, this city ſuffered greatly from an earthquake.

BENEVIS. See Ben *Nevis*.

BENEVOLENCE, in *Ethics*, denotes a hearty deſire of the good of mankind, evidencing itſelf, as ability and opportunity offer, in the chearful and diligent practice of whatever may promote the well-being of all. Some have traced the origin of this affection in ſelf-love: others again in ſome "inſtinct" or determination of our nature, antecedent to all reaſon from intereſt, which influences us to the love of others, and they have accordingly made it the foundation of univerſal "virtue:" others aſcribe it to the intelligent conſtitution of human nature, and obſerve, that it ariſes not from inſtinct, but from the natures and neceſſity of things. Hutcheſon's Inquiry concerning Moral Good and Evil, p. 140, &c. Price's Review, &c. chap. iii.

Benevolence of *God*, in *Theology*, denotes his diſpoſition to do good and to communicate happineſs. This perfection of the deity has been referred to the claſs of moral attributes. (See Attributes.) For the illuſtration and proof of divine benevolence; ſee Goodness.

Benevolence is uſed, both in our *Statutes* and *Chronicles*, for a voluntary gratuity given by the ſubjects to their ſovereign, to which each perſon contributes in proportion to his eſtate. Stow (Annals, p. 701) ſays, that it grew from the days of Edward IV. It may be found alſo Anno 11, Henry VII. c. 10. yielded to that prince in regard of his great expences in war, and otherwiſe. (12 Rep. 19.) But as benevolences had been extorted under many ſucceeding princes, without a real and voluntary conſent, it was made an article in the petition of right, (3 Car. I.) that no man ſhall be compelled to yield any gift, loan, or benevolence, &c. without common conſent by act of parliament.

Nevertheleſs, by act of parliament, (13 Car. 2. c. 4.) it was given to his majeſty king Charles II. with a proviſo that it ſhould not be drawn into future example. It was, therefore, declared by the ſtatute 1 W. & M. ſt. 2. c. 2. that levying money for or to the uſe of the crown, by pretence of prerogative, without grant of parliament; or for longer time, or in other manner, than the ſame is or ſhall be granted, is illegal. See Aid and Tax.

In this ſenſe, benevolence amounts to much the ſame with what in other nations is called "ſubſidium charitativum," given ſometimes by tenants to their lords, by the clergy to their biſhops, &c.—In France it is called *free gift*, excepting that this latter is reſtrained to the act of the clergy.

BENEVOLENT *Affections*, in *Ethics*. See Affection.

BENEVOLENTIA *Regis Habenda*, in *Law*, the form of purchaſing the king's pardon and favour, in ancient fines and ſubmiſſions, to be reſtored to eſtate, title, or place. Paroch. Antiq. p. 72.

BENEVOLI, Orazio, in *Biography*, maeſtro di cappella to the pope in 1650, and extremely applauded by his contemporaries for *poliphonic* compoſitions. Antonio Liberati, his diſciple, in a letter which he publiſhed at Rome in 1684, in which he characteriſes all the eminent contrapuntiſts of that ſchool, ſpeaking of Benevoli, ſays: that he ſurpaſſed all the maſters of his time in writing for four and even ſix choirs, in which, by the conſtruction and order of the parts, the imitations of beautiful paſſages, inverted fugues, double counterpoint, new contrivances, ligatures, preparations and reſolutions of diſcords, the texture, connection, and fluidity of the whole, which, like a river, *creſcit eundo*; in ſhort, with the wonderful richneſs and beauty of his harmony, he ſo completely vanquiſhed envy herſelf, as to obtain the applauſe of great maſters, while he excited no other with in the reſt, than to imitate his powers in the management of eccleſiaſtical harmony; by uniting numerous choruſes, without dulneſs, confuſion, or breach of rule. He was many years maeſtro di capella of the Baſilica of St. Peter at Rome, and compoſed his famous maſs for ſix choirs of four parts each, for that cathedral, on the ceſſation of the plague. It was performed by a band of more than 200 ſingers, arranged in different circles of the duomo, the ſixth choir occupying the ſummit of the cupola. Beſides this maſs in 24 parts, there is extant a motet by the ſame author, for twelve ſopranos, or treble voices of equal extent. There can be little melody in any of theſe multiplied parts; but to make them move at all, without violation of rule, requires great meditation and experience. No author of poliphonic compoſitions, perhaps, ever equalled Benevoli in this kind of ſcience, except the Netherlander, Okenhem, the maſter of Juſquin, and our countrymen Tallis and Bull, of whoſe faculties and invincible patience in ſuch atchievements, there will be further occaſion to ſpeak elſewhere. The effect of ſuch multiplied parts can ſo ſeldom be tried, that it ſeems an experiment which never can

be fairly made, and is only amuſing to the imagination. If there had been more frequent rehearſals of the *miſerere* in eight real parts by Leo, which Anſani had performed in 1781 at the Pantheon by more than forty voices, it may be ſuppoſed, from ſuch movements as were correctly executed, that the effect of the whole would have been wonderful! but Leo lived in a more poliſhed age, and was gifted, not only with patience, but with taſte and genius.

BENFE', in *Geography*, a ſmall iſland of Africa, on the river Sierra Leona, where the Engliſh had formerly a factory and a ſmall fort, which was taken by the French in 1704, and razed to the ground.

BENFIELD, or Benfelden, a town of France, and principal place of a diſtrict, in the department of the Lower Rhine, ſeated on the Ill; 4½ leagues ſouth of Straſburg. N. lat. 48° 12'. E. long. 7° 45'.

BENFIOL, a mountain of Scotland, in the iſland of Coll.

BENG, a name given among the Mahomedans to the leaves of hemp formed into pills or conſerve; the uſe of which, as well as opium, the more rigid Muſſulmen eſteem to be unlawful, though not mentioned in the Koran, becauſe they intoxicate and diſturb the underſtanding, as wine does, and in a more extraordinary manner. Theſe drugs, however, are now commonly taken in the Eaſt; but thoſe who are addicted to them are generally regarded as debauchees.

BENGAL. in *Geography*, the moſt eaſtern province of the empire of Hindoſtan, lying on each ſide of the Ganges, and bounded by Aſam, Bootan, and Bahar on the north, by Bahar, Berar, and Oriſſa on the weſt, by Oriſſa and the bay of Bengal on the ſouth, and by the mountains that ſeparate it from Caſſay, Aracan, and the Birman dominions on the caſt and ſouth-eaſt. It extends from about 21° 30', to about 26° 40' N. lat.; and from about 86°, to about 92° 30' E. long. but its boundaries are not accurately aſcertained. About 50 miles beyond Tacriagully, which is the termination of a ſtupendous range of mountains, that accompanies the courſe of the Ganges from the weſt, theſe mountains begin to form the northern boundary of Bengal on the weſtern ſide of the Ganges; and from hence another range of mountains ſtrikes from the ſouth, but in a curve ſwelling weſtward, which terminates within ſight of the ſea, about 30 miles from Ballaſore. To the north thoſe mountains divide Bengal from the ſouthern diviſion of Bahar; and to the ſouth they ſeem to be the natural ſeparation of Bengal from Oriſſa. Eaſtward the province of Bengal extends as far as Rangamatty, a town belonging to the king of Aſam, and ſeated on the river Burrampooter. The ſea-coaſt of Bengal, between the mouth of the river Hoogly and that of the Ganges, extends from eaſt to weſt 180 miles; and the whole is a dreary inhoſpitable ſhore, which ſands and whirlpools render inacceſſible to ſhips of burden. For ſeveral miles within land the country is interſected by numerous channels, through which both rivers diſembogue themſelves, by many mouths, into the ocean; and the iſlands formed by theſe channels are covered with thickets, and occupied chiefly by beaſts of prey. According to Acbar's diviſion, Bengal is one of the eleven ſoubahs, or provinces, of Hindoſtan proper; and its government extended to Cattack or Cuttack, and along the river Mahanuddy, as the ſoubah of Oriſſa appears not to have been formed at that time. The Britiſh nation poſſeſs, in full ſovereignty, the whole ſoubah of Bengal, the greateſt part of Bahar, and certain diſtricts of Oriſſa, comprehending 149,217 ſquare Britiſh miles, and, with the addition of Benares, 162,000 ſquare miles, or 30,000 more than are contained in Great Britain and Ireland; and the number of inhabitants has been eſtimated at nearly eleven millions. But by ſome later computations the number has been found to be much more conſiderable. From actual ſurveys in different diſtricts, in which the land occupied in tillage has been diſtinguiſhed, from that occupied by water or waſte, and for which latter an allowance has been made of one-fourth of the whole ſurface, it appears, that the uncultivated land in Bengal amounts to about 31,331,499 acres; and that theſe cultivated acres require 5,265,432 tenants: adding to theſe the artificers and manufacturers, in the proportion of about 11 to 40, we ſhall have 6,718,514 heads of families, at five perſons each; whence the whole number of inhabitants will be 33,590,770. By other eſtimates the population has been computed at more than 30 millions. If to theſe be added about 18 or 20 millions for the population of the Britiſh poſſeſſions in the Myſore and Carnatic, the dominions of the Eaſt India Company, will contain a number amounting, probably, to not leſs than 50 millions. With a due encouragement of induſtry, the preſent population is thought ſufficient to bring into tillage the whole of the waſte lands of Bengal and Bahar. The country of Bengal, independent of Bahar and Oriſſa, is ſomewhat larger than Great Britain. The revenue of Bengal is rated in the Ayin Acbaree, towards the cloſe of the 16th century, at 149½ lacks of rupees; under Aurungzebe it is ſtated by Mr. Fraſer, in his "Life of Nadir Shah," at 131 lacks; in Sujah Cawn's nabobſhip, A.D. 1727, it amounted to 142½ lacks; in 1778 to 197 lacks, net revenue. The total revenue of Bengal, Bahar, Oriſſa, and Benares, belonging to Great Britain, together with the ſubſidy from the nabob of Oude, is computed by Mr. Rennell at 4,210,000l. ſterling; the expence of collection, military and civil charges, &c. amounts to 2,540,00l.; whence he infers that the clear revenue is 1,670,000l. The natural ſituation of Bengal is ſingularly happy with reſpect to ſecurity from the attacks of foreign enemies. On the north and eaſt it has no warlike neighbours; but it is guarded by a formidable barrier of mountains, rivers, or extenſive waſtes, towards thoſe quarters, if ſuch an enemy ſhould ſtart up. On the ſouth is a ſea-coaſt guarded by ſhallows and impenetrable woods, and with only one port, and even that of difficult acceſs, in an extent of 300 miles. It is only on the weſt that any enemy is to be apprehended; and even there the natural barrier is ſtrong; and with its population and reſources, aided by the uſual proportion of Britiſh troops, in addition to the Sepoy eſtabliſhment, Bengal might bid defiance to all that part of Hindoſtan, which might be diſpoſed to become its enemy.

The Engliſh eſtabliſhed a commercial intercourſe with this country at an early period; and the Engliſh Eaſt India company (ſee Company) made a ſettlement on the river Ganges, in the kingdom of Bengal, probably in the former part of the 17th century. Their firſt factory in that kingdom was at the town of Hoogly, on a river of the ſame name, about 26 miles above Calcutta. About the year 1689, the company, for their greater convenience, removed to Calcutta, on the ſame river, where they built the fort, named Fort William, which they ſtill poſſeſs. Their fort and garriſon were deſigned for the protection of their veſſels that came down from Patna, laden with piece-goods, raw ſilk, and ſaltpetre, which were the principal ſtaple commodities of Bengal; otherwiſe the rajas, whoſe dominions lay on that river, and who were either tributaries to, or powerful governors under, the Mogul, were apt to make, and ſometimes did actually make, arbitrary demands of duties for paſſing that way. However, it was in the reign of Ferokſere, great-grandſon of Aurungzebe, who was depoſed in 1717, that the Engliſh Eaſt India company obtained the famous "firman," or grant, by which

their

their goods of export or import were exempted from duties or cuſtoms; and this was regarded as the company's commercial charter in India, while they ſtood in need of protection from the princes of the country. In the years 1742 and 1743, Bengal was invaded by both the Mahratta ſtates, with armies conſiſting, as it is ſaid, of 80,000 horſemen each; nor did they depart out of the provinces until the year 1744, when they had collected a vaſt maſs of plunder, and had eſtabliſhed the claim of the "Chout," or a fourth part of the net revenues of the provinces, as this proportion was called in the language of Hindoſtan. In 1753, the Berar Mahrattas obtained poſſeſſion of the province of Oriſſa, partly by conqueſt and partly by ceſſion from Aliverdy, the nabob of Bengal; and their proximity to Bengal, from which they were ſeparated only by a ſhallow river, afforded them frequent opportunities of plundering its frontier provinces; and it was not till the year 1761, when Coſſim Ally, nabob of Bengal, ceded the provinces of Burdwan and Midnapour to the Engliſh, that the Mahrattas ceaſed to plunder them. In 1756, Aliverdy Cawn, nabob of Bengal, was ſucceeded by his grandſon Surajah Dowlah, who, pretending to be irritated at the conduct of the Engliſh within his dominions, and really jealous of the riſing power of Europeans in general, in other parts of India, determined to expel the Engliſh from Bengal, and accordingly took their fort at Calcutta, the chief Britiſh ſettlement in the province, upon which their trade depended, and compelled thoſe among them, who were not made priſoners, to retire, and others he cauſed to periſh by confining them in a ſmall chamber called the "black-hole" of Calcutta. In the following year, however, an armament from Madras, under admiral Watſon and colonel Clive, not only recovered Calcutta, but brought the nabob to terms. With a view to permanent ſecurity for the future, they negotiated with Jaffier Ally Cawn, an omrah in high truſt and favour with the nabob; and he engaged, on condition of their aſſiſting him in his views towards the throne, to be their future ally and confederate. The famous battle of Plaſſey, fought in June 1757, and in which Jaffier aided the accompliſhment of their wiſhes, by remaining neuter, laid the foundation of the future power of the Britiſh nation, not only in Bengal, but in Hindoſtan. From that time they became the arbiters of the ſucceſſion of the nabobſhip of Bengal, which ſpeedily led to the poſſeſſion of the powers of government; for Coſſim Ally, who had been placed in the room of Jaffier, diſliking his ſituation, reſolved at all events to hazard a change. This brought on a war, which terminated in the expulſion of Coſſim, and left the Bengal provinces in the poſſeſſion of the Engliſh, who reſtored Jaffier to the nabobſhip. Lord Clive, aſſuming the government of Bengal in 1765, ſeized the opportunity, afforded by the recent death of nabob Jaffier Ally, of taking poſſeſſion of the Bengal provinces; and obtained from the nominal Mogul, Shah Aulum, a grant of the duanny, or adminiſtration of the revenues of Bengal, Bahar, and Oriſſa; on condition of paying the Mogul 26 lacks of rupees (260,000l.) per annum. Thus a territory producing at that time at leaſt a million ſterling per annum, after every expence was defrayed, and containing at leaſt ten millions of inhabitants, was gained to the company, on the ſide of Bengal; together with the northern circars, valued at near half a million more, and for which a grant was alſo obtained. The Bengal provinces, which have been in our actual poſſeſſion from the year 1765, have, during that whole period, enjoyed a greater ſhare of tranquillity than any other part of India; or indeed, than thoſe provinces had ever experienced ſince the days of Aurungzebe. Previous to the eſtabliſhment of our influence, invaſions were frequent, particularly by the Mahrattas, and one province or other was ever in rebellion; owing to a want of energy in the ruling power, an ill-paid and mutinous army, and an exceſs of delegated power.

The government of Bengal, and its extenſive dependencies, was firſt veſted in a governor-general and a ſupreme council, conſiſting of a preſident and eleven counſellors; but in 1773, theſe were reſtricted to four, with Warren Haſtings, the governor-general, who were to direct all affairs, civil and military, in the provinces of Bengal, Bahar, and Oriſſa; and to control the inferior governments of Madras on the eaſt, and Bombay on the weſt, with Bencoolen, in the iſland of Sumatra. The court of judicature conſiſts of a chief juſtice, and three other judges, with civil, criminal, naval, and eccleſiaſtical juriſdiction. The Hindoos are governed by their own laws, nor would it be eaſy, if practicable, to extinguiſh the influence of the Brahmins, or totally to aboliſh the caſts, to whatever degree they may countenance and maintain fanaticiſm and ſuperſtition. The military eſtabliſhment in Bengal is always reſpectable, but varies according to the ſituation of affairs. The Britiſh troops are ſupported by the ſepoys, a native militia, who are accuſtomed to have numerous idle followers, ſo that the effective men ſeldom conſtitute more than a quarter of the nominal army. A force of 20,000 Britiſh ſoldiers might probably encounter and vanquiſh 200,000 blacks or Hindoos. The deciſive battle of Plaſſey, which ſecured to us the poſſeſſion of theſe opulent provinces, was gained with an army of about 3000 men, of whom 900 only were Europeans; and at the battle of Buxar, in 1764, the whole number of combatants on the ſide of the Britiſh did not exceed 7000, and of theſe 1200 only might be Europeans.

The climate of Bengal, is reckoned by Dr. Lind, in his "Eſſay on diſeaſes incident to Europeans in hot climates, &c." the moſt inſalubrious and fatal to Europeans of any of the Britiſh ſettlements in India, that of Bencoolen excepted. This is owing partly to the heat of the air, and more eſpecially to that of the land-wind, which, paſſing over a tract of country much heated by the ſeaſon, and conſiſting in various diſtricts of extenſive ſandy deſerts, becomes ſo hot and ſuffocating that it can ſcarcely be endured. Theſe hot winds, occaſionally loaded with ſand, are ſo pernicious, particularly to perſons expoſed to them whilſt ſleeping, that they produce a kind of paralytic diſtemper, called the "barbiers," which is attended with a total loſs of the uſe of the limbs, and for which no relief can be obtained but by removing to ſome other climate. But the unhealthineſs of this climate is principally owing to the inundations of its rivers, and to its level or flat ſurface, ſo that the waters ſtagnate; and of courſe when, in the month of October, the ſtagnated waters begin to be exhaled by the heat of the ſun, the air is greatly polluted by the vapours that ariſe from the ſlime and mud that are caſt by the rivers, and by the putrefaction of dead fiſh, and other animals. Although the ſalubrity of the climate of Bengal has been conſiderably improved by clearing the country of trees and jungle, by canals, and by draining the marſhes, yet fogs are at this time common, very thick and very unhealthy; and exceſſive fogs alſo prevail at other ſeaſons, and they often occur in the months of January and February. In Bengal, the hot, or dry ſeaſon, begins with March, and continues to the end of May, the thermometer ſometimes riſing to 110°; and this intenſe heat is occaſionally interrupted by violent thunderſtorms from the north-weſt. The rainy ſeaſon continues from June to September or October; but the three laſt months of the year are generally pleaſant. The cold ſeaſon commences in November, and laſts till the beginning of February; northerly winds are then prevalent, and the mornings, eſpecially before ſun-riſe, are cold. It is alſo frequently very foggy,

foggy, but about 8 or 9 o'clock, when the ſun begins to be powerful, the thick miſt is diſſipated. For the remainder of the day the ſky is perfectly clear, ſo that no clouds appear in the air for ſeveral days together. In the months of September and October diſeaſes rage, and chiefly attack thoſe that are lately arrived; but here, as in all other places, ſickneſs is more frequent and fatal in ſome years than in others. The moſt prevalent diſtempers are fevers, of the remitting or intermitting kind; for though ſometimes they may continue for ſeveral days without any perceptible remiſſion, yet they have in general a great tendency to it, and are commonly accompanied with violent paroxyſms of rigours or ſhiverings, and with diſcharges of bile upwards and downwards. If the ſeaſon be very ſickly, ſome are ſeized with a malignant fever, of which they ſoon die. The body is covered with blotches of a livid colour, and the corpſe in a few hours becomes quite black and corrupted. At this time fluxes prevail, which may be called bilious, or putrid, the better to diſtinguiſh them from others, which are accompanied with an inflammation of the bowels. In all theſe diſeaſes at Bengal, the lancet is cautiouſly to be uſed. The mode of treating fevers and bilious complaints being now well underſtood, they are leſs alarming and fatal. Dr. Lind ſays it is a common obſervation, both at Bengal and Bencoolen, that the moon or tides have a remarkable influence on intermitting fevers; and he informs us, on the teſtimony of a gentleman of undoubted veracity, and of great knowledge in medicine, that at Bengal he could foretel the preciſe time when the patient would expire; it being generally about the hour of low water. From theſe, and other obſervations, the doctor deduces an uſeful hint, which is, to take doſes of bark at the full and change of the moon, as being the ſeaſons moſt liable to an attack or relapſe in theſe intermitting fevers.

Although the rainy ſeaſon does not commence in the flat countries of Bengal till the latter end of the month of June, the Ganges and other rivers begin to ſwell in the mountains of Thibet early in April, and by the latter end of that month, when the rain-water has reached Bengal, the rivers riſe here. This circumſtance is accounted for partly by the melting of the ſnow on the mountains, but principally, as Mr. Rennell obſerves, by the vaſt collection of vapours wafted from the ſea by the ſoutherly or ſouth-weſt monſoon, and ſuddenly ſtopped by the lofty ridge of mountains that runs from eaſt to weſt through Thibet. Hence it appears, that the rainy ſeaſon muſt commence ſooner in places that lie near the mountains than in thoſe that are more remote. In Bengal the rivers riſe by ſlow degrees; the increaſe being only about an inch per day for the firſt fortnight. It then gradually augments to two and three inches, before any quantity of rain falls in the flat countries; and when the rain becomes general, the mean increaſe is about five inches per day. By the latter end of July, all the lower parts of Bengal, contiguous to the Ganges and Burrampooter, are overflowed, and form an inundation more than 100 miles wide; nothing appearing but villages and trees, excepting, very rarely, the top of an elevated ſpot, the artificial mound of ſome deſerted village, appearing like an iſland. The inundations in Bengal are as much occaſioned by the rain that falls there, as by the waters of the Ganges; in proof of which it is alleged, that the lands in general are overflowed to a conſiderable height long before the bed of the river is filled. It ought to be obſerved, that the ground adjacent to the bank of the river, to the extent of ſome miles, is higher than that which is at a greater diſtance; and thus it ſerves to ſeparate the waters of the inundation from thoſe of the river, until it overflows. This high ground is, in ſome ſeaſons, covered a foot or more; but the height of the inundation within varies, of courſe, according to the irregularities of the ground; and is in ſome places 12 feet. When the inundation becomes general, the river appears, as well by the graſs and reeds on its banks, as by its rapid and muddy ſtream; for the water of the inundation acquires a blackiſh hue, by remaining long ſtagnant among graſs and other vegetables; nor does it ever loſe this tinge, which ſhews the predominancy of the rain water over that of the river; and the ſlow rate of the motion of the inundation, which does not exceed half a mile per hour, indicates the remarkable flatneſs of the country.

In order to guard thoſe tracts of land, which, by the nature of their culture and productions, and by the lowneſs of their ſituation, would be injured by too long an inundation, dikes or dams are raiſed at an enormous expence, extending in the whole of their length to more than a thouſand Engliſh miles. Some of theſe are at the baſe equal to the thickneſs of an ordinary rampart, and yet, on account of the want of tenacity in the ſoil of which they are compoſed, they are often found ineffectual, and need frequent repairs. One particular branch of the Ganges, navigable only during the rainy ſeaſon, and then equal to the Thames at Chelſea, is conducted between two of theſe dykes, through an interval of 70 miles; and when it is full, the paſſengers in the boats look down, as from an eminence, on the adjacent country. During the ſwoln ſtate of the river, the tide becomes incapable of counteracting the ſtream, and in a great meaſure of ebbing and flowing, except near the ſea. At ſuch a ſeaſon, a ſtrong wind, that blows up the river for any continuance, ſwells the waters two feet above their ordinary level; and ſuch accidents have occaſioned the loſs of whole crops of rice. This rice is of a particular kind, for the growth of its ſtalk keeps pace with the increaſe of the flood at ordinary times, but is deſtroyed by too ſudden a riſe of the water. The harveſt is often reaped in boats. There is alſo a kind of graſs which overtops the flood in the ſame manner, and at a ſmall diſtance has the appearance of a field of the richeſt verdure. Mr. Rennell informs us, that in the year 1763, a tragical event happened at Luckipour, about 50 miles from the ſea, by a ſtrong gale of wind, conſpiring with a high ſpring-tide, at a ſeaſon when the periodical flood was within 1½ foot of its higheſt pitch. The waters then roſe 6 feet above the ordinary level. On this occaſion the inhabitants of a conſiderable diſtrict, with their houſes and cattle, were totally ſwept away; and the calamity was aggravated by its happening in a part of the country which ſcarcely produces a ſingle tree, to which a drowning man might eſcape. Theſe inundations are traverſed by every kind of embarkation; ſuch as are bound upwards taking advantage of a direct courſe and ſtill water, at a ſeaſon when every ſtream ruſhes like a torrent. The wind too, which at this ſeaſon blows regularly from the ſouth-eaſt, although in the gulf or bay of Bengal the monſoon blows from the S. S. W. and S.W., favours their progreſs in the eaſtern and northern parts of Bengal, where it blows from the S.E. or E.S.E.; ſo that a voyage which would take up nine or ten days by the courſe of the river, when confined within its banks, may be performed in ſix days. Huſbandry and grazing are at this time both ſuſpended; and the peaſant traverſes in his boat thoſe fields which, in another ſeaſon, he was uſed to plough; happy, however, that the elevated ſite of the river-banks places within his reach the herbage which they afford; without which his cattle muſt periſh. Towards the middle of Auguſt, the inundation begins to ſubſide; for though great quantities of rain fall in the flat countries in Auguſt and September, yet, by a partial ceſſation of the rains in the mountains, the ſupplies fail that are neceſſary to keep up the inundation. However, the decreaſe of the inundation does

not always keep pace with that of the river, on account of the height of the banks; but after the beginning of October, when the rain has nearly ceaſed, the remaining inundation goes off quickly by evaporation; and the lands are left highly manured, and in a ſtate fit for receiving the ſeed, after the ſimple operation of ploughing. For an account of the "bore," to which the rivers of Bengal are ſubject; ſee the article Bore.

From the time of the change of the monſoon in October, to the middle of March, the rivers are in a tranquil ſtate; and then the "north-weſters" begin in the eaſtern parts of Bengal, and later as we advance weſtwards; and they may be expected once in three or four days, until the commencement of the rainy ſeaſon. Theſe "north-weſters," ſo called from the quarter in which they uſually originate, are the moſt formidable enemies to the inland navigation of Bengal. They are ſudden and violent ſqualls of wind, and, though they are of no long duration, they are often attended with fatal effects, and have cauſed whole fleets of trading boats to ſink almoſt inſtantaneouſly. They are more frequent in the eaſtern than in the weſtern part of Bengal; and happen oftener towards the cloſe of the day than at any other time. For ſome hours before they arrive, they are indicated by the riſing and ſingular appearance of the clouds; and thus the traveller is warned to ſeek ſhelter. But in the great rivers they are truly formidable; more eſpecially about the latter end of May, and beginning of June, when the rivers are much increaſed in width. After the commencement of the rainy ſeaſon, which period varies, in different parts, from the middle to the end of June, tempeſtuous weather muſt be occaſionally expected; but at this ſeaſon places of ſhelter are more common by the filling of the creeks and inlets, as the river increaſes, and, on the other hand, the bad weather is of longer continuance, than during the ſeaſon of the "north-weſters." The inland navigation of Bengal is performed with ſafety, with reſpect to the weather, during the long interval between the end of the rainy ſeaſon, and the beginning of the "north-weſters." At this latter ſeaſon peculiar attention and care are neceſſary. For an account of the boats that are uſed in this inland navigation; ſee Budge-row.

Bengal is a low flat country, fertilized by numerous rivers and ſtreams, and interſperſed with a few ranges of hills. The triangle formed by the Coſſimbazar and Hoogly rivers to the weſt, by the Ganges to the eaſt, and by the ſea-coaſt to the ſouth, as well as a large tract on each hand to the north of this Delta (ſee Delta), is as level as the lower Egypt. Such parts of this extenſive plain as are not watered by the Ganges or its branches, are fertilized by many other ſtreams from the mountains; and for the ſpace of three months, when the ſun is moſtly vertical, heavy rains fall every day. The periodical rains and intenſe heats produce a luxuriance of vegetation, almoſt unknown to any other country in the globe; and therefore Aurungzebe emphatically denominated Bengal "the paradiſe of nations;" and it has been peculiarly ſtyled "the paradiſe of India." The ſoil is a ſtratum of black vegetable mould, rich and loamy, extending to the depth of ſix feet, and in ſome places fourteen, and even twenty feet, lying on a deep ſand, and interſperſed with ſhells and rotten wood, which indicate the land to have been overflowed, and to have been formed by materials depoſited by the rivers. It is eaſily cultivated without manure, and bad harveſts ſeldom occur. In this country they have two harveſts; one in April, called the "little harveſt," which conſiſts of the ſmaller grain; and the ſecond, called the "grand harveſt," is only of rice. The chief grain is rice, on which the natives chiefly ſubſiſt, and which is exported from hence into other countries. Bengal produces alſo very good wheat; and it furniſhes the inhabitants of the mountains of Caſhmere, and of the elevated plains of Thibet, with both rice and wheat, in return for their ſhawls, gold, and muſk. Upon the failure of their crop of rice, a grievous famine enſues. Of this many melancholy inſtances have occurred, both in Bengal and in other parts of India. One of the moſt deplorable of this kind occurred in the year 1770. On this occaſion, the nabob, and great men of the country, diſtributed rice gratis to the poor; but when their own ſtocks began to fail, they withdrew their donations, and Calcutta was crowded with multitudes of perſons who came thither to ſolicit relief. But the whole ſtock being expended, the famine prevailed, and many thouſands fell down as victims to hunger in the ſtreets and fields; ſo that their bodies, mangled by dogs and vultures, corrupted the air, and ſeemed to threaten a plague. Many perſons were employed daily, on the company's account, in throwing dead carcaſes into the river, ſo that the waters were contaminated, and the fiſh could not be eaten without danger. Hogs, ducks, and geeſe, fed chiefly on the dead bodies; and the only meat which could be procured was mutton, which, on account of the dryneſs of the ſeaſon, was ſo ſmall, that a quarter of it would ſcarcely weigh a pound and a half. This dreadful famine was occaſioned by a preternatural drought, which cauſed both the great harveſt of 1769, and the little one of 1770 to fail. As a preſervative from the miſeries attending a dry ſeaſon, and as a ſource of ſupply of water for domeſtic purpoſes, the inhabited part of the country is furniſhed with numerous reſervoirs of an oblong ſquare ſhape, and of various ſizes, frequently more than an acre in extent, dug in the earth, and called "tanks." Theſe are filled with water in the rainy ſeaſon, and afford the inhabitants, during the dry months, a ſupply of water of a better quality and appearance than that of the Ganges, which is always thick and muddy. In theſe tanks is bred a ſort of fiſh, in taſte reſembling our carp. Among the other vegetable productions of Bengal, the moſt important of which are tobacco, ſugar, indigo, cotton, mulberry, and poppy, we may enumerate the banian tree, the cocoa-nut palm, which ſupplies a manufacture of cordage, called "coir" (ſee Coir), guavas, plantains, pomelos, potatoes, lime trees, and orange trees. They have alſo the piſang, or banana; the ſuri tree, which affords, by inciſion of the ſtem, a clear and ſweet juice, of an intoxicating quality, and when turned ſour is uſed as vinegar; and the mango tree, the fruit of which is preferred to all others in the country, except very fine pine-apples, and which is much uſed in the hot months. Mr. Ives (Voyage from India to England, &c. 4to. 1773) mentions a beautiful tree, called "chulta," which has a flower that is at firſt a hard green ball, on footſtalks about four inches long. When this opens, the calyx appears to be compoſed of five round, thick, and ſucculent leaves, and the corolla of the ſame number of fine beautiful white petals. After one day the corolla falls off, and the ball cloſes again; of theſe there is a ſucceſſion for ſeveral months. In the walks of Bengal they have a tall tree, called the "tatoon;" and near Calcutta a ſpreading tree, called the "ruſſa," making a fine appearance when in full bloom. In their gardens they cultivate moſt of the vegetables that are natives of other climates, and fit for culinary purpoſes. Among the animals of Bengal, we might mention the elephant, tiger, wild buffaloes, jackals, dogs, ſnakes, ſcorpions, &c.: and a kind of birds, named "argill," or "hurgill," a ſpecies of Ardea, which are very large and ravenous, and held in great veneration by the Brahmins. Game, poultry, fiſh, and water-fowl of all kinds, are very plentiful in Bengal. The horſes uſed by the Europeans in this province are either of Perſian or Arabian extraction,

traction, and consequently sell at a high price. The native horse of Bengal is thin, ill-shaped, and contemptible, and even in its best shape never equals the Welsh or Highland poney, either in figure or usefulness. The cattle principally used for the team in Bengal are bullocks; and the most common vehicle among the peasants is a hackery, which see. But Bengal is more defective in its breed of cattle than most other parts of India. The size of its sheep is small; their figure lank and thin; and the colour of three-fourths of a flock is black or dark grey. The quality of a fleece of wool in this country is worse, if possible, than its colour; as it is remarkably harsh, thin, and hairy.

The inland commerce of Bengal is very considerable; and it is carried on by means of those rivers and canals that intersect the country, and along the banks of which are many towns and villages, with pleasant fields of arable and pasture land, which diversifies the face of the country, and renders it very beautiful. Some of the canals, formed either by the hands of men, or by the operations of nature, are wide and deep enough to be navigated by large ships. One of the most considerable of these is the "Haze," or "Hare" channel, that runs straight through the country into the arm of the river that flows by Dacca. The chief articles of commerce which the country yields are silk, muslin, callicoes, cotton, and other piece-goods; opium, saltpetre, gum-lac, and indigo. Rice, wheat, &c. can only be reckoned casual branches of trade. Bengal has an inland trade with Thibet, which it supplies with cottons, besides some wine and cloths of European manufacture, receiving in exchange musk and rhubarb; and a much more extensive commerce with Agra, Delhi, and their adjacent provinces, in salt, sugar, opium, silk, silk-stuffs, and an immense quantity of cottons and muslins. The maritime trade of Bengal, managed by the natives of the country, has been divided into two branches, viz. that of Cattack by means of its port Balasore with the Maldives, whither they transmit rice, coarse cottons, and fine silk stuffs, and where they receive in exchange cowries, used for money at Bengal, and sold to the Europeans. The inhabitants of Cattack also carry on a considerable trade with the country of Asam, which they supply with salt in great quantities, receiving in payment a small quantity of gold and silver, ivory, musk, eagle-wood, gum-lac, and a large quantity of silk. A more considerable branch of trade, which the Europeans carry on with the rest of India, is that of opium, which is cultivated at Patna. The Dutch send rice and sugar to the coast of Coromandel, for which they are usually paid in specie. They have also formerly supplied Ceylon with rice, Malabar with cottons, and Surat with silk; whence they brought back cotton, usually employed in the coarse manufacture of Bengal. Some ships laden with rice, gum-lac, and cotton-stuffs, are sent to Bassora; and return with dried fruits, rose-water, and gold. The rich merchandise carried to Arabia is paid for entirely in gold and silver.

The articles that are disposed of to advantage in Bengal, are all kinds of spices, japan copper, sandal wood, and sapan wood, and also tin, lead, pewter, and other European commodities of various kinds. See East India Company, and Calcutta.

Bengal is peopled by various nations, but the principal are the Moguls, or Moors, and the Gentoos, Hindoos, or Bengalese, and both the Bengalese and Moors have each a distinct language.

The Moguls, or Moors, are descendants of those who between two and three centuries ago reduced this kingdom, and the whole empire of Hindostan, under their dominion. They were originally natives of Tartary. They nearly resemble the Europeans in traits and features; but differ more or less from them in colour. The Moguls are olive, though, in the Indian language, Mogul signifies white. The women are very handsome, and much use bathing; like the men, they are of an olive colour, and different in form from the women of Europe. Their legs and thighs are long, and their bodies short. According to Thevenot, the Mogul women are chaste, very fruitful, and bring forth with so much ease, that they frequently walk the streets the very next day after delivery. Stavorinus says, that their morals are infamously bad, and that they are addicted to the most unnatural vices. The Moguls are more courageous than the Bengalese; and their "Sipahis" form good soldiers, when they are trained and commanded by European officers. Their religion is that of Mahomet; and consequently they hold in abhorrence the idolatry of the Gentoos.

The Bengalese, who are much more numerous than the Moors, do not differ much from the Europeans in stature; their colour is dark-brown; the complexion of some of them approaches to yellow; their hair black and uncurled; and they are generally handsome and well made. They are indolent, lascivious, and pusillanimous; and nothing but hunger or thirst rouses their activity. Some of them, however, are intelligent and ingenious; and though most of them are poor, some of their banyans, or merchants, are very wealthy, and very expert in matters of trade. Their women are said to be uncommonly wanton and intriguing; prostitution is not thought by them a disgrace; and they have licensed places, in which the law allows them, under a certain assessment, to distribute their favours. Their artificers in gold and silver are very ingenious, and imitate any model that is set before them with great exactness. Europeans are often surprised to observe the perfection to which they have arrived in those branches of spinning cotton, and of repairing muslins that are torn, and in almost all the handicraft operations in which they are employed. The common people go almost naked. They wear nothing but a piece of linen, wrapped round the waist, and passed between the legs. Those of a higher rank have a dress of white cotton, which doubles over before as high as the shoulders, and is fastened with strings round the middle, and which hangs down to their feet. Most of them shave their heads, and eradicate the hair from all parts of the body. Rich people wear turbands, and many of them wear small ear-rings. The dress of the women consists of a piece of cotton cloth thrown over the shoulders, under which they wear a kind of coat and drawers. Those who can afford it adorn their hair with gold bodkins, and their arms, legs, and toes with gold and silver rings and bands, and also their ears and the cartilage of the nose. The inferior women wear similar ornaments, made of a sort of cowries, and called "chanclos." Their heads are bare, and their hair turned up, and fastened at the back of the head. Rice is the chief article of their food, the remainder of which consists of vegetables and milk. They eat no fish, flesh of animals, nor any thing that has had life. Their beverage is pure water.

Both the Moors and Bengalese are fond of the amusement of dancing; and for this purpose they employ young women, who are trained up from their infancy to this diversion, and who are richly decorated whenever they are engaged to perform. Dancing is accompanied with music, both vocal and instrumental. For an account of the other inhabitants of Bengal, see Gentoos and Hindoos. See also Brahmins and Faquirs. Besides these, several of the eastern nations, Persians, Armenians, and others, resort to Bengal, allured by the advantageous trade which they are enabled to pursue there.

Four European nations have established themselves in Ben-

gal for the purpoſe of commerce, viz. the Engliſh, the Dutch, the French, and the Danes. The Engliſh are the principal, and their chief ſettlement is at Calcutta, the preſent capital of the country. (See CALCUTTA.) Europeans lead, in Bengal, a very eaſy life. The men, who are almoſt all in the ſervice of the company, devote a part of the morning to buſineſs, and perſons of fortune keep in daily employment a black writer, for which he receives 20 or 25 rupees per month. They ſpend the remainder of their time in perſonal improvement or recreation. Beſides the black writers, moſt Europeans have alſo one or two banyans, who note down all payments and receipts, and who adjuſt all pecuniary matters in buying and ſelling. Mooriſh domeſtics are kept for the menial ſervices of the houſe, and "peons," to run before the palankeens, and to carry an umbrella, or paraſol, over the head of their maſter, when he goes out; and every houſe has likewiſe a porter, whoſe ſole occupation is to anſwer the door; and one or two ſets of "berras," or palankeen bearers, together with a "harry maid," or "matarani," who carries out the dirt; and a great number of ſlaves, both male and female.

The current coins in Bengal, and in the whole extent of Hindoſtan, are gold and ſilver rupees; which ſee. See alſo MOHUR. Copper coin is not ſeen in Bengal. For change they make uſe of cowries, 80 of which make a "poni," and 60 or 65 ponis, according to the ſcarcity or plenty of cowries in the country, make a rupee. However, there is great variation in the value of cowries in Bengal. Weights are calculated by the Sar, anſwering nearly to two pounds avoirdupoiſe, of which 40 make a maund; which ſee. The meaſures of length are cobidos, and geſs or goſs, which ſee. Diſtances between places are meaſured by coſs. See COSS. The veſſels uſed for inland navigation are burs, budgerows, and pulwhas, which ſee. The general conveyance of paſſengers by land is on a ſort of litters, called palankeens, which ſee. For an account of the manners and cuſtoms of the inhabitants of Bengal, and various other particulars; ſee CALCUTTA, HINDOSTAN, and INDIA. See alſo GENTOOS, HINDOOS, and BRAHMINS.

BENGAL, *bay of*, is a large gulf in the Indian ocean, between the two peninſulas of India; bounded on the north by the coaſt of the province of Bengal, on the eaſt by the kingdoms of Aracan, Pegu, Siam, the peninſula of Malacca, or Malaya, and part of the iſland of Sumatra; on the ſouth by the great Indian ocean, and on the weſt by the coaſts of Oriſſa, Coromandel, and the iſland of Ceylon. The Ganges and ſeveral other rivers, diſcharge themſelves into this gulf; it contains many iſlands; and it abounds with bays, harbours, and port towns. Its wideſt extent is about 86 leagues, and its length about 72 leagues. In a more confined view it may be ſaid to begin at cape Palmiras.

BENGAL, *Language of*, or BENGALESE, is derived from the Shanſcrit (which ſee), and diſtinct from the Perſian, Moors, and Hindoſtannic, which are ſpoken in ſeveral parts of this province, and each of which has its peculiar department in the buſineſs of the country. Its alphabet, like that of the Shanſcrit, conſiſts of 50 letters, of the form, ſound, and arrangement of which Halhed has given a very particular and detailed account in his "Grammar of the Bengal Language," printed at Hoogly in Bengal in 1778. The only impediments in acquiring the knowledge of this language are the great number of letters in its alphabet, the intricate variety of their combinations, and the difficulty of pronunciation; but the grammatical part is ſimple, though diffuſe, and complete without being complex. Its rules are plain, and its anomalies few. The vowels are diſtributed into long and ſhort, the latter of which are often omitted in writing, and they are invariably ſubjoined to the conſonant with which they are uttered, and never precede them. As every conſonant, therefore, inherently poſſeſſes the ſhort vowel on which its utterance depends, it is plain that no two conſonants could have been joined together, and ſucceſſively pronounced in the ſame ſyllable, but that a vowel muſt neceſſarily have intervened. In order to remedy this inconvenience, a ſet of diſtinct characters was invented, called "P,holaas," or adjuncts. Theſe are certain ſubordinate and ſubſidiary figures, eleven in number, that may be attached to each of the conſonants in the alphabet reſpectively, and thus provide againſt the too frequent recurrence of the internal vowel. Excluſively of theſe "P,holaas," almoſt any two or three conſonants may be blended together, for ſupplying the omiſſion of the internal vowel. The compound letters may be formed by placing one letter immediately under another; or by blending two letters together, ſo as by their union to make one character; or by making the firſt of the two conſonants much ſmaller than the other letters, which latter mode is the moſt common. The genders of this language are three, and the terminations uſually diſtinguiſhing the maſculine are *aa*, and thoſe of the feminine are *ee*; but it is not neceſſary that every noun comprehending ſex ſhould be diſtinguiſhed by a particular termination, or mode of formation, expreſsly to denote its gender. The Bengaleſe has four caſes beſides the vocative, and in this reſpect it is much inferior to the Shanſcrit, which comprehends eight different caſes. The Bengal nouns have neither dual nor plural numbers; and the ſame form of noun ſerves for the ſingular or plural. In compoſitions of this language, though the firſt and ſecond perſons occur very frequently, the uſe of the pronoun of the third is very rare; and in order to avoid the application of the words *he* and *they*, the names of perſons are repeated in a manner that is very tireſome and diſguſting. The ſecond perſon is always ranked before the firſt, and the third before the ſecond. The perſonal pronouns have ſeven caſes, which are very irregularly varied. The indefinite pronouns are all aptotes in Bengaleſe, as they are in Latin and Greek. The Shanſcrit, which is the parent of the Bengaleſe, as well as the Arabic, Greek, and Latin verbs, are furniſhed with a ſet of inflections and terminations, ſo comprehenſive and ſo complete, that by their mere form they can expreſs all the diſtinctions both of perſon and time. By their root they denote a particular act, and by their inflection they expreſs the time when it takes place, and the number of the agents; and thus their ſeparate qualities are perfectly united. Every Shanſcrit verb has a form equivalent to the middle voice of the Greek, uſed through all the tenſes with a reflective ſenſe, and the former is the moſt extenſive of the two in its uſe and office; becauſe in Greek the reflective can only be adopted intranſitively when the action of the verb deſcends to no extraneous ſubject; but in Shanſcrit, the verb is at the ſame time both reciprocal and tranſitive. Neither the Shanſcrit, nor the Bengaleſe, nor the Hindoſtannic, have any word correſponding to the ſenſe of the verb *I have*, and therefore the idea is always expreſſed by *eſt mihi*; and of courſe there is no auxiliary form in the Bengaleſe verb anſwering to *I have written*, but the ſenſe is conveyed by another mode. As the verb ſubſtantive *to be* in all languages is defective and irregular, it is called in Shanſcrit a "ſemi-verb;" and it is obſerved, by the ingenious writer above cited, that the preſent tenſe of this verb, both in Greek and Latin, and alſo in the Perſian, appears evidently to be derived from the Shanſcrit. In the Bengaleſe, this verb has only two diſtinctions of time, the preſent and the paſt; and the terminations of the ſeveral perſons of theſe ſerve as a model for thoſe of the ſame tenſe in all other

verbs reſpectively. The Bengaleſe verbs may be diſtributed into three claſſes, which are diſtinguiſhed by their penultimate letter. The ſimple and moſt common form has an open conſonant immediately preceding the final letter of the infinitive. The ſecond is compoſed of thoſe words whoſe final letter is preceded by another vowel or open conſonant going before it. The third conſiſts entirely of cauſals, derived from verbs of the firſt and ſecond conjugation. The Greek verbs in μι are formed exactly upon the ſame principle with the Shanſcrit conjugations, even in the minuteſt particular; of which inſtances occur in many verbs, which form from a root a new verb by adding the ſyllable *mi*, and doubling the firſt conſonant. In forming the paſt tenſe, the Shanſcrit applies a ſyllabic augment, like the Greek; and the future is characteriſed by a letter analogous to that of the ſame tenſe in the Greek, omitting the reduplicatio of the firſt conſonant. Nor, indeed, is the reduplication of the firſt conſonant always applied to the preſent tenſes of the Shanſcrit, any more than to thoſe of the Greek. It is obſerved, that the natural ſimplicity and elegance of many of the Aſiatic languages are very much debaſed and corrupted by the continual abuſe of auxiliary verbs; and this inconvenience has evidently affected the Perſian, the Hindoſtan, and the Bengal idioms. The infinitives of verbs, in the Shanſcrit and Bengaleſe, are always uſed as ſubſtantive nouns; and a ſimilar mode of ſignification often occurs in the Greek In the Shanſcrit language, as well as in the Greek, certain forms of infinitives and of participles comprehend time; and there are alſo other branches of the verb that ſeem to reſemble the gerunds and ſupines of the Latin. All the terms which ſerve to qualify, to diſtinguiſh, or to augment, either "ſubſtance" or "action," are claſſed by the Shanſcrit grammarians under one head; and the word uſed to expreſs it literally ſignifies increaſe or addition. According to their arrangement, a ſimple ſentence conſiſts of three members, viz. the agent, the action, and the ſubject: which, in a grammatical ſenſe, are reduced to two, viz. the noun and the verb. They uſe a particular word for ſpecifying ſuch terms as amplify the noun, which imports quality, and correſponds to our adjectives or epithets. Such as are applied to denote relation or connection, are expreſſed by another term, which may be tranſlated "prepoſition." The ſimple adjectives in Bengaleſe have no variation of gender, caſe, or number; neither is the adjective ſubject to inflection, but the ſign of the caſe is confined to the ſubſtantive, with which it agrees; and its form is confined to the ſingular number, even when joined to a plural noun. But thoſe derivative attributes, which are alternately adjectives and concrete nouns, generally preſerve the diſtinctions of gender, which they all poſſeſs in the Shanſcrit. Prepoſitions are ſubſtitutes for caſes, which could not have been extended to the number neceſſary for expreſſing all the ſeveral relations and predicaments in which a noun may be found, without occaſioning too much embarraſſment in the form of a declenſion; theſe in the Greek language are too few, and hence reſults great inconvenience. The Latin, which is leſs poliſhed than the Greek, bears a nearer reſemblance to the Shanſcrit, in words, inflections, and terminations.

The Bengaleſe method of computation, among the merchants, for the largeſt ſums is by "fours;" derived probably from the original mode of numbering by the fingers.

To this day the Bengaleſe reckon by the joints of their fingers, beginning with the lower joint of the little finger, and proceeding to the thumb, the value of which is alſo included as a joint; and thus the whole hand contains 15. From this method of performing numeration on the joints, ariſes that well known cuſtom among the Indian merchants of ſettling all matters of purchaſe and ſale by joining their hands beneath a cloth, and then touching the different joints, as they would increaſe or diminiſh their demand. See Banians.

It is a peculiarity in the Bengaleſe computation, that the ninth numeral of every ſeries of ten is not ſpecified by the term of nine, in the common order of progreſſion, but takes its appellation from the ſeries immediately above it, as twenty-nine is not expreſſed in our manner, or by what we ſhould conceive to be its proper denomination, but by a term denoting one leſs than thirty.

The Shanſcrit language, beſides other advantages, has a great variety in the mode of arrangement; and the words are ſo compacted together, that every ſentence appears like one complete word. When two or more words come together "in regimine," the laſt of them only has the termination of a caſe; the others are known by their poſition; and the whole ſentence, ſo connected, forms but one compound word, which is called a "foot."

For further particulars relating to the language of Bengal, its grammatical conſtruction, and the method of acquiring it, we muſt refer to Halhed, *ubi ſupra*.

The verſes of the Bengaleſe are regulated by accent, and by the number of ſyllables in a line; no regard whatever being paid to quantity, but as it coincides with accent. Their poems, like thoſe of the Arabians and Perſians, are in rhyme; and the Bengal poets have many rules for contracting ſuch words as are too long, and for extending thoſe that are too ſhort, for their metre. The Bengal meaſures are altogether borrowed from the Shanſcrit, and may be divided into three ſpecies; viz. heroic, lyric, and elegiac.

In muſic, the Bengaleſe always uſe the minor key, and their gamut proceeds by the very ſmalleſt intervals of the chromatic ſcale. They have no idea of counterpoint, and always play or ſing in uniſon or octaves.

The natives of Bengal write with a ſlender and tough reed, very common in all the eaſt, which they ſhape almoſt like an European pen. They write with the hand cloſed, in which they hold the pen as the Chineſe do their writing-pencil, preſſing it againſt the ball of the thumb with the tip of the middle finger. The nib or point of the pen is turned downwards towards the wriſt; while the thumb pointing upwards, and lying on the pen with its whole length, keeps it firm againſt the middle joint of the fore-finger. As they have neither chairs nor tables, they ſit upon their heels, or ſometimes on their hams, whilſt they are writing; and their left hand, held open, ſerves as a deſk on which to lay the paper on which they write, which is kept in its place by the thumb.

BENGALENSIS, in *Conchology*, a ſpecies of Venus, deſcribed by Liſter. The ſhell is orbicular, ſomewhat equilateral, with thick perpendicular ſtriæ; and the beaks turned back. Inhabits Bengal.

Bengalensis, in *Ornithology*, a ſpecies of Vultur, found in Bengal. It is of a brown colour, with the head and fore part of the neck bare of feathers, and pale chefnut; bill lead colour, black at the tip. Latham. Gmelin.

Bengalensis, a ſpecies of Otis, called by G. Edwards the *Indian Buſtard*. The colour is black; ſpace round the eyes brown; back, rump, and tail, ſhining brown. Gmelin. Inhabits Bengal, and is about twenty-three inches in length. Briſon calls this Pluvialis Benghalenſis major; and Buffon, Charge ou outarde moyenne des Indes. The beak and legs are whitiſh, tail ſtreaked, and ſpotted with black. Edwards copied this bird from a drawing, and it does not appear that a ſpecimen of it is known in any cabinet.

Bengalensis, a ſpecies of Rallus, of a white colour, with the head and neck black; wings and back greeniſh, primary quill feathers ſpotted with red. Gmelin. This is the

the Bengal water-rail of Albin; Totanus Benghalenſis of Briſſon; and Chevalier vert of Buffon. The bill, irides, and legs are yellow; crown, area of the eyes, lower part of the back and body beneath white, temples and throat black brown; primary quill feathers purple, ſecondaries green; tail purple, with fulvous ſpots.

BENGALLA, in *Geography*, a city of Hindoſtan, which exiſted during the early part of the 17th century, near the eaſtern mouth of the Ganges, but of which no traces now remain.

BENGASI, or Bernice, a ſea-port town on the coaſt of Africa, in the Mediterranean. The merchants of this place uſually join the caravan from Cairo at Augela in their way to Mourzouk, the capital of Fezzan, and import tobacco, manufactured for chewing, and ſnuff, and ſundry wares fabricated in Turkey. N. lat. 32° 10′. E. long. 20°. This town is ſaid to be the ancient Berenice, built by Ptolemy Philadelphus.

BENGEVAI, a town of Perſia, in the province of Segeſtan, 75 miles ſouth of Zareng.

BENGHUR, a town of Perſia, in the province of Cabul; 32 miles north of Cabul.

BENGLO, a mountain of Scotland, in the county of Perth, the higheſt point of which is ſaid to be 3724 feet above the level of the ſea; 5 miles N. E. of Blair Athol.

BENGO, or Benga, a province of the kingdom of Angola in Africa, ſituate along the river of its name, but more commonly known by that of Zenxa. It has the ſea on the weſt, and the province of Moſeche on the eaſt. The Portugueſe have cultivated large tracts of land in this province, which now abounds with maize and manioc root, with which they make their bread. It produces alſo plenty of banana and bacova trees. It is divided into ſeveral diſtricts, of which the chiefs are natives, though tributary to Portugal. The inhabitants are Chriſtians, and have eight churches.

BENGORE Head, a cape of Ireland, on the north coaſt of the county of Antrim, 10 miles N. E. of Coleraine. N. lat. 55° 15′. W. long. 6° 19′.

BENGUELA, a province of Angola in Africa, retaining the name of a kingdom, bounded on the eaſt by the river Rimba, or Cumani, on the north by the Coanza, and Culogi, at about 10° 51′ S. lat. and reaching weſtward quite to cape Negro, according to the generality of geographers. But M. de Liſle extends it no farther north than old Benguela, in 9° 54′. and, according to him, it is bounded on the eaſt by the Giaga Caſangi, or Giagan chief, and on the ſouth he places the province of Ohila, between the Hottentots and Benguelas, which tract is moſtly inhabited by ſuch ſavage nations as the Caffres and Giagas. Benguela was formerly governed by its own kings; and moſt parts of the kingdom were fertile and populous; but it ſuffered ſo much from the incurſions of the Giagas, and its wars with neighbouring ſtates, that, with the protection of the Portugueſe, they have not been able to recover their importance. Its valuable productions are ſimilar to thoſe of Angola and Congo; and from the humidity of the ſoil they have two fruit ſeaſons in the year. It furniſhes likewiſe a conſiderable quantity of ſalt, though of inferior quality to that of Chiſſama. The Zimbi, whoſe ſhells are current as money through ſeveral parts of Africa, are caught upon its coaſt, and paſs in payment either by weight or meaſure. The country, being moſtly mountaineus, ſwarms with wild beaſts, ſuch as rhinoceroſes, elephants, and wild mules. The lions, tigers, crocodiles, and other carnivorous animals, deſtroy great numbers of their cattle. Their fertile plains towards the ſea-ſide formerly produced numerous herds of cattle, both ſmall and great, but they are now become very ſcarce. The air of the country is ſo unwholeſome as to affect its produce, and taint even its waters. Few Europeans have, therefore, ventured to viſit it, ſo that it remains in a great degree unknown. The chief towns are Old Benguela, St. Philip, or New Benguela, Mankikondo, and Kaſchil. The commerce of ſlaves is ſo prevalent in this province, that the natives will ſell their relations or children from mere wantonneſs.

Bengunla, *Old*, a town of Africa, in a province ſo called, ſouth of a bay of the ſame name, near the Atlantic ocean. The town is ſeated on a high mountain, where large beeves, ſheep, poultry, and other proviſions, have been ſold in great plenty, together with elephant's teeth; all which the inhabitants have bartered for muſkets, and other fire-arms. S. lat. 11° 5′. E. long. 11° 30′.

Benguela, *New*, or *St. Philip*, a town in the province of Benguela, ſeated on the ſouth of a large bay, about 2 leagues long and 1 broad, called by the Portugueſe "Bahias-das-Vaccas," where they have a ſettlement and a fort, with a ſmall garriſon. S. lat. 12° 8′. E. long. 12° 20′.

BENHADAD, or the Son of Adad, in *Scripture Hiſtory*, the name of ſeveral kings of Syria. *Benhadad* I. was the ſon of Tabrimon, and began his reign about the year 940 B. C. He was induced by coſtly preſents to aſſiſt Aſa, king of Judah, againſt Baaſha, king of Iſrael, whom he obliged to return to the ſuccour of his own country, and to abandon Ramah, which he had undertaken to fortify. 1 Kings, xv. 18, &c. *Benhadad* II. was the ſon of the preceding, and his acceſſion to the throne of Syria is ſtated to have taken place about the year 901 B. C. In his war againſt Ahab, king of Iſrael, he was totally defeated; and in the following year, renewing his attack upon the Iſraelites, in the plain of Aphek, he loſt a great part of his army, and was reduced to the neceſſity of ſubmitting to the mercy of Ahab, by whom he was treated kindly, and allowed to return peaceably into his own country. In a new war for the recovery of Ramoth-Gilead, the poſſeſſion of which was retained by Benhadad, Ahab, joined by Jehoſhaphat, king of Judah, marched againſt the Syrians, and a battle enſued, in which Naaman was the general of the Syrian army, and Ahab loſt his life. Benhadad having afterwards laid ſiege to Samaria, and failing in his attempts to reduce it, fell ſick, and ſent Hazael his miniſter, to the prophet Eliſha, with preſents, in order to conſult him concerning the iſſue of his diſorder. Hazael, on his return to Damaſcus, informed Benhadad that his health would be reſtored; but Eliſha having predicted that Hazael would ſucceed to the throne of Iſrael, the miniſter accompliſhed the prediction by ſtifling Benhadad with a wet towel. Benhadad was reckoned a great prince, who contributed to advance the glory of his country, and his memory received divine honours in Syria. 1 and 2 Kings. Joſephus Ant. l. viii. and ix. *Benhadad* III. ſucceeded his father Hazael on the throne of Syria, in the year 836 B. C. After having been ſeveral times defeated by Joaſh, king of Iſrael, he was expelled from all his father's conqueſts. 2 Kings. Joſ. Ant. l. ix.

BEN-HINNON, or Geh-hinnon, the valley of the children of Hinnon, lay in the ſouth-eaſt ſuburbs of Jeruſalem. See Gehenna.

BENI, Paul, in *Biography*, a learned writer, was born in Candia, about the year 1552, and educated at Eugubio in the duchy of Urbino. In early life he entered among the Jeſuits, but afterwards quitted them. He was for ſome time profeſſor of theology at the college of Sapienza at Rome; of philoſophy, at Perugia; and of rhetoric and belles lettres, in the univerſity of Padua, from 1599 to the time of his death in 1625. He was more lively than judicious;

cious; fond of maintaining ſingular opinions, and much engaged in literary controverſies. He attacked the dictionary of La Cruſca, in a work entitled "Anti-Cruſca, &c." and defended Taſſo, whom, with Arioſto, he preferred to Horace and Virgil. He alſo wrote on the paſtor-fido of Guarini. All theſe works were written in Italian. The moſt conſiderable of his Latin productions are, "Commentaries on the poetry and rhetoric of Ariſtotle," Venice, fol. 1625; "A poetic and rhetoric, extracted from the works of Plato;" "Commentaries on the ſix firſt books of Virgil, and on Salluſt;" "Diſput. de annal. Eccl. Card. Baronii;" and "De Hiſtoria Scribenda," lib. iv. Ven. 1611, 4to. All his works were printed at Venice, in 5 vols. fol. Gen. Dict. Nouv. Dict. Hiſt.

BENI *Ammer*, in *Geography*, a diſtrict of the weſtern province of Algiers, about N. lat. 35° 45′. E. long. 0° 50′.

Beni *Arazid*, one of the eighteen provinces into which the Turks divided Algiers, ſo called from its capital.

Beni *Aſſer*, a town of Upper Egypt, on the eaſt ſide of the Nile; 2 miles north of Aſna, or Eſneh.

Beni *Haſſan*, a town of Egypt, on the eaſt ſide of the Nile, remarkable for its grottoes, dug in the mountains, which were formerly temples; 6 miles north of Achmounain.

Beni *Haſſen*, called by Leo Africanus, *Habat*, a province of Morocco, bounded to the north by the river Mamora, and extending ſouth to that of Sarrat: 4 leagues from Rabat, to the eaſt, are the provinces of Fez and Tedla, and to the weſt the ocean. This province is very extenſive, rich, and commercial; and produces wool of a very excellent quality.

Beni *Jebie*, a town of Egypt, on the weſt ſide of the Nile, 12 miles ſouth of Achmounain.

Beni *Headjah*, and *Beni Howah*, two diſtricts of the weſtern province of Algiers, bordering on the Mediterranean, about N. lat. 36° 30′. and E. long. 2° 12′.

Beni *Jubar*, mountains of Algiers, lying about 20 miles ſouth of Bujeyah, or Bugia, and extending a conſiderable way along the coaſt, both in length and width, being parts of the little Atlas. They are ſteep and rugged, and furniſh a great number of ſtreams. They abound with fruit-trees, eſpecially walnuts and figs, and produce plenty of barley, with which the inhabitants feed their numerous herds. The people are warlike, and have a chief of their own; and among them are excellent archers; and the whole ridge hath ſeveral villages, inhabited by the tribe or people whoſe name it bears.

Beni *Maran*, a town of Egypt, 9 miles ſouth of Achmounain.

Beni *Menaſſer*, a diſtrict of the weſtern province of Algiers, about N. lat. 36° 30′. and E. long. 2° 42′.

Beni *Mezzab*, a diſtrict of the eaſtern province of Algiers, between 32° and 33° N. lat. and from 7° to 7° 30′ E. long. This diſtrict is deſtitute of water, except that which they draw from wells.

Beni *Mida*, a diſtrict of the weſtern province of Algiers, N. lat. 35° 30′. E. long. 2° 12′.

Beni *Miſur*, a town of Egypt, on the weſt ſide of the Nile. 3 miles ſouth of Abu Girge.

Beni *Mohamid il Kiſur*, a town of Egypt, weſt of the Nile, and 9 miles ſouth of Abu Girge.

Beni *Raſhid*, a town of the weſtern province of Algiers, north of the river Shelliff and near it. N. lat. 36° 16′. E. long. 2° 19′.

Beni *Shekir*, a town of Egypt; 6 miles N. W. of Manfelout.

Beni *Sweal*, and *Beni Snouſe*, two adjoining diſtricts of the weſtern province of Algiers, on the confines of the Tell, about 35° N. lat. and between 0 and 1° E. long.

Beni *Zeneſſel*, anciently *Herpiditani*, a diſtrict of the weſtern province of Algiers to the north of the Montes Chalcorygii, and eaſt of the river Malva, or Mullooiah, about 34° 54′ N. lat. and 0° 30′ W. long.

Beni *Zerwall*, a branch of mount Atlas, in the weſtern province of Algiers.

BENJA, a river on the coaſt of Africa, 3 leagues E. N. E. from Ampenie, and E. from Commenda.

BENJAMIN, in *Biography*, the youngeſt ſon of Jacob by Rachel, and one of the twelve patriarchs of Iſrael. He was the object of his father's peculiar affection, and reluctantly permitted to accompany his brethren to Egypt, when his return with them was made by Joſeph the condition of their receiving a ſupply of corn. Joſeph, who was his only brother by both parents, treated him kindly, and contrived a pretext for detaining him in Egypt, but he afterwards, when he diſcloſed himſelf, permitted him to return to his aged father. The tribe of Benjamin, which formed part of Judea, properly ſo called, lay between the tribes of Judah and Joſeph, contiguous to Samaria on the north, to Judah on the ſouth, and to Dan on the weſt, which laſt parted it from the Mediterranean. It had not many cities and towns, but this defect was ſupplied by its poſſeſſing the moſt conſiderable, and the metropolis of all, the celebrated city of Jeruſalem. The other cities were Jericho, Gibeon, Bethel, Gibeah, Hai, Gilgal, Anathoth, Nebo; to which may be added the two noted villages of Bethany and Gethſemane. This tribe was at length almoſt exterminated by the others, in revenge of the violence offered to the concubine of a Levite, in the city of Gibeah. Geneſis, Joſhua, Judges.

Benjamin of *Tudela*, a city of Navarre, a Jewiſh rabbi, flouriſhed in the 12th century. Poſſeſſed of a ſuperſtitious veneration for the law of Moſes, and ſolicitous to viſit his countrymen in the eaſt, whom he hoped to find in ſuch a ſtate of power and opulence as might redound to the honour of his ſect, he ſet out from Spain in the year 1160, and travelling by land to Conſtantinople, proceeded through the countries to the north of the Euxine and Caſpian ſeas, as far as Chineſe Tartary. From thence he took his route towards the ſouth, and after traverſing various provinces of the farther India, he embarked on the Indian ocean, viſited ſeveral of its iſlands, and returned, at the end of 13 years, by the way of Egypt, to Europe, with much information concerning a large diſtrict of the globe, altogether unknown at that time to the weſtern world. He died in 1173, not long after his return from his travels. His "Itinerary" contains a narration of his travels, intermixed with many fabulous accounts, that ſerve to raiſe the credit of his nation. Caſpar Oudin, however, (Comment. de Script. Eccleſ. tom. ii. col. 1524. Lipſ. 1722.) repreſents him as a man of ſagacity and judgment, and well ſkilled in the ſacred laws; and ſays that his obſervations and accounts have been found upon examination to be generally exact, and that the author was remarkable for his love of truth. The firſt edition of the Itinerary appeared at Conſtantinople in 1543, with a tranſlation from the Hebrew into Latin, by Benedict Arias Montanus; and it was printed by Plantin, at Antwerp, in 1575, 8vo. It was afterwards tranſlated by the emperor Conſtantine, and his verſion was printed at Leyden, by Elzevir, in 1633, 8vo. A French tranſlation of it was publiſhed by John Philip Baratier, in 1734, 2 vols. 8vo. Robertſon's America, vol. i. p. 45. Gen. Dict.

Benjamin *Tree*, in *Botany*. See Laurus.

Benjamin, in *Pharmacy*. See Benzoin.

BENJAR *river*, in *Geography*. See Bendermassin.

BENIBOURD, a mountain of the Highlands of Scotland, probably higher than Caringorm, which is 4060 feet.

BENICARLOS, a town of Spain, in Valencia, celebrated for the wine made in its neighbourhood; 3 miles north of Penhiſcola.

BENIDORME, *Mount* and *Cape*, lie about S. S. W. from cape St. Martin, on the ſouth point of Altea bay, projecting eaſtward from the town, which gives it name; to the ſouth of which is the iſland Benidorme, 2 miles off; at the north-eaſt end of Alicant bay, on the eaſt coaſt of Spain, in the Mediterranean.

BENIFAJO, a town of Spain in Valencia; 5 leagues from Valencia.

BENILET, a town of Aſia, in the Arabian Irak; 145 miles N. W. of Baſſora.

BENIMERINI, the denomination of an African dynaſty, which ſucceeded that of the Almohedes, which ſee.

BENIN, an extenſive kingdom of weſt Africa, comprehending the ſlave coaſt, bounded on the weſt by Guinea proper, or, more particularly, the Gold coaſt; on the north by Gago, Nigritia, and a chain of mountains; on the eaſt by Mujaac and Makoko, and part of Congo, with the Ethiopic ocean, on the ſouth, where it extends about one degree beyond the equinoctial line. It is commonly divided into three parts, viz. Whydah and Ardah, containing the Slave coaſt, and Benin proper, which has the ſame boundaries with the former on the north, eaſt, and ſouth, and is terminated on the weſt by part of the gulf of Guinea and the Slave coaſt. Its extent from weſt to eaſt is about 600 miles, but from north to ſouth it is not aſcertained. From the river Lagos, where it commences, its coaſt forms a gulf or bight, ending at cape Lopez, in which are the trading places, or villages, ſeated on ſeveral rivers, of Benin, Bonny, Old and New Calabar, Camaron, and Gabon. Benin is watered by ſeveral ſtreams, of which ſome are conſiderable rivers. Towards the ſea-coaſt the land is low and marſhy, and of courſe the climate unhealthy; but at a greater diſtance from the ſea the land riſes, and the air is more pure. In ſome diſtricts of the country, water is ſo ſcarce, that often travellers are ſupplied with it for money by officers, to whoſe department it belongs. The rivers teem with crocodiles, ſea-horſes, a particular ſpecies of torpedo, and various kinds of excellent fiſh. The country abounds with elephants, tigers, leopards, wild boars, aſſes, civet and mountain-cats, horſes, hares, and hairy ſheep; and among its birds the principal are paroquets, pigeons, partridges, ſtorks, and oſtriches. The ſoil is generally fertile, and produces a great variety of trees and plants, ſuch as orange, lemon, and cotton trees. The pepper of this country is not ſo plentiful nor ſo good as that of the Eaſt Indies. The native negroes are in general mild and good humoured, civil to ſtrangers, and yet reſerved, eaſily wrought upon by gentle means, but inflexible and reſolute in reſiſting harſh treatment. In the conduct of buſineſs they are expert; but attached to their ancient cuſtoms and manners, which renders them ſlow and tedious in their negotiations. Honeſt and faithful in their dealings, they ſeldom or ever diſappoint the confidence that is repoſed in them. Their trade is carried on by a kind of brokers, called mercadors, or fiadors, who treat with ſtrangers about all merchandize; but all their contracts are made with great ſecrecy, through fear of exciting the jealouſy or avarice of their governors; and the richeſt perſons exhibit the appearance of poverty, in order to eſcape the rapacious hands of their ſuperiors.

The population of Benin is diſtributed into three claſſes of perſons. The firſt is compoſed of three perſons, called great lords, who attend the king, and preſent petitions to him. Such is the influence of theſe, that the ſupreme government may be ſaid to be lodged with them. The next claſs conſiſts of thoſe petty princes called "ares de roe," or ſtreet kings, of whom ſome preſide over the commerce, others over the ſlaves; ſome over military affairs, and others over every thing pertaining to cattle and the fruits of the earth. Out of this claſs are choſen the viceroys and governors of provinces, who are reſponſible to the three great lords, to whoſe recommendation they owe their appointment. Each of them is preſented by the king with a ſtring of coral as a badge of office, which he is obliged always to wear about his neck, under the penalty of degradation, and even death. The third order conſiſt of the fiadors, the mercadors, or merchants; the fulladers, or pleaders, and the veilles, or elders, all of whom are reſpectively diſtinguiſhed by ſome peculiar mode of wearing the coral chain. The loweſt claſs is formed by the plebeians, who are generally indolent and poor. The whole burden of labour, ſuch as tilling the ground, ſpinning cotton, weaving cloth, and even cleaning the ſtreets, is devolved upon the women. The chief workmen are ſmiths, carpenters, and leather-dreſſers; but in every occupation of this kind they are extremely aukward and artleſs. The common diet of the natives is beef, mutton, or fowls, and their bread is made of yams, beaten into a ſort of cake. The meaner perſons ſubſiſt on ſmoked or dried fiſh, and bread made of yams, bananas and beans, mixed together. The drink of the poor is water, and that of the richer, water mixed with European brandy. The king, and perſons of rank, ſupport a certain number of poor, ſelected from the blind, lame, and infirm; the lazy, who will not labour, are ſuffered to ſtarve; and by this excellent police, not a beggar or vagrant is to be ſeen. The natives of Benin are diſtinguiſhed by their liberality; but in the exerciſe of it they are extravagantly vain and oſtentatious. The dreſs of the natives is neat and ornamental; that of the rich, in which they appear in public, conſiſting of white callico, or cotton drawers, covered with another fine piece of callico plaited in the middle, and bound under a ſcarf, the ends of which are adorned with a handſome lace or fringe. The upper part of the body is moſtly naked. The ladies of better faſhion wear fine callico, beautifully chequered with various colours. The face and upper part of the body is covered with a thin veil, and the neck adorned with a ſtring and chain of coral. Upon their arms and legs they wear bright copper or iron bracelets, meanly wrought. The perſons of the women are not diſagreeable. The children go naked till the age of ten or twelve years; their whole dreſs, before this period, conſiſting of a few ſtrings of coral tied round the waiſt. The men neither curl nor adorn their hair; but they form part of it into locks, to which they ſuſpend a bunch of coral. The women dreſs their hair with great art in a variety of forms, and occaſionally apply to it a kind of nut-oil, which deſtroys its black colour, and in time changes it into green or yellow.

The men marry as many women as their circumſtances allow; but they have ſcarcely any nuptial ceremonies. Jealouſy is very prevalent, and adultery is ſeverely puniſhed; but the violation of the marriage-bed is leſs known in Benin than in any other country. Male infants, as ſoon as they are born, are preſented to the king, as rightfully belonging to him; but the females, being deemed the property of the father, are left wholly to his care and diſpoſal. Both male and female children are circumciſed, when they are about a fortnight old; and they are marked over their bodies with various inciſions, that expreſs certain figures. In ſome parts of Benin twin births are reckoned a happy omen; but at Aerbo, they are reputed a bad omen, and both the twins and their mother

mother are put to death. The inhabitants of Benin are leſs afraid of death than the other natives of the ſame coaſt. Such is their attachment to their own country, that thoſe who die in other provinces are preſerved for years, till they can be conveyed for burial to their native ſoil. On occaſions of mourning, which is uſually limited to 14 or 15 days, ſome ſhave their hair, others their beard, and others but half of either. The laſt obſequies of their kings are performed with ſome very extraordinary ceremonies. When the tomb-ſtone is laid, they crown it with a banquet of the moſt delicate wines and ſweetmeats, of which all are allowed to partake; and the mob, intoxicated with liquor, are guilty of the wildeſt exceſſes and riots. Thoſe who obſtruct them, as men, women, children, and even brute animals, are put to death; and having cut off their heads, they carry them to the royal ſepulchre, and throw them in as offerings to the deceaſed king, together with all the cloaths and effects of thoſe whom they have ſacrificed to his manes. Nevertheleſs, amidſt theſe barbarous cuſtoms, the kingdom of Benin is governed by laws, which breathe nothing but humanity, and ſympathy for misfortune and diſtreſs.

As to the religion of this country, it is a ſtrange mixture of good ſenſe and abſurdity. With ſome juſt notions of a Supreme Being they blend many abſurd and idolatrous ceremonies. The "Fetiſſo" is worſhipped here, as well as in all the other countries on the weſtern coaſt of Africa. To every evil they give the name of devil, and worſhip him from fear, and to prevent his doing them injury; and they honour both God the Creator, and the evil ſpirit, by ſacrifices and offerings. They are believers in apparitions; and they conceive that the ghoſts of their deceaſed anceſtors walk on the earth, and occaſionally appear to them in their ſleep to warn them of their danger, which they endeavour to elude by ſacrifices. All their houſes are full of idols, and they have particular huts or temples for the reſidence of their gods. Their prieſts alſo are numerous; and the grand, or high prieſt of Loeho, a town ſeated at the mouth of the river Formoſa, is particularly famous for his ſkill in magic, and is never approached without the moſt profound veneration and awe. Beſides their ſabbath, a day of repoſe which occurs every fifth day, they have many other days appropriated to religious purpoſes. At ſome of their feſtivals, they ſacrifice not only a great variety of brutes, but likewiſe a number of human victims, who are uſually condemned criminals, reſerved for this purpoſe. They have one annual feaſt in commemoration of their anceſtors; but their greateſt feſtival is that called the coral feaſt, on which day alone the king appears to his people in great pomp, attended by 600 of his women. Wine and proviſions are diſtributed on this occaſion among the people, and the day ends in gluttony, drunkenneſs, and riot.

The government of Benin is deſpotic. The empire is divided into a great number of petty royalties, all of which are ſubject to the king of Benin, whoſe authority is abſolute, and commands the moſt blind and ſervile obedience. The reigning monarch, when he apprehends his diſſolution to be approaching, commands one of his ſons to fill the throne, with an injunction, under pain of death, not to reveal the ſecret till after his death. When this happens, the deſtined ſovereign is removed to the town of Oſcebo, a few miles from Benin, the capital, where he remains for ſome time to be inſtructed in the art of government, and the duties of a king. Upon his return, his firſt care, for ſecuring his future tranquillity, is to murder his brothers, and thus to remove every rival to the crown. The royal revenues are very conſiderable; to theſe every governor contributes a large ſum; and the inferior officers pay their taxes in cattle, fowls, cloth, and other commodities. Certain duties are alſo laid upon foreign trade; beſides the annual taxes paid to the governor for the privilege of commerce, a ſixth of which belongs to the king. It is ſaid that the ſovereign of Benin is ſo powerful a prince, that, in one day, he can aſſemble an army of 20,000 men, and in a few days more 100,000. His troops, however, are deſtitute of courage and conduct, and obſerve neither order nor diſcipline; and, indeed, are merely a cowardly tumultuous rabble, which leave him expoſed to the incurſions of pirates and robbers, that are ſuffered to pillage and deſtroy, and ſometimes to advance even to the capital. The arms uſed by them are ſwords, poniards, javelins, bows, and poiſoned arrows.

The capital of this kingdom is Benin. The other principal towns, or rather villages, are Bododo, Arebo, Agatton, Awerri, and Meiberg.

All the ſlaves purchaſed on this part of the African coaſt, except a tribe diſtinguiſhed by the name of "Mocues," are called in the Weſt Indies "Eboes," probably from Arebo, on the river Benin. In language they differ both from the Gold coaſt Negroes, and thoſe of Whydah, and in ſome reſpects from each other; and in complexion they are much more yellow than the others; but their colour is a ſickly hue, and their eyes appear as if ſuffuſed with bile, even when they are in perfect health. Theſe Eboes appear, in general, to be the loweſt and the moſt wretched of all the nations of Africa. The great objection to them as ſlaves is, their conſtitutional timidity, and deſpondency of mind; which lead them very frequently to ſeek, in a voluntary death, a refuge from their own melancholy reflections. They require, therefore, the gentleſt and mildeſt treatment to reconcile them to their ſituation; but if their confidence be once gained, they manifeſt as great fidelity, affection, and gratitude, as can reaſonably be expected from men in a ſtate of ſlavery. The females of this nation are better labourers than the men, probably from having been more hardly treated in Africa. Theſe Eboes, notwithſtanding the depreſſion and timidity which they manifeſt, on their firſt arrival in the Weſt Indies, and which give them an air of ſoftneſs and ſubmiſſion, forming a ſtriking contraſt to the frank and fearleſs temper of the Koromantyn Negroes, are in reality more ſavage than the people of the Gold coaſt; inſomuch, that many tribes among them, and eſpecially the Mocos tribe, have been accuſtomed to the ſhocking practice of feeding on human fleſh. In their religious worſhip, they adore certain reptiles, of which the guana, a ſpecies of lizard, is in the higheſt eſtimation, and in the worſhip of this animal, it is ſaid, that they offer human ſacrifices. Mod. Un. Hiſt. vol. xiii. p. 272, &c. Edwards' Hiſt. Weſt Ind. vol. ii. p. 75.

BENIN, a city of Africa, and capital of the kingdom above deſcribed. It is pleaſantly ſeated on the river Benin, or Formoſa, about 69 miles from Agatton, at the mouth of the river, and is ſaid to be 4 miles in circumference, and to contain 30 long, broad, and ſtraight ſtreets of low houſes. The ſtreets are adorned with a variety of ſhops filled with European wares, as well as the commodities of the country, ſuch as cattle, cotton, and elephants' teeth. In their markets they expoſe to ſale, for food, dogs, of which the Negroes are fond; and alſo roaſted monkies, apes, and baboons. Bats, rats, lizards dried in the ſun, palm-wine, and fruit, form the moſt luxurious entertainment, and ſtand always expoſed to ſale in the ſtreets. As the country affords no ſtone, the houſes are built with mud and clay, covered with reeds or ſtraw; and they are ſeparated from one another by chaſms and ruins, that indicate its decay. The entrance into the city is by a gate of wood, which is defended by a baſtion of mud and earth; and it is ſurrounded by a deep ditch 40 feet wide. A guard

is ſtationed at this gate to receive the tolls, duties, and impoſts collected from the merchandize. None but natives are permitted to live in the city; and of theſe ſome are wealthy, and carry on an extenſive trade, which is committed to their wives, who go to all the circumjacent villages, and traffick in all ſorts of merchandize, and who are obliged to bring the greateſt part of their gains to their huſbands. A principal part of the city is occupied by the royal palace, which is more diſtinguiſhed by the extent of its dimenſions than by the commodiouſneſs or elegance of the ſtructure. All the male ſlaves in this town are foreigners; for the inhabitants cannot be ſold for ſlaves, and only bear the name of the king's ſlaves. This is one of the European marts for the purchaſe of ſlaves. N. lat. 6° 10'. E. long. 5° 6'.

Benin, *River of*, called by Juan Alfonſo de Aveiro, a Portugueſe, who is ſaid to have firſt diſcovered the country, *Formoſa*, on account of the verdure and beauty of its banks; a conſiderable river of Africa, in the kingdom of Benin. It divides itſelf into ſeveral branches; and has ſome towns or villages on its banks, in which Europeans, and particularly the Dutch, carry on a commerce. Notwithſtanding the beauty of its adjacent ſcenery, the air is noxious and peſtilential on account of the vapours exhaled by the ſun's heat from its marſhy banks; and it is much infeſted by the moſquito flies. The entrance into this river is in N. lat. 6° 38', and E. long. 4° 47'.

BENISH Days, among the Egyptians, a term for three days of the week, which are days of leſs ceremony in religion than the other four, and have their name from the *beniſh*, a garment of common uſe, not of ceremony. In Cairo, on Sundays, Tueſdays, and Thurſdays, they go to the baſhaw's divan; and theſe are the general days of buſineſs. Fridays they ſtay at home, and go to their moſques at noon; but though this is their day of devotion, they never abſtain from buſineſs. The three other days of the week are the beniſh days, in which they throw off all buſineſs and ceremony, and go to their little ſummer-houſes in the country.

BENISOUEF, in *Geography*, a town of Egypt, on the weſt ſide of the Nile. According to Savary, it is half a league in circumference; and Sonnini ſays, that of all the places ſituated along the Nile, from Cairo, or for the ſpace of more than 30 leagues, this is the largeſt, as well as the moſt affluent. The houſes are only cottages of brick and earth, coarſely conſtructed; but the lofty minarets, vying in height with the ſurrounding date-trees, and diſcovered through their higheſt branches, preſent an agreeable object to the view. A manufacture of coarſe carpets renders this a commercial town; and the adjacent plains are fertile and productive, ſo that the people who cultivate them appear leſs diſtreſſed and wretched than thoſe who live near the capital. Beniſouef is the reſidence of a bey, or, in his abſence, of a kiaſchef, who levies with an armed force his arbitrary tributes. Over againſt Beniſouef ſtands the village of "Baiad," partly inhabited by Copts; and on the ſame ſide of the river, and at the diſtance of 3 leagues, is "Bebé," a large village, the reſidence of a kiaſchef, where are a moſque and a convent of Copts. Beniſouef lies in N. lat. 29° 14'. E. long. 30° 58'.

BENITO, St. a ſmall iſland of the north Pacific ocean, on the north-weſt coaſt of America, ſurrounded with rocks and iſlets. N. lat. 27° 41'. E. long. 244° 38'.

Benito, *St.* or *St. Bennet*, a river of Benin, in Africa, that diſcharges itſelf 7 leagues S. by W. from the bight of Biafra, and on the ſouth ſide of the river Campo, into the gulf of Guinea. On the north ſide of this river ſtands a great hill, called the Hayburn. N. lat. 1° 45'. E. long. 8° 10'.

BENIVIENI, Girolamo, in *Biography*, was born at Florence, in 1452, and contributed, under the auſpices of Lorenzo de Medici, to reclaim the Italian poetry from its mean and trivial ſtate, and to renew the ſtyle and manner of Dante and Petrarch. The principal topic of Benivieni was divine love, which he clothed with the ſentiments of Platoniſm, and thus obſcured the poetical beauties of his works by myſticiſm. He was eſteemed on account of his integrity and virtue, and employed by Pico, prince of Mirandola, as his almoner. He died at Florence in 1542, and was buried in the ſame tomb with his friend Pico. His works were printed at Florence in 1500, and again with additions in 1519. Nouv. Dict. Hiſt.

BENLAWERS, in *Geography*, a lofty mountain, being the chief ſummit of the Grampian chain, near Kenmore, in Perthſhire, Scotland. One of its ſides riſes from the banks of the Tay, and aſſuming a conical ſhape, elevates its ſummit about 4015 feet above the level of the ſea.

BENLOJA, in *Ichthyology*, the name by which the Swedes call the *common bleak, cyprinus alburnus* of Linnæus.

BENLOMOND, in *Geography*, a mountain of Scotland, ſituated in the pariſh of Buchannan, in Dumbartonſhire. Though not ſo lofty as Bennevis or Benlawers, yet its inſulated ſituation with reſpect to the neighbouring hills, and broad lake of Loch Lomond ſpreading at its baſe, give it great magnitude and grandeur. It is computed to be 3260 feet above the level of the ſea, and 3240 from the ſurface of the lake. The form it aſſumes nearly reſembles a truncated cone, and its ſides, particularly towards the lake, are finely mantled with natural woods. Its north ſide is exceedingly ſteep, but on the ſouth-weſt it may be eaſily aſcended. On the north-eaſt ſide is the ſource of the river Forth, which, like moſt mountain ſtreams, ſoon becomes a rapid river, and is alternately ſeen expanding into a lake, or darting over ſome craggy precipices. Benlomond is moſtly compoſed of granite, interſperſed with large maſſes of quartz, and near the baſe are large ſtrata of micaceous ſchiſtus, ſome of which is alſo found at the top of the mountain. Sinclair's Statiſtical Account of Scotland.

BENNA, in *Britiſh Antiquity*, a kind of carriage, which was uſed for travelling rather than for war. It contained two or more perſons, who were called "Combennones," from their ſitting together in this machine. The name was probably derived from the Britiſh word "Ben," or pen, which ſignifies head, or chief; and theſe carriages might, perhaps, have got this appellation from the high rank of the perſons who uſed them.

BENNAVENNA, or Bannavanto, in *Ancient Geography*, a town of Britain in the itinerary of Antonine, placed by Camden, Gale, and Stukely, at Weedon, a village ſix miles weſt of Northampton, but by Mr. Horſley, for reaſons which he has ſtated, and which ſeem to be ſatisfactory, at or near Daventry.

BENNECKSTEIN, a town of Germany, in the circle of Upper Saxony, and county of Klettenberg, 22 miles S.S.W. of Halberſtadt.

BENNECUM, in *Geography*, a town of Guelderland, 2 miles north of Wageningen.

BENNET, Christopher, in *Biography*, was born at Raynton, in Somerſetſhire, about the year 1617. After the uſual ſchool education, he was entered at Lincoln college, Oxford, in the year 1632, where he proceeded bachelor, and then maſter of arts, but ſeems to have acquired his knowledge of medicine at Leyden, or ſome other univerſity, where he took his degree of doctor. He then came to London, was admitted fellow of the college of phyſicians, and appears to have had a conſiderable ſhare of reputation and practice. In 1696,

1696, he publiſhed "Theatrum tabidorum, ſeu phthiſcos, atrophiæ, et hecticæ, xenodochium," 8vo. London: a work of learning and ingenuity, but abſtruſe and theoretical. He made a number of curious experiments to diſcover the qualities of the blood in phthiſical patients. He had ſeen diſeaſes of the breaſt, he ſays, relieved by diſcharges from the legs; and on the other hand, phthiſical complaints occaſioned by ſuppreſſing hæmorrhage from the noſtrils. He obſerves, that conſumption not unfrequently occurs in England, unattended with affections of the lungs. The work has been tranſlated into moſt of the modern languages, and paſſed through numerous editions, though now almoſt forgotten. He alſo republiſhed, with obſervations, Mouſet's treatiſe, called "Health's Improvement." He died tabid, in April 1655, and probably had been induced to employ ſo much of his time and labour in acquiring a knowledge of the diſeaſe from his own ſufferings. Haller. Bib. Med. Pract.

Bennet, Henry, earl of Arlington, an eminent ſtateſman, and favourite miniſter of king Charles II. was born of a good family in the county of Middleſex, in 1618, educated at Chriſt-church college, in the univerſity of Oxford, where he diſtinguiſhed himſelf by his application, and by his turn for Engliſh poetry; and upon the king's coming to Oxford, at the breaking out of the civil war, entered himſelf into his ſervice, both as a volunteer in the royal army, and as private ſecretary to lord Digby, ſecretary of ſtate. Upon the failure of the royal cauſe, he went over to the continent, and became ſecretary to the duke of York, and poſſeſſed the full confidence and eſteem of the royal family. In 1658, he received the honour of knighthood from Charles II. and was ſent by him in the quality of his miniſter to the court of Madrid. Soon after the king's reſtoration, ſir Henry Bennet was recalled from Madrid, and in 1662, promoted to the office of ſecretary of ſtate. In 1664, he was created baron of Arlington, and at that time was conſidered as the king's chief miniſter and favoured ſervant. He is ſuppoſed to have been at the head of the party who procured the fall of the chancellor Clarendon. The conduct of foreign affairs was chiefly entruſted to him, and he had a great ſhare in the firſt Dutch war. About this time he introduced Mr. (afterwards ſir) Wm. Temple, into public employment. He formed one of the principal characters in the miniſtry of that period, diſtinguiſhed by the appellation of the *cabal*. From the collection of letters, publiſhed by John Dalrymple, it appears, that lord Arlington was one of the commiſſioners, who, in 1670, concluded and ſigned at Dover, with Monſ. Colbert, the French ambaſſador, a ſecret league between Charles II. of England, and Lewis XIV. of France; by which Charles agreed to declare himſelf a Roman catholic, and to engage in a war for the deſtruction of the United Provinces. By one article of this treaty it was ſtipulated, that his moſt Chriſtian majeſty was to furniſh the king of England, before he declared himſelf a catholic, with the ſum of 200,000l. ſterling. In conſideration probably of this ſervice, however reproachful to thoſe who conducted it, and degrading to the king their maſter, and as a recompence for other miniſterial duties, lord Arlington was raiſed, in 1672, to the dignity of earl of Arlington, and viſcount Thetford, and decorated with the order of the garter. In 1674, his conduct, and that of his colleagues in office, fell under the ſuſpicion of the commons; and an impeachment was moved againſt him, which he eſcaped by a ſmall majority. In that year he exchanged the office of ſecretary of ſtate for the leſs reſponſible, and merely honorary one, of lord chamberlain: and ſoon after he was deputed, with two other commiſſioners, on buſineſs of importance to the prince of Orange; but not ſucceeding in the conduct of it, his intereſt at court declined. This was partly owing to his affected zeal againſt popery, though he had been always regarded as a ſecret friend to the popiſh party, and was in reality a convert to that religion. He retained, however, in outward appearance, the favour of the king; and after the acceſſion of James II. who had no affection for him, he retained the office of chamberlain. He died in July, 1685, having previouſly, on his death-bed, as it is ſaid, reconciled himſelf to the church of Rome. By his wife, who was daughter of Lewis de Naſſau, lord of Beverwaert in Holland, he left one daughter, married to the earl of Euſton, afterwards duke of Grafton, natural ſon of Charles II.

"The character of lord Arlington ſeems to have been that of a thorough courtier; accommodating, eaſy, artful, with the habits of public buſineſs, rather than extenſive abilities, and the moderation of timidity rather than the reſtraint of principle. He had little knowledge of the Engliſh conſtitution, and leſs regard to it; but he wanted firmneſs and reſolution to take the lead in arbitrary meaſures. His public letters, when ſecretary, were publiſhed in 1701, 2 vols. 8vo." Biog. Brit. Gen. Biog.

Bennet, Thomas, an eminent divine of the church of England, was born in the city of Saliſbury in 1673, and ſent for completing his education to St. John's college, Cambridge, in the beginning of the year 1688. Before he had attained the age of 21 years, he took the degrees of bachelor and maſter of arts; and he was choſen fellow of his college. In 1695, he wrote a copy of Hebrew verſes on the death of queen Mary, printed in the Cambridge collection of verſes on that occaſion. In 1699, he entered into the controverſy between the church and the diſſenters, and publiſhed "An Anſwer to the diſſenters' pleas for ſeparation, or an abridgement of the London caſes." In the year 1700, he was preſented to the rectory of St. James's at Colcheſter, where he became a very popular preacher. During his reſidence in this place, he publiſhed "A Confutation of Popery," ſeveral tracts of controverſy with the diſſenters on the ſubject of "Schiſm," and alſo "A Confutation of Quakeriſm." He alſo publiſhed "A Paraphraſe, with Annotations upon the book of Common Prayer," with two letters relating to the ſame ſubject; and "The Rights of the Clergy of the Chriſtian Church." About the year 1711, he took the degree of doctor in divinity. As his popularity declined at Colcheſter, and his ſalary, which partly depended on voluntary ſubſcriptions, was reduced from 300l. to 60l. a year, he determined to remove to London, and accordingly accepted the office of deputy chaplain to Chelſea hoſpital; and this appointment was ſucceeded by the two lectureſhips of St. Olave's, Southwark, and St. Lawrence Jury. Before his removal to London in 1716, he publiſhed, in 1714, an 8vo. treatiſe, intitled "Directions for ſtudying;" and in the following year, his "Eſſay on the thirty-nine articles of Religion, &c. and the caſe of ſubſcription to the articles conſidered in point of law, hiſtory, and conſcience, with a prefatory epiſtle to Anthony Collins, Eſq." ſuppoſed to be the author of "Prieſtcraft in Perfection," publiſhed in London in 1709. In 1716, he publiſhed a pamphlet, entitled "The Nonjurors' ſeparation from the church of England examined, and found to be ſchiſmatical on their own principles," and a ſermon on "The Caſe of the Reformed Epiſcopal Churches in Great Poland, and Poliſh Pruſſia." Soon after, he was preſented by the dean and chapter of St. Paul's to the vicarage of St. Giles, Cripplegate, which afforded him a liberal income, amounting, after ſeveral deductions, to 400l. a year. For this preferment he was indebted to the private interference and recommendation of biſhop Hoadly. After his ſettlement in this pariſh, in 1717, his tranquillity was

interrupted by ſome law-ſuits in which he was engaged for recovering dues that belonged to the church. However, he publiſhed, in the ſame year "A Spital Sermon;" and in 1718, "A Diſcourſe of the ever-bleſſed Trinity in Unity, with an examination of Dr. Clarke's Scripture Doctrine of the Trinity." From this time the haraſſed ſtate of his mind, and the weight of parochial duties, prevented his undertaking any new work, except "An Hebrew Grammar," publiſhed at London, in 1716, 8vo. and intended for the uſe of ſuch as want to learn Hebrew without the aſſiſtance of a maſter. He died at London of an apoplexy, in the 56th year of his age, on the 9th of October 1728, and was buried in his own church. Dr. Bennet, though a man of ſtrong paſſions, and not altogether exempt from the charge of haughtineſs, was diſtinguiſhed by his piety and integrity, by the diligence and zeal with which he devoted himſelf to the ſtudies and duties of his profeſſion, and by his extenſive learning, more eſpecially by his ſkill in the oriental and other learned languages. As an acute reaſoner and accurate textuary, he had few equals. His talents for controverſial writing, which perhaps he indulged to exceſs, gave him a decided advantage, particularly in his diſputes with diſſenters, over incompetent antagoniſts; but on ſome occaſions they led him to recur to diſtinctions and refinements, which would not always bear examination, and which laid him open to the attacks of his adverſaries. Several of his writings, as they related to temporary controverſies, have been conſigned to oblivion. Thoſe which have excited attention in modern times, are his "Diſcourſe of the Trinity," and his "Caſe of Subſcription to the Articles of the Church of England." His explication of the Trinity has been charged with inclining to that heterodoxy which he wiſhed to avoid, and which, without doubt, he ſincerely abhorred: and his defence of ſubſcription has undergone ſome ſevere ſtrictures by the acute and learned author of the "Confeſſional." It redounds much to the honour both of Dr. Bennet and biſhop Hoadly, when we conſider the diſparity of their opinions, that the latter contributed to the preferment of the former. Gen. Dict. Biog. Brit.

Bennet, *Herb*, in *Botany*. See Geum.

BENNEVENAGH, in *Geography*, a large mountain in the northern part of the county of Londonderry, province of Ulſter, Ireland, about 8 miles weſt of Coleraine.

BEN-NEVIS. See Ben-*Nevis*.

BENNI, in *Ichthyology*, a name given by Boſc after Sonnini, to the ſpecies of Cyprinus which inhabits the river Nile, and is deſcribed by Forſkal under the ſpecific name of *bynni*. See Bynni.

BENNINGTON, in *Geography*, a county of America, in the ſouth-weſt corner of Vermont, bounded by Windham county on the eaſt, the ſtate of New York on the weſt, Rutland county on the north, and the ſtate of Maſſachuſetts on the ſouth. It contains 19 townſhips, of which Bennington and Mancheſter are the chief. It has 12,254 inhabitants, including 16 ſlaves. The mountains abound with iron ore, which employs already a furnace and two forges.

Bennington, the ſhire town of the above county, and the principal town in Vermont, including in the compact part of the town about 160 houſes, is ſituated near the foot of the Green mountain, near the ſouth-weſt corner of the ſtate, 24 miles eaſterly from the junction of Hudſon and Mohawk rivers, and about 52 miles from the ſouth end of lake Champlain, at the confluence of the eaſt and ſouth bays; 55 miles from Rutland, 202 north-eaſterly from New York, and 300 in the ſame direction from Philadelphia. N. lat. 42° 42'. W. long. 74° 10'. It has a number of elegant houſes, and is a flouriſhing town, containing 2400 inhabitants. Its public buildings are a congregational church, a court-houſe, and gaol. It is the oldeſt town in the ſtate, having been firſt ſettled in 1764. Within the townſhip is mount Anthony, which riſes to a great height in a conical form. The defeat of the Britiſh in two battles fought near this town, in 1777, contributed in a great meaſure to the ſubſequent ſurrender of general Burgoyne's army.

BENNISCH, a town of Sileſia, in the principality of Jagerndorf.

BENOIST, St. a town of France, in the department of the Loiret, and chief place of a canton, in the diſtrict of Gien; 6 leagues ſouth-eaſt of Orleans.

Benoist, St. *du Sault*, a town of France, in the department of the Indre, and chief place of a canton, in the diſtrict of Argenton; 3¾ leagues S.S.W. of Argenton. N. lat. 46° 27'. E. long. 1° 17'.

Benoist, St. *de Seyſſieu*, a town of France, in the department of the Ain, and chief place of a canton, in the diſtrict of Belley, 1½ league ſouth-weſt of Belley.

BENOIT, or Benedictus, *Renatus*, in *Biography*, a famous doctor of the Sorbonne, and curate of St. Euſtathius at Paris, was born at Sevenieres near Angers; and being a ſecret favourer of the proteſtant religion, he publiſhed, for the benefit of the people, a French tranſlation of the Bible, which had been made by the reformed miniſters of Geneva; but as ſoon as it was publiſhed, it was condemned. Benoit was appointed by Henry III. in 1587, regius profeſſor of divinity in the college of Navarre at Paris; and ſome time before the death of this prince, he publiſhed a book, entitled "The Catholic Apology," the deſign of which was to ſhew that the proteſtant religion, profeſſed by Henry, was no juſt reaſon for depriving him of his right of ſucceſſion to the crown of France. This was followed, in 1590, by a defence of the ſame book. Benoit afterwards aſſiſted at the aſſembly in which Henry IV. abjured the reformed religion; and he was promoted by the king, in 1597, to the biſhopric of Troyes in Champagne; but he was ſo obnoxious to the pope, on account of his tranſlation of the Bible, his favour to the proteſtants, and his ſtrenuous aſſertion of the liberties of the Gallican church, that he could never obtain his bull, to be inſtalled: however, he retained the temporalities till the year 1604, when he reſigned the biſhopric. He died at Paris in 1608. He was the author of ſeveral treatiſes, which are now not worth mentioning. Gen. Dict.

Benoit, Elias, a learned French proteſtant miniſter, was born at Paris in 1640. After the revocation of the edict of Nantes, he ſought refuge in Holland, and became paſtor in the church at Delft, where he died in 1728. He was patient, timid, ſubmiſſive, and laborious, and in his domeſtic connection he found ample occaſion for the exerciſe of the virtues that diſtinguiſhed his character. Of his wife he gives the following account: "I married a wife poſſeſſed of all the faults that could torment a peaceable huſband; covetous, pert, peeviſh, and capricious; by her unwearied ſpirit of contradiction, ſhe plagued, in every poſſible way, her wretched mate for the ſpace of 47 years." His only relief was inceſſant ſtudy, the fruits of which were the following publications, written in French, viz. "A Hiſtory of and Apology for the Retreat of the Paſtors on account of the Perſecution in France," 12mo. 1688; "A Hiſtory of the edict of Nantes," 5 vols. 4to. Delft. 1693; and "Miſcellaneous Remarks, critical and hiſtorical, on Toland's two Diſſertations," 8vo. 1712. Nouv. Dict. Hiſt.

Benoit, Father, a learned Maronite, whoſe Arabic name was *Ambarach*, was born at Guſta, in Phœnicia, of a noble family, in 1663. Having ſtudied from the age of nine years to twenty-two, in the Maronite college at Rome, he returned

returned to the eaſt, and was ordained prieſt by the Maronite patriarch of Antioch, and from thence he was ſent to Rome, in order to tranſact ſome affairs relating to the church at Antioch. Previouſly to his propoſed return, he was invited to Florence by the grand duke Coſmo III. where he was employed in arranging the types which Ferdinand de Medicis had cauſed to be founded for printing books in the oriental languages. Under his inſpection ſeveral eaſtern manuſcripts were printed. Coſmo, in order to retain Benoit in his ſervice, appointed him Hebrew profeſſor at the univerſity of Piſa, where he acquired great reputation for his character and learning among the literati of Italy. At the age of 44, he entered into the ſociety of Jeſuits, and was employed by Clement XI. as one of the correctors of the editions of the Greek fathers; and on the ſolicitation of cardinal Quirini, whom he had aſſiſted in his ſtudies, he publiſhed, at an advanced age, an edition of "Ephrem Syrus;" the two firſt volumes of which, begun in 1730, were, after twelve years' labour, given to the public; but in 1742, whilſt he was proſecuting the third, and after he had advanced through one half of it, he was carried off by a ſevere illneſs in his 80th year. This volume was completed by Aſſemanni, in 1743. Benoit alſo tranſlated part of the Greek Menology, and wrote ſome diſſertations relating to the works of Ephrem Syrus. Moreri. Gen. Biog.

BENON, in *Geography*, a town of France, in the department of the Lower Charente, and chief place of a canton, in the diſtrict of Rochefort; 5½ leagues N. N. E. from Rochefort.

BENOU, a town of Arabia, 110 miles ſouth-eaſt from El-Catif.

BENOWN, the capital of Ludamar, an interior kingdom of Africa, placed by Rennell in N. lat. 15° 6′. W. long. 6° 58′. See LUDAMAR.

BENRAD, a town of Germany, in the circle of Weſtphalia, and duchy of Berg; 7 miles S.S.E. of Duſſeldorp.

BENSEN. See BENESSOW.

BENSBERG, a town of Germany, in the circle of Weſtphalia, and duchy of Berg; 7 miles eaſt of Mulheim.

BENSERADE, ISAAC DE, in *Biography*, a celebrated French poet, was born at Lions, near Roan, in Normandy, in 1612. The vivacity of his genius, and the pleaſantry of his converſation, were well calculated to ſecure his reception at court, and to promote his advancement under the patronage of cardinals de Richelieu and Mazarin, who provided for him in a liberal manner by gifts and penſions. The poetry in which he excelled was that of the gallant and ſatirical kind, compoſed for the court-ballets, before operas came into vogue; and in theſe he ingeniouſly adapted to the perſonages of antiquity the known characters and adventures of thoſe who repreſented their parts in fiction. His ſucceſs in this way induced him to make an attempt for turning all Ovid's Metamorphoſes into rondeaus; but this work, though favoured by the king, and ſet off by all the ornaments of engraving, was ridiculed from its firſt appearance. As he aimed at point and conceit, the prevalence of a better taſte in the age of Lewis XIV. ſunk him into neglect. In 1674, he was choſen a member of the French academy. Towards the cloſe of his life, he abandoned the court, and retired to Gentilly, where he embelliſhed his houſe and gardens with a variety of ornaments that indicated his poetical genius. He was much afflicted with the ſtone, the excruciating pain of which he is ſaid to have endured with fortitude and reſignation. His later years were conſecrated to works of piety and devotion; and he tranſlated almoſt all the Pſalms. He died in 1691; and after his death his works were printed in two volumes. Gen. Dict. Nouv. Dict. Hiſt.

BENSHAUSEN, in *Geography*, a town of Germany, in the circle of Franconia, and county of Henneburg; 7 miles ſouth-eaſt of Smalkalden.

BENSHEIM, a town of Germany, in the circle of the Upper Rhine, and archbiſhopric of Mayence; 20 miles north of Heidelberg.

BENSON, GEORGE, in *Biography*, a diſſenting divine of conſiderable reputation for biblical learning, was born at Great Salkeld in Cumberland, on the 1ſt of September 1699. When he had finiſhed his preparatory ſtudies, he completed his education for the miniſtry at the univerſity of Glaſgow. At Abingdon in Berkſhire, where he firſt ſettled as paſtor in the year 1723, he continued for about ſeven years; and beſides a ſedulous attention to the duties of his office, he employed his time in a critical ſtudy of the ſacred writings. His firſt work, publiſhed during his reſidence in this town, was "A Defence of the Reaſonableneſs of Prayer," accompanied with a tranſlation of a diſcourſe of Maximus Tyrius, on the ſame ſubject, together with remarks upon it. A new edition of this, and of his piece on predeſtination, was publiſhed in 1737, under the title of "Two Letters to a Friend, &c." In 1729, he left Abingdon, and removed to the charge of a congregation in Southwark, with which he continued for eleven years. In 1731, he publiſhed "A Paraphraſe and Notes on St. Paul's Epiſtle to Philemon," in imitation of the manner of Mr. Locke; and to this he added "An Appendix, ſhewing that St. Paul could neither be an enthuſiaſt nor an impoſtor, and conſequently the Chriſtian religion muſt be, as he has repreſented it, heavenly and divine." This argument was afterwards illuſtrated and improved in the moſt maſterly manner by lord Lyttelton. This work, being favourably received by the public, was ſucceeded by Paraphraſes and Notes, after the ſame manner, on the two epiſtles to the Theſſalonians, the firſt and ſecond epiſtles of Timothy, and the epiſtle to Titus; together with diſſertations on ſeveral important ſubjects, particularly on inſpiration. In 1735, he publiſhed, in three thin volumes, 4to. "The Hiſtory of the firſt planting of the Chriſtian religion, taken from the Acts of the Apoſtles, and their Epiſtles, &c." A ſecond edition of this work, commonly bound up in one large volume, was publiſhed in 1756. In 1740, Mr. Benſon was choſen paſtor of the congregation of proteſtant diſſenters, in Crouched Friars, London, in the room of Dr. Harris; and in this connection, with the learned and candid Dr. Lardner as his aſſiſtant for ſome years, he continued till his death, which happened on the 6th of April, 1762. In 1743, he publiſhed his treatiſe "On the Reaſonableneſs of the Chriſtian Religion, as delivered in the Scriptures;" and in conſideration of his great abilities and learning, the univerſity of Aberdeen conferred upon him the degree of doctor in divinity. Dr. Benſon, having finiſhed thoſe epiſtles of St. Paul, on which he intended to write Paraphraſes and Notes, proceeded to explain, after the ſame manner, the ſeven catholic epiſtles, viz. that of St. James, the two epiſtles of St. Peter, that of St. Jude, and the three epiſtles of St. John. A volume of miſcellaneous ſermons, in 1747, was the laſt of his public works. His poſthumous writings, edited by Dr. Amory, appeared two years after his death, containing a life of Chriſt, and other theological eſſays. The labours of Dr. Benſon in ſacred literature met with a very favourable reception in foreign countries, as well as in Great Britain and Ireland, from the truly inquiſitive and learned, and introduced him to a friendly acquaintance and correſpondence with many perſons, eminent for their literature and rank in the eſtabliſhed church, as well as among the diſſenters. Of theſe we may enumerate ſir Peter King, lord chancellor of England; lord Barrington; archbiſhop Herring; biſhops Hoadly,

Hoadly, Butler, and Conybeare; Dr. Leland, and Dr. Duchal of Ireland; Dr. Jonathan Mayhew of New England; profeſſor Michaelis of Gottingen; Dr. Wiſhart of Edinburgh; Dr. Watts of London; Dr. Taylor of Norwich; and Mr. Bourn of Birmingham. His commentaries and notes on the epiſtles are deſervedly held in high eſtimation. The learned John David Michaelis, one of the profeſſors in the univerſity of Gottingen, propoſed tranſlating them into Latin, and in 1746, publiſhed his paraphraſe on the epiſtle of St. James, with additional notes. Several of his other tracts were tranſlated into German by M. Bamberger, a proteſtant divine at Berlin. As a zealous friend to religious toleration and free inquiry, and with a view of vindicating and recommending them, he publiſhed a defence of Servetus, and an account of archbiſhop Laud's perſecution of Dr. Leighton. Biog. Brit.

BENSON, in *Geography*, the north-weſternmoſt townſhip of Rutland county, in the ſtate of Vermont, North America, is ſituated on the eaſt ſide of lake Champlain, 57 miles N.N.W. of Bennington, and has 658 inhabitants.

BENTAVEO, in *Ornithology*, the French name of that ſpecies of SHRIKE, called *Lanius pitangua*, by Linnæus.

BENTENDORF JEPLITZA, in *Geography*, a town of Hungary, 4 miles north-eaſt of Roſenberg.

BENT-GRASS, in *Botany*. See AGROSTIS.

BENTHAM, JAMES, in *Biography*, was born at Ely in 1708, and educated for the church at Trinity college, Cambridge. After having held in ſucceſſion ſeveral livings in the counties of Cambridge and Norfolk, he obtained, in 1779, a prebendal ſtall in the church of Ely, where he had an opportunity of cultivating his natural taſte for church architecture and antiquities. The reſult of his obſervation and reſearch was publiſhed under the title of "The Hiſtory and Antiquities of the conventual and cathedral church of Ely, from the foundation of the monaſtery, A. D. 675, to the year 1771, illuſtrated with copper-plates," Cambr. 1771, 4to. The introduction to this work contains an account of Saxon, Norman, and Gothic architecture, and has been frequently cited as authority by later writers on theſe ſubjects. The grand repair of this church, entruſted to the ſuperintendance of Mr. Bentham, afforded him an opportunity of inveſtigating the principles upon which edifices of this kind were conſtructed, and ſuggeſted to him the idea of a general hiſtory of ancient architecture in this kingdom; and for this purpoſe he occaſionally employed himſelf in collecting materials almoſt to the cloſe of his life. He alſo intereſted himſelf in the improvement of his native county, by planning turnpike roads, and propoſing the drainage and incloſure of parts of the Ely Fens; and ſome of his ſchemes were beneficially executed. In ſuch uſeful occupations, and the faithful diſcharge of his profeſſional duties, he protracted his life, by a courſe of temperance which his naturally tender conſtitution required, to his 86th year. He died Nov. 17, 1794. Gen. Biog.

BENTHEIM, in *Geography*, a county of Germany, in the circle of Weſtphalia, about 40 miles long, and from 12 to 15 broad. It is ſurrounded by the province of Overyſſel and the biſhopric of Munſter, and abounds with wood, quarries of ſtone, game, and veniſon. The chief part of this territory is diſtributed into fertile corn-fields and beautiful meadows, which feed a great number of ſheep and cattle; furniſhing the inhabitants with an ample ſupply of the neceſſaries of life, and enabling them to make profitable exports. The principal river is the Vechte, which traverſes the whole country. It is inhabited by Lutherans, Calviniſts, and Roman catholics; and its traffic conſiſts in linen, thread, wool, yarn, ſtone, wood, cattle, and honey. Its towns are Bentheim, Schuttorff, North-horn, and Nienhus. In 1753, count Frederic Charles Philip, mortgaged this county to the houſe of Hanover, for an an advance of money. The count of Bentheim or Benthein, has a ſeat and voice in the college of the Weſtphalian courts of the empire, and at the diets of the circle.

BENTHEIM, a town of Germany, and capital of the above county, is ſeated partly on an eminence, and partly on a river of the ſame name. It contains one Calviniſt, and one Roman Catholic church. The caſtle or palace ſtands on a high rock north of the town, and is ſurrounded with towers. Bentheim is diſtant 26 miles N.N.W. from Munſter. N. lat. 52° 21′. E. long. 7° 1′.

BENTHOORN, a town of Holland, 6 miles S.S.E. of Leyden.

BENTHULUD, a town of Africa, in the kingdom of Fez, at the foot of mount Atlas.

BENTHUYSEN, a town of Holland; 6 miles ſouth of Leyden.

BENTINCK, WILLIAM, earl of Portland, in *Biography*, a favourite miniſter of king William III, was born in Holland, and deſcended from an ancient and noble family in the province of Guelderland. He accompanied the prince of Orange to England in 1670, as gentleman of his bedchamber; and when the prince became ſtadtholder, he was promoted to the command of the favourite regiment of Dutch guards. In 1675, he manifeſted his attachment to this prince, by ſleeping in the ſame bed with him when he had the ſmall pox, in conſequence of medical advice; and by thus expoſing himſelf to the infection of a diſtemper with which he was actually ſeized, he laid the prince under an obligation, of which he was never unmindful. He took an active part in the preparations for the revolution of 1688, and in the progreſs of that event; and upon the prince of Orange's acceſſion to the throne, he received many marks of royal favour. Suſtaining ſeveral high offices near the king's perſon, he was naturalized, and in 1689, he was advanced to the rank of an Engliſh nobleman, with the title of baron of Cirenceſter, viſcount Woodſtock, and earl of Portland. In the following year, he acted as envoy to king William at the grand congreſs held at the Hague. The royal favour, however, by which he was diſtinguiſhed, and particularly the grant of ſeveral lordſhips in Denbighſhire, which were part of the demeſnes of the principality of Wales, occaſioned, in 1695, a warm oppoſition in the houſe of commons; but though this grant was revoked, in conſequence of an addreſs to the king, the earl was recompenſed by other liberal grants from the crown, which conſtitute a great part of the preſent ample poſſeſſions of the family. This nobleman attended king William in his campaigns in Ireland and Flanders, and diſtinguiſhed himſelf, as a military officer, on various occaſions. After the concluſion of the peace of Ryſwick, in the negociation of which he had a principal concern, he was nominated embaſſador-extraordinary to the court of France, where he received the higheſt diſtinctions. On occaſion of a jealouſy, excited by the royal favour to a young Dutchman, named Keppel, afterwards earl of Albemarle, the earl of Portland reſigned his poſts in the king's houſhold, and withdrew from affairs of ſtate; but he ſtill retained ſome portion of the king's eſteem and confidence, and was entruſted with the adminiſtration of Scotland, and with the negociation of the famous treaty for the ſucceſſion to the crown of Spain, called the "partition-treaty," which was afterwards the ſubject of an impeachment of the earl by the houſe of commons. The king's death, in 1701, terminated the earl of Portland's public life, and all hoſtilities againſt him. Of the attachment of his royal maſter, however, he had the moſt ſatisfactory evidence; when, on his death-bed, with his laſt words he inquired

inquired for him, and on his approach, laid hold of his hand and preſſed it to his heart. The cloſe of the earl's life was ſpent in retirement at Bulſtrode, where he employed himſelf in acts of charity, and in the improvement of his fine gardens. He died Nov. 23, 1709, in the 61ſt year of his age, and was buried in Weſtminſter Abbey. He left children of both ſexes by his two wives, Anne, daughter of ſir Edward Villiers, and Jane, daughter of ſir John Temple.

His temper was, like that of his royal maſter, grave, ſedate, and inclined to reſerve; and his demeanour ſomewhat loſty, without pride. Although he was an object of jealouſy and enmity, theſe were more national and political than perſonal; and his general character was that of an able and upright ſtateſman, connected with private virtue. *Biog. Brit.*

BENTIVOGLIO, Guido, *Cardinal*, was born of a noble family at Ferrara in 1579; and after having ſtudied at Padua with great reputation, he returned, in 1597, to his own country, where he diſplayed much dexterity in reconciling his brother, the marquis Hippolito, with cardinal Aldobrandini, the general of the church, and in concluding peace between the pope and Cæſar. Having finiſhed theſe tranſactions, he was appointed by pope Clement VIII. his private chamberlain, and allowed to complete his ſtudies at Padua. He then ſettled at Rome, and by his prudence and integrity acquired general eſteem. After having performed, from 1607 to 1619, the office of nuncio in Flanders, and alſo in France till the year 1621, he was raiſed to the dignity of cardinal by pope Paul V. He was alſo appointed by Lewis XIII. protector of the French nation in Rome; which office he declined on becoming biſhop of Terracina in 1641. On the death of Urban VIII. in 1644, he was thought to be the moſt proper perſon for the honour of ſucceeding him; but when he entered the conclave, in the hotteſt and moſt unhealthy ſeaſon of the year, he was ſeized with a fever, which terminated in his death on the 7th of September, at the age of 65. The principal of his works, which are held in high eſtimation, are his "Hiſtory of the Civil Wars in Flanders," written in Italian, and firſt publiſhed at Cologne in 1634, and ſince tranſlated into foreign languages; "Memoirs" of himſelf, an "Account of Flanders," and a collection of "Letters," reckoned the moſt approved ſpecimens of epiſtolary writing in the Italian language. Moreri. Gen. Biog.

Bentivoglio, in *Geography*, a ſmall town and fortified palace of Italy, in the ſtates of the church; 10 miles north of Bologna.

BENTLEY, Richard, in *Biography*, a very eminent critic, was born at Oulton, near Wakefield in Yorkſhire, on the 27th of January 1661-2, and after receiving the rudiments of claſſical learning at the free ſchool of Wakefield, was entered in his 15th year at St. John's college, Cambridge. In 1681, he left the univerſity, and became a ſchool-maſter at Spalding. From this ſituation he was ſoon removed to be preceptor to the ſon of Dr. Stillingfleet, dean of St. Paul's, who appointed him to be his domeſtic chaplain. In February 1691-2, he publiſhed his firſt work, which was a Latin epiſtle to Dr. Mill, containing "Critical Obſervations on Malala's Chronicon;" and about the ſame time he had the honour of being ſelected as the firſt perſon to preach Boyle's lecture, founded for the vindication of natural and revealed religion. The ſubject of the eight diſcourſes, which he delivered on this occaſion, and which were afterwards publiſhed and tranſlated into moſt of the modern languages of Europe, was the folly of atheiſm, or the confutation of this abſurd and joyleſs ſyſtem from the faculties of the ſoul, from the ſtructure and origin of human bodies, and the origin and frame of the world itſelf. Whilſt he carried on this lecture, he maintained a philoſophical correſpondence with ſir Iſaac Newton, whoſe friendſhip he ardently cultivated, nor did he write any thing on this occaſion without this illuſtrious philoſopher's approbation. In 1692, he was inſtalled by biſhop Stillingfleet a prebend of Worceſter; and in the following year he was appointed keeper of the royal library at St. James's. In 1696, he was admitted to the degree of doctor of divinity; and he delivered a diſcourſe on the day of the public commencement from 1 Pet. iii. 15. It is ſaid, that he was ſoon after admitted, "ad eundem," in the univerſity of Oxford. His "Annotations on Callimachus," were inſerted in an edition of that poet, publiſhed in 1697, by Grævius; and in the ſame year Dr. Bentley himſelf publiſhed, at the end of Wotton's Reflections on Ancient and Modern learning, his "Diſſertations on the Epiſtles of Themiſtocles, Socrates, Euripides, Phalaris, and the fables of Æſop." This publication was ſucceeded by a literary controverſy, which engaged at the time a great degree of public attention. The immediate ſubject of this controverſy was the genuineneſs of the epiſtles of Phalaris. In order to give our readers ſome notion of its riſe, progreſs, and iſſue, we ſhall detail the following particulars. Soon after Dr. Bentley was made royal librarian, the honourable Mr. Boyle, who was about to publiſh an edition of the ſuppoſed epiſtles of Phalaris, applied, by means of a bookſeller in London, to Dr. Bentley, for the uſe of a MS. in the king's library, which, after much ſolicitation and delay, was at length obtained; but before the collation could be completed, and indeed, about ſix days after the manuſcript had been delivered, it was redemanded by Dr. Bentley, with many ſlighting and diſparaging expreſſions, both of Mr. Boyle, and the work. This conduct, Mr. Boyle, in the preface to his edition of Phalaris, publicly reſented; and in return, Dr. Bentley, in the above-mentioned diſſertation, endeavoured to evince the ſpurioufneſs of the epiſtles that had been publiſhed, adding ſome reflections on Mr. Boyle's edition and verſion. In 1698, Mr. Boyle retorted, with effuſions of wit and perſonal abuſe, in a treatiſe entitled "Dr. Bentley's Diſſertation on the epiſtles of Phalaris, and the fables of Æſop examined," and commonly known by the title of "Boyle againſt Bentley," a ſecond edition of which was publiſhed in 1742. In 1699, Bentley recriminated in the ſame ſtyle, in a piece uſually denominated "Bentley againſt Boyle," reprinted in 1777, by Meſſrs. Bowyer and Nichols, with ſeveral notes and obſervations, collected from, or communicated by, biſhops Warburton and Lowth, Mr. Upton, Mr. W. Clarke, Mr. Markland, Dr. Salter, Dr. Owen, and Mr. Toup. Among the wits and critics, who united as auxiliaries of Boyle, were Swift, Pope, Garth, and Middleton; and it muſt be allowed, that they proceeded with an unwarrantable ſeverity in attacking the moral character and literary acquirements of their adverſary. Bentley, however, though unaided, ſuſtained the conteſt with unyielding firmneſs, and in the event with full ſucceſs, ſo far as the authenticity of the epiſtles aſcribed to Phalaris is concerned. Since prejudice and paſſion have ſubſided, it has been very generally acknowledged that Bentley had not only the evident advantage with reſpect to learning and argument, but that he is little, if at all, inferior to his antagoniſt in point of wit and ſmartneſs. The reputation of Dr. Bentley, during the progreſs of this literary ſquabble, was not very materially affected; for before its complete termination, he was preſented by the crown, in 1700, with the honourable and lucrative office of maſter of Trinity college, Cambridge; and in the following year collated archdeacon of Ely. In the former ſtation, he introduced reform, and curtailed ſalaries, and thus incurred the

the ill will of ſome of the ſenior members of the college; but as he appeared to have exerciſed an undue authority, and to have conſulted his own advantage more than the public, a charge was exhibited againſt him in 1709, by the vice-maſter, thirty of the ſenior fellows, and other members of the college, for peculation, breach of the ſtatutes, and other acts of mal-adminiſtration. The charge was preſented to the biſhop of Ely, as viſitor of the college. But Dr. Bentley contended, that the crown was the viſitor; and upon this a law-ſuit commenced, which was not terminated till the year 1731, when the crown aſſerted its viſitorial power, but declined interfering in the preſent inſtance. It appeared afterwards, that, upon the whole, the charges againſt the maſter were well founded.

In 1710, Dr. Bentley publiſhed at Amſterdam his critical annotations on the two firſt comedies of Ariſtophanes; and, about the ſame time, at Rheims, his emendations of the fragments of Menander and Philemon, under the feigned name of "Philelcutherus Lipſienſis." This latter was undertaken with the view of diſparaging a ſimilar performance of Le Clerc, and thus by degrading his literary character in the public eſtimation, to ſet aſide a ſcheme, which was then in agitation, for inviting him to England, by the offer of ſome conſiderable church preferment. In the year 1711, he publiſhed his long expected and much commended edition of "Horace." This correct and elegant edition of Horace, which was pronounced by Dr. Hare to be the compleateſt work produced by criticiſm ſince the reſtoration of learning, was printed in 4to. and dedicated to the earl of Oxford. It was ſucceeded, in 1713, by ſome excellent remarks on Collins's diſcourſe of free-thinking, publiſhed under the former name of "Philelcutherus Lipſienſis," and dedicated to Dr. Hare. In 1716, Dr. Bentley was appointed regius profeſſor of divinity; and in the ſame year he circulated propoſals for a new edition of the Greek Teſtament, with St. Jerom's latin verſion. Theſe propoſals were the ſubject of ſevere animadverſion by Dr. Middleton, who profeſſed a ſerious conviction, that Dr. Bentley had neither talents nor materials proper for the work, and that religion was much more likely to receive detriment than ſervice from it. Several pamphlets were publiſhed on the occaſion; and it is much to be regretted, that a work of ſuch importance to ſacred literature and biblical criticiſm was abandoned. The completion of this noble undertaking was the principal employment of the latter part of Dr. Bentley's life. In the proſecution of it he had collected and collated all the MSS. of Europe to which acceſs could be obtained; and for this purpoſe, his nephew, Thomas Bentley, L.L.D. well known in the republic of letters, had travelled through Europe at his uncle's expence; the whole was completed for publication; but when he determined not to let it appear during his own life, the ſum of 2000l., which he had received in part of the ſubſcriptions, was returned to the ſubſcribers. A circumſtance occurred in 1717, which materially affected the doctor's reputation, and which was attended, at leaſt for a time, with detrimental conſequences to himſelf. Upon the creation, by royal mandate, of ſeveral doctors in divinity, Dr. Bentley demanded from each of them, beſides the cuſtomary perquiſite, an extraordinary fee of four guineas. In this demand they acquieſced, on condition that the money ſhould be reſtored, if it ſhould appear that Dr. Bentley had no right to enforce it. Dr. Middleton, however, ſome time after, obtained a decree for the repayment of the money; and in conſequence of this decree, Dr. Bentley was arreſted, and appeared by his proctor before the court of the vice-chancellor. On this occaſion, the beadle teſtified on oath, that Dr. Bentley had declared, "I will not be concluded by what the vice-chancellor and two or three of his friends ſhall determine over a bottle;" and for this expreſſion he was ſuſpended by the vice-chancellor, without a citation or hearing, from all his degrees, and afterwards by the caput deprived of all his privileges and honours, as well as degrees, in the univerſity. Dr. Bentley appealed to the king, and after ſucceſſive references to the council and to a committee of council, and to the court of king's bench, and many delays, the univerſity received a mandamus in February 1718, which reverſed all their proceedings, and required a reſtoration of Dr. Bentley to all degrees, honours, &c. of which he had been deprived. In 1726, he publiſhed an edition of "Terence and Phædrus;" and in 1732, the laſt of his works, which was his edition of "Milton's Paradiſe Loſt;" and which made no addition to his reputation, though it has been ſaid that many of his corrections of that poet have been unreaſonably objected to by biſhops Pearce and Newton. This work was undertaken at the requeſt of queen Caroline. Dr. Bentley died on the 14th of July 1742, in the 81ſt year of his age, and was buried in the chapel of Trinity college. When we conſider the unqueſtionable abilities and erudition of Dr. Bentley, it may excite ſome degree of ſurpriſe, that his literary character ſhould have been held in much higher eſtimation by foreigners, than by his own countrymen. This may be partly owing to that pride, petulance, and irritability of temper, with which he, in common with many others who have excelled in verbal criticiſm, ſeems to have been chargeable; to the perſonal diſputes in which he was engaged; and to the political differences that diſquieted the period in which he lived. But, perhaps, it aroſe principally from his having, in the claſs of his adverſaries, the poets and wits of the age, and from their having made him the object of their ſatire and ridicule. The aſperity of Mr. Pope, who attacked him in the character of Ariſtarchus (works, vol. iii. p. 207—211.) has, however, been aſcribed to perſonal reſentment. Whilſt they were both together at dinner with biſhop Atterbury, Dr. Bentley was queſtioned as to his opinion of the Engliſh Homer; and, after ſome demur, being urged to ſpeak out, he ſaid "the verſes are good verſes, but the work is not Homer; it is Spondanus." Another circumſtance, which contributed to degrade Dr. Bentley in the eſtimation of ſome of his contemporaries was that love of money, which he ſeems to have unduly indulged, and which involved him in diſputes, that were diſhonourable to him. As to the charge of ſcepticiſm, with reſpect to revelation, alleged againſt him by Mr. Whiſton, it does not appear to have been well founded. Dr. Salter deſcribes him as having been a very amiable and pleaſant man in private life, and as poſſeſſing much good nature, though he has been otherwiſe repreſented. Againſt the diſparaging judgment of the learned biſhop Lowth, who allows him to rank only among grammatical and verbal critics, may be contraſted the encomium of Dr. Samuel Clarke, eminently diſtinguiſhed by his literature and critical diſcernment, who, in the preface to his edition of Cæſar's Commentaries, ſpeaks of him as "vir in hujuſmodi rebus peritiâ plane incredibili et criticos omnes longé longéque judicio et ſagacitate antecellens." The judgment of poſterity, more impartial than that of his contemporaries, has allowed Dr. Bentley's profound ſkill in the idiom of the Latin and Greek languages; and though, as a verbal critic, many of his emendations are unſanctioned by the authority of ancient MSS. they frequently approve themſelves as juſt and reaſonable, and are regarded as real improvements. It muſt be acknowledged, however, that thoſe corrections of ancient and modern authors, which depend upon mere conjecture, and which ſuggeſt what might, or ought to have been written, rather than

what they actually did write, extend the province of criticiſm beyond its juſt limits; and whilſt they afford ſcope for the unwarrantable exerciſe of fancy or judgment, they ſhould be very cautiouſly admitted. In this way doctor Bentley is ſaid to have incurred the charge of temerity and preſumption. The ſon of Dr. Bentley, who was called after his own name, was a gentleman of acknowledged ingenuity, taſte and learning, and known as the author of ſeveral publications, and particularly of a tragedy, entitled "Philodamus," publiſhed by Dodſley in 1767, and eſteemed by the late eminent poet Mr. Gray, as one of the moſt capital poems in the Engliſh language. His youngeſt daughter married a grandſon of the learned Dr. Cumberland, biſhop of Peterborough, whoſe famous book "De Legibus Naturæ" Dr. Bentley is ſaid to have corrected upon a viſit to his ſon-in-law, who was biſhop of Kilmore in Ireland. The ſon of this biſhop, Richard Cumberland, eſq. is well known by his ingenious writings, and eſpecially by his juſtly applauded dramatic pieces. Biog. Brit.

BENVORLICH, in *Geography*, a mountain of Scotland, in the county of Perth; 3300 feet high. See GRAMPIAN MOUNTAIN.

BENY, a town of France, in the department of the Calvados, and chief place of a canton, in the diſtrict of Caen, 2¼ leagues N.N.W. of Caen.

BENY, LE, a town of France, in the department of the Calvados, and chief place of a canton, in the diſtrict of Vire, 7½ leagues S. W. of Caen.

BENY, a ſmall town of Hungary, in the county of Zempling, ſeated on the river Bodrog, and noted for its excellent wine, not inferior to Tokay.

BENYOWSKY, MAURITIUS AUGUSTUS, *Count de*, in *Biography*, magnate of the kingdoms of Hungary and Poland, a ſingular adventurer, was born at Verbowa, in the country of Nittria, in Hungary, in the year 1741, and educated for military ſervice, to which he devoted himſelf from his youth. Being wronged in his paternal inheritance by his family, he ſeized by force the caſtle which was his father's reſidence; in conſequence of which he was deprived of his whole property by a decree of the chancery at Vienna, and was obliged to fly for refuge into Poland. Here he engaged, in 1767, in the conſpiracy againſt king Staniſlaus, and in the courſe of this irregular ſervice he was taken priſoner, firſt in 1768, and afterwards in 1769, by the Ruſſians, who treated him with ſeverity, becauſe he had violated his parole, and becauſe he was forming plans for the liberation of himſelf and his companions. The Ruſſians conveyed him to Caſan, where he was allowed to live at large, under the notice of the garriſon, as a ſtate-priſoner; but here his enterpriſing diſpoſition recommended him to a party, which was then forming a conſpiracy againſt the Ruſſian government, in the execution of which he was invited to aſſociate. But the plot being diſcovered, he was exiled to Siberia; and after a tedious journey and voyage of twelve months, during which the count made ſome unſucceſsful efforts for eſcaping, he arrived on the 2d of December 1770, at Kamtſchatſka, and was conducted to the town called Bolſoretzkoy Oſtrog, or Bolcheretſk, where he and his companions in exile were informed that they muſt provide for themſelves, and where they were furniſhed for this purpoſe with the neceſſary arms and implements. Diſſatisfied with this preſcribed mode of ſavage life, the count ſoon began to concert meaſures with his fellow-priſoners for their eſcape; and in the mean time, he improved his circumſtances by opening a ſchool, in which he educated the ſon and three daughters of the governor, M. Nilow, or Nilloff, and by his knowledge of the game of chefs, at which he played with ſome merchants, on behalf of the Hettman of the Coſſacks, who allowed him a certain proportion of the ſums which he won. Having gained the confidence of the governor and the affections of Aphanaſia, one of his daughters, he proceeded in maturing and accompliſhing his plan of liberation; but before its execution, the ſecret was diſcovered, and the force of the ſettlement was employed in reducing the malcontents. In the conflict on this occaſion, the governor was killed; but the exiles at laſt ſucceeded, ſecured a veſſel, and, accompanied by Aphanaſia, who choſe to follow the count, took their final leave of Kamtſchatſka. Their whole number, including the exiles, women, and the ſhip's crew, amounted to 96 perſons. After enduring many naval hardſhips at ſea, the veſſel arrived at Japan; and on the 14th of Auguſt 1771, he anchored on the iſland of Uſmay Ligon, which he places in N. lat. 29°, and which muſt conſequently lie between Japan and the iſland of Lekeio. This iſland, according to his account, is abſolutely independent both of China and Japan; its inhabitants are mild, virtuous, and in a high ſtate of civilization; and they are ſaid to have been converted to Chriſtianity by a Portuguefe miſſionary Jeſuit, Ignatio Salis, who arrrived in the iſland in 1749. Upon quitting this iſland, whither he promiſed to return, he ſailed for Formoſa, and arrived there on the 27th of Auguſt; but meeting with an oppoſition on his landing, he made a great ſlaughter among the natives. At length he opened, by means of a Spaniard, who reſided on the iſland, a more friendly intercourſe with the inhabitants of another canton, and aſſiſted Huapo, their prince, in a war againſt one of his neighbours. After a ſtay of about ſixteen days on this iſland, he departed and ſteered for Macao, in the harbour of Canton, in China. Here his female companion, Aphanaſia Nilow, died. During his ſtay in this place, he made ſome attempts for procuring leave to go to Canton; but when theſe proved ineffectual, he determined to ſail for Europe. Accordingly, in his way thither, he arrived at the iſle of France, March 16th 1772, and having touched at the iſle of Madagaſcar, he landed in France in July, and was well received by the French miniſtry.

Of the propoſals made to the miniſters of France by this adventurer, we have no documents; but he ſeems to have been regarded by them as a fit perſon to be employed in eſtabliſhing a ſettlement in the iſland of Madagaſcar. With this view they furniſhed him with a body of troops, in 1773; and in his way thither he touched at the iſle of France, in order to ſolicit the co-operation of the chiefs of that iſland. Jealouſy, and the dread of a rival ſettlement, prevented his obtaining their concurrence; and therefore, after ſome delay, he proceeded to Madagaſcar, and landed there in February, 1774; forming his ſettlement at the bottom of the bay of Antongill, at the mouth of the river Fingballe. The count made little progreſs in accompliſhing the object of his miſſion, although he expended on account of the French government a ſum amounting to 50,000l. and therefore, towards the end of the year 1776, commiſſioners were deputed to examine the ſtate of the ſettlement, and to convey the count to France. In the mean time, this enterpriſing adventurer had contrived to raiſe himſelf to conſequence in the iſland by a curious ſtratagem. The Sambarives, conſtituting one of the diſtinct nations of Madagaſcar, had been formerly governed by a chief, whoſe name was Ramini; and as he had left only one daughter, who had been taken priſoner and ſold to foreigners, his family was ſuppoſed to be extinct. Of this circumſtance the count artfully availed himſelf; and obtaining the teſtimony of an old negroe woman whom he had brought with him from the iſle of France, who declared that ſhe knew him to be the

ſon of Ramini's daughter, her own companion in ſlavery, he ſucceeded in his views of being publicly acknowledged as the heir of Ramini. Under this character he was veſted with ſovereignty, formed alliances with other tribes, made war and peace, and received ſubmiſſions from the vanquiſhed. But as his European reſources were with-held, he renounced the ſervice of France, and perſuaded his ſubjects to permit him to return to Europe, for the purpoſe of forming an alliance with France, or ſome other power, and for making commercial arrangements with a view to the improvement of a ſettlement on the iſland. Accordingly, he departed for Europe in November 1776, on board a brig which he had freighted to the cape of Good Hope. With this event his own narrative terminates. Among his ſtate papers, however, we find his propoſal to the king of Great Britain, dated Dec. 25, 1783; of which the preliminary article is his being acknowledged ſovereign of the iſland of Madagaſcar; under which character he offers terms for an offenſive and defenſive alliance with this country. But it appears, from a declaration prefixed to this paper, that he had previouſly applied, probably with ſimilar views, to the emperor of Germany. The application to the Britiſh miniſtry, if it was ever made, and if it was ever the ſubject of diſcuſſion, as ſome have aſſerted, was not attended with ſucceſs. The count, therefore, determined to return to Madagaſcar with ſuch ſupplies as he could obtain from individuals; and having procured goods and merchandize in London to the amount of 4000l. and finding it difficult to get the flag of any European power to ſail beyond the cape of Good Hope, he departed for Maryland in America, in April 1784. A reſpectable commercial houſe engaged in his undertaking, and ſupplied him with a veſſel and goods to a conſiderable amount. In this veſſel he failed for Madagaſcar; and after eſcaping the hazard of ſhipwreck on the lee ſhore of America, and doubling the cape of Good Hope, he touched at Sofalo, and on the 7th of July 1785, anchored in Antangara bay, 10 leagues S.W. of cape St. Sebaſtian, in Madagaſcar, where the cargo was landed. Under an apprehenſion that the count had been cut off by the natives, the party on board the ſhip ſet ſail for the iſland of Joanna, and at Oibo, on the oppoſite continent, ſold the ſhip. The count heading a body of natives, commenced hoſtilities againſt the French by ſeizing their ſtore-houſe at Angoutzi. Here he began to build a town after the manner of the country, and from thence he detached 100 men to ſeize their factory at Foul Point, who reſiſted on ſeeing a frigate at anchor. In conſequence of theſe tranſactions, M. de Soullac, governor of the iſle of France, ſent a ſhip with ſixty regulars, who landed, and attacked the count on the 23d of May 1786, in a redoubt which he had conſtructed, mounting two cannon, and in which he, with two Europeans, and thirty natives, waited their approach. The blacks fled, and Benyowſky, receiving a ball in his breaſt, fell behind the parapet, whence he was dragged by the hair, and ſoon expired.

Whilſt none can queſtion the ability and bravery of count Benyowſky, the principles of his conduct are not eaſily aſcertained. His enemies repreſent him as a tyrant and a robber; and his friends, on the contrary, exhibit him as diſtinguiſhed by a noble, humane, and generous diſpoſition. Mr. Nicholſon, the editor of his "Memoirs and Travels," who had all the letters and documents before him, declares, that he has "not yet ſeen any thing againſt the count, which will not bear two interpretations, or which has not been written by men who contradict each other, and had an intereſt in traducing him." "His conduct in Madagaſcar," ſays Wadſtrom, in his "Eſſay on Colonization," deſerves no ſmall portion of admiration, and even of reſpect; and, all things duly conſidered, I ſee no reaſon, why a monument might not be erected to his memory, inſcribed "MAGNIS TAMEN EXCIDIT AUSIS." A very different character is given of him by M. de Leſſeps, in his "Travels in Kamtſchatſka;" who repreſents him as perfidious and cruel, and by the Abbé Rochon, in his "Voyage a Madagaſcar, &c." who ſays, "that he aimed at the conqueſt of Madagaſcar by fire and ſword, and treated the natives with ſuch cruelty, that he was called by no other name by them than the "Wicked White." Memoirs and Travels of count Benyowſky, written by himſelf. 2 vols. 4to. 1790.

BENZELIUS, ERIC, a learned Swediſh divine, was born in 1642, in Weſtro-Gothland, and educated under the patronage of a rich uncle at Upſal. He was firſt preceptor to the ſons of the count de la Gardie, chancellor of Sweden; and having completed their education, he travelled through various parts of Europe, cultivating an acquaintance with the learned, and conſulting the principal libraries. Upon his return to Upſal in 1665, he was appointed profeſſor of hiſtory and morality in the univerſity, and afterwards promoted to the theological chair, and to a ſeat in the conſiſtory. In 1675, he was made doctor in theology; in 1677, biſhop of Strengnes, and, in 1700, archbiſhop of Upſal, occupying alſo the vice-chancellorſhip of the univerſity. He died in 1709; and was the author of ſeveral diſſertations on the lives of the patriarchs, and other parts of eccleſiaſtical hiſtory. He wrote alſo various theological works, and tranſlated the whole Bible into the Swediſh language. Moreri.

BENZELIUS, *Eric*, ſon of the former, was born at Upſal in 1673, where he began and completed his ſtudies. Having travelled into Germany, England, and France, he returned to Upſal in 1702, and was appointed librarian to the univerſity, an office which he held for 22 years. In 1724, he was nominated profeſſor of divinity; and afterwards ſucceſſively created biſhop of Gotheborg, Lindkioping, and archbiſhop of Upſal. He died in 1743. Benzelius undertook, in conjunction with other learned men, a review, as well of all books publiſhed in Sweden, or by Swedes abroad, as of thoſe works printed in other countries, which had any relation to this kingdom. This publication, containing, beſides reviews, ſome few original acts, was denominated "Acta Literaria Sueciæ," and conducted for 10 years on this plan by a ſociety of gentlemen, who afterwards formed the royal ſociety of Upſal. See SOCIETY.

BENZIE ISLAND, in *Geography*, lies on a river of the ſame name, within Sierra Leone, on the coaſt of Africa.

BENZOE, in *Botany*. See CROTONA.

BENZOIN. See LAURUS.

BENZOIN, *Benjamin Gum*, and *Benzoic Acid*, in *Chemiſtry* and *Pharmacy*.

The gum benzöin or benzöe, by ſome called alſo *Aſa Dulcis*, is a very fragrant reſin, procured from a large tree found in many parts of the Eaſt Indies, Sumatra, Arabia, Perſia, &c. See STYRAX *Benzöe*.

The reſin is brought in large brittle maſſes of a light yellow, interſperſed with white nodules, which laſt are conſidered as the fineſt, and called by ſome *Benzöe Amygdaloides*. The ſmell of benzoin is extremely fragrant, eſpecially when rubbed or heated: it has ſcarcely any taſte, except previouſly diſſolved in ſpirit of wine, which it does with eaſe, into a yellowiſh tincture. On adding water to this tincture, the reſin again ſeparates into a white pulverulent maſs, which has received the ſingular name of *Lac Virginale*, and alſo *Magiſtery of Benzoin*. When gently dried, it forms a white powder, formerly in great requeſt as a coſmetic. It is at leaſt innocent, and its ſcent is one of the moſt agreeable. But the moſt ſtriking ingredient of this reſin is the

Benzoic

Benzoic Acid, which is of ſufficient importance to require being deſcribed more at large. If benzoin is gently heated a little above the degree of boiling water, it melts into an adhe-ſive maſs, and at the ſame time ſends out a very copious, denſe, white fume, of an extremely fragrant, diffuſive, penetrating ſmell, and ſo acrid as irreſiſtibly to excite coughing and tears in thoſe who are in any degree expoſed to it. This fume ſoon condenſes on the firſt cool body, and then appears in the form of very beautiful ſpicular cryſtals, which gradually collect into a bulky feathery maſs, extremely light, and of remarkable elegance and luſtre. This cryſtalline maſs is the benzoic acid, and its acid property is proved by reddening litmus, neutralizing alkalies, and forming with them peculiar ſalts; in modern chemical nomenclature called *Benzoats*. After the greater part of the acid has riſen by ſublimation, or before it, if the heat be at all increaſed, a thin yelloviſh oil riſes ſlightly empyreumatic, but ſtrongly imbued with the fragrance of the reſin. On further heating, an acidulous liquor comes over, together with a thick butyraceous matter; ſtill, however, containing ſome of the cryſtallizable acid, which is not totally expelled till the end of the proceſs.

This acid is readily ſoluble in alcohol, and in hot water, but ſo ſparingly in cold water, that a hot ſaturated ſolution will depoſit in cryſtals almoſt its ſaline contents by cooling.

Several methods have been deviſed for obtaining the benzoic acid. The oldeſt and moſt expeditious is by ſimple ſublimation. To perform any quantities of it, put benzoin in an earthen pipkin; apply to the veſſel a large cone of clean white paper, paſted down to the edges of the pot, and ſet it over an extremely ſlow charcoal, or other fire, juſt ſufficient to melt the benzoin. The acid will riſe and cryſtallize upon the inſide of the paper cone. However, as in this method the vapour has hardly room to concrete, inſtead of the paper cone, another veſſel inverted over that which contains the reſin, and with a ſmall hole drilled through its bottom, may be ſubſtituted; and when full, it may be gently ſhaken, to detach the acid, and again applied. From nine to twelve drachms may be thus obtained from ſixteen ounces of benzoin. The remaining reſin is ſtill very aromatic, and ſhould not be loſt.

Another method has been recommended by Scheele, who in his excellent practical obſervations upon this ſalt, has treated it with that preciſion and ingenuity which ſo eminently diſtinguiſh this chemiſt in every ſubject, of greater or leſs importance and difficulty, which he has illuſtrated by his labours.

He obſerves, that beſides ſublimation, the acid may be extracted by lixiviation, and with the advantage of obtaining it free from any admixture of oil, which is apt to impair its whiteneſs and luſtre. If benzoin is boiled with water, and the ſolution ſtrained while hot, and ſuffered to cool, moſt of the acid taken up by the hot water depoſits when cold, and may then be collected pure. This method, however, is imperfect; for as the water does not mix with and divide the gum, this laſt ſoon ſoftens, and ſinks down, cloſely adhering to the bottom of the veſſel, and does not allow of the water eaſily to penetrate it. Hence the ſolution takes place only at the ſurface of the benzoin.

The ſame chemiſt boiled powdered chalk and benzoin in water, and filtrated the liquor. No cryſtals were now depoſited on cooling, for the acid had diſſolved part of the chalk into a benzoat of lime, which, being very ſoluble, remained in the liquor. But on adding ſome drops of vitriolic acid, the benzoic acid was again ſeparated from the lime, and fell to the bottom in a powdery form. Subſtituting alkali for the chalk, the ſame effect took place, and the benzoic acid, as before, was precipitated by the vitriolic. But this method was ſtill attended with the inconvenience of the benzoin concreting together, which floated on the ſurface during the boiling. But on ſubſtituting quick lime this inconvenience was avoided; and it is therefore in the following method that the benzoic acid may be procured the moſt copiouſly and the pureſt. Upon four ounces of unſlacked lime pour twelve ounces of water, and after the ebullition is over, add ſix pounds more of water; then put a pound of benzoin, finely powdered, into a tin pan; pour on it at firſt about ſix ounces of the above lime water; mix them well together, and then ſucceſſively the reſt of the lime water. By this method the reſin will be prevented from running together into one maſs. Boil the mixture for half an hour, with conſtant ſtirring, then let it ſtand, and pour off the clear liquor. On the remainder in the pan, pour more lime water, and proceed as before, adding the clear liquor to that firſt obtained, and alſo filter the reſidue, to exhauſt the liquor, which is now a weak ſolution of benzoic acid, with the lime of the lime water. Boil down this liquor (which is of a light yellow) to two pounds, and ſtrain. When cold, add to the liquor muriatic acid gradually, which will produce a white cryſtalline depoſition, and continue to add the acid till the liquor is ſuperſaturated, and taſtes ſouriſh. The ſtronger acid thus unites with the lime, and the benzoic acid, now free, being of itſelf ſcarcely ſoluble in cold water, falls down as a white coagulum, which ſhould be waſhed with more cold water, and gently dried. To give it a cryſtalline appearance, diſſolve it in boiling water, filter it through a cloth, and by cooling it will ſeparate in the form of ſpicular cryſtals, but with ſome loſs of the acid.

The above proceſs of Scheele's may however be a little ſhortened, if the lime in ſubſtance be mixed with the lime water, previous to the addition of the benzoin; for by this method the ſolution may be at once made more concentrated, and leſs of the liquid will ſuffice, ſo that much of the evaporation will be ſaved. Any of the ſtronger acids will diſplace the benzoic from lime, but the muriatic is the moſt convenient.

Scheele obtained from 12 to 14 drachms of the concrete acid from a pound of benzoin by this proceſs.

The benzoic acid, when pure, is quite white; for if yellow, it is mixed with a ſmall portion of the oil of the reſin. Though cryſtallized, it is conſiderably elaſtic, and difficult to be reduced to powder. Its taſte is ſharp, pungent, and acidulous. It reddens tincture of litmus. When cold, it is without ſmell, but on applying heat it ſends forth the peculiar grateful odour by which it is characterized. Heated by itſelf, it chiefly ſublimes, but a part is decompoſed, giving an acid phlegm, much oil, and carburetted hydrogen gas. It is not alterable in the air, and does not evaporate by keeping in a moderate temperature. Cold water diſſolves only about $\frac{1}{400}$ of its weight, but boiling water $\frac{1}{25}$; and hence the copious cryſtallization from a hot water ſolution. It unites readily to moſt of the alkalies and earths forming benzoats, the properties of which have been but little examined.

The benzoat of lime is almoſt the only ſalt of this kind found native. It is contained in the urine of ſome animals, particularly the herbivorous quadrupeds, and is aſcertained by adding to this ſecretion ſome muriatic acid, by which the benzoic acid is made perceptible.

With potaſh this acid forms a readily cryſtallizable ſalt, decompoſable, like the reſt of the benzoats, by a ſtrong acid.

Moſt of the metallic oxyds are diſſolved by this acid, but not the pure metals.

Mr. Hermbſtadt, in a ſeries of experiments on the action of nitrous acid on the benzoic, found that the latter regularly aſſumed in the proceſs a ſmell like that of water diſtilled over

bitter almonds, but on the whole, this acid is but with difficulty altered in its nature by the nitrous. Diſtilling the nitro-benzoic acid with pure alcohol, he obtained ethereal liquor, part of which was nitrous ether, but the remainder appeared, by the ſmell of almonds, to be a dulcified, or ethereal benzoic acid. But theſe experiments require to be repeated with accuracy, as the powerful operation of the nitric acid on vegetable matter, though highly inſtructive, is often not a little embarraſſing.

Several other ſubſtances, beſides the reſin of benzoin, contain more or leſs of this acid. The balſam of Peru, and of Styrax, appear to owe to this acid much of their fragrant ſmell. Ambergris, vanilla, and ſome of the aromatic barks, and even urine, contain a ſmall quantity of it. When uncombined with an alkaline or earthy baſe, it is generally known by a pungent fragrant ſmell, and denſe white ſmoke, on applying a heat leſs than is neceſſary to burn or decompoſe the ſubſtance with which it is united. When kept down by an alkali or an earth (as in the caſe of urine), it is ſeparated by a ſtrong acid. It has been ſuppoſed, with probability, that the fragrant ſcent is not proper to the acid, but is owing to the preſence of a portion of reſin or eſſential oil, combined with it ſo intimately as to be inſeparable by any means hitherto known, without entire decompoſitions of the acid; and hence too may be explained the very weak affinity of this acid for all baſes, which is generally ſuperior to no acid but the carbonic.

Gum benzoin is almoſt diſuſed in medicine, though ſtill retained in a few preparations of the London and Edinburgh pharmacopœias. The compound tincture *Tinctura Benzöes Compoſita*, formerly *Balſamum Traumaticum*, contains gum benzoin, balſam of Tolu, and aloes; and the benzoic acid enters into the Edinburgh *Tinctura Opii Ammoniata*, and in ſome other compounds of foreign diſpenſaries.

The fragrance of this reſin has cauſed it to be uſed in fumigations of various kinds. Where the object is merely to produce a penetrating agreeable ſcent, it may be of conſiderable uſe; but as a *corrective* of foul or contagious air, its powers are very ſmall, by no means comparable to thoſe of the mineral acid vapours, while the irritation which it gives to the lungs is more intolerable. Scheele's Eſſays. Fourcroy. Hermbſtadt in J. Phyſ. tom. 34, &c.

BEOLIPA Gulf, in *Geography*, lies on the eaſt ſide of the ſtrait of Dardanelles, near the opening into the ſea of Marmora.

BEORI Animal (*Laët. Amer.*), in *Zoology*, the *Tapir Americanus* of Gmelin, &c.

BEOSTER Island, in *Geography*, one of the Shetland iſlands, between which and Green iſland, at the north end of Braſſa, or Braſy ſound, is a good channel, that runs out into the ſea.

BEOTIA, Cape, lies within the iſland of Negropont, to the north of Corinth, on the north ſide of the peninſula, ſtretching ſouth-eaſt from Corinth.

BEQUIA, a ſmall iſland of the Weſt Indies, dependent on the government of St. Vincent, and containing 3,700 acres It is chiefly valuable from the commodiouſneſs of its fine harbour, called "Admiralty bay."

BER, a diſtrict of Swiſſerland, in the government of Ælen and canton of Bern, comprehending two parochial villages.

Ber. See Berbice.

BERABZAN, a long lake in New North Wales, lying N. and S. and running gradually from its north end, till it mixes with the waters of Schecharas lake, at the ſouth end, and where theſe waters form Seal river, which empties into Hudſon's bay, at Churchill fort. The north end of Berabzan lies in about 60° 30′ N. lat. and 93° 50′ W. long.

BERÆA, in *Ancient Geography*. See Berœa.

BERAMS, in *Commerce*, a coarſe cloth, made altogether of cotton thread, which is brought from the Eaſt Indies, and particularly from Surat.

BERAMUN, in *Geography*, a town of Egypt, on the Nile; 3 miles north eaſt of Manſora.

BERARDI, Angelo, in *Biography*, an Italian writer on muſic, who publiſhed at Bologna a conſiderable number of muſical tracts, between the years 1681 and 1693, which, with a large portion of pedantry and common-place information, contain much curious and uſeful knowledge. Their titles are: "Ragionamenti Muſicali, Muſical Diſſertations;" "Documenti Armonici, Harmonical Documents;" "Miſcellanea Muſicale, a Muſical Miſcellany;" "Orcani Muſicali, Dialo, Muſical Arcana, a Dialogue;" and the "Perche Muſicale, Muſical Definitions." If the whole had been compreſſed, methodiſed, and digeſted into a ſingle treatiſe, and all the muſical information diſperſed through theſe ſeveral tracts arranged in a regular and gradual order, a more uſeful and practical didactic work might have been produced, than Italy ſeems to have furniſhed during the 17th century.

BERAR, in *Geography*, a ſoubah, or kingdom of Hindoſtan, bounded on the north by Allahabad and Malwa; on the weſt by Candeiſh and Amednagur; on the ſouth by Tellingana and Golconda; and on the eaſt by Oriſſa. It contains 13 circars, divided into 42 pergunnahs. The weſtern parts of this province were reduced by Acbar; and its revenue under Aurungzebe, as ſtated by Mr. Fraſer, in his "Life of Nadir Shah," amounted to 153½ lacks of rupees. The principal part of this province is poſſeſſed by the Berar or Nagpour rajah; and the remainder is held by the Nizam, or ſoubah of the Deccan, who pays to the rajah a "chout," or fourth part of its clear revenues. The interior parts of Berar are leſs known than moſt other countries in Hindoſtan; but it is thought to be neither populous nor rich. Its preſent capital is Nagpour, about midway between Bengal and Bombay. This province produces wheat, rice, poppies, and many ſorts of legumes. In the ſouthern part is found the deer, which yields the Bezoar ſtone; and the ſheep of this province differ from the common ſpecies, their neck being lengthened, their tail very ſhort, their ears long, and their wool not curled.

BERASTEGUE, a mountain of Spain, in the province of Guipuſcoa, 3 leagues from Toloſa.

BERAULT, Nicholas, in Latin *Beraldus*, in *Biography*, one of the learned men of the ſixteenth century, was either a native of Orleans, or for a long time reſident in this place, where he was profeſſor of the civil law. He was tutor to admiral de Coligni; and well acquainted with Eraſmus, who, in his "Ciceronianus," ſpeaks with commendation of his eaſy and flowing elocution, and who, in 1522, dedicated to him his treatiſe, "De Conſcribendis Epiſtolis." Among the Latin works of Berauld, were "A Græco-Latin Dictionary," Paris, 1521; an "Oration on the Peace of Cambray," Paris, 1528; another "On ancient and modern juriſprudence," Lyons, 1533; and "A Dialogue on the faculty of ſpeaking extempore;" Lyons, 1534. He alſo wrote paraphraſes on the Politics and Œconomics of Ariſtotle, and notes on the Ruſticus of Politian. His comments on the Natural Hiſtory of Pliny, though not mentioned by Hardouin, are much commended by Eraſmus. He was eſteemed for his integrity, and greatly regarded by Poncher, archbiſhop of Sens, a prelate diſtinguiſhed in France by his patronage of literature.

BERAUN, in *Geography*, a royal borough of Bohemia, in a circle of the ſame name. The chief produce of the circle is wood and corn, and in ſome parts are found mines of iron.

iron. The town is ſeated on the river Mies or Miza; 14 miles S.W. of Prague. N. lat. 50° 2′. E. long. 14° 25′.

BERBECZ, a river of European Turkey, which runs into the Birlet, near Tecuczi, in the province of Moldavia.

BERBEGAL, a town of Spain, in Aragon, 3 leagues from Balbaſtro.

BERBERES. See Brebes.

BERBERINA, in *Entomology*, a ſpecies of Tipula, with ſooty, incumbent wings, having the baſe, and marginal ſpot white. Schrarck. This inſect has the thorax and abdomen red; it feeds on the berberry, and forms ſmall ſtrumous excreſcences on the branches.

Berberina, in *Natural Hiſtory*, a ſpecies of Vorticella, of a ſimple oval form, with a branched rigid ſtem, and white granulations. Gmelin. This is Vorticella compoſita, floribus ovalibus muticis, ſtirpe ramoſa, of Linn. Syſt. Nat. edit. 12. It is alſo Brachionus berberiformis, of Pallas; and Pſeudopolypus beriformis, of Rœſel. Found in freſh water in Europe; uſually in cluſters.

BERBERIS, *Barberry*, or *Pipperidge Buſh*, in *Botany*, Lin. gen. n. 442. Schreb. 595. Reich. 476. Juſſ. 286. Gærtn. t. 242. Tournef. 385. Smith. 181. Claſs and Order, *Hexandria Monogynia*. Gen. Char. *Cal.* perianth ſix-leaved, patulous; leaflets ovate, with a narrower baſe, concave, alternately ſmaller, coloured, deciduous. *Cor.* petals ſix, roundiſh, concave, erect-expanding, ſcarcely larger than the calyx: nectary, two ſmall, roundiſh, coloured bodies, faſtened to the baſe of each petal. *Stam.* filaments ſix, erect, compreſſed, obtuſe; anthers two, faſtened on each ſide to the top of the filaments. *Piſt.* germ cylindric, the length of the ſtamens; ſtyle, none: ſtigma, orbiculate, broader than the germ, ſurrounded with a ſharp edge. *Per.* berry cylindric, obtuſe, umbilicated with a point, one-celled. *Seeds* two, oblong, cylindric, obtuſe. B. *cretica* has three ſeeds. Reich.

Eſſ. Char. *Cal.* ſix-leaved: *pet.* ſix, with two glands at the claws; *ſtyle* none; *berry* two-ſeeded.

Species, 1. B. *vulgaris*, common barberry; B. dumetorum. Ray, Syn. 465. Spina acida or oxycantha. Ger. em. 1325. β. B. *violacea*, purple-fruited barberry. γ. B. *canadenſis*, Canada barberry. "Peduncles racemed, ſpines triple." A ſhrub riſing to the height of 8 or 10 feet; with ſtems upright and branched, ſmooth and ſlightly grooved, brittle, with a large white pith, and covered with a whitiſh or aſh-coloured bark, yellow on the inſide: ſtems and branches are armed with ſharp thorns, commonly growing by threes; firſt leaves obovate, ſerrate-ciliate, not jointed; ſtem-leaves alternate; ſecondary leaves in pairs, oblong and ſerrate, with ſmaller leaves concealed between the lowermoſt leaves and the thorns: flowers towards the ends of the branches in pendulous racemes, with a bracte to each pedicel; corolla yellow, petals frequently ſerrate about the edge, and at the baſe of each are two orange-coloured dots, which are probably the nectaries: anthers roundiſh, yellow; ſtigma, greeniſh: berries at firſt green, and when ripe, changing to a fine red colour; ſeeds, two, rarely three, faſtened at bottom to a minute tubercle, oblong, ſmooth, of a pale teſtaceous colour, and hard; the ſeed-lobes of an elliptic form. A native of the eaſtern countries, and now of moſt parts of Europe in woods, coppices, and hedges; in England, chiefly in a chalky ſoil, as particularly about Saffron-Walden in Eſſex. The flowers appear in May and June, and the fruit ripens in September. Miller mentions three varieties of this ſhrub, viz. B. ſine nucleo; Bauh. pin. 454, 2. or without ſtone, occaſioned by the age of the plant; B. with white fruit, having leaves of a lighter green colour, and the bark whiter than the common ſort: and B. orientalis procerior fructu nigro ſuaviſſimo, Tournef. cor. differing only in the colour and flavour of the fruit. He makes the Canada barberry a diſtinct ſpecies, and ſays, that the leaves are much broader and ſhorter than thoſe of the common ſort, and that the fruit is black when ripe. It has been long ago obſerved by Linnæus, that when bees in ſearch of honey touch the filaments of this ſhrub, the anthers approximate to the ſtigma, and explode the pollen. This irritability is ſo remarkable, that if the filaments are touched near the baſe with the point of a pin, a ſudden contraction is produced, and this may be repeated ſeveral times. Dr. Smith, who has made this property the ſubject of particular examination, obſerves (See Phil. Tranſ. vol. lxxviii. p. 158,) that neither the outſide of the filament, nor the anther has any irritability; and that the ſpring of the ſtamens is owing to an high degree of irritability in the ſide of the filament next the germ, by which, when touched, it contracts, that ſide becoming ſhorter than the other, and conſequently the filament being bent towards the germ. After irritation, the ſtamens will return to their original place, and on being again touched, they will contract as eaſily as before. The purpoſe which this curious contrivance of nature is deſigned to anſwer is evident. When the ſtamina ſtand in their original poſition, their anthers are effectually ſheltered from rain by the concavity of the petals. Thus they probably remain till ſome inſect, in order to extract honey from the baſe of the flower, thruſts itſelf between their filaments, and almoſt unavoidably touches them in the moſt irritable part; in this way the impregnation of the germen is performed; and as it is chiefly in fine ſunny weather that inſects are on the wing, the pollen is alſo in ſuch weather moſt fit for the purpoſe of impregnation. Another peculiarity aſcribed to this ſhrub is, that ears of corn growing near it conſtantly prove abortive, and that it extends this ſterile influence over them to the diſtance of 3 or 400 hundred yards acroſs a field. Duhamel long ſince looked upon the mildewing power of barberry as totally void of foundation, and M. Brouſſonet aſſured Dr. Smith, from his own obſervations, that the opinion, though very prevalent, was altogether groundleſs. Young's Annals. vol. vii. p. 188. Eng. Bot. p. 49. Withering's Bot. Arrang. vol. ii. p. 351.

The leaves of barberry are gratefully acid; the flowers are offenſive to the ſmell when near; but at a proper diſtance their odour is extremely agreeable. The berries are ſo acid that birds will not eat them. The barberry, however, is cultivated for the ſake of theſe, which are pickled and uſed for garniſhing diſhes; and being boiled with ſugar, they form an agreeable rob or jelly; they are uſed alſo as a dry ſweet-meat, and in ſugar-plumbs or comfits. They are moderately reſtringent, and are ſaid to be of great uſe in bilious fluxes, and in all caſes where heat, acrimony, and putridity of the humours prevail. On the authority of Proſper Alpinus (Med. Egypt. l. iv. c. 1.) we are informed, that the Egyptians employ them in peſtilential fevers and fluxes with great ſucceſs; and Simon Paulli relates, that he was cured of a malignant fever, accompanied with a bilious diarrhœa, by uſing theſe berries according to the Egyptian practice; that is, macerating the fruit for a day and a night in twelve times its quantity of water; with the addition of a little fennel ſeed; and then ſtraining and ſweetening the liquor, and uſing it as a common drink. Dr. Woodville obſerves, (Med. Bot. vol. iv. p. 62.) that theſe berries are well calculated to allay heat and thirſt, and to correct a putrid tendency in the fluids; but that in this reſpect they ſeem to poſſeſs no peculiar advantage over moſt of the other acid fruits; hence the colleges of London and Edinburgh have expunged this fruit from the Materia Medica, and retained only that of the currant. The bark is ſaid to be purgative, and Ray experienced its good effects taken

taken as a decoction in the jaundice. The roots boiled in lye dye wood yellow. In Poland they dye leather of a moſt beautiful yellow with the bark of the root: and the inner bark of the ſtem dyes linen of a fine yellow, with the aſſiſtance of alum. Withering, *ubi ſupra.* Kine, ſheep, and goats, are ſaid to eat this ſhrub, and horſes and ſwine to refuſe it.

2. B. *cretica*, Cretan, or box-leaved barberry; Lycium Creticum, Alp. Exot. 21. t. 20. Pon. Ital. 137. "Peduncles ſub-umbelled, ſpines triple." A ſhrub that never riſes more than 3 or 4 feet high in England, where the flowers are not ſucceeded by fruit. A native of the iſland of Candia, or Crete, and alſo of Japan. Cultivated, in 1759, by Mr. Miller; flowering in April and May. 3. B. *ilicifolia*, holm-leaved barberry. Lin. Syſt. 343. Suppl. 210. "Leaves obovate, ſerrate-ſpinous, pedicels elongated cymoſe, ſpines digitate." Found in the Terra del Fuego by Sparrman, where the inhabitants uſed the wood for bows, on account of its great elaſticity. 4. B. *ſibirica*, Siberian barberry. Lin. Syſt. 343. Murr. in com. got. 1784. 37. t. 6. Pall. it 2. 737, t. P. f. 2. "Peduncles one-flowered, ſolitary, nodding, ſpines palmate." A ſmall ſhrub, ſcarcely a ſpan in height. A native of Siberia, where it was obſerved by Pallas.

Propagation and Culture. The common ſort is generally propagated by ſuckers; but as the plants thus propagated ſend out ſuckers in greater abundance than thoſe which are propagated by layers, the latter method ſhould be preferred. The beſt time for laying down the branches is autumn, and the young ſhoots of the ſame year are the beſt; which will be well rooted by the next autumn, when they may be taken off and planted where they are to remain. When this plant is cultivated for its fruit, it ſhould be planted ſingle, and not in hedges; and the ſuckers taken away every autumn, and all the groſs ſhoots pruned out; by this method the fruit will be fairer and more abundant. A few of theſe ſhrubs will make an agreeable variety in wilderneſſes or plantations of ſhrubs; and the fruit will be ſood for birds; but they ſhould not be planted in too great quantities, or near walks that are much frequented, becauſe their flowers emit a very ſtrong diſagreeable odour. The Canada ſort may be propagated in the ſame way as the common ſort, and is equally hardy. The box-leaved ſort, which is now very rare in England, may be propagated by laying down the branches in the ſame manner as the firſt; but the young plants ſhould be ſet in pots, or ſheltered under a frame in the winter; and when they have acquired ſtrength, they may be turned out of the pots, and planted in a warm ſituation. Martyn's Miller's Bot.

BERBI, in *Geography*, a town of Africa, on the Ivory coaſt, N. E of cape Palmas. N. lat. 4° 30′. W. long. 5° 34′.

BERBICE, the ſeat of a colony of Guiana in South America, formerly belonging to the Dutch, on a river of the ſame name, about 25 leagues N. W. by W. ½ N. diſtant from Surinam, which runs from N. to S. and diſcharges itſelf into the Atlantic ocean. The coaſt on each ſide of the river forms a bay at its entrance, nearly a mile broad, in the middle of which is a ſmall iſland, called "Crab iſland." Oppoſite to this iſland, on the eaſtern ſhore, is a fort, with ſeveral pieces of artillery, and ſome ſoldiers; but the channel on the other ſide, which is navigable for ſhips of any burden, is undefended, and covered by the iſland from the guns on the oppoſite ſhore. Without the entrance of the river is a bar, which, at high tide, has ſeldom more than 16 feet of water; but within the water is of ſufficient depth, and the river is navigable for ſhips of burden 200 miles from its mouth. The plantations are ſituated on each ſide of the river, and extend nearly 300 miles from its entrance at fort Naſſau, which was formerly the ſeat of government, and contiguous to which were the public offices and houſes of the civil and military officers, about 100 miles from the mouth of the river. But the ſeat of government is now fixed at a point of land on the eaſtern ſhore of Berbice, about a mile from its entrance, which is formed between Berbice and the river Conya, which there diſcharges itſelf into the former. This is a narrow, but deep river, running from ſouth to north, but diverging ſomewhat eaſterly from Berbice. On the ſides of this river are ſeveral plantations, which form a part of the colony of Berbice. The produce of theſe plantations conſiſts chiefly of ſugar, coffee, cotton, and cocoa, and other articles, ſuch as are furniſhed by Surinam. Bancroft's Nat. Hiſt. of Guiana, p. 350, &c. The colony of Berbice ſurrendered to the Britiſh arms in September 1803. The river Berbice diſcharges itſelf into the Atlantic in N. lat. 6° 30′. and W. long. 57° 20′.

BERBUDA. See BARBUDA.

BERBURG, a town of the Netherlands, in the duchy of Luxemburg; 12 miles N E. of Luxemburg.

BERCAD, a town of Poland, in the palatinate of Braclaw. near the Bog; 52 miles S. S. E. of Braclaw.

BERCARIA, BERQUERIA, or BERKERIA, in *Middle Age Writers*, denotes a ſheep-fold, ſheep-cote, ſheep pen, or other incloſure, for the ſafe keeping of a flock of ſheep.

The word is abbreviated from *berbicaria;* of *berbex*, detorted from *vervex*. Hence alſo a ſhepherd was denominated *berbicarius*, and *berquarius*.

BERCHEM, or BERGHEM, NICHOLAS, in *Biography*, an eminent painter of landſcapes and cattle, was born at Haerlem in 1624, and formed for the practice of his art under ſome of the beſt maſters of his time. In his manner of painting he was eaſy and expeditious, and though he ſelected a very great variety and beauty of ſites for his landſcapes, he executed them with a ſurpriſing degree of neatneſs and truth. He poſſeſſed a clear and ſtrong judgment, and a facility in expreſſing his ideas; and therefore, in the lower kind of ſubjects to which he directed his attention, his choice of nature was judicious, and he gave to every ſubject as much beauty and elegance as it would admit. The leafing of his trees is exquiſitely and freely touched: his ſkies are clear; and his clouds float lightly, as if ſupported by air. The diſtinguiſhing characters of the pictures of Berchem are the breadth and juſt diſtribution of the lights; the grandeur of his maſſes of light and ſhadow; the natural eaſe and ſimplicity in the attitudes of his figures; the juſt degradation of his diſtances; the brilliancy and harmony, as well as tranſparency, of his colouring; the correctneſs and true perſpective of his deſign; and the elegance of his compoſition. He painted every part of his ſubjects ſo well, as to render it difficult to determine in which he excelled moſt; his trees, buildings, water, rocks, hills, cattle, and figures, being all equally admirable. One of the moſt capital pictures of this maſter was painted for the principal magiſtrate of Dort, in whoſe family it is preſerved; it exhibits the proſpect of a mountainous country, enriched with a great variety of ſheep, oxen, goats, and figures, excellently pencilled, and moſt beautifully coloured. Berchem was indefatigable, partly from his love of labour, and partly to gratify the avaricious diſpoſition of his wife, who never allowed him to relax; and he painted, in the ſummer months, from four in the morning till day light failed: in conſequence of this cloſe application, his pictures were very numerous; and yet at this day they are rarely to be purchaſed, and always afford a

very

very high price. Berchem died in 1683. We have feveral etchings by this maſter, that are executed in a fine, bold, maſterly ſtyle; and from theſe John Viſſcher ſeems to have formed that admirable ſtyle in which he engraved the copies from Berchem's pictures. Pilkington and Strutt.

Berchem, in *Geography*, a town of Brabant; 4 miles S. W. of Raveſtein.

Berchem, or *Bergen*, a town of Germany, in the circle of Weſtphalia, and duchy of Juliers; 9 miles eaſt of Juliers.

BERCHEROIT, or Berkcoits, in *Commerce*, a weight uſed at Archangel, and in all the Ruſſian dominions. It is equal to about 364 pounds Engliſh avoirdupois.

BERCHET, Peter, in *Biography*, an hiſtorical painter, was born in France, in 1659, and placed, at the age of 15, under the care of La Foſſe, ſo that in 3 years he was qualified to be employed in the royal palaces. In 1681, he came over to England, and worked under Rambour, a French painter of architecture. Berchet painted the ceiling in the chapel of Trinity college, Oxford, the ſtaircaſe at the duke of Schomberg's houſe in London, and the ſummer-houſe at Ranelagh. His drawings in the Academy were much approved. Towards the cloſe of life he only painted ſmall hiſtorical pieces, the ſubjects of which were taken from fabulous hiſtory; and his laſt performance was a Bacchanalian picture, to which he affixed his name the day before he died, in the year 1721. He occaſionally amuſed himſelf with the point. Pilkington and Strutt.

BERCHING, in *Geography*, a ſmall town of Germany, in the biſhopric of Eichſtett, or Aichſtadt, ſeated on the river Sulz.

BERCHORIUS, Bercheur, Peter, in *Biography*, a learned divine and voluminous writer of the 14th century, was born at the village of St. Pierre du Chemin, 3 leagues from Poictiers in France, and was conſtituted grammatical preceptor to the novices of the Benedictine monaſtery at Clugni, in the year 1340. He died prior of the Benedict convent of St. Eloi at Paris, probably at an advanced age, in the year 1362, as we learn from his epitaph in that monaſtery. Berchorius was one of thoſe writers, who affected to interpret allegorically, not only texts of Scripture, but alſo poetical fables and profane hiſtories, which they arbitrarily applied to the explication or confirmation of the myſteries of Chriſtianity. His three grand printed works are, "Reductorium Morale ſuper totam Bibliam," in 26 books, firſt printed Argentorat. 1473, fol. and containing all the incidents and ſtories in the Bible, reduced into allegories: "Repertorium, or Reductorium, Morale," in 14 books, which is a dictionary of things, perſons, and places, all which are ſuppoſed to be myſtical, and are therefore explained in their moral and practical ſenſe; and "Dictionarium Morale," in two parts, and ſeeming to be principally deſigned as a moral repertory for ſtudents in theology. Theſe pieces were all printed at a very early period; and a folio edition of them was printed, in 3 volumes, at Venice, in 1583. Berchorius was alſo the author of a comment on a profody, called "Doctrinale Metricum," which was uſed as a ſchool-book in France. Glaſſius, in his "Philologia Sacra," written about the year 1623, and of which a third edition was printed at Francof. and Hamb. in 1653, aſcribes to this author the famous work entitled "Geſta Romanorum;" the writer of which has for a long time remained unknown to the moſt diligent enquirers into Gothic literature. The learned Mr. Thomas Warton concurs in this opinion, and thinks it amply confirmed by the general coincidence of the plan, manner, method, and execution between the "Geſta Romanorum," and the three works of Berchorius abovementioned. He ſuppoſes it was written about the year 1340, with a view of rendering the exerciſes of his ſcholars, in the monaſtery at Clugni, in Latinity, more agreeable and eaſy, by means of an entertaining Latin ſtory-book, capable of being readily applied to leſſons of religion. This piece operated powerfully on the general body of our old poetry, and afforded a variety of inventions, not only to Chaucer, Gower, and Lydgate, but to their diſtant ſucceſſors. It was firſt printed in the Gothic letter without date, and as it is ſuppoſed, before or about the year 1473, in folio; and contains 152 chapters. The ſecond edition was printed in the ſame or following year at Louvain, in 4to, and contains 181 chapters. Another edition was printed in folio, in 1488. At the commencement of typography in England, a tranſlation of it in Engliſh was printed by Wynkin de Worde, and it was afterwards frequently reprinted. This work is compiled from the obſolete Latin chronicles of the later Roman, or rather German ſtory, heightened by romantic inventions, from legends of the ſaints, oriental apologues, and many of the ſhorter fictitious narratives, which came into Europe with the Arabian literature, and were familiar in the ages of ignorance and imagination. The claſſics are ſometimes cited for authorities; but theſe are of the lower order, ſuch as Valerius Maximus, Macrobius, Aulus Gellius, Seneca, Pliny, and Boethius. To every tale is ſubjoined a moraliſation, reducing it into a Chriſtian or moral leſſon. Warton's Hiſt. Eng. Poetry. vol. iii.

BERCHTOLDSDORF, or Petersdorf, in *Geography*, a town of Germany, in the archduchy of Auſtria, 6 miles ſouth-weſt of Vienna.

BERCHTOLSGADEN, or Bergtolsgaden, a proveſtſhip and principality of Germany, in the circle of Bavaria, environed by the archbiſhopric of Saltzburg, but exempt from the juriſdiction of that ſee. It is wholly mountainous, and contains two towns and a few villages, and alſo ſeveral lakes. At Bergtolſgaden, as well as at Hallein, in the principality of Saltzburg, ſalt is found in its foſſile ſtate. In order to obtain it, large cavities, or chambers, are dug in the mines, and filled with freſh water. Some of theſe are ſo large that the water muſt ſtand in them during two years before it is ſufficiently impregnated with ſalt; in others, this proceſs does not require more than a few weeks. When the water is ſaturated, it is carried through the mountain by pipes into a reſervoir, whence it is conveyed to the cauldrons. Of theſe there are four at Hallein, and two at Bergtolſgaden, which are not above four leagues diſtant from each other. The ſalt annually made at the former of theſe places, amounts to 400,000 quintals, and at the latter to 160,000. Count Razoumowſki ſuppoſes (Hiſt. et. Mem. de la Societé des Sciences Phyſiques de Lauſanne, vol. iii. for 1787 and 1788), that the mines at Hallein, and thoſe at Bergtolſgaden, are parts of the ſame bank of ſalt, which, in his opinion, is a continuation of that at Gmund in Auſtria, about 8 leagues from Hallein; and the irregularity of the ſtrata ſeems to indicate that the connexion between the two mines muſt have been broken by ſome violent convulſion.

BERCKEL, a town of Holland, 5 miles eaſt of Delft.—Alſo, a river of Germany, which riſes in the biſhopric of Munſter, and runs into the Iſſel at Zutphen.

BERCKSENBROECK, a town of Holland, 6 miles north of Rotterdam.

BERD, a river of Siberia, which runs into the Oby, near Berſkoi.

BERDA, in *Ichthyology*, a ſpecies of Sparus, that inhabits the Red ſea. It is of a whitiſh grey; lateral ſcales marked in the middle with a ſingle tranſverſe brown band; dorſal ſpines recumbent. Forſk. Fn. Arab. The body of this fiſh is oval: back gibbous, with pale bands; beneath white;

ſcales broad, rounded, entire. The crown is naked, convex, ſloping; iris white; noſtrils large, linear, with a conic cirrus; four long, conic, ſubulate, inciſive teeth; grinders numerous, hemiſpherical, thoſe behind largeſt; upper lip long, protractile; gill-covers entire; lateral line neareſt the back; fins brown, pectoral ones tranſparent and lanceolate; tail two-lobed. Gmelin.

Berda, *Cape*, or Berdinskaya, in *Geography*, the eaſt point of a large bay of the ſea of Azoph; cape Wiſarionova, or Besfarionova, being the weſt point. Several rivers empty themſelves into this bay. N. lat. 46° 42′. E. long. 56° 24′.

BERDAA, a town of Aſia, in Armenia, 160 miles eaſt of Erivan.

BERDANIEH, a town of Aſiatic Turkey, in the province of Caramania; 32 miles north of Alameh.

BERDASCHIR. See Barsir.

BERDASH, in *Antiquity*, was a name formerly uſed in England for a certain kind of neck-dreſs; and hence a perſon who made or ſold ſuch neckcloths was called a *berdaſher*, from which is derived our word *haberdaſher*.

BERDICZOW, in *Geography*, a decayed town of Poland, in the palatinate of Volhynia, 148 miles E.S.E. of Lucko, and 324 S.W. of Warſaw.

BERDIN, or Berlin, in *Conchology*, the name by which the *limpet*, or pap-ſhells, *patella* of Linn. is known on the coaſt of Normandy. It is alſo called in ſome places *bernacle*, or *bernicle*.

BERDOA, in *Geography*, a province of Africa, in the eaſtern diviſion of the great deſert or Sahara, conſtituting one of the Oaſes or fertile iſlands, which forms a part of that extenſive deſert that ſeparates Egypt from Fezzan, and contains the wandering tribe of Lebeta or Levata. It is ſituated to the north-eaſt of Agadez, and has Knar or Kawar to the ſouth and eaſt, to the north Augela, and the deſert of Barca, and to the weſt Fezzan. It extends northward from N. lat. 25°, and lies between 20° and 25° E. long.; but its exact boundaries are not aſcertained. Berdoa, its capital, lies north of the mountains of Tibeſti; and, according to Rennell's map, is placed in N. lat. 26° 32′. E. long. 21° 35′.

BERE-ALSTON, though only a ſmall inconſiderable hamlet, in the pariſh of Bere-Ferris, Devonſhire, has the privilege of returning two members to the Engliſh parliament. The right of election is veſted in thoſe perſons who poſſeſs land in the borough, and pay three-pence acknowledgment to the lord of the manor, who varies the number of electors at pleaſure, by granting burgage tenures to his own partizans only. The firſt return of members for this borough was in the 27th of Elizabeth. In the vicinity of this place are ſeveral lead mines; but none of them produce much ore, though in the time of Edward I. they were not only very rich in this metal, but yielded a great quantity of ſilver. It is ſaid that 1600 weight of the latter was obtained in the courſe of three years.

BERECYNTHUS, in *Entomology*, a ſpecies of Papilio, with entire wings, black above, with a yellow marginal band; ſix ocellar ſpots on the underſide of the poſterior pair. Fabricius. This is *papilio berecynthia* of Cramer, is of a large ſize, and inhabits Surinam.

BERECYNTIA, in *Ancient Geography*, a town of Aſia Minor, in Phrygia. Steph. Byz.

Berecyntia *Regio*, a country of Aſia, towards the river Sangar. Steph. Byz.

BERECYNTIUS *Tractus*, a canton of Aſia Minor, in Caria. Pliny.

BERECYNTUS, a mountain of Aſia Minor, in Phrygia, conſecrated to the mother of the gods.

BERECZINA, in *Geography*, a river of Lithuania, which riſes in the palatinate of Vilna, and runs into the Niemen, 16 miles north-eaſt of Novogrodek.

BEREFIORD, a trading place and port of the iſland of Iceland.

BEREGRA, or Beretra, in *Ancient Geography*, a town of Italy, in Picenum, at a ſmall diſtance north from Interamna.

BEREGSZAZ, in *Geography*, a town of Hungary, 24 miles north of Zatmar. It gives name to a county, and derives its appellation from a Saxon colony eſtabliſhed there; but its preſent inhabitants are Hungarians.

BEREIA, a town of Africa, north of Sierra Leone, at a ſmall diſtance from the coaſt. N. lat. 8° 58′. W. long. 12° 28′.

BEREILLY, or Barelly, a city of Hindoſtan; is the capital of Rohilcund, which was added to the dominions of Oude in 1774. It lies about half way between Lucknow and Delhi. N. lat. 28° 27′. E. long. 79° 45′. See Barelly.

BERELOS, a lake of Egypt, between Damietta and Roſetta; about 32 miles long and ten broad in the middle, but gradually contracting towards each end. It has within it ſeveral iſlands.—Alſo, a town of Egypt, 30 miles weſt of Damietta.

BEREN, an iſland of Aſia, 40 leagues weſt from Corgo iſland in the gulf of Baſſora.

Beren, or Bieron, a town of Sileſia, in the province of Ratibor; 34 miles eaſt of Ratibor.

BERENBORG, called alſo Joan Main iſland, an iſland in the north ſeas, near the coaſt of Eaſt or Old Greenland. N. lat. 71° 10′. W. long. 9° 19′.

BERENGARIANS, in *Eccleſiaſtical Hiſtory*, a religious ſect, adhering to the opinions of Berengarius, who, in the latter part of the eleventh century, a conſiderable time before Luther, oppoſed the doctrine of tranſubſtantiation, and the real preſence, ſtrenuouſly maintained by Lanfranc and Anſelm. See Berenger.

He is farther charged by the Romaniſts with decrying marriage, and maintaining the common uſe of all ſorts of women, and aſſerting baptiſm of no effect.

His followers were divided on the head of the euchariſt: though they all agreed, that the bread and wine were not eſſentially changed, yet ſome allowed, that the body and blood of Chriſt were contained in them, though concealed under an impanation: others denied any change at all, and reſolved the whole into figure; others again allowed a change in part; and others an entire change, with this reſtriction, that to thoſe who preſented themſelves unworthily it was changed back again.

Mabillon has an expreſs diſſertation on the manifold condemnations of Berengarius, his retractations, relapſes, and repentance.

BERENGER, James, in *Biography*, a native of Carpi, in Modena, from whence he took his name, being much more known by the name of Carpus, than by that of his family, Berengarius; one of the reſtorers and improvers of anatomy, was born about the end of the fifteenth century. He was initiated into the knowledge of ſurgery by his father, who practiſed that art, and had for his inſtructor in languages and philoſophy, the celebrated Albertus Minutius. At a proper age he went to Bologna, and afterwards to Padua, where he filled for ſome time the office of profeſſor of anatomy. Returning in 1518 to Bologna, he was there raiſed to the ſame office, which he continued to fill until about the year 1525. While teaching here, he is ſaid to have diſſected upwards of an hundred human bodies: a

prodigious number for the time, when the prejudice againſt handling or diſturbing the dead was ſo ſtrong. To that circumſtance, aided by his known antipathy to the Spaniards, perhaps may be attributed the ſtory of his having diſſected two of the natives of that country alive, with the view of ſeeing the motion of the bowels, and of his being on that account obliged to fly his country. A ſimilar ſtory had been told of Herophilus, and was afterwards told of Veſalius. That this, however, had been done by ſome anatomiſts, or that he was accuſed of it, ſeems probable by his ſpeaking of ſuch a practice in his commentary on the works of Mundinus, with diſguſt and horror. He is with more reaſon ſaid to have offended the miniſters of religion by the levity and indecency of his converſation on the ſubject of his diſſections, and by the profligacy of his life; and on that account to have been obliged to quit Bononia.

By his numerous diſſections, he was enabled to correct many erroneous opinions as to the ſtructure of the interior parts of the body, which prevailed to his time, and thence to pave the way for the further improvements made by Veſalius, his immediate ſucceſſor. If he was not the inventor, as Douglas calls him, he was one of the firſt who uſed mercurial frictions in curing the venereal diſeaſe, by which he is ſaid to have acquired a large fortune, which he left, at his death, to the duke of Ferrara, to whoſe territory he retired, and where he died, about the year 1527. His works are, "Commentaria, cum ampliſſimis additionibus, ſupra anatomiam Mundini, cum textu ejus in priſtinum nitorem redacto," Bononia, 1521, 4to., containing, beſides numerous corrections of Mundinus, a prodigious number of anatomical facts, which bear abundant teſtimony to his diligence and ingenuity. "Ea omnia enarrare, quæ recte videt (Haller ſays), infinitum foret;" and further on, "Invenio apud hunc virum, teſtimonium irrefragabile pro antiquo more, quo cardinales teſtes pontificis, nuper electi, contrectârunt." There are ſeveral rude engravings of the muſcles of the abdomen, and of other parts, in this volume. "Iſagogæ breves, perlucidæ et uberrimæ in anatomiam humani corporis ad ſuorum ſcholaſticorum preces in lucem editæ," Bonon. 1522, 4to. alſo with plates. Both theſe works have paſſed through numerous editions. In 1664, it was publiſhed in London, with the title, "A Deſcription of the Body of Man, being a practical Anatomy." He alſo publiſhed, in 1518, 4to. Venet. "De Cranii Fractura." Douglas. Bib. Anat. Haller. Biblioth. Chirurg.

Berenger, Berengarius, an eminent logician and controverſialiſt, was a native of Tours in the eleventh century, and having ſtudied under Fulbert at Chartres, he returned to Tours, where he was made principal of the ſchool of St. Martin, and treaſurer of the church. From Tours he removed to Angers, and became archdeacon of that city. Diſtinguiſhed by his acute and ſubtil genius, by his extenſive learning, and by his peculiar talents for controverſy, as well as by the exemplary ſanctity of his life and manners, he was held in very high eſtimation. At length, however, he found reaſon to deviate from the doctrines of the church concerning the euchariſt; and in 1045, he began to maintain publicly the doctrine of Scotus, in oppoſition to the opinions of Radbert; and he perſiſted in teaching that the bread and wine were not changed into the body and blood of Chriſt in the euchariſt, but preſerved their natural and eſſential qualities, and were merely figures and external ſymbols of the body and blood of our Saviour. Although the church of Rome had not, in this century, adopted any ſettled and decided opinion concerning the nature and manner of Chriſt's preſence in the euchariſt, the doctrine of Berenger was not only oppoſed by ſeveral doctors in France and Germany, but attacked with peculiar vehemence and fury by the Roman pontiff Leo IX. who, in 1050, convened two councils, one at Rome, and the other at Vercelli, in which it was ſolemnly condemned; and the book of Scotus, from which it was deduced, was committed to the flames. The council of Paris, ſummoned in the ſame year by Henry I., concurred in its condemnation, and menaced Berenger, and his numerous adherents, with all ſorts of evils, both ſpiritual and temporal. The hereſiarch was deprived by Henry of all his revenues; but he continued for ſome time afterwards firm and reſolute in his adherence to the doctrine he had embraced, and enjoyed unmoleſted tranquillity. The prevalence of his doctrine, notwithſtanding the oppoſition with which it encountered from the writings of its antagoniſts, and particularly from thoſe of Anſelm and Lanfranc, archbiſhops of Canterbury, alarmed the church; and two councils were ſummoned by Victor II. at Tours, in 1054, to examine anew this dangerous doctrine. In one of theſe councils, Hildebrand, afterwards pope Gregory VII. appeared as the pope's legate, and took the lead in oppoſing this new hereſy. Berenger, who was preſent, was at length overpowered by threats, and not only abandoned his opinions, but ſolemnly abjured them, and made his peace with the church. This abjuration, however, was only an act of timidity and diſſimulation; for he ſoon after taught the opinions he had formerly profeſſed, though the dread of danger rendered him more circumſpect and cautious. As ſoon as Berenger's perfidy was announced to Nicholas II., the exaſperated pontiff ſummoned him to Rome in 1058, and in a council held there the following year, he was ſo terrified, that he declared his readineſs to embrace and adhere to the doctrines which that venerable aſſembly ſhould think proper to enjoin. Accordingly, Humbert was employed by the pope and council to draw up a confeſſion of faith, which Berenger publicly ſigned, and to which, by a ſolemn oath, he avowed his adherence. As ſoon as Berenger returned to France, and found himſelf countenanced and protected by his ancient patrons, he expreſſed his deteſtation of the doctrines which he had been obliged to profeſs at Rome, abjured them ſolemnly both in his diſcourſes and writings, and zealouſly inculcated his former opinion. Pope Alexander II. attempted by ſoothing and friendly expoſtulations to regain the apoſtate; but his remonſtrances were ineffectual; the controverſy was prolonged for many years, and the followers of Berenger continually increaſed. As ſoon as Hildebrand was advanced to the papal chair, he undertook to terminate the controverſy; and with this view required Berenger, in 1078, to repair to Rome. Towards the concluſion of this year, a council was held in this city, and Berenger was permitted to draw up a new confeſſion of his faith, and to renounce that which had been compoſed by Humbert, and approved by Nicholas II. and a Roman council. On this occaſion the perſecuted prelate made a declaration, confirmed by an oath, that he would for the future adhere to the following propoſition: viz. "that the bread laid on the altar became, after conſecration, the true body of Chriſt, which was born of the Virgin, ſuffered on the croſs, and now ſits at the right hand of the father; and that the wine placed upon the altar became, after conſecration, the true blood which flowed from the ſide of Chriſt." This declaration ſatisfied the pontiff, but was thought by the enemies of Berenger to be too vague and equivocal. Gregory yielded to their clamours; and at a council held at Rome, in 1079, a new confeſſion of faith was drawn up, to which Berenger, after reading and ſubſcribing it, declared his aſſent by a ſolemn oath. This confeſſion expreſſed his belief, "that the bread and wine were, by the myſterious influence of the holy

prayer, and the words of our redeemer, ſubſtantially changed into the true, proper, and vivifying body and blood of Jeſus Chriſt ;" and this was followed by a ſolemn declaration, "that the bread and wine, after conſecration, were converted into the real body and blood of Chriſt, not only in quality of external ſigns and ſacramental repreſentations, but in their eſſential properties, and in ſubſtantial reality." Gregory diſmiſſed him with the moſt honourable teſtimonies of his friendſhip and liberality, and he returned to his own country. But Berenger, not conceiving himſelf bound by this declaration, publicly retracted the ſentiments which he had ſolemly avowed at Rome, and even compoſed an elaborate refutation of the doctrine to which he had been compelled to profeſs his aſſent. Gregory, who ſeems not to have approved the laſt confeſſion impoſed upon Berenger, when appealed to, declined interfering, and took no meaſures for moleſting him. From this time, Berenger obſerved a profound ſilence amidſt the clamours of his incenſed adverſaries, and made no reply to their bitter and repeated invectives. At length, decaying with age, overpowered by the oppoſition with which he had inceſſantly ſtruggled, and probably depreſſed with the reproaches of his own mind for the puſillanimous and diſhoneſt part he had acted, he abandoned all his worldly concerns, and retired to the iſle of St. Coſme, in the neighbourhood of Tours, where, in a courſe of penitential and pious exerciſes, he paſſed the ſhort remainder of his life; and in 1088, he was releaſed by death. On the minds of the people, he left behind him a deep impreſſion of his extraordinary ſanctity; and an annual ſervice is ſtill performed for him in the church of St. Martin at Tours. His unſteady conduct was unqueſtionably very diſgraceful to him; and there is reaſon to believe that it embittered the reflections of his retirement and cloſing ſcene. It is therefore a queſtion of little importance, whether he abandoned his original opinion before his death, as the Roman catholic writers maintain, or whether he adhered to it in the laſt period of his life, as the proteſtants, with greater probability, have aſſerted. All his works, which were numerous, have been loſt; except two letters, his three profeſſions of faith, and part of his treatiſe againſt one of them. Cave's Hiſt. Lit. tom. ii. p. 130. Moſheim's Eccl. Hiſt. vol. ii. p. 559, &c.

BERENICE, or Bernice, a Jewiſh queen, the daughter of Agrippa the elder, and ſiſter of Agrippa the younger, kings of Judæa. She was born about the year of Chriſt 28, and at the age of 16 married her uncle Herod, king of Chalcis. After her huſband's death, A. D. 48, ſhe was ſuſpected of having criminal intercourſe with her brother Agrippa; and in order to remove ſuſpicions, and to ſilence rumours of this kind, ſhe conſented to marry Polemon, king of Pontus and part of Cilicia, on condition of his embracing Judaiſm. She lived with him, however, but a little while, and returned to her brother, with whom ſhe lived on terms of intimacy, which ſubjected her to reproach. Juvenal refers to this inceſtuous connection (ſat. vi. v. 155):

—— "Deinde Adamas notiſſimus, et Berenices
In digito factus pretioſior; hunc dedit olim
Barbarus: inceſtæ dedit hunc Agrippa ſorori."

When Agrippa heard the diſcourſe of St. Paul before Feſtus at Cæſarea of Paleſtine, Berenice was preſent with him. After the commencement of the Jewiſh war in 67, when Agrippa was driven from Jeruſalem by the ſeditious people, ſhe remained for ſome time after him, and interceded for the Jews with the Roman governor Florus, by whom ſhe was treated with great diſreſpect. She afterwards accompanied Agrippa to the army of Veſpaſian in Syria; and contrived, by coſtly preſents, to engage the good will of that avaricious emperor as long as he lived. Her beauty and addreſs had alſo captivated Titus; and on the death of Veſpaſian ſhe followed him to Rome. The emperor was much attached to her, and diſpoſed to make her his queen; but in deference to the ſentiments of the Roman people, who diſliked the idea of a foreign queen, and who well knew that her character was not irreproachable, he diſmiſſed her, and ſent her away to her own country. What became of her afterwards hiſtory does not inform us. Joſ. Antiq. l. xix. xx. De Bell. Jud. l. ii. Tacit. Hiſt. l. ii. Crevier. Gen. Dict.

Berenice, was likewiſe the name of ſeveral Egyptian and eaſtern queens. One of them, the wife of Ptolemy Euergetes, king of Egypt, under an apprehenſion of the danger to which he would be expoſed in his expedition to Syria, made a vow to conſecrate her hair, which was her chief ornament, in caſe of his ſafe return. When the prince returned, not only in ſafety, but crowned with glory and ſucceſs, ſhe immediately cut off her hair, and dedicated it to the gods in the temple which Ptolemy Philadelphus had built in honour of his beloved Arſinoë, under the name of the Zephyrian Venus, on the promontory of Zephyrium in Cyprus; but this hair being loſt by the negligence of the prieſts, Ptolemy was enraged, and threatened to puniſh them. Upon which Conon of Samos, a flattering courtier, as well as ſkilful mathematician, with a view to appeaſe the king's anger, and to conciliate his favour, affirmed, that the queen's locks had been conveyed to heaven, and pointed out ſeven ſtars near the tail of the lion, which till that time had not belonged to any conſtellation, declaring that they were the queen's hair. Several other aſtronomers confirmed the aſſeveration of Conon; and hence "Coma Berenices," or Berenice's hair, became one of the conſtellations.

Callimachus, who lived at that time, and had been a great favourite of Philadelphus, wrote a hymn on the hair of Berenice, which was afterwards tranſlated by Catullus, whoſe verſion is extant among his other performances. Berenice, according to Plutarch (In Quæſt. Græc.) and Stephanus Byzantinus (verb. Βερενικη), was formed from Φερενικη, a bearer of victory, by the Macedonians, who exchanged Ph into B.

Berenice, in *Entomology*, the name under which Cramer figures *papilio erippus* of Fabricius and Gmelin.

Berenice, in *Ancient Geography*, the name of ſeveral cities, of which Ortelius reckons nine. The principal are as follow: viz. a town of Thrace:—another of Aſia Minor in Cilicia:—another of Aſia, called Pella in Cœlo-Syria; all three mentioned by Stephanus Byzantinus: — another of Africa in Cyrenaica, near the mouth of the river Lathon, or Lethon, where it diſcharges itſelf into the bay of Syrtis, anciently called Heſperis, and Heſperides, now Berenice: near this town was ſituated the garden of Heſperides, and a wood ſtill marks its poſition, in a country deſtitute of trees:—another, a maritime town of Arabia Petræa, ſituated at the extremity of the Arabian gulf, or Red ſea, the promontory of Heroopolis, and that of Strobilus, according to Pomponius Mela; it is mentioned by Joſephus, in his account of Solomon's fleet, who ſays, it was not far from the city of Ælana, and that it was formerly called Aſſingaber, or Eziongaber, in which poſition of it M. d'Anville acquieſces: —another, a famous town of Egypt, ſo named from the mother of Ptolemy Philadelphus, who founded it on the weſtern ſide of the Red ſea, and nearly under the tropic, about 450 miles below Suez, in order to avoid the ſlow and dangerous navigation of the upper part of the Red ſea; this city ſoon became the ſtaple of the trade with India. From Berenice the goods were tranſported by land, to Coptos, a city three miles diſtant from the Nile, but which had a communication with that river by a navigable canal, of which there are ſtill ſome remains, and thence carried down the ſtream of the Nile,

and

and its canals, to Alexandria. The diſtance between Berenice and Coptos, according to Pliny (Nat. Hiſt. l. vi. c. 29.) confirmed by the itinerary of Antonine, and approved by M. d'Anville, was 258 Roman miles; and the road lay through the deſert of Thebais, almoſt entirely deſtitute of water. But the attention of a powerful monarch made proviſion for ſupplying this want, by ſearching for ſprings, and wherever theſe were found he built inns, or more properly, in the eaſtern ſtyle, caravanſeras, for the accommodation of merchants. See Strabo. Geog. l. xvii. p. 1157. D. 1169. In this channel the intercourſe between the eaſt and weſt continued to be carried on during 250 years, as long as Egypt remained an independent kingdom. Berenice continued to be the port of out-fit for the Roman Eaſt India trade, in the time of Pliny (A. D. 79.) who details, in his 6th book, the account of the navigation to India, and who informs us, that it coſt 50 millions of ſeſterces, or about 440,000l. every year. From Berenice it was reckoned 30 days' navigation down the Red ſea to Ocelis (Gella) juſt within the ſtrait of Babelmandel. From Ocelis to Muziris, the firſt port of merchandize in India, was 40 days' ſail: ſo that as they left Berenice about Midſummer, they might arrive in India in the latter end of Auguſt, when the violence of the S. W. monſoon was abated, and the coaſting navigation ſafe and eaſy. Theſe voyages were firſt made by coaſting along the Arabian ſhore, to the promontory Syagrus (now cape Raſalgate,) and thence along the coaſt of Perſia, either directly to Pattala (now Tatta,) at the head of the lower Delta of the Indies, or to ſome other emporium on the weſt coaſt of India. Afterwards, a ſhorter and ſafer courſe was diſcovered; and from cape Raſalgate veſſels ſailed in a direct courſe to Zizerus, which, according to major Rennell, was a port on the northern part of the Malabar coaſt. In a ſubſequent period, a direct courſe was purſued from the outlet of the Red ſea to Muziris. It has not been accurately aſcertained, what were the other ports in India which the merchants from Berenice frequented, when that trade was firſt opened; but it is probable, that as their veſſels were of ſmall burden, and kept near the coaſt, their voyages were circumſcribed within very narrow limits, and that under the Ptolemies, no conſiderable progreſs was made in the diſcovery of India. Rennell's Mem. Introd. p. 35—37. Robertſon's Hiſt. Diſq. concerning India, p. 46, &c. — Another Berenice was a town of Africa, on the Red ſea, ſituate more to the ſouth than the preceding, in the country of the Troglodytes, at the entrance of the Red ſea, near the ſtrait of Babel Mandel, known by the epithet of "Epidiris:"—another, denominated by Pliny (l. vi. c. 29.) "Panchryſos," from the gold dug in its vicinity; and by Strabo, κατὰ Σαβᾶς, *juxta Sabas*, on the ſame coaſt; transferred by Hardouin to Arabia Felix, but mentioned by Strabo and Pliny in connection with the country of the Troglodytes.

BERENICE's Hair, in *Aſtronomy*. See Berenice *above*, and Coma *Berenices*.

BERENTHA, in *Ancient Geography*, a ſmall town of Peloponneſus in Arcadia, mentioned by Step. Byz. and Pauſanias.

BERENTHEATE, a ſmall river of Peloponneſus in Arcadia, that diſcharged itſelf into the Alpheus. Pauſanias.

BERENTZ, in *Geography*, a town and caſtle of Hungary; 20 miles N. N. E. of Preſburg.

BERES, in *Ancient Geography*, a town of Thrace. Steph. Byz.

BERESKY, in *Geography*, a town of Poland, in the palatinate of Braclaw; 40 miles S. E. of Braclaw.

BERESNA, or Beresin, a diſtrict and town of Tchernigof in Ruſſia, ſituated on the Deſna, 24 miles E.N.E. of Tchernigof.

BERESOF, or Beresow, a diſtrict of the province of Tobolſk in Ruſſia, in the country of the Samoiedes, ſituated on the river Soſſva, which falls into the Oby; and bounded to the north by the ſtraits of Waygats; on the eaſt by the Ural mountains; on the ſouth by the river Konda, and a large bay of the Frozen ocean, which runs into the land towards the ſouth, and ſeparates near the 66th degree of north latitude, into two parts, one of which is called the Obſkaia Guba, or bay of Oby, and the other Tazowſkaia Guba, or the bay of Tazow. Into the former the river Oby empties itſelf, and into the latter the Taz; and from theſe two rivers the bays derive their names. This diſtrict was added to the Ruſſian empire by the czar Gabriel, in 1530, long before the other parts of Siberia were conquered. The town of Bereſof is ſituated on the weſt ſide of the river Oby, 372 miles N. N. W. of Tobolſk. N. lat. 64°. E. long. 65° 14'. This diſtrict is famous for its gold mines, in the mineral mountains of Ural, opened in 1754, and affording annually 3, 4, 5, or 6, and in later years 7 or 8 pood of gold. From the commencement of the work, in 1754, till the year 1788, during an interval of 34 years, the quantity of about 120 pood has been generally gained, which, eſtimated in value, amounts to about 1,198,000 rubles, and after deducting the coſts, to above 480,000 net profit. Taking the gold and ſilver here obtained, according to its ſtandard in coinage, and balancing it with the expences paid in copper money, according to its true value, a profit accrues of nearly 800,000 rubles. Tooke's View of Ruſſia, vol. iii. p. 296.

Beresof, is alſo a town of Ruſſia, in the government of Olonetz. N. lat. 64° 15'. E. long. 30° 34'.

BERETELSKO, a town of Poland, in the palatinate of Volhynia; 24 miles S. S. W. of Lucko.

BERETHALOM, or Birthelem, a ſpacious town of Tranſylvania, in the diſtrict of Weinland, which is the reſidence of the Proteſtant biſhop. The church is ſeated on a high rock, and its vicinity produces good wine.

BERETZHAUSEN, a town of Germany, ſeated on the Laber, in the circle of Bavaria, and principality of Neuburg; 12 miles W. N. W. of Ratiſbon.

BEREWICHA, or Berewica, in our *Old Writers*, denotes a village or hamlet belonging to ſome town or manor, ſituate at a diſtance from it.

The word frequently occurs in Doomſday-book: *Iſtæ ſunt* berewichæ *ejuſdem manerii*.

BEREZA, in *Geography*, a town of Poland, in the palatinate of Kiof; 30 miles W. of Bialacerkiew.—Alſo, a town of Lithuania, in the palatinate of Poleſia, and territory of Brzeſk; 56 miles E. N. E. of Brzeſk. In this place the Carthuſians have a convent.

BEREZEC, a town of Little or Red Ruſſia, in the palatinate of Chelm; 22 miles eaſt of Chelm.

BEREZEN, a river which runs into the Black ſea; 20 miles weſt of Oczakow.

BEREZENE, a town of Poland, in the palatinate of Volhynia. N. lat. 51° 45'. E. long. 25° 30'.

BEREZEUKA, a town of Ruſſia, in the government of Saratof, on the weſt ſide of the Volga; 124 miles S. of Saratof.

BEREZINA, or Berezyna, a river of Lithuania, which riſes in the palatinate of Polotſk, and runs into the Druec, in N. lat. 52° 18'. E. long. 30° 55'. This river has been erroneouſly laid down, by ſome modern geographers, as forming the new boundary between Ruſſia and Poland.

Berezina, a town of Lithuania, in the palatinate of Minſk, near the ſource of the river of the ſame name; 44 miles N. E. of Minſk. N. lat. 54° 28'. E. long. 28° 39'.

BEREZINSKOI, a town of Siberia, on the north ſide of the Irtiſh; 40 miles E. of Tobolſk.

BEREZNA, a town of Ruſſia, in the diſtrict of Kargapol, ſeated on the river Onega. N. lat. 62° 18′. E. long. 38° 5′.

BEREZNE, a town of Poland, in the palatinate of Volhynia, near the river Siucz. N. lat. 51° 10′. E. long. 26° 52′.

BEREZNIKI, a town of Lithuania, in the palatinate of Troki; 40 miles N. N. W. of Troki.

BEREZOF. See Beresof.

BEREZOVOI, a fortreſs of Aſiatic Ruſſia, in the government of Orenburg, on the Uvelka, 240 miles eaſt of Ufa, and 68 S. E. of Tcheliabinſk.

BEREZOVSKOI, a fortreſs of Aſiatic Ruſſia, in the government of Orenburg, on the Ural, 140 miles E.N.E. of Orenburg.

BER-FISCH, in *Ichthyology*, a name given by the Germans to the *common perch*.

BERG, Matthys Vanden, in *Biography*, a painter of portrait and hiſtory, was born at Ypres in 1615, and, as one of the diſciples of Rubens, he obtained ſome diſtinction. In his drawing he was correct, and being aſſiduous in deſigning after the life, and after the beſt models, pictures of his own invention are uncommon; although excellent copies after the finiſhed pictures of his maſter are numerous. He died in 1687. Pilkington.

Berg, in *Geography*, a duchy of Germany, in the circle of Weſtphalia, called in Latin "Ducatus Montenſis," *berg* and *mons* being ſynonymous, and denoting mountain or hill, is bounded on the weſt and ſouth by the archbiſhopric of Cologn, from which it is ſeparated by the Rhine; on the north by the duchy of Cleves; and on the eaſt by Naſſau-Siegen, the duchy of Weſtphalia, and the county of Mark. It is about 72 miles long, and from 10 to 26 in breadth. The country, which upon the whole is mountainous, is, nevertheleſs, along the Rhine flat, very fertile, and produces corn in abundance; on the hills the inhabitants cultivate vines, and the higher tracts are covered with extenſive foreſts; and the vallies afford excellent paſture. In this duchy there are mines of lead, iron, and coal; its principal manufactures are ſwords, knives, and other articles of iron and ſteel; and alſo thoſe of cloth, ribbands, and handkerchiefs. The principal rivers are the Rhine, which flows to the eaſt of this country, the Wipper, the Sieg, and Ruhr. Its capital is Duſſeldorf; and its other principal towns are Elberfeld, Gemark, Lennep, Rattingen, and Solingen. Hoeck computes the number of inhabitants to be 261,504. Render (Tour, vol. ii. p. 294.) ſays, that this duchy contains 9 cities, 8 market towns, 35,942 hearths, 202 churches, 44,646 Calviniſts, 36,807 Lutherans, and 1,300 Jews: and he adds, that this duchy, and that of Juliers, contain a number of manufacturers, who are computed to be about 150,000. The duchy of Berg belonged to the elector palatine; but in the year 1795, it was entirely over-run by the French. See Juliers.

Berg. See Bergues.

Berg *Reichinſtein*, or *Kaſchperſki Hory*, a royal town of Bohemia, in the circle of Prachalitz, ſeated on a mountain, in which are mines of ſilver, 20 miles Weſt of Prachalitz.

BERGA, a town of Norway, 60 miles E.N.E. of Chriſtiana. N. lat. 59° 50′. E. long. 9° 38′.—Alſo, a ſmall town of Spain, in Catalonia, ſeated on the river Llobregat.—Alſo, a town of Germany, in the circle of Neuſtadt, and prefecturate of Weyda, ſeated on the Elſter, 5 miles Weſt of Weyda.

BERGAMASCO, or Bergamo, a country of Italy, being part of Lombardy, and belonging to the ſtates of Venice, is bounded on the north by the Valteline, on the eaſt by the Breſciano, on the ſouth by the Cremaſco, and on the weſt by the Milaneſe. It extends about 36 leagues from north to ſouth, and 30 from eaſt to weſt. Towards the north it is mountainous and uncultivated, but the vicinity of Bergamo, its capital, is fertile. Some of its vallies produce wine and oil; others are barren. In the mountains are mines of iron, and quarries of marble and of ſtones. The inhabitants are inclined to corpulency, and are ſubject to the goitre; nevertheleſs, they are induſtrious, and intelligent in commerce, and carry on a conſiderable traffic in iron, wool, carpets, and tapeſtry, which they manufacture; cattle, marble, and mill-ſtones. Their language is a very corrupt Italian. Bergamaſco now belongs to the Ciſalpine republic.

BERGAMO, James Philip de, in *Biography*, an Auguſtin monk, was born at Bergamo in 1434, and wrote a "Chronicle" in Latin, from the creation of the world, to the year 1503, and "Treatiſe of Illuſtrious Women." He died at the place of his nativity in 1518. Gen. Dict.

Bergamo, anciently *Bergomum*, in *Geography*, a fortified city of Italy, and capital of Bergamaſco, is ſeated on ſeveral hills, at the bottom of which are ſome handſome ſuburbs. Between the city and the ſtrong caſtle on the mountain, is a ſubterraneous communication. Bergamo is the ſee of a biſhop, ſuffragan of Milan, and contains 13 pariſh churches, 12 convents for men, 10 for women, and about 30,000 inhabitants. The old church of mingled Gothic and Grecian architecture, contains ſeveral valuable pictures, and deſerves notice. It is a place of conſiderable trade, and has a large fair on St. Bartholomew's day, which is reſorted to by a great number of merchants from other parts of Italy, Germany, and Switzerland. The principal articles of commerce are wool and ſilk; and the ſerges and tapeſtry of this place have been celebrated. Their ſilks equal thoſe of Turin. The inhabitants are diligent and active, and by their induſtry, render fertile the ſandy environs of the town. Bergamo is 25 miles N. E. of Milan, and 26 N. W. of Breſcia. N. lat. 45° 42′. E. long. 9° 38′.

Bergamo, a name given by the Turks to the ancient Pergamus.

BERGAMOT, in *Botany*, *cedrat* or *bergamot citron-tree*, the Citrus *mella-roſa* of Lamarck, and a variety of the Citrus *medica* of Linnæus. It is diſtinguiſhed from the common citron-tree by its leaf, which has the odour of the roſe, by its fruit, which is red, and by the piſtil of its flower, which is ſhort. The fruit has a fine taſte and ſmell; and its eſſential oil is in high eſteem as a perfume.

Bergamot, *Oil*, or *Eſſence of*, is a fragrant eſſential oil procured from the outer rind of the bergamot orange, and prepared in a very large quantity for the table and perfumery in the ſouth of France, and eſpecially in Italy and Sicily. There are ſeveral other ſpecies of oranges uſed for this purpoſe, but the bergamot is eſteemed the moſt fragrant.

As the oil exiſts pure and ready formed in the orange peel, being ſimply depoſited in ſmall cells, the extraction is very eaſy. There are two methods of procuring it, either by diſtillation, as with all other eſſential oils, (for which, ſee the article Oil *Eſſential*) or by expreſſion. The latter is in ſome reſpect the beſt, as the oil is not liable to be altered by heat. Seſtini relates, that in Sicily, a vaſt quantity of the oil is procured ſimply by ſqueezing the peel in the hand, and holding a ſmall piece of ſponge to the ſurface, which imbibes the oil as faſt as it flows out; when the ſponge is full, its contents are preſſed out into a veſſel in which the oil is collected. It is not eaſy to imagine a more indolent and inartificial method: but in Italy, and the ſouth of France, the orange peels are firſt torn to pieces on a ſmall machine ſtuck over with nails, with the points projecting, like

like a carding mill, whereby they are entirely torn to pieces, from which much of their oil flows out on the ſmall mill, and is conducted away by a channel cut for the purpoſe, leading to a large bottle, where it is collected. After this, the peel, now in a pulpy ſtate, is ſtrongly compreſſed between two plates of glaſs, and the remainder of the oil is forced out. This laſt being mixed with the other parts of the pulp, is at firſt turbid, but gets clear by repoſe.

Theſe expreſſed eſſential oils, or as they have ſometimes been diſtinguiſhed by the term *eſſences*, are more fragrant than the oils prepared by diſtillation, but being mixed with a little mucilage, they are ſomewhat thicker, and do not keep quite ſo long as the diſtilled. The Sicilian method of preparing the eſſence by hand, though attended with great waſte of materials, certainly affords a purer oil, than where a mill and preſs are uſed.

If the pulp, remaining after preſſure, is mixed with ſpirit of wine and diſtilled, an addition of water to the diſtilled ſpirit ſeparates an additional quantity of the oil, and leaves the liquor highly flavoured with its exquiſite ſcent.

Beaumé obtained two ounces of the oil by diſtillation, from two pounds of the peel of lemons, and probably the bergamot is yielded in ſomewhat ſimilar proportion. Beaumé. Murray.—Encycl. Arts. & Met. tom. vii.

There is likewiſe a kind of ſnuff of the ſame name, which is only clean tobacco, with a little of the eſſence rubbed into it.

Bergamot, in *Commerce*, is alſo the denomination of a coarſe tapeſtry, manufactured with flocks of ſilks, wool, cotton, hemp, ox, cow, or goats hair, and ſuppoſed to be invented by the people of Bergamo in Italy.

BERGANDER, in *Ornithology*, a name by which ſome have called the *ſhieldrake* or *burrough duck*, a very beautiful ſpecies of duck, common on the Lancaſhire, and ſome other coaſts of England; but not in much eſteem for eating. This is *anas tardona* of Linnæus, which ſee.

BERGARA, in *Geography*. See Vergura.

BERGASE, a town of Romania, in European Turkey, ſeated on the Lariſſa. N. lat. 41° 22′. E. long. 27° 24′.

BERGBIETHEIM, a large market town of France, in the department of the Lower Rhine, and diſtrict of Dachſtein.

BERGEN, Dirk Vanden, in *Biography*, was born at Haerlem, and was reckoned one of the beſt diſciples of Adrian Vandervelde. His colouring is more glowing than that of his maſter; but his cattle, and other objects, are leſs correctly drawn. He ſpent ſome time in England; but not ſucceeding, returned to his own country, and for want of economy, died poor in 1689. Pilkington.

Bergen, Charles Augustus de, ſon of George Bergen, profeſſor of medicine in the univerſity of Frankfort on the Oder, was born Aug. 11, 1714. After being initiated by his father into the knowledge of anatomy and medicine, he was ſent to Leyden, where he ſtudied under Boerhaave and Albinus, and thence, to complete his education, to Paris, and to Straſburg. In 1734, being thought qualified to aſſiſt his father, he recalled him to Frankfort, where he was made doctor, and the year following, profeſſor in medicine. On the death of his father in 1738, he was promoted to the chairs of profeſſor of anatomy and botany. With what zeal and ability he filled thoſe offices, his numerous, learned, and ingenious diſſertations on thoſe ſubjects evince. In 1744, he was appointed to ſucceed Goeliches as reader in theraupeutics and pathology, which poſt he filled to the time of his death, October 7, 1760.

His works, conſiſting chiefly of academical diſſertations, were collected by Haller, and publiſhed with his "Theſes Anatomicæ." The titles of a few of them follow. For the remainder, ſee Bib. Anat. et Botan. Haller. "De nervo intercoſtali," 1731; "Icon nova ventriculorum Cerebri," 1734; "Methodus Cranii Oſſa diſſerendi, et machinæ hunc in finem conſtructæ per figuras, ligno inciſas, delineatio," 1741; "Flora Francofurtuna, facili modo elaborata, &c." 1750.

Bergen, or *Berghen*, in Latin *Berga*, in *Geography*, the capital of Norway, and of the province of Bergenhuys, was founded in the year 1069 or 1070. It is a ſea-port town, ſeated in the middle of a valley, and forming a kind of ſemicircle round a ſmall gulf of the ſea, called by the inhabitants Waag. On the land ſide it is defended by high mountains, conſtantly overhung with clouds, which deſcend upon the town in frequent rains; and towards the ſea by ſeveral fortifications. All the churches and public edifices, as well as many of the dwelling houſes, are built of ſtone. The moſt remarkable buildings are the caſtle, and the cathedral ſchool, founded in 1554. This city carries on a large trade in all kinds of fiſh, fiſh-oil, tallow, tar, hides, and timber, which are brought from the northern parts of the kingdom, and exported from hence. The returns conſiſt chiefly in corn and foreign commodities. Bergen was formerly connected with the Hans towns, and enjoyed the privilege of coining till the year 1575. The origin of its commerce was owing to the merchants of the Hanſeatic league; fifty-eight ſtore houſes are ſtill to be ſeen on the quays, which were eſtabliſhed by thoſe merchants for the convenience of their exportation of fiſh. They had alſo a particular court here, the deciſions of which tended to exclude the native inhabitants from all ſhare in the trade; but they were at length entirely expelled, chiefly by the vigour of a bailiff, Walkendorf. This city, being chiefly conſtructed of wood, has been ſubject to frequent conflagrations, as in 1428, when eleven pariſh churches were entirely conſumed, and alſo in 1702, 1623, 1640, 1702, 1756, and 1771, on which laſt occaſion, the flames, it is ſaid, were viſible in the iſles of Shetland, or at leaſt, the red reflection in the ſky. It has now only four pariſh churches, three Daniſh, and one German, together with ſome private chapels. The population is computed at 19 or 20,000. The harbour is reckoned one of the beſt in Europe. Bergen poſſeſſes a very laudable inſtitution for the encouragement of the uſeful arts. N. lat. 60° 23′. E. long. 5° 33′.

Bergen, Berghen, or Bergenhuys, the moſt weſterly province of Norway, ſituate between Aggerhuus and the northern ocean. It is about ſixty leagues long, and 7 wide. Its capital is Bergen. This province, or dioceſe, is very populous, and is remarkable for having 7 marble quarries. It includes 7 vogteys or diſtricts, and the ſame number of provoſtſhips. The vogteys are Haardanger, Sundhard-Lehn, Nord-hord Lehn, Sogn, or Sygna-Filke, Sundfiord, Nordfiord, and Sundmor.

Bergen, a county of America, in New Jerſey, on Hudſon river, lies oppoſite to New York on the eaſt, and was firſt planted by the Dutch from New York. It is a mountainous country, and its extent is about 30 miles long and 25 broad; forming part of the eaſtern and northern extremities of the ſtate, and at its north-weſtern extremity meeting the north-eaſtern part of Suſſex county. Bergen contains 6 townſhips, the chief of which are Bergen and Hackinſack, and 12,601 inhabitants, including 2301 ſlaves. Here are 7 Dutch Calviniſt churches, and 2 of Dutch Lutherans.

Bergen is the ſhire town of the above county, and lies ſurrounded by water, except on the north. It is ſeparated by the Hudſon river, from New York, at the diſtance of 3 miles; on the ſouth, a narrow channel lies between it and Staten iſland; and on the weſt, it has Hackinſack river. The inhabitants are chiefly deſcendants of the Dutch ſettlers.

BERGEN *Neck*, is the ſouthern extremity of the above township.

BERGEN, a town of Germany, in the circle of the Upper Rhine, and principality of Hanau Munzenberg. The environs produce excellent wine.—Alſo, a town of Germany, in the circle of Upper Saxony, and capital of the iſle of Rugen; its ancient name was *Gora*. It is ſituated in the centre of the iſland, where are held the tribunals of Swediſh Pomerania. N. lat. 54° 28′. E. long. 13° 40′.

BERGEN on *the Dumme*, a town of Germany, in Lower Saxony, and principality of Zell, 12 miles S. W. of Danneberg.

BERGENHUYS. See BERGEN, *ſupra*.

BERGEN-OP-ZOOM, a ſea-port town of Dutch Brabant, ſeated on an eminence, in the middle of a moraſs, near the eaſtern ſhore of Zoom, at its junction with the Scheldt. It was firſt ſurrounded by a wall in 1287, by the firſt lord of the town, and erected into a marquiſate by the emperor Charles V. in 1533. The church, which is a beautiful ſtructure, was made collegiate in 1442. The houſes are well built, and the market places and ſquares handſome and ſpacious. It has a good tract of land under its juriſdiction, with ſeveral villages, and ſome iſlands in the Scheldt. This place, naturally ſtrong on account of the moraſſes that ſecure it, was regularly fortified in 1629, and eſteemed nearly impregnable. The fortifications are reckoned the maſter-piece of that great engineer Coehorn. It was unſucceſsfully beſieged by the prince of Parma in 1588, and alſo by the marquis of Spinola in 1622. In 1746, the marechal Saxe deputed count Lowendahl to lay ſiege to it with 36,000 men; and after perſevering attacks, and a vigorous, obſtinate defence, in which many lives were loſt, it was ſurrendered to the French, who became maſters of the whole navigation of the Scheldt. At the peace of Aix-la-Chapelle, it was reſtored to the Dutch. It is diſtant 18 miles N.N.W. from Antwerp. N. lat. 51° 30′ E. long. 4° 15′.

BERGENTE, in *Ornithology*, one of the names of *anas marila*. (Scaup. Duck.) *Bloch, beſch derberl naturf. &c.*

BERGERA, ſo called from Chriſt. Joh. Berger, profeſſor at Kiel, in *Botany*. Auth. D. Konig. Lin. gen. Schreb. n. 718. Claſs and Order, *decandria monogynia*. Gen. Char. *Cal.* perianth, five-parted, very ſmall, acute, ſpreading, permanent. *Cor.* petals five, oblong, bluntiſh, ſpreading. *Stam.* filaments ten, five alternately ſhorter; anthers round. *Piſt.* germ roundiſh, ſuperior; ſtyle filiform, club-ſhaped; ſtigma turbinate, ſhining, with tranſverſe grooves. *Per.* berry ſubglobular, one-celled. *Seeds* two.

Eſſ. Char. *Cal.* five-parted. *Pet.* five; *berry* ſubglobular, one-celled, with two ſeeds.

Species, 1. B. *Koenigii*. Lin. Mantiſſ. 563. A leafy tree, with the bark of alder. A native of the Eaſt Indies. Martyn.

BERGERAC, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Dordogne; beautifully ſituate in an extenſive plain on the Dordogne, which divides it into two towns, called "St. Martin," and "St. Magdelaine." It is a rich, commercial, and populous town, containing about 8540 inhabitants. In the canton are 14,140. The territorial extent comprehends 175 kiliometres, and the number of the communes is 12. Before the revocation of the edict of Nantes, it is ſaid there were 40,000 Proteſtants in this town and neighbourhood. N. lat. 44° 51′. E. long. 0° 37′.

BERGFINK, in *Ornithology*, the name of *fringilla montifringilla*, in the Hiſt. Birds. *Friſch, ſander naturf. &c.*

BERGGANS, (Kolbe) the mountain gooſe, *anas montana*. Gmelin.

BERGGIEFZHUBEL, or BERG GIESHUBEL, in *Geography*, a town of Germany, in the circle of Upper Saxony, and margraviate of Meiſſen, near which are warm medicinal ſprings, 6 miles ſouth of Pirna.

BERGH, or BERGHLAND, an iſland in the Indian ſea, north of Naſſau iſland, and ſouth-weſt of the iſland of Sumatra. S. lat. 2° 50′. E. long. 100°.

BERGHEIM, a town of Germany, in the circle of the Upper Rhine, and county of Waldeck, and by the new French diſtribution, the chief place of a canton, in the department of Roer, containing 469 inhabitants, and the population of the canton is eſtimated at 10,365; 4 miles S. E. of Waldeck.

BERGHEM, in *Biography*. See BERCHEM.

BERGHIRI, in *Geography*, a town of Aſia, in the province of Kurdiſtan, 70 miles S. E. of Betlis.

BERGHMOT, or BERGMOTE, vulgarly barmote, formed from the Saxon *berg*, *mons*; and *mote*, *conventus*, *aſſembly*, or *meeting*. See BARGHMOTE.

BERGLAX, in *Ichthyology*, one of the ſynonymous names of *corpyhæna rupeſtris*. Ström. Söndm.

BERGIA, ſo called from P. J. Bergius, M.D. profeſſor of natural hiſtory at Stockholm, in *Botany*. Lin. gen. Reich. p. 631. Schreb. 791. Juſſ. 301. Claſs and Order, *decandria pentagynia*. Nat. Ord. *Succulentæ. Caryophylleæ*, Juſſ. Gen. Char. *Cal.* perianth, five-parted, ſpreading; leaflets lanceolate, permanent. *Cor.* petals five, oblong, ſpreading, the length of the calyx. *Stam.* filaments ten, briſtle-ſhaped, of middling length; anthers roundiſh. *Piſt.* germ roundiſh, ſuperior; ſtyles five, very ſhort, approximating; ſtigmas ſimple, permanent. *Per.* capſule ſimple, ſubglobular, mucronate, with five little ſwellings, five-celled, five-valved; valves ovate, flat, opening along the furrows, permanent, ſpreading very widely. *Seeds* numerous, minute.

Eſſ. Char. *Cal.* five-parted; *Pet.* five; *Capſ.* one, globular, with ſwellings, five-celled, five-valved; valves reſembling petals; *Seeds* very many.

Species, 1. B. *capenſis*. Lin. Syſt. 431. Reich. 2. 386. Suppl. 243. Mant. 241. Pola-tsjira, Rheed. Mal. 9. 153. t. 78. "Leaves lanceolate, or elliptic, flowers in whorls." This has the ſtature of Ammonia. A native of Tranquebar, in the Eaſt Indies, and therefore miſnamed *Capenſis*. The valves of the capſule, continuing after it is ripe, form a kind of five-petalled wheel-ſhaped flower. 2. B. *glomerata*. Lin. Syſt. 431. Suppl. 243. "Leaves obovate, crenulate, flowers glomerate." Found at the cape of Good Hope by Bergius. Martyn.

BERGIER, NICHOLAS, in *Biography*, was born at Rheims in 1557, and became profeſſor of the univerſity in his native city, where he was educated for the law, and became fyndic. Under this character he viſited Paris, and there formed an intimate friendſhip with Peireſc, and du Puy, by whom he was induced to execute a work which he had projected on the high roads of the empire. M. de Bellievre took him to his houſe, and procured for him a penſion, with the brevet of hiſtoriographer. He died in 1623. The principal of his works are his "Hiſtoire des grand chemins de l'Empire Romain," firſt printed in 1622, 4to. and reprinted, with notes, at Bruſſels, in 2 vols. 4to. in 1729. This valuable work was tranſlated into Latin by Henninius, and is included in the 10th volume of Grævius's Roman Antiquities. Bergier alſo wrote in French "A ſketch of the Hiſtory and Antiquities of Rheims, with curious remarks concerning the eſtabliſhment of the people, and the foundation of the towns of France," 4to. 1635.

BERGIMUS, in *Ancient Mythology*, a deity peculiar to the inhabitants of Breſcia, in Italy, where he had a temple, and an order of prieſts. Gruter, Muratori, and Spon, have recorded many inſcriptions relating to this deity. It is thought, that he was the god of the mountains, becauſe *berg*, in Celtic, ſignifies a mountain.

BERGMANN, Torbern, in *Biography*, profeſſor of chemiſtry at Upſal, was born at Catherineberg, in Weſt Gothland, March 20th 1735; and after having finiſhed the firſt courſe of his education, entered at the univerſity of Upſal. His application, particularly to the ſtudy of mathematics and natural philoſophy, was ſo intenſe, that his health was endangered; and as theſe ſciences afford no peculiar proſpect of emolument, a relation, who had the charge of him, diſcouraged his proſecution of them, and rendered it neceſſary for him to conceal the books which aſſiſted him in his favourite ſtudies. At the cloſe of a year his health was ſo much impaired, that the reſtoration of it required an intermiſſion of his application, and a courſe of exerciſe, which obliged him to return to his family. His hours of relaxation were, however, occupied in the ſtudy of botany and entomology, and his diſcoveries in the laſt of theſe ſciences were communicated to Linnæus. As ſoon as his health was re-eſtabliſhed, he returned to the univerſity, with ample permiſſion to purſue thoſe ſtudies which were moſt agreeable to his inclination. Beſides mathematics and natural philoſophy, he directed his attention to natural hiſtory, under the patronage of Linnæus; and began with a memoir on the nature of the ſubſtance found in certain waters, and called coccus aquaticus, which he found to be the egg of a leech, including 10 or 12 young. This was followed by other memoirs on the hiſtory of inſects which attack fruit-trees, and the means of preventing their ravages; and he propoſed a method of claſſing theſe inſects from the form of the larva, in which ſtate the deſtruction of noxious inſects is moſt eſſential. About this time, the famous Swediſh naturaliſt teſtified his eſteem of Bergmann's character and talents, by giving his name to a new ſpecies of inſects. In 1761, Bergmann was appointed profeſſor of mathematics and natural philoſophy in the univerſity of Upſal; and both before and after this time he enriched the volumes of the Swediſh acts with ſeveral papers on philoſophical ſubjects. His paper, containing "A Review of the ſeveral explanations which Natural Philoſophers have given of the Rainbow," was publiſhed in 1759; and in 1760, he publiſhed ſome thoughts "On the origin of thoſe meteors, which are not accompanied by any ſenſible ſound or exploſion," and alſo "On the opinions held by Philoſophers relating to the Twilight," to which is prefixed an account of Mairan's "Anticrepuſculum," or that of the horizon oppoſite to the ſun. In 1761, and in 1762, profeſſor Bergmann wrote on the ſubject of electricity, in conſequence of a correſpondence with Mr. Wilſon; and particularly on the electrical quality of Iceland cryſtal, and double refracting ſpar. His remarks on the tenthredo, or ſaw-fly, ſhewing how to diſtinguiſh between the caterpillars of this inſect and thoſe of the butterfly and moth, and diſcovering the feet in the latter to be never more than 16, and thoſe of the tenthredo always exceeding that number, were publiſhed in 1763; and the ſame year produced the unſatisfactory reſult of ſome electrical experiments, made with ſilk of various colours. In 1764, the profeſſor wrote a paper to aſcertain, from a number of obſervations, the height in the atmoſphere at which the aurora borealis exiſts (ſee Aurora *Borealis*); and in 1765 and 1766, he wrote again on electrical ſubjects; and principally on the property and laws of electricity in the tourmalin, which had been referred to his examination by the Royal Academy of Sciences at Stockholm. At this time it does not appear that the ſubject of chemiſtry had employed much of Mr. Bergmann's attention; however, in 1767, on the reſignation of Walerius, he was choſen to ſucceed him as profeſſor of chemiſtry and metallurgy. This appointment was much oppoſed by the party of the former profeſſor, united with others who envied Bergmann's riſing merit; and their oppoſition was ſupported by ſome ſevere criticiſms on two papers, which the profeſſor publiſhed at this time, relating to the depuration of alum; in which he recommends the uſe of argillaceous earth, and propoſes tobacco-pipe clay, inſtead of alkali, to free it from the vitriol. But the prince royal of Sweden, who afterwards ſucceeded to the throne, and who was then chancellor of the univerſity of Upſal, determined the diſpute, and fixed him in the profeſſor's chair. With enlarged views of the practical importance and utility of chemiſtry, of what had already been performed in this department of ſcience by preceding authors, and of what yet remained to be done, Bergmann proſecuted his chemical reſearches, and by a combination of experimental analyſis with mathematical reaſoning, he extended and improved this ſcience by a variety of valuable diſcoveries and obſervations. In order to purſue his experiments and enquiries with the greater facility, and to communicate the reſult with advantage to his pupils, he formed, near his laboratory, a cabinet, in which all the mineral ſubſtances were ranged in order, together with the products of thoſe experiments which had aſcertained their compoſition. Another collection exhibited all the minerals of Sweden, arranged according to the places where they are found. In a third, were exhibited models of the various machines and apparatus by means of which theſe ſubſtances were converted into uſeful articles, which articles were placed near the materials from which they were formed. From this ſyſtematical arrangement Bergmann derived peculiar advantage in his profeſſion as a teacher. While he excelled as a profeſſor of chemiſtry and mineralogy, and devoted much of his time to this occupation, he was actively and inceſſantly employed in making diſcoverics which have placed him in the firſt rank of philoſophical chemiſts. He examined the carbonic acid, diſcovered by Black, and denominated fixed air, in its ſeveral properties and habitudes. Nickel, manganeſe, the magneſian earth, and barytes, which were newly diſcovered ſubſtances, were particularly inveſtigated by Bergmann, and afforded materials for regular and perſpicuous treatiſes. The acid obtained from ſugar, and many other vegetables, by the abſtraction of the nitric acid, and thoſe acids which are obtained from arſenic, molybdena, fluor ſpar, and tungſten, were diſcovered either by himſelf or ſome of his diſciples; and to him we are indebted for leading the way in the inveſtigation of their properties, and for aſcertaining many intereſting phenomena attending their combinations. From him we learn, that iron contains a number of foreign admixtures, chiefly of a metallic nature, and that the three ſtates of crude iron, and malleable iron, and ſteel, principally depend upon the greater or leſs abundance of carbon. In his analyſis of waters, he added, to the re-agents before uſed, other ſubſtances more effectual, and whilſt he evinced the imperfection of this method, he rendered it much more accurate. He alſo aſcertained the quantities of products, without ſeparating them from all their combinations; and in this way he infers the quantity of metal from the weight of precipitate it affords, by the addition of an alkali, or ſome other known ſubſtance, from tables founded on former experiments. He likewiſe analyſed the precious ſtones, known by the name of gems, and deviſed peculiar methods for ſeparating them into the known earths in determinable proportions. Profeſſor Bergmann evinced the neceſſity and utility of performing decimaſtic operations in the humid way, or by an analyſis, in which liquid ſolvents are uſed; and he alſo exhibited the advantages of the proceſs by fire, applied to materials in minute portions, by means of the blow-pipe, either upon a piece of charcoal, or in a ſpoon of pure ſilver. This mode of examining mineral ſubſtances, united with that of the habitudes which they exhibit, with a few ſimple re-agents, facilitated the claſſification of them, according to their chemical properties; a method adopted by this ingenious chemiſt, without

out the exclufion or difparagement of that method of inveſtigation which regards the external character. This appears from his ſhort eſſay on the forms of cryſtals. The ſubject of elective attractions engaged the particular attention of profeſſor Bergmann; and he engaged in the laborious undertaking of improving and extending the tables of Geoffroy, for which he perceived that, according to his views, no leſs than 30,000 experiments would be neceſſary. He therefore, under an apprehenſion that his life would not allow the completion of his plan, contented himſelf with publiſhing, what appeared to him to be an imperfect work, though it was otherwiſe regarded by the ſcientific world. His table of ſimple affinities is the firſt that exhibits the laws of affinities as they are obſerved in the dry way; and in his ſcheme it is ſeen at once whether the operation takes place in the humid or dry way; what are the ſubſtances preſented to each other; their component parts and proportions; the numerical expreſſions of their attractions; what new compounds take place; and whether they fall down, or ſublime, or remain in ſolution, and which of them are thus reſpectively affected. (See AFFINITY.) In this work, as well as in his work on metallic precipitates, Bergmann, not appriſed of thoſe effects of oxygen, which have been developed in later times, conſiders the exiſtence of phlogiſton, or a common principle of inflammability, as an acknowledged truth. He alſo admits of the matter of heat as a ſelf-exiſtent independent principle, and ſeems not to have apprehended that it may be a diſtinct modification. Accordingly, theſe two principles enter into many of his explanations of facts; but in all thoſe explanations, the matter is arranged with ſuch order and perſpicuity, that it is extremely eaſy to ſubſtitute the abſorption of oxygen inſtead of the extrication of phlogiſton, and the contrary effect wherever the latter imaginary principle, as it is now thought to be, is abſorbed. The life of profeſſor Bergmann, like that of other ſtudious and ſcientific men, admits of little variety. Attentive to the duties of his profeſſion, he reſided conſtantly at Upſal, and had the honour to be elected rector of the univerſity, which in his time was divided into two parties, of theologians and civilians on one ſide, and of natural philoſophers on the other, between whom Bergmann maintained peace and equality. The king of Pruſſia wiſhed to engage the profeſſor of Upſal to become a member of his academy, and to remove to Berlin; but attached to his office, though exhauſted by it, and in a declining ſtate of health, which might have been relieved by a warmer climate, and under obligations of gratitude to Guſtavus, king of Sweden, who had been his benefactor, and who had honoured him with the order of Vaſa, he declined the propoſal, and remained at Upſal. The diſciples of his ſchool, of whom the celebrated Scheele ſuſtained a very diſtinguiſhed rank and character, reflected honour on their maſter, who never failed to encourage their reſearches, and to mention their diſcoveries in terms of approbation and reſpect. How much ſir Torbern Bergmann was eſteemed whilſt he lived, in every part of Europe, it is needleſs to ſay; and of his works it is ſufficient to obſerve, that, notwithſtanding the rapid improvements which have taken place ſince his time in chemical ſcience, they will long remain repoſitories of facts and reaſoning, to which every philoſopher muſt recur. When it is conſidered that he began this purſuit rather at a late period of life, and that he made his various diſcoveries in the courſe of 17 years, and that he died before he attained his 50th year, his death will be regretted as a premature event, by which ſociety ſuſtained a very conſiderable loſs. He died on the 8th of July 1784, at the baths of Medwi in Sweden. His works were very numerous; the principal of them are as follows: viz. "Opuſcula phyſica et chemica, pleraque ſeorſim antea edita jam ab auctore collecta, reviſa et aucta;" publiſhed in Latin in 3 vols. 8vo, in 1779, 1780, 1783, and tranſlated by Dr. Cullen of Dublin, in 2 vols. 8vo. with illuſtrations and notes by the tranſlator. "Meditationes de ſyſtemate foſſilium naturali;" printed in the 4th volume of the Tranſactions at Upſal for 1784, and tranſlated into Engliſh in 1788, in 8vo.; "Phyſick Beſkrifnung oefoer Jordklotet," or phyſical deſcription of the earth, in 2 vols. in which he has given lucubrations on the ſtructure and form of the earth; "Eſſay on the uſefulneſs of Chemiſtry," publiſhed in Swediſh in 1779, and tranſlated into Engliſh in 1783, 8vo.; two academical diſſertations on the origin and progreſs of chemiſtry, intitled "De Primordiis Chemiæ," in 1777, and "Chemiæ Progreſſus a medio Sæc. vii. ad medium Sæc. xvii." in 1782; and "Sciagraphia Mineralis," or outlines of Mineralogy, firſt printed in 1782, at Leipſic and Deſſau, and tranſlated into French by M. Mengez, and into Engliſh by Dr. Withering in 1783, 8vo. Eloge of Bergmann, inſerted in the Acts of the Academy of Sciences at Paris for 1784. Coxe's Travels in Sweden, &c. vol. iv. p. 228, &c. Gen. Biog.

BERGMANNIA, in *Entomology*, a ſpecies of PHALÆNA (*Tortrix*), with pale yellow wings, ſpotted with bright yellow; faſciæ whitiſh, and the third bifid; found in the gardens of Germany and northerly parts of Europe.

BERGOO, in *Geography*, a diſtrict of Abyſſinia, ſituate north of Darfur, and ſouth of Bornou, between 15° and 19° of N. lat. and between about 24° and 27° 31′, E. long. Its capital is Wara, in N. lat. 15° 30′. E. long. 25° 30′. Bergoo is ſaid to be 15 days or (allowing 12½ geographical miles per day), 187½ geographical miles in extent, from E. to W. and from N. to S. 20 days, or 250 miles. Within about a day's journey of Wara, are ſaid to be eight large mountains, the inhabitants of each of which uſe a diſtinct language. They are Mahometans, zealouſly attached to the faith; and read the Koran daily. They are ſaid to be brave, and furniſh the armies of the ſultan of Bergoo with recruits as often as they are required. They make war by ſudden incurſions, traverſing and laying waſte a large ſpace in a ſhort time. On theſe occaſions they leave their women behind, and are therefore better adapted to military operations than the people of Darfur, who never march without a hoſt of female attendants. The people of Bergoo ſeldom make "ſelatea," i. e. an expedition to procure ſlaves by force. Some of the idolatrous nations, dependent upon Bergoo, are repreſented as conducting their wars in a very formidable manner. The combatants never retreat; and the women behind light a fire, in which they heat the heads of the ſpears, and exchange them for ſuch as are cooled in the combat. They alſo uſe poiſoned weapons. Mr. Browne informs us, that in a remote part of the pagan country, from which ſlaves are brought, the inhabitants eat the fleſh of priſoners taken in war. They are alſo habituated to ſtrip off the ſkin of the hands and faces of their ſlaughtered foes, which, after undergoing ſome preparation, is worn as an emblem of triumph. Their arms, which are a ſpear and a javelin, are formed of iron, wrought by themſelves. Theſe they make red hot, and ſtick the point in a tree, where they leave them till the juice is dried; and in this manner, according to report, they acquire a moſt deadly poiſon. Browne's Travels in Africa, p. 310. 468.

BERGSNYLTRA, in *Ichthyology*, the name under which Linnæus mentions *Labrus ſuillus* of Fn. Suec. in It. Wgoth. 179.

BERGSPERLING, in *Ornithology*, the name of *Fringilla montana* in Friſch. birds.

BERGSTADT, in *Geography*, a town of Moravia, in the circle of Olmutz, 18 miles north of Olmutz.

BERGSTRASS, a long tract or tongue of land, on the ſide of the Rhine, between Heidelberg and Darmſtadt. It contains

contains a few ſmall places, as Benſheim, Oppenheim, and Weinheim. It has in it a highway, commanding proſpects of wide extent. The beſt part of this continued chain of hills, is from Heidelberg to Benſheim, where it is about 8 leagues long and 4 broad. On the right hand it is covered with woods near the top, and nearer the plain with vineyards. The level road is planted with rows of walnut trees, and on each ſide are fields and meadows that are very fertile. The walnut trees of Bergſtraſs and the Odemwald, yield a conderable profit to the country by the wood and the fruit; and the wine produced there is an inexhauſtible ſource of ſupply to the inhabitants. In one year they have exported 40,000 rough made walnut tree muſket ſtocks, from theſe parts to Saxony. From the nuts they make an excellent oil, which ſerves the common people inſtead of butter, and the inferior ſort is uſed for lamps. The almond trade, of which great quantities grow along the Bergſtraſs, is very conſiderable. The warmth of the climate, and goodneſs of the ſoil in the Bergſtraſs, are ſuch, that after rye-harveſt the land may be ſown a ſecond time with ſpelt, buck-wheat, or oats, which are always reaped the ſame year.

BERGUES, or Berg, or Bergues *St. Vinox*, a town of France, and principal place of a diſtrict, in the department of the North; ſo called from St. Vinox, a Flemiſh lord, who lived here. It is ſeated on the river Colme, at the union of ſeveral canals, which paſs to Dunkirk, Gravelines, St. Omer, Furnes, &c., and contains two pariſhes. Berg was the laſt town of Weſt Flanders which held out for the Dutch in the 16th century. It was taken by the French in 1658, and confirmed to them by the peace of the Pyrenées, in the following year. Since that time it has been fortified by new works, and the country round it may be laid under water by means of ſluices; 1½ league ſouth of Dunkirk. It contains 5085 inhabitants, and in the canton are 14,026. The territorial extent comprehends 130 kilometres, and 13 communes. N. lat. 50° 57′. E. long. 2° 35′.

BERGUN, a ſmall town of Swiſſerland, in the country of the Griſons, near a river which flows from a lake of the ſame name, and diſcharges itſelf into the Albula. It lies between the Albula and the Inn, about 6 miles from the latter, and 12 miles from the former. N. lat. 46° 31′. E. long. 3° 55′.

BERGWERBEN, a town of Germany, in the circle of Upper Saxony, 2 miles north of Weiſſenfels.

BERGWERK, a town of Hungary, 13 miles weſt of Steinam.

BERG-ZABERN, a town of Germany, in the circle of the Upper Rhine, and duchy of Deux Ponts, ſeated on the Erlbach, 30 miles ſouth-eaſt of Deux Ponts. By the new arrangement of the French, it is the chief place of a canton in the department of the Lower Rhine, containing 1947 inhabitants. The canton has 9,005; its extent is 150 kilometres, and the number of communes is 15. N. lat. 49° 7′. E. long. 7° 54′.

BERIA, Berie, Berry, in *Middle Age Writers*, denotes a large open field; and the cities and towns of England, which end with that word, are built in plain and open places, and do not derive their names from boroughs, as ſir Henry Spelman imagines. That the word "berie," which has been confounded with "bury," and "borough," is a flat wide campaign, is proved from ſufficient authorities, by the learned Du Freſne, who obſerves, that "Beria Sti. Edmundi," mentioned by Matt. Paris, ſub ann. 1174, is not to be taken for the town, but for the adjoining plain. Beſides, many flat wide meads, and other open grounds, are called by the names of "beries," and "berry-fields;" thus the ſpacious meadow between Oxford and Iſley was in the reign of king Athelſtan called "Bery;" and the largeſt paſture ground in Quarendon in the county of Buckingham is known by the name of "Beryfield." And though theſe meads have been interpreted demeſne, or manor meadows, yet they were in reality any flat or open meadows, that lay adjoining to any vill or farm. (Cowel.) Hence alſo "berras aſſartare" ſignifies to dry or plough up heaths and downs; and hence our warrens are called "coney-berries."

BERIBERIA, or Beriberi, in *Medicine*, a barbarous name, employed to denote a ſpecies of palſy, frequent in the Eaſt Indies. It is called by ſome Britiſh authors, who have written on the diſeaſes of hot climates, *the barbiers*. According to Bontius, it comes on with great wearineſs, trembling, numbneſs, and peculiar tingling ſenſation of the limbs, ſo that the patient is rendered incapable of walking, or otherwiſe uſing them. The upper as well as lower limbs are often affected. Sometimes it is accompanied with a faultering of ſpeech. Its attack is generally ſudden. Thoſe whom it afflicts are chiefly the lower claſs of people, who imprudently get chilled after being heated, by drinking cold water; but more eſpecially by ſleeping in the night air, after great fatigue or intoxication. The remedies againſt this obſtinate complaint are ſtrong frictions, aromatic fomentations, warm-bathing, and ſudorific decoctions. According to Bontius, the moſt efficacious topical application is a ſpecies of naphtha, or petroleum, from Sumatra, uſed as a liniment. The natives of India (ſays Dr. Lind) have a method of putting the patient into a hole dug into the ground, and covering him with ſand up to his neck; this is done in the middle of the day, and he remains there as long as he can bear the heat of the ſand, which is conſiderable. Camphire, and a decoction of Guaic wood, have ſometimes produced a good effect; alſo the expreſſed bitter oil of the mergooſe, an Indian plant. But notwithſtanding the uſe of the moſt powerful nervous medicines, the patient generally continues paralytic for ſome months, unleſs he is removed into another air.

On the Malabar coaſt (continues the laſt mentioned author) this diſeaſe is moſt violent and frequent, and attacks both natives and ſtrangers, eſpecially in the months of December, January, February, and March. During theſe months, the land winds blow every morning about ſun-riſe, from the neighbouring mountains, with remarkable coolneſs; and ſuch as, being tempted by the ſerenity of the ſeaſon, ſleep expoſed to theſe winds, are often ſuddenly ſeized with a very painful ſenſation in the perioſteum of the arms and legs. In perſons of a good conſtitution, this pain abates as the day advances, and as the air becomes warmer; but in others it continues for a conſiderable time, attended with a weakneſs of the knees, and uneaſy ſenſations in the calves of the legs and ſoles of the feet, eſpecially on any attempt to walk. This is ſcarcely ever cured by medicine, till after the ſhifting of the monſoon, unleſs the patients can be moved to the coaſt of Coromandel, or to any place to the eaſtward of the Balagat mountains, where, by the change of air, they quickly recover. See Bontius de Med. Indorum; and Lind on Diſeaſes incidental to Europeans in Hot Climates.

BERICARIA. See Bercaria.

BERIEZEN, in *Geography*. See Beresina.

BERIGAN, a town of Africa, in the kingdom of Algiers, and capital of the country of Beni-Mezzab. N. lat. 32° 15′. E. long. 2° 59′.

BERINBAL, a town of Egypt, on the weſt branch of the Nile, 7 miles S.E. of Roſetta.

BERING, in *Biography* and *Geography*. See Beering.

BERINGEN, in *Geography*, a town of Germany, in the circle of Weſtphalia, and biſhopric of Liege, 18 miles N.W. of Maeſtricht.

BERINGOU. See Beering's *Iſland*.

BERINSCHUL, a rocky iſland in the Mediterranean, near the coaſt of Algiers.

BERISA, a town of Africa, in Kaſſina, weſt of the town of Kaſſina, ſeated on the river Neel Abeed, or Guin. N. lat. 16° 45'. E. long. 9° 10'.

BERITH, a ſimple mentioned in Scripture, uſed for cleanſing or taking out ſpots. Jerem. chap. ii. ver. 22. Some will have it to be the *kali*, or ſalt-wort, from the aſhes of which ſoap is made; and in our verſion it is rendered *ſoap*; others, after Rudbeck, make it to be the dye of the purple fiſh.

BERKA, in *Geography*, a town of Germany, in the circle of Upper Saxony, and principality of Weimar, on the Ilm; 6 miles S.S.W. of Weimar.—Alſo, a town of Germany, in the ſame circle, and principality of Eiſenbach, on the Werra, 9 miles W. of Eiſenbach.

BERKA, or Berku. See Barracoo.

BERKASZESTI, a town of European Turkey, in the province of Moldavia, on the Berbecz, 56 miles N.W. of Galatz.

BERKELEY, Dr. George, in *Biography*, the learned and ingenious biſhop of Cloyne in Ireland, was born March 12, 1684, at Kilcrin, near Thomaſtown, in the county of Kilkenny; and having received his preparatory education at Kilkenny ſchool, under Dr. Hinton, was admitted at the age of fifteen, a penſioner of Trinity college, Dublin, of which he became a fellow, June 9, 1707. In this year he publiſhed his firſt literary eſſay, written before he was 20 years of age, entitled "Arithmetica abſque Algebra aut Euclide demonſtrata," and evincing his talents for thoſe ſubtile metaphyſical ſtudies, by which he was afterwards ſo eminently diſtinguiſhed. In 1709 was publiſhed his "Theory of Viſion," being the firſt attempt that was ever made to diſtinguiſh the immediate and natural objects of our ſenſes from the concluſions which we have been accuſtomed from infancy to draw from them, and to trace the boundary that divides them. For this purpoſe he ſhews, that although habit hath connected the ideas of ſight and touch, ſo that they are called by the ſame names, they have originally no ſuch connection; inſomuch that a perſon born blind, and ſuddenly made to ſee, would, at firſt, be unable to tell how any object that affected his ſight would affect his touch, and from ſight could not derive any ideas of diſtance or external ſpace, but would imagine that all the objects he ſaw were in his eye, or rather in his mind. In proof of this aſſertion, the caſe of a young man born blind, and couched at the age of 14, by Mr. Cheſelden, mentioned at the cloſe of his anatomy, has been adduced. This work was ſucceeded in the following year by the "Principles of Human Knowledge," in which Berkeley controverted Mr. Locke's account of abſtract ideas and general names, and attempted to prove, that the commonly received notion of the exiſtence of matter is falſe, and inconſiſtent with itſelf; that thoſe things which are called ſenſible material objects are not external, but exiſt in the mind, and are merely impreſſions made upon our minds by the immediate act of God, according to certain rules, termed laws of nature, from which, in the ordinary courſe of his government, he never deviates; and that the ſteady adherence of the Supreme Spirit to theſe rules is what conſtitutes the reality of things to his creatures, and ſo effectually diſtinguiſhes the ideas perceived by ſenſe from ſuch as are the work of the mind itſelf, or of dreams, that there is no more danger of confounding them together on this hypotheſis than on the common ſuppoſition of matter. See Abstraction, Body, Existence, and Matter.

In the year 1712, Berkeley's attention was directed, by the peruſal of Locke's "two Treatiſes of Government," to the doctrine of paſſive obedience; in ſupport of which he printed the ſubſtance of three common-places or ſermons, delivered in the college chapel. In conſequence of this publication, he was repreſented as a Jacobite, and prevented from obtaining ſome preferment in the church of Ireland, to which he had been recommended; but the unfavourable impreſſion that had been thus made on the mind of the prince of Wales, afterwards George II., was removed by Mr. Molyneux, who took occaſion of introducing Berkeley to queen Caroline. In 1712, he publiſhed, in London, a farther defence of his ſyſtem of immaterialiſm, in "Three Dialogues between Hylas and Philonous." Such was the reputation which he had now acquired by his writings, for acuteneſs of parts, and a beautiful imagination, that his company was courted even by thoſe who did not embrace his opinions; and he was introduced to the acquaintance of perſons of rank and learning, by two gentlemen of oppoſite principles, Sir Richard Steele, and Dr. Swift. For the former, he wrote ſeveral papers in the "Guardian," and at his houſe formed an intimacy with Mr. Pope, which laſted during his whole life. Dean Swift alſo introduced him to Lord Berkeley of Stratton, and to other valuable acquaintance; and procured for him the appointment of chaplain and ſecretary to the earl of Peterborough, who being appointed ambaſſador to the king of Sicily, and to the other Italian ſtates, took Berkeley with him, in November 1713. On his return to England, in 1714, he found that his hopes of preferment had expired with the fall of queen Anne's miniſtry; and he therefore accepted the offer of accompanying the ſon of Dr. Aſhe, biſhop of Clogher, in a tour through Europe. At Paris he viſited the illuſtrious father Malebranche, whom he found in his cell, cooking, in a ſmall pipkin, a medicine for an inflammation of the lungs, with which he was afflicted; and as they engaged in a converſation on Berkeley's ſyſtem, Malebranche, in the heat of diſputation, raiſed his voice ſo high, and indulged the natural impetuoſity of his temper to ſuch a degree, that he brought on an increaſe of his diſorder, which carried him off a few days after, viz. October 13, 1715. During four years' abſence from England, Mr. Berkeley not only proſecuted, what is uſually called by travellers, the grand tour, but he viſited Apulia, Calabria, and Sicily. The materials he collected, with a view to the natural hiſtory of the latter country, were unfortunately loſt in his paſſage to Naples; and this circumſtance is the more to be regretted, as he has given to the world ſatisfactory ſpecimens of his talent for lively deſcription, in his letters to Mr. Pope and Dr. Arbuthnot. At Lyons, in his way home, he drew up a curious tract, "De Motu," which he ſent to the royal academy of ſciences at Paris, and which he committed to the preſs ſoon after his arrival in London, in 1721. The diſaſtrous South Sea ſcheme of 1720, engaged his attention at this time, and he wrote "an Eſſay towards preventing the ruin of Great Britain," which was printed at London, in 1721. By his travels, his natural politeneſs, and his talents for converſation were ſo much improved, that he found eaſy acceſs to the beſt company; and he was introduced by Mr. Pope to lord Burlington, who conceived for him a very high eſteem on account of his diſtinguiſhed taſte and ſkill in architecture, which had been the object of his particular ſtudy in Italy. By this nobleman he was recommended to the duke of Grafton, lord lieutenant of Ireland, and accompanied him thither in 1721. Having been elected ſenior fellow of his college, in 1717, he now took the degrees of bachelor and doctor in divinity. By the death of Mrs. Vanhomrigh, the celebrated "Vaneſſa," to whom he was introduced by Dean Swift, in 1713, and who altered her purpoſe of making the dean her heir, in conſequence of diſcovering his connection with "Stella," Dr. Berkeley became poſſeſſed of half her property, amounting to about 4000l. and in the diſcharge of his office, as one of her executors, committed

committed to the flames ſeveral letters that had paſſed in correſpondence between her and the dean, not, as he declares, becauſe there was any thing criminal in them, but becauſe he obſerved a warmth in the lady's ſtyle, which delicacy required him to conceal from the public.

On the 18th of May 1724, Dr. Berkeley reſigned his fellowſhip, and was promoted by his patron to the deanery of Derry, worth 1100l. *per annum*. Having for ſome time conceived the benevolent project of converting the ſavage Americans to Chriſtianity, by means of a college to be erected in the Summer iſlands, otherwiſe called the iſles of Bermuda, he publiſhed a propoſal for this purpoſe at London, in 1725, and offered to reſign his own opulent preferment, and to dedicate the remainder of his life to the inſtruction of youth in America, on the moderate ſubſiſtence of 100l. a year. Such was the influence of his diſtinguiſhed example, that three junior fellows of Trinity college, Dublin, concurred with him in his deſign, and propoſed to exchange, for a ſettlement in the Atlantic ocean, at 40l. *per annum*, all their flattering proſpects in their own country. The propoſal was enforced on the attention of the miniſtry, not merely by conſiderations of national honour and a regard to the cauſe of Chriſtianity, but by the immediate advantage likely to accrue from it to the government. Having, by diligent reſearch, eſtimated the value of the lands in the iſland of St. Chriſtopher's, ceded to Great Britain by France at the treaty of Utrecht, he propoſed to diſpoſe of them for the public uſe, and thus to raiſe a ſum of money, part of which was to be applied to the eſtabliſhment of his college. The ſcheme was communicated by the intervention of the abbé Gualtieri, or Altieri, to king George I. and by the royal command introduced into the houſe of commons by Sir Robert Walpole. A charter was granted by his majeſty for erecting a college, by the name of St. Paul's college in Bermuda, which was to conſiſt of a preſident and nine fellows, who were obliged to maintain and educate Indian children at the rate of 10l. *per annum* for each. The firſt preſident, Dr. George Berkeley, and the firſt three fellows named in the charter, thoſe junior fellows of Dublin college abovementioned, were licenſed to hold their preferments in theſe kingdoms till the expiration of one year and a half after their arrival at Bermuda. The commons, in 1726, voted an addreſs to his majeſty, praying a grant of ſuch a ſum to effect the above purpoſe out of the lands of St. Chriſtopher's, already mentioned, as his majeſty might think proper. The ſum of 10,000l. was furniſhed by the miniſter, and ſeveral private ſubſcriptions were immediately raiſed for promoting ſo pious an undertaking. The dean, having, in 1728, married the eldeſt daughter of the right honourable John Forſter, eſq. ſpeaker of the Iriſh houſe of commons, prepared to ſet ſail for Rhode iſland, in the execution of his ſcheme, and took with him a pretty large ſum of money of his own property, and a collection of books for the uſe of his intended library. Upon his arrival at Newport in Rhode iſland, he contracted for the purchaſe of lands on the adjoining continent, and fully expected that the purchaſe money would, according to grant, be immediately paid. His expectations, however, were diſappointed; and after various excuſes he was at length informed by biſhop Gibſon, at that time biſhop of London, in whoſe dioceſe the whole Weſt Indies is included, that on application to Sir Robert Walpole, he received the following honeſt anſwer: "If you put this queſtion to me," ſays Sir Robert, "as a miniſter, I muſt, and can aſſure you, that the money ſhall, moſt undoubtedly, be paid as ſoon as ſuits with public convenience; but if you aſk me as a friend, whether dean Berkeley ſhould continue in America, expecting the payment of 10,000l. I adviſe him, by all means, to return home to Europe, and to give up his preſent expectations." Accordingly, the dean, after having expended a great part of his private fortune, and more than ſeven years of his life in the proſecution of a laudable ſcheme, returned to Europe. Before he left Rhode-iſland, he diſtributed the books he had brought with him among the clergy of that province, and upon his arrival in London, immediately returned all the private ſubſcriptions that had been advanced for the ſupport of his undertaking. In 1732, he publiſhed the "Minute Philoſopher," a work conſiſting of a ſeries of dialogues, on the model of Plato, in which he purſues the free-thinker through the various characters of atheiſt, libertine, enthuſiaſt, ſcorner, critic, metaphyſician, fataliſt, and ſceptic, and employs ſeveral new arguments from his own ſyſtem. Of the company, which at this time attended the philoſophical converſations that were carried on in the preſence of queen Caroline, according to a practice which had commenced when ſhe was princeſs of Wales, ſome of the principal perſons were doctors Clarke, Hoadly, Berkeley, and Sherlock. The debates that occurred were chiefly conducted by Clarke and Berkeley; and Hoadly adhered to the former, as Sherlock did to the latter. Hoadly affected to conſider the philoſophy of Berkeley, and his Bermuda project, as the reveries of a viſionary. Sherlock, on the other hand, eſpouſed his cauſe; and on the publication of the "Minute Philoſopher," preſented a copy of it to the queen, and left it to her majeſty to determine, whether ſuch a work could have been the production of a diſordered underſtanding. The queen honoured Berkeley with admitting him to frequent viſits, and took pleaſure in his converſation on ſubjects relating to America; and upon a vacancy in the rich deanery of Down in Ireland, procured it for him. But as lord Burlington had neglected to give proper notice of the royal intention to the duke of Dorſet, then lord-lieutenant of Ireland, and to obtain his concurrence, the duke was offended, and the appointment was not urged any farther. Upon this, her majeſty declared, that ſince they would not ſuffer Dr. Berkeley to be a "dean," in Ireland, he ſhould be a "biſhop;" and accordingly, upon a vacancy in the ſee of Cloyne, in 1733, he was promoted by letters patent to that biſhopric. In conſequence of this appointment, he reſided continually at Cloyne, and devoted his time and attention to the faithful diſcharge of all epiſcopal duties. He revived in his dioceſe the uſeful office of rural dean, viſited often parochially, and confirmed in ſeveral parts of his ſee. In the proſecution of his ſtudies, however, his diligence was unabated; and about this time he engaged in a controverſy with the mathematicians of Great Britain and Ireland, on the ſubject of Fluxions. He was led to it by the following occurrences: Mr. Addiſon having viſited Dr. Garth in his laſt illneſs, addreſſed him ſeriouſly on the neceſſity of preparing for his approaching diſſolution; but the doctor replied, "Surely, Addiſon, I have good reaſon not to believe thoſe trifles, ſince my friend Dr. Halley, who has dealt ſo much in demonſtration, has aſſured me, that the doctrines of Chriſtianity are incomprehenſible, and the religion itſelf an impoſture." This converſation being reported by Addiſon to the biſhop, he took up arms againſt this redoubtable dealer in demonſtration, and addreſſed to him "the Analyſt," with a view of ſhewing, that myſteries in faith were unjuſtly objected to by mathematicians, who admitted much greater myſteries, and even falſehoods in ſcience, of which he endeavoured to prove that the doctrine of fluxions furniſhed an eminent example. See FLUXIONS. In the courſe of the controverſy on this ſubject, the biſhop, in 1735, publiſhed a reply to Philalethes, ſuppoſed to be by Dr. Jurin, entitled "A Defence of Free-thinking in Mathematics." From this controverſy, he diverted his thoughts to

ſubjects of more apparent utility; and printed, in 1735, his "Queries," for the good of Ireland; in 1736, his "Diſcourſe addreſſed to Magiſtrates;" and in 1750, his "Maxims concerning Patriotiſm;" all of which evince his knowledge of mankind, and his zeal for the ſervice of true religion, and of his country. In 1745, during the Scots' rebellion, he addreſſed a "Letter to the Roman Catholics" of his dioceſe; and in 1749, another to the clergy of that perſuaſion in Ireland, under the title of "a Word to the Wiſe," which was ſo well received by them, that they returned him their public thanks, with expreſſions of marked eſteem and reſpect, which deſcribe him as "the good man, the polite gentleman, and the true patriot." That he diſcovered this character in a very eminent degree, was very generally acknowledged; and particularly by lord Cheſterfield, who as ſoon as he was advanced to the government of Ireland, in 1745, offered him the ſee of Clogher, then vacant, and the value of which was double that of Cloyne. This offer the biſhop, moderate in his views, diſintereſted in his ſupport of government, and particularly attached to his cuſtomary place of reſidence at Cloyne, and to the connections and duties attending it, reſpectfully declined. Towards the cloſe of his life he laboured under a nervous colic, the effect of his ſedentary courſe of living, in which he found conſiderable relief from the uſe of tar-water; and he therefore communicated his thoughts on this celebrated medicine to the public in a treatiſe, entitled "Siris, a Chain of Philoſophical Reflections and Enquiries concerning the Virtues of Tar-water," printed a ſecond time in 1747, and followed in 1752, by "Farther Thoughts on Tar-water," which was his laſt performance.

In 1752, he removed, with his lady and family, to Oxford, for the purpoſe of ſuperintending the education of one of his ſons, who was admitted a ſtudent at Chriſtchurch college, in that univerſity: but ſenſible in a high degree of the impropriety of non-reſidence, he endeavoured firſt to procure an exchange of his high preferment for ſome canonry or headſhip at Oxford; and failing of ſucceſs, he afterwards, by a letter to the ſecretary of ſtate, requeſted permiſſion to reſign his biſhopric, worth at that time not leſs than 1400l. *per annum*. When the petition for this purpoſe was preſented to his majeſty, he declared he ſhould die a biſhop in ſpite of himſelf, and gave him full liberty to reſide wherever he pleaſed. Before he left Cloyne, he ſigned a leaſe of the demeſne lands in that neighbourhood, renewable yearly at the rate of 200l. and directed this ſum to be annually diſtributed, until his return, among poor houſe-keepers of Cloyne, Youghall, and Aghadda. At Oxford, he was highly reſpected by the members of the univerſity; but his reſidence among them was of no long duration. On Sunday evening, January 14th, 1753, whilſt he was ſurrounded by his family, and his lady was reading to him one of Dr. Sherlock's ſermons, he was ſuddenly ſeized with a diſorder, called the palſy of the heart, and inſtantly expired. His remains were interred at Chriſtchurch Oxford, and a marble monument was erected to his memory by his widow, with a Latin inſcription, drawn up by Dr. Markham, head-maſter of Weſtminſter ſchool, and now archbiſhop of York. In this inſcription he is ſaid to have been born in 1679, and his age to be 73; whereas his brother, who furniſhed the particulars of his life, ſtates the year of his birth to have been 1684, and of courſe he died at the age of 69.

The perſon of biſhop Berkeley was handſome, his countenance expreſſive and benign, and his conſtitution robuſt, till it was impaired by his ſedentary life. At Cloyne he conſtantly roſe between three and four in the morning; and often ſpent the greater part of the day in ſtudy; his favourite author, from whom many of his notions were borrowed, was Plato. The enthuſiaſm of his private character, which was ſingularly excellent and amiable, entered into his literary one: and it was manifeſted in his public works, as well as in his life and converſation. Few perſons were ever held, by thoſe who knew his worth, in higher eſtimation than biſhop Berkeley. When biſhop Atterbury was introduced to him, he lifted up his hands in aſtoniſhment, and exclaimed, "So much underſtanding, ſo much knowledge, ſo much innocence, and ſuch humility, I did not think had been the portion of any but Angels, till I ſaw this gentleman." This teſtimony ſerves to remove the air of hyperbole from the well-known line of his friend Mr. Pope:—

"To Berkeley every virtue under heaven."

In matters of ſpeculation, his natural ardour might, poſſibly, have led him to imbibe ſome notions that are more fanciful than juſt. It has been ſaid, that towards the cloſe of his life, he began to doubt the ſolidity of metaphyſical ſpeculations, and that he therefore turned his thoughts to the more beneficial ſtudies of politics and medicine. He has been charged by ſome conſiderable perſons, and particularly by biſhop Hoadly, with corrupting the native ſimplicity of religion, by blending with it the ſubtilty and obſcurity of metaphyſics; and Mr. Hume aſſerts, that his writings form the beſt leſſons of ſcepticiſm which are to be found either among the ancient or modern philoſophers, Bayle not excepted; that "all his arguments," againſt Sceptics, as well as againſt Atheiſts and Free-thinkers, ſays Hume, "though otherwiſe intended, are, in reality, merely ſceptical, appear from this, *that they admit of no anſwer, and produce no conviction.*" That his knowledge extended to the minuteſt objects, and included the arts and buſineſs of common life, is teſtified by Dr. Blackwell, in his "Court of Auguſtus." The induſtry of his reſearch, and the acuteneſs of his obſervations, comprehend not only the mechanic arts, but the various departments of trade, agriculture, and navigation; and that he poſſeſſed poetical talents in a conſiderable degree, is evident from the animated letters that are found in the collection of Pope's Works, and alſo from ſeveral compoſitions in verſe, particularly the beautiful ſtanzas written on the proſpect of realizing his noble ſcheme relating to Bermuda. The claſſical romance, entitled "The Adventures of Signior Gaudentio di Lucca," has generally been attributed to him.

Beſides the writings already mentioned, biſhop Berkeley publiſhed, at Dublin, in 1735, a ſmall pamphlet relating to the doctrine of fluxions, entitled "Reaſons for not replying to Mr. Walton's full Anſwer," &c. His ſmaller pieces were collected and printed under his inſpection at Dublin in 1752, under the title of "Miſcellanies." "The works of George Berkely, D. D. late biſhop of Cloyne; to which is added an account of his life, and ſeveral letters, &c." were publiſhed in 2 vols. 4to. in 1784. Biog. Brit.

BERKENHOUT, John, ſon of a reſpectable merchant of Leeds in Yorkſhire, but originally from Holland, was born about the year 1730. Being intended by his father for merchandize, after receiving a ſchool education at Leeds, he was ſent to Germany, to acquire a knowledge of that language. Paying a viſit to the baron de Bielfeldt, a relation of his father, reſiding at Berlin, he was, through the influence of that nobleman, firſt made a cadet, and, in progreſſion, an enſign, and afterwards a captain in the Pruſſian army; but on the breaking out of a war between England and France, he obtained his diſmiſſion from the Pruſſian ſervice, and was preferred to the command of a company here. On the return of peace, in 1762, he went to Edinburgh, where he commenced ſtudent in medicine, and after a ſhort reſidence there, he removed to Leyden, and in the year 1765, took his degree

degree of doctor in that faculty. The theſis he wrote on this occaſion is intitled, "Diſſertatio medica inauguralis de podagra," and is dedicated to his relation the baron de Bielfeldt. On his return to England, he ſettled at Iſleworth, near the Thames; and ſoon after publiſhed his "Pharmacopœia medica," which has been ſo much approved, as to paſs through ſeveral editions. But he ſeems to have been of too active a diſpoſition to remain long in the practice of medicine, in which he never made much progreſs. In 1778, he was appointed by government one of the commiſſioners who were ſent to America with a view of ſettling the differences between that country and England, and was the only one of them that was permitted to go to Philadelphia, where the congreſs was ſitting. Here he remained ſome time, but ſuſpected at length by the congreſs, and perhaps not without reaſon, of carrying on a ſecret correſpondence with ſome of the Americans, who diſapproved of their proceedings, he was firſt ſent to priſon, but was ſoon releaſed, and then ſent to his brother commiſſioners at New York. On his return to England, he received a penſion from government for the ſervices he had endeavoured to render his country; on which, and his own fortune, he lived as a private gentleman to the time of his death, which happened on the 3d of April 1791.

Dr. Berkenhout was author of various works, beſides thoſe mentioned above. In 1770, he publiſhed "Outlines of the Natural Hiſtory of Great Britain and Ireland;" a uſeful manual for ſtudents in that line. In 1788, "Firſt lines of the theory and practice of philoſophical chemiſtry;" which he dedicated to Mr. Eden (lord Auckland), who had been one of the commiſſioners with him to America. He alſo wrote "An Eſſay on the bite of a mad dog;" "An Anſwer to Dr. Cadogan's Eſſay on the gout;" "A Preface to the tranſlation of Pomme's treatiſe on hyſteric diſeaſes." He was alſo the author of "Lucubrations on ways and means," from which the idea of ſeveral of our preſent taxes is ſaid to be taken; and of "A Tranſlation of count Teſſins' letters to the late king of Sweden." New Biog. Dict.

BERKER's Creek, *Arian*, in *Geography*, a ſand which ſhoots off from the land towards the ſea, to the ſouth of Blenk, or the ſouth ſand-hill, on the coaſt of Holland. It is ſituated on the ſouth of the Land Deep channel into the Texel, the coaſt trending nearly N. and S. from the Maes to the Texel.

BERKHAMPSTEAD, a market town of Hertfordſhire, England, is ſituated in a fertile country, on the ſouthern bank of the ſmall river Bulberne, at the diſtance of 26 miles N. W. of London. This town and its vicinity have been the ſeat of war, and noted by hiſtorians as the property and reſidence of ſome of the Saxon kings, and other diſtinguiſhed characters of that nation. After the Norman conqueſt it was poſſeſſed by ſome princes of the blood, and dukes of Cornwall. On the north ſide of the town are the embankments, and other remains, of a conſiderable caſtle, which Camden ſuppoſed was built by Robert Moreton earl of Cornwall, who was brother to the conqueror, and enjoyed the manor, &c. from him. At this place the conqueror had an interview with the Engliſh nobility, after his ſucceſsful battle againſt Harold. The caſtle raiſed by earl Moreton, was demoliſhed in his ſon's time, who was accuſed of rebellion, and the town and manor forfeited to the crown. Henry II. granted the inhabitants many privileges, among which was the liberty of ſelling their goods free of tolls and duties, either in this country or in Normandy, Aquitain, or Anjou. In Domeſday-book we find fifty-two burgeſſes named in this town, whoſe merchandize was chiefly wool, which was manufactured into cloth on the continent. Henry II. kept his court here, as appears from a grant dated at this place, conferring the church of Havering in Eſſex on the monks of St. Bernard de Monte Iovis, to provide firing for the poor. King John, in the 7th year of his reign, granted this caſtle and honour to Geoffrey Fitzpeers earl of Eſſex; but two years after his death, theſe places were again in the king's hands. The dauphin of France, in concert with the barons, beſieged this fortreſs, which was bravely defended. The beſieged made two ſucceſsful ſallies, and held out until the king ſent them orders to ſurrender. Previouſly to the ſecond year of Henry III. the markets were held here on a Sunday, but in that year they were changed for Monday, which is ſtill the market day. This caſtle and lordſhip continued for a long period in the poſſeſſion of the earls and dukes of Cornwall, and was repeatedly the ſcene of rendezvous and baronial contention. The caſtle was ſurrounded by a foſs and vallum, incloſing about four acres of ground, and the keep, or citadel, was placed on the north ſide of it: upon the dilapidation of its walls, a large houſe was conſtructed with the materials, which was poſſeſſed in the rebellion by colonel Axtel.

The town is much reduced from its former conſequence, and conſiſts of one long ſtreet, having St. Leonard's hoſpital at one end, and St. James's at the other. The church, dedicated to St. Peter, is a large handſome pile of building, and has ſeveral ſmall chapels, or oratories, included within its walls; alſo ſome curious old monuments. Here is an alms-houſe for ſix poor widows, who are jointly allowed 50l. a year towards their maintenance. The town has alſo a charity-ſchool and a free grammar ſchool; the latter of which was endowed by king Edward VI. for 144 boys, and provided with a maſter and uſher. Beſides theſe charitable foundations, here is another alms-houſe, which was endowed by John Layer and his wife, with a legacy of 1300l. Berkhampſtead gives the title of marquis to the duke of Cumberland. The chief trade of the place conſiſts in the turning of bowls, of ſhovels, ſpoons, and other articles, made of beech wood. Here are three annual fairs, and a ſtatute fair for the hiring of ſervants, &c. The houſes in the pariſh are 338, and the inhabitants amount to 1690. This town is called Berkhampſtead St. Peter's, in contradiſtinction to another pariſh a little to the north of it, which was formerly ſeparated from this, and called Northchurch, or Berkhamſtead St. Mary's. Salmon's Hiſtory of Hertfordſhire, &c.

BERKI, a town of Aſiatic Turkey, in the province of Natolia, near the river Caiſter; 36 miles E. of Smyrna. N. lat. 38° 23′ E. long. 25° 39′.

BERKLEY, a county of Virginia in North America, lies weſt of the Blue ridge, north of Frederick county, and ſeparated from the ſtate of Maryland, on the north and eaſt by Potowmack river. This fertile county, about 40 miles long and 20 broad, has 16,781 free inhabitants, and 2932 ſlaves. Its chief town is Martinſburg.

Berkley, the name of a county and town in Charleſton diſtrict, ſouth Carolina, lying near Aſhley and Cooper rivers. In the cenſus of 1791, it was called St. John's pariſh, in Berkley county, and contained 752 free perſons, and 5170 ſlaves.

Berkley, a townſhip of Briſtol county in Maſſachuſetts, containing 850 inhabitants; 50 miles S. of Boſton.

Berkley, or Berkeley, an ancient town of Glouceſterſhire, England, is diſtinguiſhed in the annals of this country for its maſſy baronial caſtle, and the popular events that have occurred within its walls. The town is ſcarcely ever noticed in the page of hiſtory, whilſt the caſtle is repeatedly mentioned, and referred to from the Norman conqueſt to the diſaſtrous warfare in the ſeventeenth century. In ſome old records

this place is called Berchelai, and is diſtinguiſhed by the appellation of borough, though it does not appear ever to have ſent members to parliament. Formerly the great public road from Briſtol to Glouceſter, and from the weſtern to the northern counties, paſſed through the town, and conſequently gave it ſome advantages; but this road is now conducted through Newport, and ſome other places, to the eaſt of the town. This circumſtance, with the powerful attractions of Glouceſter and Briſtol, have conſpired to reduce the ſize and conſequence of this place, which at preſent conſiſts of one ſtreet only. The river Avon ſkirts the ſouthern ſide of the town, and is navigable to the Severn for veſſels of 40 or 50 tons. Theſe muſt wait for high tide, which flows round the caſtle gardens, and extends a ſhort diſtance above them. This part of the county is diſtinguiſhed by its fine paſture land, the rich cheeſe made in its dairies, and the golden and London-pippin cyder, obtained from its orchards. The cheeſe moſtly made here is diſtinguiſhed by the double name of Glouceſter, the beſt of which is bought up by the London factors, at high prices. (See CHEESE.) The town is one of the five ancient boroughs of this county, which ſubſiſted in the time of Edward I. and though deprived of moſt of its ancient privileges, yet a mayor is annually elected.

The manor of Berkley is one of the largeſt in England, and was taxed in the Domeſday book at 160 hides, and 294 plough-tillages and a half. It was poſſeſſed, immediately after the Norman conqueſt, by Roger de Berkeley, who came into England with the conqueror, and was rewarded by him with this manor. It has continued in this noble family without interruption to the preſent time, and is now enjoyed by Frederick Auguſtus, the fifth earl of Berkeley, who is the twenty-firſt in deſcent from Harding the Dane.

The caſtle of Berkeley is one of the moſt perfect of the Engliſh baronial edifices, and has ſuffered leſs by the ſcourge of war and injudicious alteration, than any other Engliſh caſtle belonging to a ſubject. Some parts of the original ſtructure are ſtill perfect, and are intereſting examples of the firſt Norman architecture, which was employed in conſtructing the baronial caſtles. The ſite of this building occupies an area of ground whoſe outline is nearly circular. It riſes from a valley on the ſouth and eaſt, and its other ſides are guarded by embattled walls, towers, and fortified gates. The great entrance gate opens into a baſe court, having the keep on the left, and the domeſtic apartments on the right, and in front. The keep, whoſe walls are lofty and maſſive, reſembles the form of a Roman D, and is flanked by three ſemicircular towers, beſides that in which the great ſtone ſtairs are contained. This is ſquare, and has a ſmall dark room near the top, where Edward II. was ſecretly murdered by the machinations of the biſhop of Hereford, who invented and directed the execrable deed.

The elegant and energetic poet, Gray, notices this event in the following expreſſive terms:—

"Mark the year, and mark the night,
When Severn ſhall re-echo with affright,
The ſhrieks of death through Berkeley's roof to ring,
Shrieks of an agonizing king."

The hall, chapel, and moſt of the apartments, are fitted up and preſerved nearly in their ancient ſtyle, and in ſome of them are ſeveral curious relics of antiquity. Among them are many fine old hiſtorical portraits, and the ſopha, chairs, and bedſtead, which belonged to the cabin of the circumnavigator Sir Francis Drake. The hall, which is 43 feet by 33, was built in the reign of Edward III. and has a fine old raftered roof, with a gallery at one end for the accommodation of minſtrels, in "days of yore." Leland mentions ſeveral parks and chaces, as connected with this caſtle at the time he viſited it; but all, except two, have been converted to the more uſeful purpoſe of farming. One of theſe, called Whitley-park, which is incloſed with a wall ſeven miles in circumference, ſtill remains, and contains much fine foreſt-timber.

At Purton near this caſtle, the preſent earl of Berkeley has made a decoy pool, which is the only one in this county, and where a great number of wild-ducks are annually netted. The celebrated Dr. Jenner, the great promoter of the vaccine inoculation, was born in this pariſh.

To the north of the caſtle is the pariſh church, which is a large handſome ſtructure, and contains ſeveral handſome and ancient monuments to the Berkeley family. The tower is a modern building, and conſtructed at a ſmall diſtance from the church.

In this townſhip are 99 houſes, and 658 inhabitants. In the hundred of Berkeley there appear to be, by the late population act, 3450 inhabited houſes, 9,148 males, 10,074 females, 3968 perſons employed chiefly in agriculture, 6151 employed in trade, manufactures, and handicraft, and the whole number of perſons amounts to 19,222. Rudge's Hiſtory of Glouceſterſhire. Rudder's Hiſtory of ditto.

BERKLEY'S *Point*, lies on the north ſide of lord Egmont's iſland, or New Guernſey, the principal of the groupe called Queen Charlotte's iſlands, in S. lat. 10° 40'. E. long. about 164° 10'.

BERKLEY *Sound*, ſo called from captain Berkley, who viſited it in 1787; an inlet, or bay, on the N. W. coaſt of North America, being the entrance into the ſuppoſed ſtrait of Juan de Fuca, terminated on the ſouth by cape Flattery, and on the north by the ſouthern part of Quadra, or Vancouver's iſland; about 1° 51' ſouth-eaſt of Nootka ſound. N. lat. 48° 30'. E. long. 235° 35'.

BERKS, a county of Pennſylvania in North America, has Northampton county on the N. E. Northumberland on the N. W. part of Luzern on the N. Dauphin and Lancaſter on the S. W. and Cheſter and Montgomery on the S. E. It is watered by Schuylkill river, and is 53 miles long, and near 29 broad, and contains 1,030,400 acres. Iron and coal, which are plentiful, ſupply ſeveral iron works. The northern parts are rough and hilly. Berks contains 30,179 inhabitants, of whom 65 are ſlaves. It has 29 townſhips, of which Reading is the chief.

BERKSHIRE, a county of the ſtate of Maſſachuſetts, is bounded on the N. by the ſtate of Vermont, on the S. by that of Connecticut; on the E. by Hampſhire county, and on the W. by the ſtate of New York. It runs through the whole extent of the ſtate from N. to S. and contains 26 townſhips; and the number of inhabitants is 30,291. White and coloured marble is found in ſeveral towns, in the rough and hilly parts of this county.

BERKSHIRE, a newly ſettled townſhip of Franklin county in the ſtate of Vermont.

BERKSHIRE, an inland county of England. Previous to, and at the period of the Roman invaſion of Britain, this part of the iſland was inhabited by three Britiſh tribes, reſpectively termed Attebrates, Bibroces, or Rhemi, and Segontiaci. The firſt occupied the weſtern part of the county, from the river Lodden on the ſouth-eaſt, to the Thames on the north-weſt; whilſt the ſecond poſſeſſed the ſouth-eaſtern part of the county; and the Segontiaci inhabited the remaining part on the ſouthern ſide. When Conſtantine divided this country into Roman provinces (in 310,) Berkſhire was included in the firſt diviſion, called Britannia Prima. During the Saxon Heptarchy, it conſtituted part of the kingdom of the weſt Saxons, which commenced about A. D. 519, and continued till A. D. 828, when Weſſex became the only ſovereignty,

ſovereignty, and its monarch, Egbert, gave the whole country the name of England. Alfred, grandſon to Egbert, and a native of Wantage in this county, proceeding on the plan of his grandfather, more firmly cemented the kingdoms which Egbert had united, divided the whole into hundreds, tithings, pariſhes, &c. and gave this diviſion the name of Berrocſhire, which was afterwards contracted and ſoftened into Berkſhire.

This county is bounded by the ſhires of Oxford and Buckingham on the north, having the river Thames running the whole courſe; on the caſt by Surry; on the ſouth by Hampſhire, and on the weſt by Wiltſhire. In the eſtimation of its ſize authors are at variance, but the moſt accurate ſtatement gives its length from E. to N.W. at 48 miles, and its breadth, in the wideſt part, at 25 miles; though a narrow part near the centre is little more than 6 miles acroſs. It contains about 530,000 acres of land, and is locally divided into twenty hundreds, containing 12 market towns, 140 pariſhes, 62 vicarages, about 670 villages and hamlets, 21,195 houſes, and 109,515 inhabitants. A range of chalk hills entering this county from Oxfordſhire, croſſes it in a weſterly direction, and forms the ſouthern boundary of the vale of White Horſe. Independent of this range of hills, the county is characterized by gentle eminences and valleys; having much rich fertile land, and abounding with picturesque and beautiful ſcenery. Though almoſt every kind of grain is cultivated in the county, yet that of barley is raiſed in greater quantities than either of the other ſpecies, and when made into malt, is chiefly ſent to London. Many large dairy farms are found in the White Horſe vale. Berkſhire is well ſtocked with timber, particularly oak and beech in the weſtern part, and alſo with numerous deciduous and exotic trees in Windſor foreſt and park, and in the various ornamental plantations ſcattered through the county. The open commons and uncultivated fields of Berkſhire are ſuppoſed to conſtitute nearly half the county. Of theſe; Windſor-foreſt, Maidenhead-thicket, Tylehurſt-heath, Wickham-heath, and the numerous commons and marſhes, that are found in almoſt every pariſh, contain above 40,000 acres. The county derives but little advantage from manufactures, there being only a few clothiers eſtabliſhed in the weſtern part of it, and ſome pin-makers, &c. at Reading. On the banks of the river Kennet, in the vicinity of Newbury, are ſome large beds of peat, which furniſhes the poor with fuel, and the farmer with aſhes to meliorate his land.

The principal rivers of Berkſhire are the Thames, the Kennet, the Lamborn, the Ock, and the Lodden. The firſt, though it ſerves to irrigate and fertilize a great part of this county, does not ſtrictly belong to it, being the natural boundary line between this and the counties of Oxford and Buckingham. It enters Berkſhire almoſt one mile ſouth of Lechlade, and in its progreſs eaſtward waters the ſeveral towns of Abingdon, Wallingford, Henley, Maidenhead, Windſor, &c. and having received the tributary waters of various ſtreams, leaves the county near Runnymead.

The Kennet enters the county on its weſtern ſide at Hungerford, and paſſes through a narrow boggy valley to Newbury. Flowing eaſtward, in nearly a direct line, it runs through the county town of Reading, and ſoon afterwards unites with the Thames.

The Lamborn, a tributary ſtream to the former river, riſes near a town of its own name, and after a courſe of about 11 miles, falls into the Kennet at Newbury. This river has been deſcribed as a phenomenon, by many topographical writers, ſome of whom have aſſerted that its current is more powerful and copious in ſummer than in winter. To account for this ſingular occurrence, they have had recourſe to various hypotheſes, but had they viſited the place, and there made inquiries, they would have found, that the river has no remarkable characteriſtic different to others, whoſe courſe is through a ſhort tract of flat country.

The Ock riſes in the vale of White Horſe, near Kingſton-Liſle, and flowing eaſtward, receives ſeveral other ſtreams before it reaches the town of Abingdon, near which it unites with the Thames.

The Lodden enters the ſouthern ſide of the county near Swallowfield, and running directly north, forms the weſtern boundary to Windſor foreſt, and falls into the Thames near Wargrave.

Berkſhire is in the dioceſe of Saliſbury, and included in the Oxford circuit. It ſends nine members to parliament: two of whom are returned for the county, and two for each of the towns of Reading, Wallingford, and New Windſor. The other member is elected for the borough of Abingdon. The Lent aſſizes, and the Epiphany county ſeſſions, are conſtantly held at Reading; the Eaſter ſeſſions at Newbury; the Summer aſſizes at Abingdon; and the Michaelmas ſeſſions alternately at the latter town, and at Reading.

Among the objects of antiquity in this county, is the celebrated White Horſe; which the moſt learned antiquaries refer to Saxon origin; and Mr. Wiſe, who has publiſhed two quarto pamphlets on the ſubject, endeavours to prove that it was deſigned by Alfred, to commemorate a victory obtained by the Saxons over the Danes. It was formed on the ſide of a chalk hill, by the ſimple proceſs of cutting off all the green turf within a certain line, which reſembled the ſhape of a horſe. This trophy is now nearly obliterated by the graſs growing on its ſurface. Near the White Horſe is a very large encampment, called Uffingdon-caſtle, and about one mile weſtward of the latter is a Druidical monument, named Wayland-Smith. It is a large cromlech on a barrow, with ſeveral ſmaller ſtones, which were formerly placed in a circle round it. Another Druidical relic is to be found at Park-place in this county. This was brought from the iſle of Jerſey, and all its ſtones were placed here in the exact poſition, and relative ſituation in which they were originally found. See HENLEY.

Beſides ſeveral ancient encampments of different ſizes and ſhapes, this county had two Roman ſtations, which are named in Antoninus's Itinerary "Spinis," and "Calleva," and are found in the thirteenth Iter of that work. In the ſeventh Iter is another ſtation, named Pontibus, or Pontis, which antiquaries agree in fixing near the eaſtern border of the county. The Roman Watling-ſtreet paſſed acroſs the northern corner of Berkſhire, entering it near Wallingford, and leaving it on the north-weſtern ſide. Reading is the county town of Berkſhire, and the caſtle of Windſor its greateſt ornament. Camden's Britannia. Coates's Hiſtory of Reading. Horſley's Britannia Romana. Beauties of England and Wales.

BERKUSSA, a town of Croatia, on the river Kulpa, 11 miles weſt of Petrenta.

BERLAI, a town of Croatia, on the river Korana, 8 miles ſouth of Sluin.

BERLAMONT, a town of France, in the department of the North, and chief place of a canton, in the diſtrict of le Queſnoy, 2½ leagues E.S.E. of le Queſnoy. It contains 1579 inhabitants, and thoſe of the canton amount to 5,794. The territory includes 150 kiliometres, and 14 communes.

BERLASREUT, a town of Germany, in the circle of Bavaria, 12 miles N. of Paſſau.

BERLEBURG, a town of Germany, in the circle of the Upper Rhine, 56 miles E. of Cologn.

BERLEUX, a town of France, in the department of the Somme, and chief place of a canton, in the diſtrict of Péronne, 3 miles S. W. of Péronne.

BERLIN, a city of Germany, in the circle of Upper Saxony,

Saxony, and capital of the electorate of Brandenburg, and of the whole Pruſſian dominions, is ſituated on the banks of the river Spree, and has been reckoned one of the moſt beautiful cities in Europe, as it is one of the largeſt and moſt populous in Germany. Its extent is about 4½ miles in length, from the Muhlenthor on the ſouth-eaſt, to the Oranien-burgerthor on the north-weſt; and about 3 miles broad from the Bernaverthor, on the north-eaſt, to the Potſdamerthor on the ſouth-weſt: but within this extenſive incloſure there are many gardens and corn fields. The ſtreets are diſpoſed with great regularity, and are of a convenient breadth. In the new town they are perfectly ſtraight. Frederick ſtreet is reckoned 2½ Engliſh miles in length; and others, which interſect this at right angles, are a mile, or a mile and a half long. Some have aſſerted that it covers as much ground as Paris; but though this be not true, and it be allowed to occupy more than half the extent of the capital of France, its number of inhabitants is much ſmaller in proportion. The number of houſes has been variouſly eſtimated. Reiſbeck computes them at 6000; count Hertzberg ſtates the number of buildings public and private, as amounting in 1790, to 6725; and according to Hoeck, the number of houſes is 6950. The number of inhabitants, according to the loweſt ſtatement, is 140,000; Hoeck computes them at 142,099; and Hertzberg at 150,803, being, at an average, more than 22 inhabitants to each houſe. There are a few very magnificent buildings in this town; and the reſt are neat houſes, built according to a plan preſcribed by the late and preſent king, who have directed their particular attention to the external decorations of the city, either of a fine white free-ſtone, or of bricks covered with a thin coating of plaſter, painted with a light colour, and generally one, or at moſt two ſtories high. The ſituation of the city, in a barren ſandy plain, expoſes it very much to duſt, which, in dry windy weather, is not only inconvenient to the eyes and lungs of the inhabitants, and injurious to their health, but detrimental to the beauty of the buildings, which exhibit a ſoiled and ſhabby appearance. The finiſhing of the houſes within by no means correſponds with their external elegance; the rooms are in a ruinous condition, the furniture covered with duſt and dirt, and the variety of perſons of the meaneſt condition who inhabit them, altogether incongruous to their outward magnificence and decoration. In theſe handſome houſes, ſoldiers are quartered even on the ground floor, in rooms looking out to the ſtreet; and the loweſt mechanics occupy the different ſtories. The principal edifices are the king's royal palace, and that of the prince royal. The former is a magnificent ſtructure of free-ſtone, begun by Frederick I. in 1699; but as it has been conſtructed at different periods, and by ſeveral architects, its fronts are not exactly regular. It conſiſts of four ſtories, with large apartments, fine cielings, and ſuperb furniture. The ſtate chambers are decorated with capital paintings and rich tapeſtry, and furniſhed with tables, ſtands, luſtres, chandeliers, looking-glaſs frames, ſcreens, couches, &c. of ſolid ſilver. The library, though a mean apartment, is well furniſhed with books; among which is a collection of 500 Bibles in different languages and editions, particularly the Bible uſed by our Charles I. when he was beheaded, preſented as a kind of relic by Dr. Juxon to the elector of Brandenburg, and alſo the firſt Bible printed in America, and one of 1450, the firſt printed in the German language; and alſo a koran, in a character ſo ſmall, and on a paper ſo thin, as to form only 1½ inch in bulk. The arſenal is a noble ſtructure, forming a ſpacious quadrangle, and containing arms, ranged in excellent order, for 200,000 men. Over the principal gate is a portrait of the elector, William the Great, in a large model of gilt braſs; and the four cardinal virtues, of a gigantic ſize, are placed on pedeſtals on each ſide of the portico, and ſeem to look towards the picture. The ſoldiers of the garriſon amount to about 30,000. The royal ſtables are very magnificent, adjoining to which are grand apartments for the maſter of the horſe, and his inferior officers; and in the rooms over the ſtables, may be ſeen the rich accoutrements of the horſe on which Frederick I. rode, when he made his public entry; all the ornaments of the bridles, the breaſt-leather and crupper, as well as the bits and ſtirrups, being of gold, adorned with brilliants. The opera-houſe is a beautiful ſtructure, and on the front bears this inſcription, "Fredericus rex, Apollini et Muſis." The king allows the free exerciſe of religion: and, accordingly, in Berlin are 25 churches, 14 of which are Lutheran, 10 Calviniſt, and one Roman Catholic, which is the moſt elegant in the city. The churches are decorated with Mercuries, Apollos, Minervas, and Cupids, "which might lead a ſtranger to ſuſpect," ſays Dr. Moore, "that the Chriſtian religion was exploded from the Pruſſian dominions, and old Jupiter and his family reſtored to their ancient honours." Inſtead of ſaints and crucifixes, ſays the ſame writer, Frederick III. propoſed to adorn the church of Berlin with the portraits of men who have been uſeful to the ſtate; thoſe of the marſhals Schwerin, Keith, Winterfield, and ſome others, were actually placed in the great Lutheran church before his death. We may alſo reckon among the public buildings and eſtabliſhments of Berlin, the academy of ſciences, (See ACADEMY), another of arts and painting, an anatomical college, 5 gymnaſia, 2 public libraries, and many excellent and important fabrics and manufactures of ſilk, woollen ſtuffs, and ſtockings, cotton, linen, lace, porcelain, &c. which ſupply it with a very conſiderable and advantageous trade, to the proſperity of which, the unlimited toleration granted to Roman Catholics, Lutherans, Calviniſts, and Jews, has very much contributed. In Berlin, there are ſeveral large ſquares, in one of which is an equeſtrian ſtatue of marſhal Schwerin, holding the enſign with which he advanced at the famous battle of Prague, and which he ſeized from one of his officers when his troops were giving way, exclaiming, "Let all, but cowards, follow me." On the new bridge over the Spree, ſtands alſo an equeſtrian ſtatue of William the Great, which is highly eſteemed as a piece of fine workmanſhip; the man and horſe in one piece, caſt at the ſame time, and the ſtatue weighs 3,000 quintals. The ſuburbs are adorned with the magnificent garden of count Reuſſen, the beautiful houſe and garden called Mombijon, the houſe and garden of Belvidere, and the ſtately hoſpital of invalids, for the maintenance of about a thouſand officers and ſoldiers. In the new Calviniſt church of Old Coln, is the burying place of the royal family. At Berlin there are many public walks and gardens. The principal walk is that in the park, on the ſouth ſide of the Spree, which is upwards of three miles in circuit, and reſorted to by the inhabitants of the city in great crowds on a Sunday; and here they are provided with every kind of refreſhment, and indulged with any ſort of amuſement. The moſt faſhionable walk in the city, is that which lies in the middle of one of the ſtreets. Before the houſes at Berlin, on each ſide, is a cauſe-way, and between theſe two cauſe-ways, are fine gravel walks planted with lime-trees. Under theſe are pitched tents, in which are ſold ice, lemonade, and other refreſhments. In the ſummer, the bands of muſic belonging to the regiments practiſe in this walk. In all the private houſes a very rigid economy is obſerved; the chief article of expence is that which pertains to the dreſs of the ladies, who deny themſelves common indulgences, for the ſake of powder and millinery. The

ladies

ladies of the court have much of the air of French women. There are ſome kinds of irregularities that prevail to a great degree in this city. Public courtezans are more numerous here than in any town of Europe, in proportion to the number of its inhabitants. They appear openly at the windows, beckon to paſſengers as they walk in the ſtreets, and ply for employment in any way they pleaſe, without diſturbance from the magiſtrate. Citizens and manufacturers of the better kind live altogether among thoſe of their own rank; and without affecting the manners of the courtiers, or ſtooping to the mean debauchery of the commonalty, maintain the decency, plainneſs, and honeſty of the German character. Jealouſy is held in equal contempt and deteſtation by the inhabitants of Berlin, and ſcandal is very little known. The environs of this city are remarkably pleaſant, being interſperſed with villages, vineyards, canals, pleaſure-houſes, and gardens. Among the palaces in the neighbourhood belonging to the royal family, Schonhauſen and Charlottenburg are the moſt worthy of notice. The former is ſituated about two miles from Berlin, on the Panko, which ſupplies the pond in the ſumptuous garden of this palace with water. Charlottenburg alſo, one of the royal or electoral palaces, ſeated on the river Spree, was only a ſmall village, till the electreſs, conſort to Frederick I. being pleaſed with its ſituation, began to build in it, and after her death the works were carried on by the elector, who gave it its name in commemoration of his wife Sophia Charlotte. This palace is one of the moſt conſiderable ſtructures in Germany, and is adorned with a moſt beautiful garden.

Berlin is divided into five wards, called Berlin proper, Coln on the Spree, Frederick's Werder, Dorotheenſtadt, and Frederickſtadt. The proper Berlin was founded in the 12th century, by ſome coloniſts invited thither from the Netherlands, and the vicinity of the Rhine, under the margrave Albert, the Bear. The ſuburbs of this town are frequently called Konigſtadt, and by others divided into three viertels, or quarters. Berlin proper is ſeparated by a principal arm of the Spree from Coln, over which are four bridges, three of timber, and one of ſtone, called the Pontneuf. Coln was probably built about the ſame time as Berlin; and it is formed into a kind of iſland by two branches of the Spree, which environ it. New Coln is now a conſiderable part of the old town of Coln, from which it is ſeparated by the Spree. The ſuburbs of Coln were incloſed in 1736, within the outer wall. The Frederickſwerder was built by the elector Frederick William, on a ſwampy werder, or iſland. This ward is ſeparated by a rampart and ditch from the Dorotheenſtadt, or Neuſtadt, founded by the elector Frederick William, and named after his conſort, Dorothy. This new town is the moſt beautiful part of Berlin, and it is chiefly inhabited by the French. In a ſtreet of this town is the walk above mentioned. Frederickſtadt, founded by the elector Frederick III. immediately on his acceſſion to the government, communicates with the new town and the Werder, and is the pleaſanteſt ward in the whole city; the ſtreets being ſpacious, ſtraight, and planted with lime-trees. Behind this is erected a new ward, which ranges to the end of the new town, where many of the nobility have built palaces. In the ſuburbs, the houſes are generally of timber, but ſo well plaſtered, that they ſeem to be of ſtone, and the ſtreets are broad and ſtraight. From this town there is a free communication, by means of canals, between the Spree and the Oder, and the Spree and the Elbe. Berlin lies in N. lat. 52° 32′ 30″. E. long. 13° 26′ 15″. The annual average of temperature of Berlin for fifteen years, from 1769, to 1782, was, according to Mr. Beguelin's obſervations, 49°; nor could he find that the temperature decreaſes. The Baltic, within 120 miles N. of it, tempers the north winds, ſays Kirwan (See his Eſtimate of the temperature of different latitudes, p. 71.) and to this is owing the moderate temperature which it enjoys. The influence of the vicinity of the Baltic muſt be allowed, when it is conſidered, that the temperature of Berlin is higher than that of Dreſden, Altenburgh, or Gotha, whoſe latitude is one degree lower, but more diſtant from the Baltic. Reiſbeck's Travels, vol. iii. Moore's Travels through France, &c. vol. ii.

Berlin, a neat and flouriſhing town of America, in York county, and ſtate of Pennſylvania, containing about 100 houſes. It is regularly laid out, on the S. W. ſide of Conewago creek, 13 miles weſterly of York town, and 101 weſt of Philadelphia. N. lat. 39° 56′.—Alſo, a townſhip in Orange county, Vermont, on Dog river, a branch of Onion river from the ſouth, which laſt ſeparates Berlin from Montpelier on the N.N.W. Berlin contains 134 inhabitants, and is about 94 miles north-eaſterly from Bennington.—Alſo, a townſhip in Hartford county, Connecticut, 12 miles S.S.W. from Hartford, 42 N.W. from New London, and 26 N.N.E. from New Haven.—Alſo, a townſhip in Worceſter county, Maſſachuſetts, containing 512 inhabitants, 34 miles W. from Boſton, and 15 N. E. from Worceſter. Hops have been cultivated here, and promiſe to be a valuable article of huſbandry.—Alſo, a townſhip of Somerſet county, formerly in that of Bedford, Pennſylvania, which lies on a branch of Stoney creek, a ſouth water of Conemaugh river on the weſt ſide of the Alleghany mountain; 25 miles W. from Bedford; 23 N. W. from Fort Cumberland, in Virginia, and 200 W. from Philadelphia. Stone creek, the chief ſource of Kiſkeminitas river, riſes N.N.E. of Berlin. N. lat. 39° 54′.

Berlin, a ſort of vehicle, of the chariot kind; taking its name from the city of Berlin, in Germany: though ſome attribute the invention of it to the Italians, and derive the word from *berlina*, the name given by them to a ſort of ſtage, whereon perſons are expoſed to public ſhame. In proof of its having derived its origin, as well as its name, from Berlin, it is alleged, that Philip de Chieſe, a native of Piedmont, and deſcended from the Italian family of Chieſa, was a colonel and quarter-maſter in the ſervice of Frederick William, elector of Brandenburg, and that he was much eſteemed by the elector on account of his ſkill in architecture. Being once ſent to France on his maſter's buſineſs, he cauſed to be conſtructed, for the convenience of this journey, a carriage capable of containing two perſons; which in France, and every where elſe, was much approved, and called a berline. This Philip de Chieſe died at Berlin in 1673.—Beckman's Hiſt. of Inventions, vol. i. p. 130.

The berlin is a very convenient machine to travel in, being lighter, and leſs apt to be overturned, than a chariot. The body of it is hung high, on ſhafts, by leathern braces; there being a kind of ſtirrup, or footſtool, for the conveniency of getting into it: inſtead of ſide windows, ſome have ſcreens to let down in bad weather, and draw up in good weather.

Berlin, in *Natural Hiſtory*. See Berdin.

BERLINCHEN, in *Geography*, a town of Germany, in the circle of Upper Saxony, and New Mark of Brandenburg, 80 miles E.N.E. from Berlin, and 36 N.N.E. from Kuſtrin.

BERLINECZ, a town of Poland, in the palatinate of Braclaw, 52 miles W. from Braclaw.

BERLOCH, a town of Bohemia, in the circle of Czaslau, 9 miles N. E. from Czaslau.

BERME, in *Fortification*, a ſmall ſpace of ground, four or five feet wide, left without the rampart, between its foot

and the ſide of the moat, to receive the earth that rolls down from the rampart, and prevent its falling into, and filling up the moat.

This is alſo called *liſiere, relais, retraite, pas de ſoures, foreland, &c.*

Sometimes, for greater ſecurity, the berme is paliſadoed.

BERMEJO, in *Geography*, the name of an iſland and port on the S. W. coaſt of South America, in about 2 degrees N. a little W. from Lima. It is four leagues diſtant from Mengon on the north, and 6 from Guarmey port on the ſouth. The iſland is a ſmall white iſland, in the middle of which is a bay: the land from hence to Mengon is high, and abounds with hillocks, having large ſpots of white ſand. It has a good harbour, and fine freſh water at a ſmall diſtance from the ſhore; and the harbour is known at ſea by a large high hill with a cleft in it, which runs down ſouthward to the ſea-ſide; on the north it is very ſteep.

BERMEO, or Vermeo, a ſea-port town of Spain, in the province of Biſcay, near cape Machicaca, 5 leagues N.W. of Bilbao.

BERMUDA HUNDRED, or City Point, is a port of entry, and poſt town of America, in Cheſterfield county, Virginia, ſeated on the point of the peninſula formed by the confluence of the Appamattox with James river, 36 miles weſterly from Williamſburg, 64 from Point Comfort, in Cheſapeak bay, and 315 S.W. by S. from Philadelphia. City Point, from which it is named, lies on the ſouthern bank of James River, 4 miles S.S.W. from this town. The town has about 40 houſes, including ſome warehouſes. It trades chiefly with the Weſt Indies, and the different ſtates. City Point, in James River, lies in N. lat. 37° 16′. W. long. 77° 31′ 30″.

BERMUDAS, or Somers' Islands, vulgarly called *Summer Iſlands*, a cluſter of ſmall and rocky iſlands, forming the figure of a ſhepherd's crook, and amounting in number to about 400; ſituated in the Atlantic, and diſtant from the coaſt of Carolina about 200 leagues. N. lat. 32° 35′. W. long. 63° 28′.

They derived their firſt name from John Bermudas, a Spaniard, who diſcovered them in 1527; and their ſecond appellation they owe to ſir George Somers, who was ſhipwrecked on theſe rocks in his paſſage to Virginia in 1609, and lived there 9 months. But he and his companions, having built a ſhip of cedar wood, ſailed from thence to Virginia. Sir George Somers, it is ſaid, was driven a ſecond time on theſe iſlands, and died there. But his companions, returning to England, made ſo favourable a report of their beauty and fertility, that the Virginia company, who, as the firſt diſcoverers, claimed the property, ſold them to about 120 perſons, to whom king James I. granted a charter. Accordingly, in 1612, they planted the largeſt of them, viz. St. George's iſle, with 160 perſons, and in 1619, ſent thither 500 perſons more; upon which they inſtituted an aſſembly, with a governor and council. It is ſaid, that they are much incommoded by want of freſh water, and by the ſtorms, thunder, &c. to which they are ſubject. Shakeſpear has therefore juſtly deſcribed them as ever "vexed" with ſtorms; but the poet Waller, who reſided there for ſome time, on being condemned for a plot againſt the parliament in 1643, repreſents them as enjoying a perpetual ſpring. In 1725, the benevolent biſhop Berkeley propoſed to erect a college in theſe iſlands for the converſion of the ſavage Americans. See Berkeley.

This group of iſlands is ſaid to conſiſt of about 400: but the greater number ſeem to be mere iſlets and rocks, not of ſufficient importance to have received a name. From the chart by Lempriere in 1797, it ſhould ſeem that the largeſt iſland, called "Bermuda," reſembles a hook, the great ſound fronting the north. The length is about 35 geographical miles, and the breadth between one and two. The other iſlands which have received names are St. George's, St. David's, and Sommerſet. The iſland of St. George's lies eaſtward of the main land, and has a capital town of the ſame name, containing about 500 houſes. Contiguous to this is St. David's, which ſupplies the town with proviſions. The air is healthy, and a continual ſpring prevails; ſo that moſt of the productions of the Weſt Indies might probably be cultivated in theſe iſlands. The houſes are built of a ſoft ſtone, which is ſawn like timber, and ſeemingly reſembling that of Bath; and the ſtone is much uſed in the Weſt Indies for filtrating water.

With regard to the ſuppoſed fertility and productiveneſs of theſe iſlands, it appears, from the anſwers of governor Brown to the inquiries of the privy council of England, that they contain from 12 to 13 thouſand acres of very poor land, of which 9 parts in 10 are either uncultivated, or reſerved in woods for a ſupply of timber towards building ſmall ſhips, ſloops, and ſhallops, for ſale, this being the principal occupation of the inhabitants; and the veſſels which they furniſh, being built of cedar, are light, buoyant, and unexpenſive. Of the land in cultivation, no part was appropriated to any other purpoſe than that of raiſing Indian corn, and eſculent roots and vegetables, of which a conſiderable ſupply is ſent to the Weſt Indies, until the year 1785, when the growth of cotton was attempted, but without much ſucceſs; there not being at preſent more than 200 acres applied to this ſpecies of culture. The number of white people of all ages in Bermudas, is 5462, and of black, 4919. The Bermudians are generally ſeafaring men, and the negroes are expert mariners. In the war between Great Britain and America, there were at one time between 15 and 20 privateers fitted out from hence, which were manned by negroe ſlaves, who behaved irreproachably; and ſuch is the ſtate of ſlavery in theſe iſlands, and ſo much are the negroes attached to their maſters, that ſuch as were captured always returned when it was in their power. Some part of the trade of the Bermudians, conſiſts in carrying the ſalt which they fetch from Turks iſland to America, where they ſell it for proviſions, or for caſh. Theſe iſlands are frequented by whale-fiſhers. The government is conducted by a governor named by the Britiſh crown, a council, and a general aſſembly: the religion is that of the church of England. There are 9 churches under the care of 3 clergymen; and one Preſbyterian church. The women of theſe iſlands are ſaid to be handſome, and both ſexes are fond of dreſs. Edwards's Hiſt. of Weſt. Ind. vol. i. p. 470.

Bermudas *Cedar*, in *Botany*. See Juniperus.

BERMUDIANA. See Sisyrinchium.

BERN, in *Geography*, was, before the French revolution, one of the thirteen cantons of Swiſſerland, bounded on the eaſt by the cantons of Uri, Underwalden, Lucern, and the county of Baden; on the north by the Auſtrian foreſt-towns and the cantons of Baſle and Soleure; on the weſt by the canton of Soleure, the county of Bienne, and a part of France; and on the ſouth by the lake of Geneva, the Valais, and the duchy of Savoy. In the year 1352, Bern acceded to the Helvetic confederacy; and poſſeſſed ſuch power, even at that early period, as to obtain the ſecond rank among the Swiſs cantons. Since the acquiſition of the Pays de Vaud, the domains of this canton formed nearly the third part of Swiſſerland, and about the fourth of the actual population. It contained 3840 ſquare miles; its population was eſtimated at 374,000 perſons, and its contingents amounted to 2000. At the introduction of the reformation in 1528, government acquired a large increaſe of revenue by ſecularizing the eccleſiaſtical

ecclefiaſtical poſſeſſions. At the ſame period the whole canton followed the example of the capital; and the reformed religion was permanently eſtabliſhed. This canton was divided into two great portions; the Pays de Vaud, and the German diſtrict. The Pays de Vaud having been conquered from the houſe of Savoy, and the German diſtrict from the States of the Empire, juſtice was adminiſtered, and taxes regulated in each by peculiar laws and cuſtoms. Each of theſe diviſions had its treaſurer and chamber of appeal reſident in the capital; the chamber of appeal belonging to the Pays de Vaud judged in the laſt reſort; but the inhabitants of the German diſtrict were allowed to appeal to the ſovereign council.

The ſovereign power of this canton reſided in the great council of two hundred, which, when complete, conſiſted of 299 members choſen from the citizens, from whom they were conſidered as deriving their power, and as acting by deputation. The authority with which they were inveſted, was in ſome reſpects the moſt uncontrouled of any among the ariſtocratical ſtates of Swiſſerland. The great council of Bern, ſince the year 1682, when it was declared the ſovereign, was reſtrained by no conſtitutional check, like ſome of the others. As a general aſſembly of the citizens was never convened on any occaſion, the executive powers of government were delegated by this ſovereign council to the ſenate, choſen by themſelves from their own body; the former ordinarily aſſembled three times a week, and extraordinarily upon particular occaſions; the ſenate, every day, Sundays and feſtivals excepted. The ſenate, compriſing the two avoyers, or chiefs of the republic, was compoſed of 27 members; and from this ſelect body were taken the principal magiſtrates. On a vacancy in the ſenate, 26 balls, 3 of which were golden, were put into a box, and drawn by ſeveral members; and thoſe who drew the three golden balls, nominated three electors out of their body. In the ſame manner, ſeven members were choſen from the great council, who alſo nominated ſeven electors out of their own body. Theſe ten electors fixed on a certain number of candidates, not exceeding ten nor leſs than ſix; and ſuch among theſe candidates as had the feweſt votes in the ſovereign council, retired till their number was reduced to four; then four balls, two golden and two ſilver, were drawn by the four remaining candidates; the two who drew the former were put in nomination, and he who had the greateſt number of ſuffrages in the ſovereign council was choſen. But the candidate, in order to be eligible, muſt have been a member of the great council ten years, and muſt be either a married man or a widower. The greateſt excellence of this mode of election conſiſted, as Mr. Planta obſerves, in making the chance of lots apply chiefly to the electors, and not to thoſe who might pretend to the ſucceſſion, by which the dangerous effects of cabal were in a great meaſure obviated, and yet a fair proſpect of ſucceſs was given to the meritorious, while thoſe wholly unqualified could entertain little hopes of being preferred. The ſelected candidates drew lots only in one ſtage of the proceeding; and this when their number being reduced to only four, an even chance was given to thoſe few to whom eminent qualifications had ſecured the marked approbation of their fellow-citizens; and when fortune proved unfavourable in one inſtance, repeated opportunities would occur, in which, unleſs ſhe proved ſingularly unpropitious, the deſired object would be ultimately obtained.

The great council was generally filled up every ten years; as within that period there was uſually a deficiency of 80 members to complete the whole number of 299. When this deficiency occurred, and not before, a new election was

propoſed; nor could it be deferred when there was a deficiency of 100. The time of election being determined by vote, each avoyer nominated two of the new members; each ſeizenier, and each member of the ſenate, one; and two or three other officers of ſtate enjoyed the ſame privilege. Some few perſons claimed, by virtue of their office, a right of being elected, which was generally allowed. Theſe ſeveral nominations and preteſtions generally amounted, on the whole, to about 50; the remaining vacancies were ſupplied by the ſuffrages of the ſenate, and the ſeizeniers. Theſe ſeizeniers were ſixteen members of the great council, drawn yearly from the abbayes or tribes; and the candidates were generally taken from thoſe who had exerciſed the office of bailiffs, and were elected by lot. They were inveſted with an authority ſimilar to that of the Roman cenſors; and in caſe of mal-adminiſtration, might remove any member from the great council or ſenate, though they have ſeldom exerciſed this power. The principal magiſtrates were two avoyers, two treaſurers, and four bannerets; each choſen by a majority of voices in the ſovereign council, and yearly confirmed in their reſpective offices. The avoyers held their poſts for life; the treaſurers, ſix years; and the bannerets, four. The two treaſurers, one for the Pays de Vaud, and the other for the German diſtrict, formed, in conjunction with the four bannerets, an economical chamber or council of finance, which paſſed the accounts of the bailiffs, and received the revenues from thoſe who were accountable to the government. The four bannerets, the ex-avoyer, who was the firſt ſenator in rank, and preſident of the ſecret council, the ſenior treaſurer, and two members of the ſenate, compoſed a committee or ſecret council, in which all ſtate affairs, requiring ſecrecy, were diſcuſſed.

Although the form of this conſtitution was ariſtocratical, and the ſenate poſſeſſed a very conſiderable influence, yet it did not enjoy (ſays Mr. Coxe) that almoſt excluſive authority which exiſts in many ariſtocratical governments. For, by ſeveral wiſe and well obſerved regulations, the ſovereign council, although it delegated the moſt important concerns of government to the ſenate, yet aſſembled at ſtated times, and ſuperintended the adminiſtration of public affairs. Mr. Burke aſſerts, that the republic of Berne was one of the happieſt, moſt proſperous, and beſt governed countries on earth.

The canton of Bern, by its old conſtitution, was divided into a certain number of diſtricts, called bailliages (ſee Bailliage), over which bailiffs were choſen from the ſovereign council. Theſe were the moſt profitable poſts in the diſpoſal of government, and very eagerly purſued. They were formerly nominated by the bannerets, but the mode of election was altered in 1712, and they were choſen by lot. The bailiffs were repreſentatives of the ſovereign power in their reſpective diſtricts; whoſe buſineſs it was to enforce the edicts of government, to collect the public revenues, to act as juſtices of the peace, and to be judges in civil and criminal cauſes, except where there was any local juriſdiction. In civil caſes, beyond a certain value, an appeal lay to the courts of Bern: in criminal affairs, the proceſs underwent a reviſion in the ſenate, and was referred to the criminal chamber, which inflicted puniſhments for ſmall miſdemeanours; but in capital caſes, the ſentence was to be confirmed by the ſenate, and by the ſovereign council, if the delinquent was a citizen of Bern. The bailiff delivered his accounts to the economical chamber, to which court an appeal lay in caſe of exaction on his part, or on the part of his officers. The profits of the bailiff's office aroſe from the produce of the demeſnes, of the tithes, certain duties paid to government in the reſpective bailliages, and from the fines impoſed

for criminal offences. In ſome parts of the German diviſion, the bailiff became entitled, upon the death of every peaſant, to a determinate part of the inheritance, which proved in ſome ſituations an oppreſſive tax upon the family. The bailiff, being governor and judge in his own diſtrict, and having a magnificent chateau for his accommodation, not only poſſeſſed great power, but in the courſe of his adminiſtration, which laſted ſix years, was able to live with proper magnificence, and to lay up two or three thouſand pounds without extortion or unbecoming parſimony.

In Bern, the militia was ſo well regulated, that government was able to aſſemble a very conſiderable body of men at a moment's warning. To this purpoſe, every male at the age of 16 was enrolled, and about a third of the whole number was formed into particular regiments, compoſed of fuſileers and electionaries; the former being bachelors, and the latter married men. Every perſon thus enrolled was obliged to provide, at his own expence, an uniform, a muſquet, and a certain quantity of powder and ball; and no peaſant was allowed to marry, unleſs he produced his uniform and arms. Every year a certain number of officers, called land-majors, were deputed by the council of war, to inſpect the arms, to complete the regiments, and to exerciſe the militia. The regiments were, beſides this annual review, occaſionally exerciſed by veteran ſoldiers appointed for that purpoſe. Beſide the arms in the arſenal of Bern, a certain quantity is alſo provided in the arſenal of each bailliage, ſufficient for the militia of that diſtrict, and likewiſe a ſum of money amounting to three months' pay, which is appropriated to the electionaries in caſe of actual ſervice. The dragoons were choſen from the ſubſtantial farmers, each of whom provided his horſe and accoutrements. In time of peace, the avoyer out of office was preſident of the council of war; but during war, a general in chief was nominated for the forces of the republic. A certain number of regiments being thus always ready, ſignals are fixed on the higheſt part of each bailliage, for aſſembling the militia at a particular place in each diſtrict, where they receive orders for marching. As the page of hiſtory does not exhibit a greater curioſity than what was called the "exterior ſtate" at Bern, we ſhall here ſubjoin a brief account of it. It was a model of the ſovereign council, and compoſed of thoſe burghers who had not attained the age requiſite for entering into that council. It had a great council, a ſenate, two avoyers, treaſurers, banncrets, and ſeizeniers; all of whom were choſen in the uſual manner, and with the accuſtomed ceremonies. The poſt of avoyer in this mimic legiſlative community was ſolicited with great aſſiduity, and ſometimes obtained at a conſiderable expence, as the ſucceſsful candidate was always admitted into the great council without any farther recommendation. This body poſſeſſed 66 bailliages, conſiſting of ſeveral ruined caſtles diſperſed throughout the country, among which Hapſburg was the principal. It had alſo its common treaſure, and its debts; differing in this latter reſpect from the actual government of Bern, which was not only free from debts, but poſſeſſed of a very conſiderable fund in reſerve. Great honours were paid to this ſingular inſtitution, as it was in fact a kind of political ſeminary for the youth of the canton, who were likely to arrive in ſome future period at the higheſt offices in the ſtate. Its badge, or coat of arms, which was an ape ſitting on a lobſter, and viewing itſelf in a mirror, was no bad emblem of its mock conſequence.

The revenues of Bern, out of which were paid the ſalaries of the principal magiſtrates, which were extremely moderate, the reigning avoyer being allowed 400l., each of the ſenators 150l., and the banneret 230l., and which were applied to the expences of the goverment, were derived principally from the public demeſnes appropriated at the time of the reformation; the tithes, ſequeſtered at the ſame period, and aſſigned to the maintenance of the clergy, public ſeminaries, and charitable inſtitutions; quit-rents, and monopoly of ſalt and gunpowder; produce of the poſt-office; cuſtoms and tolls; duty on wine imported into the capital; and fines impoſed for miſdemeanors; alſo a tax on the alienation of landed property in the French diſtrict; the intereſt of money accumulated from a regular progreſſion of ſavings, of which nearly 500,000l. were lodged in the Engliſh funds. The whole revenue has been ſtated by the beſt authorities as not exceeding 300,000 crowns, which were always more than ſufficient to ſupply the expenditure, and to conſtruct and ſupport the magnificent public works. A large treaſure was always reſerved in a vault of the capital for ſudden emergencies, and the care of this vault entruſted to the principal magiſtrates, each of whom had a ſeparate key, and without their concurrence, and a ſpecial order from the ſovereign council, the door could not be opened. The amount of this treaſure could not be accurately aſcertained, but it muſt have been very conſiderable, as not leſs than 160,000l. ſterling was depoſited in the mountains of Haſli and Oberland. The pillage of this treaſure was one of the principal objects of the French directory, to defray the expences of their armament againſt Egypt. In the plunder of Bern, it is ſaid that the French did not acquire leſs than 400,000l. in ſpecie.

When the directory of France determined to revolutionize Swiſſerland, it directed its whole force againſt the canton of Bern, on the conqueſt or ſubmiſſion of which the reduction of the country at large depended. Its hoſtilities were preceded, in 1797, by requiring Bern, and the other Helvetic cantons, to diſmiſs the Britiſh miniſter, who withdrew, and voluntarily announced the termination of his embaſſy in a dignified note addreſſed to the rulers of Bern. France, having accompliſhed the firſt part of its plan, which was that of dividing the confederate ſtates, proceeded to the attainment of their ſecond object, which was the ſubjection of Bern. With this view they ſecured the paſſes which facilitated the invaſion of the Berneſe territory, by ſeizing the Erguel and the town of Bienne. The ſubſequent attempt to detach the Pays de Vaud from Berne, and to erect it into a republic, under the auſpices of France, was equally ſucceſsful, from the paſillanimity and infatuation of the Berneſe government. Bern, after ſome feeble and ineffectual remonſtrances, relinquiſhed its claims on the Pays de Vaud, and made overtures of conciliation to the French directory, and to Mengaud, their agent, in Swiſſerland. But theſe degrading meaſures ſerved only to haſten the fall of the republic. At length, after ſome fruitleſs negotiations, they had recourſe to arms; and the forces of Soleure and Friburgh ranged themſelves under the ſtandard of Bern; and the chief command was entruſted to general d'Erlach, a member of the ſovereign council, who was a veteran diſtinguiſhed for military ſkill and undaunted courage. The combined forces of Bern, Soleure, and Friburgh, amounted at this time to 25,000 men, and extended from the northern frontiers of the canton of Soleure beyond Friburgh; occupied the ſtrong poſition of Vailly, between the lakes of Morat and Neufchatel, and puſhed their advanced corps as far as the vallies of Ormond, towards the ſouth-eaſtern extremity of the lake of Geneva. By this poſition they covered the towns of Soleure, Bern, and Friburg, and prevented all communication between the two French armies, in the Pays de Vaud, and the biſhopric of Baſle. Erlach, having arranged his plan of offenſive operations in a maſterly manner, was confident of ſucceſs, and his troops were eager for the combat. In

this ſtate of preparation, and whilſt he was employed in diſtributing his inſtructions previouſly to an engagement, he received orders from Bern, which revoked the powers with which he had been intruſted, and commanded him to ſuſpend hoſtilities, as a negotiation was opened with the commander in chief of the French forces, general Brune. He immediately repaired to Bern, and there found the fatal aſcendancy of the French party. Diſſatisfied with Brune's ultimatum, the magiſtrates iſſued their orders to general Erlach to renew his plan of attack. But ſtill timid and wavering, they renewed their negotiations, which ſeemed merely to ſubject them to freſh inſult. In the mean while a ſpirit of diſaffection was ſpread among the troops, which Erlach, by his ſeaſonable interpoſition, ſuppreſſed; and they again prepared for attacking the enemy. But no ſooner was the order iſſued to this purpoſe, than it was again revoked, and a new conference was opened with the French general. Theſe contradictory orders rouſed the indignation of the troops, ardent for an engagement; and they withdrew all confidence from their officers, whom they regarded as accomplices in the deſtruction of their country; and many of them indignantly quitted their ſtandards. The army of Bern, thus diſpirited by counter-orders, pretended negotiations, and the gradual advances of the enemy from one advantageous poſt to another, and reduced to the number of 14,000 men, determined, however, under the command of their valiant leader Erlach, to make a final effort for expiring liberty, and to encounter 40,000 veterans, flushed with conqueſt, and in a high ſtate of diſcipline. After four deſperate engagements, Erlach reſiſted a fifth aſſault under the walls of Bern, nor did he finally abandon the conteſt, till his little army, diminiſhed to 7000 men, had loſt 2000 of their number, and the troops of the two French generals, Brune and Schawembourg, were on the point of uniting, while the capital was unprepared for a ſiege. Bern ſurrendered to the firſt ſummons of general Brune, and a tree of liberty was planted in his preſence. Erlach, having wonderfully eſcaped from the repeated aſſaults of the enemy, was haſtening towards the mountains of Oberland, with hopes of collecting his ſcattered forces for another effort; but being recognized upon the high road between Bern and Thun by ſome ſtraggling ſoldiers, he was ſeized, bound, and placed in a cart, in order to be conveyed to the capital; but another deſperate band aſſaulted him, and, amidſt reproaches and execrations, maſſacred him with their bayonets and hatchets. The ſubjugation of Bern ſpeedily decided the fate of Swiſſerland. Upon the diſſolution of the Helvetic confederacy, in 1798, Geneva, Mulhauſen, Bienne, and the biſhopric of Baſle, were annexed to France; the remainder of the country, except the Griſons, was modelled into a republic, one and indiviſible, divided into 18 departments, and governed by a ſenate, a great council, and five directors, who firſt aſſembled at Arau, and were afterwards transferred to Lucern. By the conſtitution now eſtabliſhed, Bern, including the central and weſtern part of the ancient canton, with the diſtrict of Schwartzenburgh, was made one of the 18 departments, and Bern was its capital. According to this diſtribution, the canton of Bern is bounded on the north by that of Soleure, on the eaſt by that of Lucern, on the ſouth by that of Oberland, and on the weſt by that of Sarine and Broie. During the campaign of 1799, part of Swiſſerland experienced a momentary deliverance; but from the unfortunate miſunderſtanding between the courts of Peterſburg and Vienna, the directorial government was re-eſtabliſhed. This was ſucceeded by a proviſional government, which was firſt ſeated at Lucern, and on the progreſs of the Auſtrians in 1799, removed to Bern. When peace was eſtabliſhed with the emperor by the treaty of Luneville, the French ambaſſador tranſmitted the plan of a new conſtitution; according to which, Swiſſerland, including the Griſons, was divided into 17 cantons. Accordingly, by this conſtitution of 1801, Bern, in its former extent, except the Pays de Vaud and Argovie, was the firſt of the 17 departments, or cantons, and the number of its repreſentatives deputed to the diet was nine. The whole body conſiſted of 77 members, choſen by the repreſentatives of each diſtrict, and aſſembled at Bern, to organiſe the new conſtitution. The legiſlative authority was veſted in the ſenate, compoſed of two landammans and twenty-three counſellors. The executive power was lodged in a little council of four ſenators, in which each of the landammans preſided in turn. The landamman in office was to receive a ſalary of 50,000 French livres, and the other landamman and four counſellors 10,000 each. The ſalaries of the ſenators were not to exceed 6000 livres. Each canton was governed by a prefect, nominated by the landamman, and was provided with its interior adminiſtration, which approved or rejected the projects of laws preſented by the ſenate. By the conditions of eligibility, univerſal ſuffrage was aboliſhed; and no perſon admitted to any public office, unleſs he was proprietor of land, or exerciſed an independent profeſſion, and paid a contribution to the public burdens, the amount of which was regulated by each canton. A counter-revolution afterwards took place, by which the diet was diſſolved, and the proviſional government eſtabliſhed as it exiſted before the 29th of May 1801. But the fate of Swiſſerland is not yet decided. For a further account of the alterations that have taken place from this period in the conſtitution and government of the Swiſs cantons, ſee HELVETIA. Coxe's Travels, vol. i. & ii. Planta's Hiſt. of the Helvetic Confederacy, vol. ii.

The canton of Bern is fertile and well cultivated; the plains produce corn and fruit; and the Alpine eminences afford excellent paſture, which ſupports herds of cattle and flocks of ſheep, from whoſe milk they make butter and cheeſe. The inhabitants of the diſtrict of Saanenland in this canton, are principally herdſmen and ſhepherds, who hold a middle rank between that of cultivators and wandering Tartars or Arabians. Each family changes its habitation five or ſix times in a year; and every week it is cuſtomary to meet the father of his houſhold, with his wife and children, and preceding them, herds, a cheeſe, kettle, and ſome wooden utenſils, travelling, like an ancient patriarch, in ſearch of a new reſidence. The country abounds with cots and houſes, moſt of which are conſtructed of wood, and in ſuch a manner as to be eaſily taken to pieces and removed for the convenience of their migration. In ſome of the vallies, the meadows are ſometimes twice mowed, and thus fed. The mountain herbage for the cattle continues ten or twenty weeks, according to its height and ſituation. When their winter forage is finiſhed, they remove to the loweſt parts of the mountains, and having conſumed their whole ſtock, proceed with their flocks towards the ſummits. Their progreſs is regular and majeſtic. The moſt beautiful cow of the herd, adorned with a magnificent collar and bell, takes the lead, accompanied by the maſter of the family. Then follow his attendants, with the reſt of the flocks. Shepherds and cattle are all bedecked with garlands of flowers; and every part reſounds with the jingling of bells, lowing of cows, and cheerful notes of the herdſmen. The ſmaller flocks bring up the rear, and the proceſſion is cloſed with the wife and children. Towards the end of Auguſt they again deſcend toward the lower parts, paſture the laſt graſs in the vallies, and at laſt retire to their warm retreats in the vale, to wait the return of ſpring and the ſame pleaſing migration. In this part of the country no attention is paid to the culture of the meadow land; for though they

contrive

contrive to water their meadows without any fixed rules, and dung them in winter, they never drain thofe that are marfhy, and water is left to ſtagnate on the ſides of ſlopes and declivities. In the cold vallies, where in April the ſnow remains at the depth of ſome feet, they frequently ſtrew mould on its ſurface, which ſoon melts it, and thus various gardens are cultivated in the midſt of large tracts of ſnow. Potatoes have been lately planted, and are become a favourite food of the people, and in many caſes have been ſubſtituted for bread inſtead of corn. The Alpine bean, ground into flour, ſerves the ſame purpoſe; whilſt its leaves ſupply fodder for the ſheep, and its ſtalk litter for the pens. Since the introduction of the commerce of cheeſe, the cultivation of corn has been annually decreaſing. Some few ſpots of ground are, however, ſown with wheat and barley, and others with hemp and flax, which are very thriving. The operations of the dairy render them negligent in the culture of fruit-trees; nevertheleſs, plum, cherry, pear, and apple-trees, are ſcattered here and there, but are nowhere collected into an orchard. In the German parts of Sanenland, they boil cherries with cloves and cinnamons into a kind of paſte, which is preſerved good for thirty years. Mixed with a few grains of muſtard-ſeed, and other ſpices, they uſe it as a ſweet muſtard; and beaten together with ſpices and juniper berries, they allow it to ferment, and drink it as a red beer. For want of ſome regulation about their woods, whole foreſts are cut for palings to incloſe their meadows, which ſoon become rotten, and uſeleſs even for fuel. Madder grows in this diſtrict wild and high. The moſt beautiful and moſt fertile ſpots of the canton of Berne are on the ſides of the lakes of Geneva and Neufchatel, where grow the moſt excellent fruits, and where are made the moſt valuable wines. In this canton are found a variety of coloured earths and clays, ſome of which are uſed for pottery, and ſtones of different ſorts, plaſter of Paris, cryſtal, ſalt ſprings, coal, ſulphur, mines of iron, copper, lead, and ſilver, and medicinal baths. They count in this canton 39 towns, great and ſmall, and 1300 villages. The rivers that water it, are the Aar, the Emmat, the Wigger, the Reuſz, the Limmat, the Sanen, and the Kandel. The principal lake is that of Geneva; beſides which there are thoſe of Neufchatel, Biel, Murat, or Murten, Thun, Brientz, and Halwyl, all which abound in fiſh. The part of the chain of the Alps ſeen from Bern, is diſtinguiſhed by the different names of Wetterhorn, Schreckhorn, Finſter Aar-horn, Vieſcherhorn, Exterior and Interior Eger, Eungfrace horn, Gletcher horn, Ebeneſluh, Mittaghorn, Briethom, Lauterbrunen, Blumlis Alp, and Neiſs; and it forms an amphitheatre, gradually riſing from the environs of the city to elevated peaks, covered with eternal ſnow, and hitherto inacceſſible. The Jungfrau, or Virgin, is one of the higheſt and moſt beautiful mountains in the canton of Bern.

The following table exhibits the height of the principal Alps in this canton.

The prevailing language is the German; but the people of faſhion ſpeak either French or Italian; and the common people in the Pays de Vaud, and in thoſe parts that border on France and Italy, uſe a corrupt French or Italian, or a jargon, founded on both. The eſtabliſhed religion is Calviniſm; and the miniſters are divided into deaneries and claſſes, and hold yearly chapters or ſynods. They are more independent of the civil power than in the other cantons, and are forbidden to interfere in matters of ſtate. The nobility of Bern are accuſed of an extraordinary degree of pride and ſtatelineſs, and affect to keep the citizens and perſons of lower rank at a great diſtance. As the whole power of government, and all the honourable offices of ſtate, are in their hands, they are not permitted to engage in trade; and without the places and penſions which they enjoy, they muſt be poor and wretched. The lucrative offices being thus in the hands of the nobility, it might be imagined that people of the middle and lower ranks are indigent and oppreſſed. This, however, is by no means the caſe; for the citizens, i. e. the merchants and trades-people, ſeem in general to enjoy all the comforts and conveniences of life; and the peaſantry is uncommonly wealthy throughout the whole canton of Bern. They poſſeſs the privilege of bearing arms, and form a very reſpectable body of military, that have been uſually attached to the exiſting government, and particularly favoured by it. The manufacturer, in this reſpect, leſs docile than the peaſant, is leſs regarded; and the government of Bern has been charged with diſcouraging, or at leaſt not zealouſly promoting, manufactures and commerce. Mr. Coxe informs us, that, in his firſt viſit to Swiſſerland, he found the people of Bern much leſs informed, and more indifferent about the encouragement of literature, than thoſe of the other cantons; their academical ſtudies being principally directed to thoſe branches of knowledge that fitted them for the church; and the ſociety for the encouragement of agriculture, which was almoſt the only eſtabliſhment tending to promote the arts and ſciences, obtained little countenance from government. However, in his ſecond journey, after an interval of about ten years, viz. in 1786, he ſays, that the government, rouſed from its former lethargy, had begun to perceive that it is the intereſt of every wiſe ſtate to eſteem and protect the ſciences; and that the magiſtrates had lately purchaſed and appropriated at Bern a large manſion for the public library, increaſed the collection of books, and procured from England an extenſive apparatus for experimental philoſophy. A literary ſociety had alſo been inſtituted for the promotion of phyſics, and natural hiſtory in general, and that of Swiſſerland in particular. In January 1788, this ſociety conſiſted of ten members reſident at Bern, of whom ſeveral poſſeſſed, and others were forming, collections agreeable to the plan of the inſtitution. A regular correſpondence was alſo eſtabliſhed in various parts of Europe; and the members have been diſpoſed to ſatisfy the inquiries of foreign naturaliſts relating to the natural hiſtory of this country. The principal articles of exportation from this canton are horſes, cheeſe, linen cloth, coarſe cloth and canvas made of hemp, cloth of cotton, and woollen ſtuffs. It is ſaid that 10,000 pieces of linen have been ſent annually from this canton; the principal part of which has been conveyed to Lyons. At Bern they have manufactures of ſilk, chiefly ſtuffs, and coloured ſtockings. In the weſtern part of the mountains, the principal employment is clock-making, and the poliſhing of falſe ſtones.

Bern, a city of Swiſſerland, and capital of the canton of that name above deſcribed, derives its name, as it has been ſaid, from a "bear," which was found there when its foundations were laid; "berne" in German ſignifying bears; and

and accordingly, it bears this animal in its arms, and always maintains one. It was built by Berchtold the 5th, duke of Zæringen, and was, from its foundation, an imperial city. Upon his death in 1218, the emperor Frederic II. conferred upon the inhabitants conſiderable privileges, and compiled a code, which forms the baſis of their preſent civil law. The liberty which this city enjoyed, attracted many perſons from the adjacent country, who found a ſure aſylum from the oppreſſion of the nobles. Although Bern, from its foundation, was engaged in perpetual wars with its neighbours, and for ſome time with the houſe of Auſtria, yet it continued to aggrandiſe itſelf by degrees, and conſiderably enlarged its territory.

This is a regular well-built town, with ſome air of magnificence. The principal ſtreets are broad and long, not ſtraight, but gently curved; the houſes are built of a greyiſh ſtone upon arcades, and are moſtly uniform, and of the ſame height. On each ſide are piazzas, with a wall raiſed four feet above the level of the ſtreet, which are very commodious in wet weather. A ſtream of the Aar runs in a clear current, and along a ſtone channel, through the middle of the ſtreets, which furniſhes ſeveral fountains not leſs ornamental to the place than beneficial to the inhabitants. The river Aar almoſt ſurrounds the town; winding its courſe over a rocky bed much below the level of the ſtreets, and forming by its ſteep and craggy banks a kind of natural rampart. The ſtream that paſſes through the town ſerves to keep the ſtreets always clean; for which purpoſe criminals are alſo employed in removing rubbiſh, both from the ſtreets and public walks. The more atrocious delinquents are chained to waggons, while thoſe who are condemned for ſmaller crimes, are employed in ſweeping the light rubbiſh into the rivulet, and throwing the heavier into the carts or waggons, which their more culpable companions are obliged to puſh or draw along. Theſe wretches have collars of iron round their necks, with a projecting handle in the form of a hook to each, by which on the ſlighteſt offence or mutiny, they may be ſeized, and are entirely at the command of the guard, whoſe duty it is to ſee them perform their work. People of both ſexes are condemned to this labour for months, years, or life, according to the nature of their crimes. The public buildings at Bern, as the hoſpital, the granary, the guard-houſe, the arſenal, and the churches, are magnificent, and announce the riches and grandeur of the republic. The cathedral is a noble pile of Gothic architecture, ſtanding upon a platform raiſed from the bed of the river, and commanding a moſt extenſive view. The arſenal contains arms for 60,000 men, and a conſiderable quantity of cannon, which is caſt in the town. The Berneſe value themſelves on the trophies contained in it, as well as upon the quantity, good condition, and orderly arrangement of the arms. Here is exhibited the ſtatue of William Tell, who, with an arrow, is ſaid to have ſtruck off the apple placed upon his ſon's head by the governor Grifler, and by that means ſaved his life, which occaſioned the beginning of the Swiſs republic. The granary always contains a large proviſion of corn, ſupplied in conſequence of particular treaties by France and Holland. The charitable inſtitutions in this town are numerous, and well regulated. The hoſpitals are in general large, clean, and airy; and in the alms-houſe for the reception of 50 poor citizens, is a curious eſtabliſhment ſimilar to one at Baſle, which provides for the reception of diſtreſſed travellers, who are accommodated with a meal and lodging at night, and each receives ſixpence on their departure; if ſick or wounded, they are maintained till their recovery. The houſe of correction is conducted partly on the plan of the benevolent Mr. Howard, and in conſequence of his ſuggeſtion. The delinquents are ſeparated and diſtributed in two houſes; one called the houſe of correction for greater crimes, and the other the houſe of labour for miſdemeanors. The priſoners are alſo diſcriminated by the appellations of "brown" and "blue," from the colour of their clothes; the former being appropriated to the houſe of correction, and the latter to the houſe of labour. The men and women occupy ſeparate apartments; and both are conſtantly employed in cleaning the ſtreets, and other ſervile occupations, and at other times in learning to read and write, and in acquiring the knowledge of various trades, which may enable them to gain a maintenance when their time of confinement expires. By theſe means the expence of the eſtabliſhment is nearly ſupported, and an honeſt livelihood aſſured to thoſe who would otherwiſe prove uſeleſs or pernicious members of ſociety. There are four tables, at which the reſpective ſeats are made of diſtinction appropriated to good behaviour, and a larger or leſſer ſhare is diſtributed to each in proportion to their induſtry. After earning their food, the priſoners in the houſe of labour receive 10 per cent., thoſe in the houſe of correction 8 per cent., for their extra-work. The torture at Bern is now formally aboliſhed, by a public act of government; and juſtice is wiſely and impartially adminiſtered. The ſolemnity uſed in paſſing capital ſentence on a criminal deſerves to be mentioned. When the trial is finiſhed, the priſoner is informed of his condemnation by the "grand ſautier," or lieutenant of the police, and attended by two clergymen to prepare him for death. On the day appointed for execution, a large ſcaffold, covered with a black canopy, is conſtructed in the middle of the principal ſtreet. The avoyer, with a ſceptre in his hand, is ſeated on an elevated kind of throne between two ſenators, and attended by the chancellor and lieutenant of the police, holding an iron ſtick, called "the rod of blood," all habited in their official robes. The criminal, being brought to the foot of the ſcaffold, without chains, receives the ſentence of condemnation, which is read aloud by the chancellor, at the cloſe of which the avoyer commands the executioner to approach, who inſtantly binds the arms of the culprit, and leads him away to the place of execution.

The public library is a ſmall, but well-choſen collection, containing 20,000 volumes, to which additions have been made by purchaſe, and by the liberality of private contributors; to this belong alſo a few antiques, a cabinet of Swiſs coins and medals, ſome curious manuſcripts, particularly of the thirteenth century, conſiſting of ſeveral ſongs and romances of the Troubadours, written in that and the preceding ages, and ſome other curioſities. The ſmall figure of the prieſt pouring wine between the horns of a bull, is merely valuable, becauſe it illuſtrates a paſſage of Virgil, and has been mentioned by Addiſon.

To the account of the public buildings of Bern, we may add that of an elegant edifice, built by the voluntary ſubſcription of the nobility, furniſhed with accommodations for many public amuſements, ſuch as balls, concerts, and theatrical entertainments, which latter are ſeldom permitted in this city. The walk by the great church was formerly the only public walk, and much admired on account of the view from it, and the peculiarity of its ſituation; being on one ſide on a level with the ſtreets, and on the other ſome hundred feet of perpendicular height above them. Beſides this, there is now another walk on a high bank on the ſide of the Aar, and at ſome diſtance from the town. This walk is ſingularly magnificent, commands a view of the river, the town of

Bern

Bern, the country about it, and the glaciers of Switzerland. The adjacent country is richly cultivated, and agreeably diverſified with hills, lawns, wood, and water; the river flows rapidly below, and an abrupt chain of rugged and ſnow-capt Alps bounds the diſtant horizon.

The population of Bern is eſtimated at about 13,000: the ſociety is extremely agreeable; and foreigners are received with great eaſe and politeneſs. The men do not meet in ſeparate ſocieties; and the women are the life and ornament of their daily aſſemblies, which begin about four or five in the afternoon, and continue till eight, when the parties uſually retire to their reſpective houſes. The inhabitants are particularly fond of dancing, which of courſe is a frequent amuſement; and this diverſion commences at the early hour of five in the afternoon, on account of a ſtanding order of government, which prohibits their continuance after eleven. There is but little trade in the capital. Some few manufactures, chiefly of linen and ſilk, have been eſtabliſhed; but they are carried on only by thoſe who have no proſpect of being admitted into the ſovereign council, and who would think themſelves degraded by commerce. But as offices of the ſtate, thoſe of the bailliages excepted, are neither numerous nor very profitable, many enter, as their ſole reſource, into foreign armies. As for the peaſants, who have acquired opulence either by manufactures or commerce, they ſeldom quit their ſtation, but retain the habits acquired in early life, and, however wealthy, never give their daughters in marriage to any but perſons of their own deſcription. Of the burghers of Bern, thoſe only are qualified for the magiſtracy and government of the city, who are the deſcendants of ſuch as were made burghers before the year 1635; and, beſides, they muſt not be under 30 years of age, and muſt be enrolled in one of the twelve companies. The Britiſh envoy to the Swiſs cantons uſually reſides at Bern. N. lat. 46° 55′. E. long. 7° 20′. Coxe's Travels, vol. ii. Moore's View of Society, &c. in France, Switzerland, &c.

Bern-*Machine*, in *Agriculture*, the name of an engine for rooting up trees, invented by Peter Sommer, a native of Bern in Switzerland. This machine, of which there is a model in the machine-room of the Society for the encouragement of Arts, is repreſented in *Plate* III. *Agriculture;* and conſiſts of three parts, the beam, the ram, and the lever. The beam ABC (N° 1.) of which only one ſide is ſeen in the figure, is compoſed of two ſtout planks of oak, three inches thick at leaſt, and ſeparated by two tranſverſe pieces of the ſame wood, at A and C, about three inches thick. Theſe planks are bored through with correſponding holes, as repreſented in the figure, to receive iron pins, upon which the lever acts between the two ſides of the beam, and which is ſhifted higher and higher as the tree is raiſed, or rather puſhed out of its place. The ſides are well ſecured at the top and bottom by ſtrong iron hoops. The iron pins on which the lever reſts ſhould be an inch and a quarter, and the holes through which they paſs, an inch and a half, in diameter. The poſition of theſe holes is ſufficiently indicated by the figure. The foot of the beam, when the machine is in action, is ſecured by ſtakes repreſented at G, driven into the earth. The ram D, which is made of oak, elm, or ſome other ſtrong wood, is capped with three ſtrong iron ſpikes, repreſented at *f*, which take faſt hold of the tree. This ram is ſix or eight inches ſquare; and a ſlit is cut lengthwiſe through the middle of it, from its lower end at K to the firſt ferule *a*, in order to allow room for the chain *gh* to play round the pulley K, which ſhould be four inches thick, and nine inches in diameter. This ram is raiſed by means of the chain *gh*, which ſhould be about ten feet long, with links four inches and three quarters in length, and an inch thick. One end of this chain is faſtened to the top of the beam at C, while the other, after paſſing through the lower part of the ram, and over the pulley K, terminates in a ring or link, repreſented N° 3, the two ears *mn* of which ſerve to keep it in a true poſition between the two planks of the beam. In this ring the hook F is inſerted. The hook is repreſented in profile N° 2, where F is the part that takes hold of the ring. But it muſt be obſerved, that the parts of this machine, repreſented in N° 2, 3, are drawn on a ſcale twice as large as the whole engine. The hook F, N° 2, ſhould be made of very tough iron, as well as the handle D, and the arch Ee. This handle ſhould be two inches thick at *z*, where it joins to the hook, and the thickneſs gradually leſſens by degrees up to the arch, which need not be more than half an inch thick. On each ſide of the pin *z*, is a ſemicircular notch, *x*, *y*, which reſts alternately on the pins when the machine is worked. The hole D, and the arch Ee, ſerve to fix a long lever of wood EF, N° 1, by means of two iron pins; and by this contrivance the lever is either raiſed or depreſſed at pleaſure, in order to render the working of the machine eaſy in whatever part of the beam the lever may be placed; for without this contrivance the extremity of the lever EF, would, when the handle is near the top of the beam, be much higher than men ſtanding upon the ground could reach. It muſt however be remembered, that the lever is often ſhortened by this contrivance, and conſequently its power leſſened.

The machine is worked in the following manner: It is placed againſt a tree, in the manner repreſented in the figure, ſo that the iron ſpikes at *f* may have hold of the tree, and the end of the beam A be ſupported by ſtakes repreſented at G. The iron handle N° 2, is placed in the opening between the two planks of the beam, and the wooden lever fixed to it, by means of the iron pins already mentioned. The hook F takes hold of the chain, and one of the iron pins is thruſt into the outer row of holes, by which means the outer notch *x* will reſt on the pin, which will be now the centre of motion; and the end of the lever E, N° 1, being preſſed downwards, the other notch *y*, N° 2, will be raiſed, and at the ſame time the chain, and conſequently the ram. The other iron pin is now to be thruſt into the hole in the inner row, next above that which was before the centre of motion, and the end of the lever E elevated or puſhed upwards, the latter pin on which the notch *y* reſts now becoming the centre of motion. By this alternate motion of the lever, and ſhifting the pins, the chain is drawn upwards over the pulley K, and conſequently the whole force of the engine exerted againſt the tree. There it a ſmall wheel at L, in order to leſſen the friction of that part of the machine.

From this account the reader will very eaſily perceive that the machine is nothing more than a ſingle pulley compounded with a lever of the firſt and ſecond order. It muſt, however, be remembered, that as the puſh of the engine is given in an oblique direction, it will exert a greater or leſſer force againſt the horizontal roots of the tree in proportion to the angle formed by the machine with the plane of the horizon; and that the angle of 45° is the maximum, or that when the machine will exert its greateſt force againſt the horizontal roots of the tree.

BERNABEI, Ercole, in *Muſical Biography*, the ſcholar and ſucceſſor of Benevoli at St. Peter's, and inſtructor of the abate Steffani, may be ranked among the greateſt maſters of harmony, in the ancient eccleſiaſtical ſtyle, of the 17th century. This compoſer being invited by the elector of Bavaria to Munich, about the year 1650, entered into the ſervice of that court, where he continued the reſt of his life. His ſon, Guiſeppe Ant. Barnabei, after following his father's ſteps in the ſtudy of eccleſiaſtical harmony, ſurpaſſed him conſiderably

conſiderably in melody and modulation, as he lived long enough to ſee a great relaxation in the rigour of ancient rules. There is a canon by this compoſer in the firſt volume of Paolucci, page 158, and an excellent Agnus Dei, in P. Martini Sagg. di Contrap. II. 127, extracted from his maſs, for four voices, intitled, "Laudate cum lætitia, qui fuiſtis in triſtitia." After ſucceeding his father as maeſtro di capella to the elector of Bavaria, by whom he was honoured with the title of conſeiller aulique, and publiſhing ſeveral compoſitions for the church, replete with muſical ſcience of the firſt claſs, he lived till the year 1732, extending his exiſtence to the great age of eighty-nine.

Theſe maſters, with many other good harmoniſts, in the ſtyle of the 17th century, ſupplied the churches of Italy with innumerable compoſitions, in which the chief merit conſiſted in pure harmony, and the contrivance of canon, fugue, and imitation on ſimple and often inſipid ſubjects; but to theſe excellencies the beſt moderns have added melody, a more varied modulation, and not only an attention to long and ſhort ſyllables, but to the expreſſion of words. In the 15th century almoſt every maſs was compoſed upon the ſubject of ſome well-known ſong or ballad; but theſe airs being pſalmodic, and a little more lively or varied than canto fermo, admitted of no greater variety of modulation than the ancient chants of the church, upon fragments of which, during the 16th and part of the 17th centuries, it was thought neceſſary to conſtruct the chief part of choral muſic. Though the preſent ſtudents in counterpoint at Naples, and other parts of Italy, ſtill exerciſe themſelves in harmonizing canto fermo, the writing maſſes or motets on the ſubjects of theſe chants is ſeldom done but in pure pedantry, and to give an air of antiquity to dry and fancileſs compoſitions.

The church ſtyle of compoſition was, however, much altered during the 17th century, not only by the imitation of dramatic muſic, and the introduction of inſtruments, but by writing in tranſpoſed keys, and ſupplying the deficiencies in the ſcales, which too ſtrict an adherence to the ſpecies of octave, and modes of the church, had occaſioned. Indeed, before this time, there was no deciſion of keys, either in ſacred or ſecular muſic, according to our preſent rules of beginning and ending upon the chord major or minor, of the key note, or of ſome determinate note in the ſcale.. The prohibitions were ſo numerous in the writings of the old theoriſts, that if the moſt regular modern compoſitions were tried by ſuch rules as ſubſiſted at the beginning of the 17th century, they would appear extremely licentious. No part was to be extended above or below the ſtaff, or five regular lines, on which it was written; the combination of chords was never to be broken by moving to an unrelative harmony; and the intervals of the ſharp ſeventh, the tritonus, or ſharp fourth, falſe fifth, ſharp ſecond, and even the major ſixth, were prohibited. Indeed, an excellent compoſition might now be produced, merely from ancient diſallowances.

BERNACCHI, Antonio, an eminent opera ſinger, who firſt arrived in England in 1716, as ſecond man, while Nicolini was the firſt. Bernacchi's voice ſeems to have been feeble and defective, but he ſupplied the defects of nature by ſo much art, that his performance was always much more admired by profeſſors than by the public in general. He ſtaid here at this time but one year, after which he went back to Italy; but returned in 1729. After quitting the ſtage, Bernacchi eſtabliſhed a ſchool for ſinging at Bologna, where he had himſelf been educated, under the celebrated Piſtocchi, and where he formed ſeveral admirable ſcholars, who rendered his name and ſchool famous. He came to England a ſecond time in 1729, but he was now paſt his meridian; his voice was never good, but now little was left, except a refined taſte, and an artificial manner of ſinging, which only profeſſors, and a few of the moſt intelligent part of an audience, could feel or comprehend. After he quitted the ſtage, he retired to Bologna, where he formed ſo many great vocal performers by his inſtructions, that to have been of Bernacchi's ſchool was almoſt ſufficient to eſtabliſh the reputation of a young ſinger.

BERNADA, or Bernalda, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra, 5 miles weſt of St. Severina.

BERNAGORE, a town of Hindoſtan, in the country of Bengal, on the eaſtern bank of the Ganges, 10 or 12 leagues below Chinſurah, and 5 miles N.W. of Moorſhedabad. The coarſeſt ſorts of blue handkerchiefs are made here. It is famous on account of the great number of ladies of pleaſure, who reſide there, and who pay a monthly recognition to the fiſcal of Chinſurah, for the free exerciſe of their profeſſion. It belonged to the Dutch; but was taken by the Britiſh forces in October, 1803.

BERNAL, a hill on the weſt coaſt of New Mexico, near the coaſt, and 4 leagues W.S.W. of the burning mountain of San Salvador. N. lat. about 13°. W. long. about 93°.

BERNARD, in *Biography*, abbot of Clairvaux, and a ſaint of the Romiſh church, was born of a noble family at Fontaine in Burgundy, in 1091, and educated at the church of Chatillon, where he manifeſted at an early period an ardent ſpirit of devotion. At the age of 23, he, and 30 of his companions, entered into the abbey of Citeaux, lately founded by St. Robert. Here he acquired ſuch reputation, that, within two years, viz. A.D. 1115, he was deputed, with a colony of monks, to found the abbey of Clairvaux in the dioceſe of Langres, of which he was created the firſt abbot, and where he continued, without ſeeking or accepting any higher preferment. In a ſhort time he found himſelf at the head of 700 novices; and, by his eloquence and zeal, Clairvaux became a ſeminary of the moſt diſtinguiſhed reputation, ſo that, during the life of the founder, it produced one pope, ſix cardinals, and thirty prelates. In this retreat the influence of Bernard was greater than if he had occupied the throne of St. Peter; he was conſulted as an oracle; his cenſures were regarded with awe in the remoteſt parts of Europe; and the Ciſtercians, by his example, became ſo powerful, that he lived to ſee the eſtabliſhment of 160 convents, which acknowledged him as their head. Having exerted himſelf in reſtoring peace to the church, which had been interrupted by the ſchiſm that had happened between the years 1131 and 1138, he engaged in combating the ſuppoſed hereſy of Abelard, who had propagated ſome opinions that were thought to militate againſt the doctrines of the church, and ſucceeded in procuring his condemnation by the council of Sens, in 1140. He alſo refuted the errors of Peter de Bruys (ſee Petrobrussians); combated the fanaticiſm of the Apostolics; reſiſted the monk Raoul, who recommended the extermination of the Jews; contended againſt the followers of Arnold of Breſcia; and cauſed Gilbert de la Porrie, and Eon de l'Etrile, to be condemned by the council of Rheims, in 1148. But his influence was much more ſignally exerted in promoting the ſecond cruſade againſt the Saracens. In this romantic expedition, he engaged, by his eloquence, Lewis VII. of France, with his principal nobles, and the emperor Conrad; and he boaſts, that from Conſtance to Cologne, he emptied cities and caſtles of their inhabitants, and verified the prediction of only one man being left to ſeven women. Miracles of various kinds were reported to have attended his miſſion, and he obtained the appellation of "Thaumaturgiſt," or wonder-worker of the weſt. The enterpriſe which he had entruſted with Conrad and Lewis, proved unfortunate; and the abbot who had predicted their ſucceſs, incurred a variety of cenſures and reproaches on account of the calamities which he had

been inſtrumental in bringing upon Europe. He attributed its failure to the ſins of the croiſes, which had hindered the accompliſhment of his propheeies. How far he was affected by the diſcomfiture and general diſtreſs in which this expedition terminated, or by the accuſations he ſuffered, it is impoſſible to ſay. However, it is certain that he did not long ſurvive that diſaſtrous event; for he died at Clairvaux, in 1153, in the 63d year of his age.

Few men poſſeſſed a more extenſive and uncontroulable command over the minds of men than St. Bernard: and his influence was wholly owing to his perſonal qualifications. But though he had an abſolute command by his eloquence and writings, he ſeems to have been more an enthuſiaſt than a politician, and to have wanted worldly wiſdom to direct and manage the various engines which he put into motion. With good intentions he blended paſſion and prejudice, and the love of power. He was, without doubt, a man of diſtinguiſhed piety, as well as integrity; and, conſidering the time in which he lived, an elegant and learned ſcholar. Eraſmus gives the following character of him: "Chriſtianè doctus, et ſanctè facundus, et piè feſtivus." As a writer, he was copious; his ſtyle was characterized by force, vivacity, elevation, and ſweetneſs; and his imagination furniſhed him with figures of compariſon and ſtrong antitheſes in great variety and abundance; ſo that he has been regarded as the laſt of the fathers formed upon the models of St. Ambroſe and St. Auguſtin. The beſt edition of Bernard's works is that of the learned Benedictine Mabillon, in 2 vols. fol. firſt printed at Paris in 1666, 1667, and reprinted in 1690 and 1719. A Latin impreſſion of this edition was made at Venice, in 6 vols. fol. Cave's Hiſt. Lit. ii. p. 186. Gen. Dict. Nouv. Dict. Hiſt. Moſheim's Eccl. Hiſt. vol. iii. p. 66.

Bernard *of Menthon*, the founder of a religious community, was born in the Genevois, in 903, and deſcended from one of the moſt illuſtrious houſes of Savoy. Having dedicated himſelf to the eccleſiaſtical profeſſion, he retired to Aoſta, a ſmall town at the foot of the Alps, and became archdeacon of its church. Here he employed himſelf in miſſions among the unconverted Pagans, who inhabited the mountains, and proſelyted them to Chriſtianity. Having witneſſed the hardſhips and dangers encountered by the French and German pilgrims, in their paſſage to Rome over the Alps, which Hannibal had anciently traverſed with ſingular fortitude and perſeverance, this benevolent monk founded two monaſteries or hoſpitia, for their relief, on Mont-joux, called from him "Great and Little St. Bernard." Theſe were peopled with canons-regular of St. Auguſtin, and Bernard himſelf became their firſt provoſt. He obtained ſeveral important privileges for his eſtabliſhment from ſucceſſive popes, and it acquired great popularity and large poſſeſſions. Bernard died at Novara, at the age of 85, and was canonized by the Romiſh church. His inſtitution has undergone a variety of viciſſitudes, and loſt great part of its riches; but it ſtill ſubſiſts, and is eminently uſeful. There are ordinarily between twenty and thirty monks belonging to the convent; eight of whom are uſually diſperſed among the Alpine pariſh churches, under their patronage; and ten or twelve conſtantly reſide, being ſuch as, from their age and health, are able to bear the keen atmoſphere of the mountain. The few others, who can no longer bear it, are permitted to reſide with the aged provoſt of the whole, in a houſe belonging to the convent, and ſituated at Martigny below. The monks of the mountain are induſtriouſly employed in the proſecution of their private ſtudies, in the inſtruction of their novices, in the education of ſome ſcholars who are ſent to board and lodge with them, and in managing the temporal economy of the whole. They have a prior, the deputy of the provoſt, and governor of the convent in his abſence; a ſacriſtan, who takes care of their chapels; a cellarer, ſerving as purveyor, comptroller of the kitchen, and managing all the exterior concerns of the monaſtery; a clavandeer, who keeps the keys, and diſpenſes the requiſite articles to the monks and to the travellers; and an infirmier, who takes care of the ſick in the apartment appropriated to them. The cellarer keeps twenty horſes conſtantly employed during the ſummer in fetching the magazines of flour, bread, cheeſe, liquors, and dried fruits, for themſelves and their gueſts; and forage for the milch cows and fatting cattle, during winter. Their firewood, of which they expend a great quantity, is brought to them on the backs of mules, from the diſtance of four leagues, and by a ſteep path, that is paſſable only for ſix months in the whole year. Before the winter ſets in, they ſend down their horſes for the ſeaſon to a farm which they have on the northern ſide of the Rhone. To a ſympathiſing and compaſſionate mind it is peculiarly pleaſing to obſerve the ſolicitude of theſe amiable monks on ſuch days as the paſs is moſt frequented, in perſonally receiving, warming, and recovering travellers, that are exhauſted by their exceſs of fatigue, or indiſpoſed from the ſeverity of the air. With equal attention they relieve both their own countrymen, and foreigners. They make no diſtinction of ſtate, ſex, or religion; and aſk no queſtions concerning the country or the creed of the wretched. In winter and in ſpring, their ſolicitude has a larger range of attention and activity. From that very time nearly, in which Hannibal conducted an army over Great St. Bernard, and at which the Romans reckoned the general winter of Italy to commence, from the 1ſt of November, through the winter, to the 1ſt of May, a truſty Alpine ſervant, who, as an Alpine, is denominated a Maronnier, and one or two dogs of an extraordinary ſize accompanying him, are conſtantly engaged in going to meet travellers a conſiderable way down the deſcent towards the Vallais. Theſe dogs poſſeſs an inſtinct, and receive a training, which fit them to be peculiarly uſeful in their employment. They point out the road to the guide and the travellers, through fogs, tempeſts, and ſnows; they have alſo the ſagacity to diſcover travellers that have loſt their way, that have fallen amidſt the drifts of ſnow, and that are lying upon them, wearied and exhauſted. The monks themſelves often accompany the guide, and aid him in adminiſtering neceſſary relief. Apprized of the benumbing and ſtupefying effect of extreme cold, they rouſe the ſleeping travellers, and exert themſelves in a variety of ways in preſerving and recovering them from approaching or apparent death; and in doing this, they expoſe themſelves to great danger. In order to avoid the numbneſs occaſioned by the cold, they carry with them ſhort thick ſtaffs, armed at the ends with iron, and with theſe they continually ſtrike their hands and feet. About three miles below the convent, on the road of Hannibal's aſcent, they have built a ſmall vaulted room, called the hoſpital, which is intended for the caſual refreſhment of travellers benumbed, and unable to reach the convent. The truſty Maronnier viſits it frequently, in order to meet the traveller; but principally at the approach of night, and on his return leaves bread, cheeſe, and wine. On extraordinary occaſions, when a ſtorm ſubſides, he ſallies forth to this building, with his ſtock of wine and meat, and aſſiſts all whom he finds diſtreſſed. The monks themſelves are often ſeen on the tops of their rocks, watching opportunities for the exerciſe of their humanity. When the ſnow juſt fallen is deep on the ground, they employ themſelves in making roads through it, and thus by timely vigilance prevent many fatal accidents. But notwithſtanding all their charitable efforts, ſcarcely a winter paſſes in which ſome traveller is not brought to the convent with his limbs benumbed and frozen. The traveller is ſometimes overwhelmed at once, and plunged into the body of deſcending ſnow. When he is not very deep, the dogs

discover him by the scent, and when they fail, the monks engage in the laborious office. They range upon the snow, and found it with long poles: and they have thus rescued many from imminent danger of being lost. Nouv. Dict. Hist. Saussure Voy. des Alpes, vol. ii. Whitaker on the Course of Hannibal over the Alps, &c. 1794. See BERNARD, in *Geography*.

BERNARD, ANDREW, a Latin scholar, and successively poet-laureat to Henry VII. and Henry VIII., was a native of Thoulouse, and an Augustin monk. He was not only the king's poet-laureat, as it is supposed, but his historiographer, and preceptor in grammar to prince Arthur. He obtained many ecclesiastical preferments in England. The pieces which he wrote under the character of poet-laureat, are in Latin. These are "An Address to Henry VIII. for the most auspicious beginning of the 10th year of his reign," with an "Epithalamium on the marriage of Francis, the dauphin of France, with the king's daughter;" "A new year's gift," for the year 1515; and "Verses," wishing prosperity to his majesty's 13th year. He has left some Latin hymns; and many of his prose pieces in Latin, written as historiogapher to both monarchs, are extant. Warton's Hist. Eng. Poetry, vol. ii. p. 132.

BERNARD, EDWARD, a learned English astronomer and linguist, was born at Perry St. Paul, near Towcester, in Northamptonshire, in 1638, and educated at Merchant-Taylors' school in London, whence he was removed, in 1655, to St. John's college in Oxford. Here he applied himself with the utmost diligence to the study of history, philology, and philosophy; and acquired an accurate knowledge, not only of the Greek and Latin languages, but of Hebrew, Syriac, Arabic, and Coptic: he also directed his attention to the mathematics, which he studied under the celebrated Dr. Wallis. Having taken several academical degrees at Oxford, and engaged the esteem of all who knew him, by his distinguished talents and learning, and no less amiable temper, he removed in 1668 to Leyden, with a view of examining several oriental MSS., and particularly the Arabic version of the three lost Greek books of Apollonius Pergæus's conic sections, brought from the east by James Golius. These books he transcribed, with an intention of publishing them at Oxford, but his design was never executed. Upon his return to Oxford, he resumed his studies with fresh vigour, and by his collation of the most valuable MSS. in the Bodleian library, the result of which he was always ready to communicate, he was engaged in a very extensive correspondence with learned men of most countries. About the year 1669, he was recommended by the famous Dr. (afterwards sir Christopher) Wren, Savilian professor of astronomy at Oxford, to be his deputy, and he succeeded this eminent professor, on his resignation in 1673. He had been previously inducted to the rectory of Cheame in Surry, and appointed chaplain to Dr. Mews, bishop of Bath and Wells. A scheme having been proposed in the university of Oxford, which was chiefly promoted and encouraged by bishop Fell, for collecting and publishing all the ancient mathematicians, Bernard, who first formed the project, assiduously engaged in accomplishing it, by collecting all the old books and MSS. in the public libraries, and drawing up a synopsis of their contents. He also printed, at his own expence, as a specimen of this noble design, a few sheets of Euclid in folio, containing the Greek text and a Latin version, with Proclus's commentary in Greek and Latin, and learned scholia and corollaries. With a view of promoting the study of astronomy, he also undertook an edition of the "Parva Syntaxis Alexandrina," or "Μικρὸς Ἀστρονόμος," of which there is an account in the "Veterum Mathematicorum Synopsis," and in which, besides Euclid, are contained the small treatises of Theodosius, Autolycus, Menelaus, Aristarchus, and Hypsicles; but this was never published. In 1676, he was sent to France by king Charles II. as tutor to his two natural sons, by the duchess of Cleveland; but his disposition and habits not being adapted to this situation, he returned, after a year's absence, to his studious retirement at Oxford. During his stay at Paris, however, he cultivated an acquaintance with several learned persons, collated various ancient and valuable MSS., and bought many scarce and curious books for his own library. At Oxford he pursued his studies with renewed alacrity; and besides mathematics, to which he applied according to the duty of his professorship, he devoted himself from inclination to the prosecution of history, chronology, and antiquities. At this time he undertook a new edition of Josephus, which he never completed. In 1683, he visited Holland, for the purpose of attending the sale of Nicholas Heinsius's library, where he purchased many valuable books; and on this occasion he renewed, or contracted an acquaintance with several persons of eminent learning. As he experienced many civilities from the Dutch, and found that in Holland he should enjoy favourable opportunities for making great improvement in oriental learning, he seemed much inclined to settle at Leyden; but disappointed in his expectation of being chosen professor of the oriental tongues in that university, he returned to Oxford. In 1684, he took his degree of doctor in divinity; and in 1691, he was presented to the rich rectory of Brightwell in Berkshire, which being at the distance of about 9 miles from Oxford, allowed of his occasional residence in this city. Soon after he resigned his professorship of astronomy, which had been for some time irksome and unpleasant to him, in favour of Dr. David Gregory, professor of mathematics at Edinburgh. In 1692, he superintended the preparation of a catalogue of the MSS. in the libraries of Great Britain and Ireland, and in some foreign libraries; and in the following year he married an agreeable lady in the bloom of youth, with whom he lived very happily. In 1696, he attended the sale of Golius's MSS. in Holland; and not long after his return fell into a constitutional decline, of which he died in January 1697; and he was interred in St. John's college chapel. His widow erected a monument of white marble, in the middle of which there is carved the figure of a "heart," circumscribed, according to his own direction, by these words; "Habemus Cor Bernardi." The publications of Dr. Bernard, were some astronomical papers in the Philosophical Transactions, N° 158. p. 567. N° 163. p. 721. and N° 164. p. 747; "A Treatise on the ancient weights and measures," first printed at the end of Dr. Pococke's Commentary on Hosea, and afterwards reprinted in Latin, with great additions and alterations, Oxon. 1688, 8vo.; "Private Devotions, &c." Oxford, 1689, 12mo. "Orbis eruditi literatura, a charactere Samaritico deducta," in a large sheet of engraving, exhibiting at one view the alphabets of many nations, together with the abbreviations used by the Greeks, physicians, mathematicians, and chemists; "Etymologicum Britannicum," Oxon. 1689, printed at the end of Dr. Hickes's Grammatica Anglo-Saxonica, &c.; "Chronologiæ Samaritanæ Synopsis," published in the "Acta Eruditorum Lipsiensia," April, 1691. He was also the author of some notes and commentaries, printed in editions of learned works. He likewise assisted several learned persons in their editions of books, and collated MSS. for them. Among his papers were found many MSS. of his own composition, with very large collections; which, together with several of his books, were purchased by the curators of the Bodleian library. The rest of his books were sold by auction. Of his great and extensive learning, his works are a sufficient evidence. Dr. Smith, his biographer, represents him as a man of a meek, mild, and conciliating disposition, averse from contests of

every kind, modeſt in delivering his own opinions on diſputed ſubjects, candid in his judgment of other men's performances, ſteadily attached to the eſtabliſhed church, and at the ſame time liberal in his ſentiments with regard to diſſenters of all denominations, and deſirous of peace and union. His piety was ſincere and unaffected; and his devotions, both public and private, were regular and exemplary. The learned Huetius, in his "Comm. de rebus ſuis," bears this concife but very honourable teſtimony to his memory: "Edwardus Bernardus Anglus, quem pauci hac ætate equiparabant eruditionis laude, modeſtiâ vero pene nulli;" i. e. Edward Bernard, an Engliſhman, whom few in this age equalled in erudition, in modeſty ſcarcely any. Biog. Brit. Gen. Dict.

Bernard, James, was born in 1658, at Nions in Dauphiné, ſtudied at Geneva, and became paſtor of the church in his native province. But being driven from France by perſecution, he ſought refuge firſt at Geneva, then at Lauſanne, and afterwards in Holland, where he was employed as a penſionary miniſter at Gouda. In 1705, he was choſen paſtor of the Walloon church at Leyden, and ſoon after was appointed profeſſor of philoſophy and mathematics in that univerſity, and received a doctor's degree. He cloſed his life of literary labour in 1718. He was the author of ſeveral political and hiſtorical works; in 1699, he undertook the continuation of Bayle's "Nouvelles de la republique des lettres," which he continued till 1710, and reſuming it in 1716, continued it till his death. He alſo wrote a great part of the 20th to the 25th vols. of Le Clerc's "Bibliotheque Univerſelle;" and a "Supplement to Moreri's Dictionary," in 1 vol. fol. Amſt. 1714. He alſo publiſhed ſeveral theological and hiſtorical treatiſes, in the compoſition of which he has diſplayed more learning and induſtry than genius and ſkill. Nouv. Dict. Hiſt.

Bernard, Peter-Joseph, a French poet, was the ſon of a ſculptor at Grenoble, and born in 1708. Having been educated in the college of the Jeſuits at Lyons, where he made rapid progreſs in literature, he rambled to Paris in purſuit of pleaſure and liberty, and for two years employed himſelf as clerk to a notary; but here he publiſhed ſome light poems which attracted notice, and in 1734 he was taken to the campaign in Italy by the marquis de Pezay, and acquitted himſelf with honour at the battles of Parma and Guaſtalla. The commander in chief, the marſhal de Coigne, pleaſed with his talents, appointed him his ſecretary, and procured him the poſt of ſecretary-general to the dragoons. He continued with the marſhal till his death in 1756. He afterwards lived in the circle of faſhion and pleaſure at Paris, till the year 1771, when the loſs of his memory reduced him to a mere ſtate of vegetation, in which he continued till his death in 1776. His works are all in the eaſy, elegant, and voluptuous kind. His firſt performances conſiſt of anacreontics and ſongs, in ſhort and playful meaſures, from which he obtained the appellation of "le gentil Bernard." He afterwards wrote the opera of "Caſtor and Pollux," and a ballet called "Les Surpriſes de l'amour." His principal poem is "L'art d'aimer," in three cantos, in which are ſeveral tender paſſages, but in point of ſtyle negligently written. His poetical tale intitled "Phroſine et Melidore," is of ſimilar character. A collection of his works has been publiſhed, and the following lines of Voltaire are prefixed:

"Les trois Bernards."

"Dans ce pays trois Bernards ſont connus:—
L'un eſt ce ſaint, ambitieux reclus;
Prêcheur adroit, fabricateur d'oracles:
L'autre Bernard eſt l'enfant de Plutus,
Bien plus grand ſaint, faiſant plus grands miracles:
Et le troiſieme eſt l'enfant de Phébus,
Gentil Bernard, dont la muſe feconde
Doit faire encor les délices du monde,
Quand de premiers on ne parlera plus."

The ſecond, "Bernard" above mentioned is "Samuel," the famous financier under Lewis XIV., called the Lucullus of the age. Nouv. Dict. Hiſt.

Bernard *of Bruſſels*, a painter of animals and hunting-pieces, in which he excelled, by giving to his wild animals a ſtrong and ſpirited expreſſion. He was patroniſed by Margaret, counteſs of the Netherlands, for whom he deſigned ſubjects for tapeſtry, and in the ſervice of the emperor Charles V. he painted hunting-pieces, in which he introduced the portraits of the emperor and of all his attendants. In a picture of the laſt judgment, he covered the pannel with leaf-gold, before he laid on his colours, and thus preſerved them from changing, and gave to his tints a heightened luſtre. This method is ſaid to have produced a happy effect, particularly in the ſky. He died in 1540; the time of his birth is not known. Pilkington.

Bernard, Solomon, an ingenious engraver, was a native of France, and reſided chiefly at Lyons. He worked chiefly for the bookſellers, and his engravings were deſigned with ſpirit, and executed in a clear, neat ſtyle. He appears by his works to be a man of great genius, and fertile invention. His moſt eſteemed performance is a ſet of prints for the Bible. He flouriſhed from 1550 to 1580. Strutt.

Bernard, Francis, doctor in medicine, was principal phyſician to king James II., and in conſiderable practice. He left a large collection of ſcarce and valuable books, which was ſold, in 1698, the year after his death, for 1600l. His brother Charles, who was ſurgeon to the princeſs Anne, and who had the ſame paſſion for collecting books, left alſo a curious library, which was ſold by auction in 1711. The "Speccio della Beſtia triomfante," by Jordano Bruno, an Italian atheiſt, which was in this collection, was ſold, as we learn from the Spectator, N° 389, for 30l. This book was printed, Ames ſays, in England in 1584, by Thomas Vantrollier. An Engliſh edition of it was printed in 1713. New Gen. Biog. Dict.

Bernard, Christopher. This ſurgeon, who lived in the beginning of the 18th century, is only known as the author of two books, very popular in their time, though now in little requeſt. "The preſent ſtate of ſurgery, with ſome remarks on the abuſes committed in it," London, 4to. 1703. "The crafts and frauds of phyſic exploded, diſcovering the low prices of the beſt medicines," 8vo. 1703. Haller. Bib. Med.

Bernard, *St.* in *Geography*, a town of Germany, in the archduchy of Auſtria, 2 miles N.W. of Horn.—Alſo, an iſland of North America, in the lake of Nicaragua.

Bernard, ſouth end of a ſmall ſand between Southwold and Leoſtoff, on the coaſt of Suffolk, the north end of which is called "Newcomb," about a mile from the ſhore, within which ſmall veſſels may paſs in good weather and a full ſea.

Bernard *River*, a river on the weſt coaſt of France, which falls into the bay within the iſland of Belleiſle.

Bernard's *Bay*, lies on the N.W. ſide of the gulf of Mexico. The paſſage into it, between ſeveral iſlands, is called Paſco de Cavallo. N. lat. 28° 30'. W. long. 96° 16'.

Bernard, *Great St.*, a mountain which is a branch of the Alps (the Alpes Penninæ of ancient writers), that ſeparates the Lower Valais from Savoy, and particularly from the duchy of Aoſta, in the principality of Piedmont, and from which flows into the former country the river Drance, and into the latter, the Doire. On the ſummit of this mountain is the monaſtery of St. Bernard (ſee Bernard), ſuppoſed to be 8006 feet above the level of the Mediterranean. N. lat. 45° 48'. E. long. 7° 2'. It was by this track that Hannibal is ſuppoſed to have conducted the Carthaginian army into

Italy; and it was in the same direction that Bonaparte, the consul of France, led his army of reserve over the Alps, previously to the battle of Marengo, in the year 1800.

Bernard, *Little St.*, a part of the Alps (anciently Alpes Graiæ), separating the duchy of Aosta from Savoy, and lying to the south-west of the former. Over this lies a road into Savoy, and upon it is a monastery or hospitium for the convenience of travellers.

Bernard *the Hermit*, in *Entomology*, the name by which *Cancer bernhardus* is very commonly known. This creature is also called the hermit crab; a name indiscriminately applied to all the parasitical species of the cancer genus; or, in other words, to all those which having no shelly covering to protect the body, inhabit the shells of whelks, or other testaceous animals. See Pagarus *Fabr.*

BERNARDI, Steffano, in *Biography*, was a learned theorist in *Music*, as well as composer of masses and madrigals of a most elaborate and correct kind. He flourished from 1611 to about 1624, and in 1623 was maestro di cappella of the Duomo, at Verona. He published a didactic work, called "Porta Musicale," the first part of which appeared at Verona, 1615, in quarto; and, as an elementary tract, it has the merit of clearness and brevity.

BERNARDIA, in *Botany*. See Adelia.

BERNARDIN, in *Biography*, a Romish saint, denominated *of Sienna*, was born at Massa, in Tuscany in 1380, according to Mr. Warton, but in 1383, according to M. Du Pin. After studying at Sienna, he entered into the confraternity of the hospitallers of la Scala, and distinguished himself by his attendance on those who were afflicted with the plague. In 1404 or 1405, he became a member of the Franciscan order, and afterwards an eminent preacher. Besides the natural and acquired talents which he possessed, the power of working miracles was ascribed to him both during his life and after his death. He visited Jerusalem under the character of commissary of the Holy Land, and after his return visited several cities of Italy, where he preached with great applause. Being accused to pope Martin V. for maintaining some erroneous opinions, he explained himself to the satisfaction of the pontiff, and was absolved. Such were his humility and self-denial that he refused several bishoprics, and contented himself with the office of vicar-general of the observance of St. Francis in Italy, and as such, reformed, or newly founded 300 monasteries. He died at Aquila in Abruzzo in 1444, and was canonized in 1450 by pope Nicholas V. He left several works, which were printed at Venice in 1591, 4 vols. 4to.; and at Paris in 1636, 2 vols. fol. They consist of religious treatises, sermons, commentaries on the Apocalypse, &c. Du Pin. Gen. Dict.

Bernardin, or *Bernhardin*, in *Geography*, a mountain of Switzerland, being part of the Alps, separating the district of Rheinwalden from the vallies of Calanca and Masox. In this mountain springs the river Musa, which flows down the Val Masox, and forms a junction with the Tesino, above Bellinzone.

BERNARDINS, or Bernardites, in *Ecclesiastical History*, the name of a religious order, differing very little from the Cistercians. They derived their name and order from St. Bernard, abbot of Clairvaux, who was considered as the second parent and founder of the Cistercians. (See Bernard.) Their usual habit is a white gown, with a black scapulary; but when they officiate, they put on a large white coul with great sleeves, and a hood of the same colour.

BERNARDO, St. in *Geography*, an island, or rather group of islands in the South sea, called St. Bernardo of Mendana, and supposed by M. Fleurieu, in his "Discoveries of the French in 1768 and 1769, &c." to be Mr. Byron's "Isles of Danger." Mendana says, that St. Bernardo is in S. lat. 10° 30′, and 1400 (Spanish) leagues from Lima, i. e. allowing Lima to be in W. long. 77° 50′, and 1400 leagues in the latitude of 10° 30′ to make 81° 30′ of longitude, the longitude of St. Bernardo will be about 159° 20′. But the situation of St. Bernardo may be more accurately determined from that of the Marquesas, placed by Capt. Cook, in his second voyage, in W. long. 139° 9′: for Figueroa says, that Mendana sailed west 400 (Spanish) leagues from the Marquesas, before he made St. Bernardo; and 400 Spanish leagues in the lat. of 10°, making 23° 13′ difference of longitude; if this be added to 139° 9′, we shall have 162° 22′ W. for the longitude of St. Bernardo. Com. Byron places the Islands of Danger in S. lat. 10° 58′, and W. long. 169° 53′; but Mr. Wales, who collated and published the astronomical observations which were made in Hawkesworth's voyages for the Board of Longitude, reduces this longitude to 165° 59′ W., exceeding that of Mendana only by 3° 37′. Mr. Fleurieu joins M. Pingré (see "Memoire sur le Transit de Venus," Paris, 1767, p. 51.) in thinking that this island is not the same with that which Quiros saw, and called St. Bernardo, in 1605; but Mr. Dalrymple thinks that they are the same; and it is probable that Quiros thought so; for in enumerating *his own* discoveries to Philip II. of Spain, in the memorial which he presented to that monarch (see "Dalrymple's collection," vol. i. p. 145.) he omitted this island, whence it may be inferred, that he thought it to be a discovery which belonged to another person.

Bernardo, *St. de Tarijah*, a town of South America, and principal of the district of Chicas, or Tarijah.

BERNARDSTOWN, a township in Somerset county, New Jersey, America, containing 2377 inhabitants, including 93 slaves.—Also, a township in Hampshire county, Massachusetts, containing 691 inhabitants; distant 110 miles W. from Boston.

BERNASCONI, Andrea, in *Biography*, born at Verona, but who resided chiefly at Venice, was a pleasing and graceful composer. He flourished at the same time as Hasse, and though inferior to him in force and resources, it is said that Faustina, the wife of Hasse, used to prefer the melodies of Bernasconi. He resided long at Munich, in the service of the elector of Bavaria, where he died about the middle of the 17th century.

Bernasconi, *La Signora*, daughter of the composer of that name, arrived in England 1778, as first woman at our lyric theatre, when Pacchioretti appeared there for the first time. She had gained considerable reputation as an actress at Vienna, in the part of Eurydice, when she sung with Millico in Gluck's Orfeo, which had such great success from its novelty of style, that ascribing part of this success to the Bernasconi's vocal powers, we expected more than we found. And little is to be said of her as a performer, except that she had a neat and elegant manner of singing, though with a voice that was feeble, and in decay.

BERNAU, in *Geography*, a town of Germany, in the archduchy of Austria, 5 miles south of Wels.—Also, a town of Germany, in the circle of Upper Saxony, and middle mark of Brandenburg, surrounded with walls, ramparts, and ditches, containing three churches; the principal commerce of which is beer, of which large quantities are brewed in this town; 14 miles N.N.E. of Berlin.

BERNAVILLE, a town of France, in the department of the Somme, and chief place of a canton, in the district of Dourlens, 2½ leagues south-west of Dourlens. The population of this town consists of 984, and that of the canton of 9944 persons. The territorial extent contains 185 kiliometres; and 27 communes.

BERNAY, a town of France, and principal place of a district, in the department of the Eure; 7½ leagues west of Evreux. Its population amounts to 6142, and that of the canton to 14,957 persons. Its extent in kiliometres is 187½, and

and it contains 21 communes. N. lat. 49° 6'. E. long. 0° 50'.

BERNBURG, in Latin, *Bernburgum*, *Arctopolis*, and *Ursopolis*, a town of Germany, in the circle of Upper Saxony, the capital of Anhalt Bernburg, and the reſidence of the prince, ſeated on the Sala. It is divided into the Old and New Town, which had each its own magiſtracy, till they were united in 1560; beſides which, there is a third part, called "Vordenburg," ſeated on a hill on the other ſide of the Sala, under a diſtinct magiſtracy. The church in this part ſerves for the caſtle and the court. The caſtle is one of the moſt ancient and moſt celebrated fortreſſes in the principality of Anhalt; 20 miles weſt of Deſſau. N. lat. 51° 55'. E. long. 12° 36'.

BERNCASTEL, a town of Germany, in the circle of the Lower Rhine, and electorate of Treves, and chief place of a canton in the diſtrict of Treves, and department of the Sarre, ſeated on the Moſelle, and owing its privileges to the emperor Rodolphus I.; 8 miles E.N.E. of Treves. Its population includes 1263, and that of the canton 11,718 perſons. It contains 34 communes. N. lat. 50° 1'. E. long. 6° 36'.

BERNE, a townſhip of America, in Albany county, New York. According to the ſtate cenſus of 1796, there appear to be 477 electors.

BERNECK, a town of Germany, in the circle of Franconia, and principality of Bayreuth.

BERNECOURT, a town of France, in the department of the Meurte, and chief place of a canton in the diſtrict of Pont-a-Mouſſon, 3 leagues S.W. of Pont-a-Mouſſon.

BERNERA, or BERNERAY, one of the weſtern iſlands of Scotland, is only about four miles in length, and one and a half in breadth. The ſoil of it is ſandy, but when well manured proves extremely fertile, and produces ſome fine corn and clover paſtures. It has a freſhwater lake, called Lochbruis, which has ſome ſmall iſlands, and abounds with eels. Theſe are frequently caught in great numbers by the inhabitants, who reſort in the night, with lights, to a ſmall rivulet, where the eels are found going towards the ſea. They are often caught twiſted together in heaps. The tides of the ſea often produce very ſingular effects round this iſland. In their ordinary courſe the flood runs eaſt in the Frith, where Bernera lies, and the ebb runs weſt; the ſea ebbing and flowing regularly for four days before, and as long after the full and change of the moon. The ſpring tides commonly riſe to the height of 14 feet perpendicular, and the others proportionably; but for four days before and after the quarter moons, there is a ſingular variation; at thoſe times the tide runs eaſtward for twelve hours ſucceſſively, from nine o'clock in the morning till nine at night, when the current turns, and runs weſtward for the twelve following hours. Thus the reciprocations continue; one flood and ebb running eaſtward, and another weſtward, till within four days of the full and change of the moon, when they reſume their ordinary courſe, running eaſt during the ſix hours of flood, and weſt during the ſix hours of ebb. There is another phenomenon in theſe tides equally remarkable. Between the vernal and autumnal equinoxes, the tides about the quarter moons run all day to the eaſt, and all night to the weſt; and during the other ſix months, their courſe is reverſed, being weſtward in the day, and eaſtward in the night. The number of inhabitants in Bernera and the iſle of Pabbay, which lies between the former and Harris, was 494 in the year 1792. W. long. 7° 30'. N. lat. 67° 45'. The Rev. Mr. M'Leod's Account in Sir I. Sinclair's Statiſtical Hiſtory of Scotland.—Alſo, a town of Scotland, in the county of Inverneſs, in which are barracks; 32 miles N.W. of Fort William.

BERNESSO, a town of Piedmont, in the diſtrict of Coni; 4½ miles W.N.W. of Coni.

BERNEVILLE, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the diſtrict of Arras, 4 miles S.W. of Arras.

BERNEUT BAY, lies at the point of Quiberon, on the coaſt of France.

BERNEX, a town of Savoy, 2½ miles N.N.E. of St. Julien.

BERNHARDUS, in *Entomology*, a ſpecies of CANCER, with heart-ſhaped, muriated hand-claws; that on the right ſide largeſt. Inhabits whelks, &c. common on moſt ſea-ſhores. See BERNARD *the Hermit*.

BERNHARTS, in *Geography*, a town of Germany, in the archduchy of Auſtria, 7 miles E.S.E. of Feldſburg.

BERNI, or BERNIA, FRANCIS, in *Biography*, an Italian poet, was a deſcendant of a noble but indigent family of Bibiena, in Tuſcany, and born at Campovecchio, about the cloſe of the 15th century. He paſſed the firſt 19 years of his life in poverty at Florence; and though he was afterwards patronized by cardinal Bernardo of Bibiena, Angelo, and Giberti, biſhops of Verona, his love of unreſtrained liberty, and inclination to pleaſure and raillery, prevented his deriving any permanent advantage from their patronage. At Rome, however, he was greatly eſteemed by the literati, and was one of the moſt illuſtrious members of the famous academy "De Vignajuoli." At length, he retired to Florence, and ſubſiſted on a canonry in the cathedral, under the protection of cardinal Hippolito de' Medici, and duke Alexander. It has been ſaid, that he was taken off by poiſon, becauſe, in a quarrel between theſe two princes, he refuſed to comply with the deſire of one of them, who requeſted him to adminiſter poiſon to the other. The æra of his death, as well as the truth of this ſtory, are uncertain: it has been fixed by ſome to the year 1536; but others have ſuppoſed that he lived to a later period. Mr. Roſcoe, in his "Life of Lorenzo de Medici," ſays, that he cultivated a branch of poetry (a kind of burleſque) with ſo much ſucceſs, that it has from him obtained the name of "Berneſche." The characteriſtic of this ſpecies of poetry is an extreme ſimplicity, which the Italians denominate "ideotiſmo." The moſt extravagant ſentiments, the moſt ſevere ſtrokes of ſatire, are expreſſed in a manner ſo natural and eaſy, that the author himſelf ſeems ſcarcely to be conſcious of the effect of his own work. Perhaps the only indication, ſays Mr. Roſcoe, of a ſimilar taſte in this country, appears in the writings of the facetious Peter Pindar. Berni, though he ſeems to have blotted and corrected much, has nevertheleſs not been ſufficiently careful in expunging licentious images, and free equivoque; and his wit is often mere buffoonery. One of his principal performances, was the recompoſition of Boiardo's "Orlando Inamorato," which he has rendered much more pure and poetical. The beſt edition of it is that of Venice, in 1545. His other poems were collected and publiſhed, with thoſe of other burleſque writers, in 1548, in 2 vols. 8vo. and reprinted at London in 1721 and 1724, after the edition of Venice. Berni was a cauſtic ſatiriſt, and the avowed enemy of Peter Aretin, whoſe life he wrote in a ſtrain of bitter invective. He excelled in Latin poetry, and imitated the ſtyle of Catullus with ſucceſs. Gen. Biog.

BERNICIA, in *Britiſh Geography*, one of the kingdoms of the Saxon heptarchy. Although the Saxons, ſoon after the landing of Hengiſt, had been planted in Northumberland, their progreſs was ſlow in overcoming the obſtinate reſiſtance with which they were oppoſed, and none of their princes for a long time aſſumed the appellation of king. At laſt, in 547, Ida, a Saxon prince of great valour, who claimed a deſcent, as did all the other princes of that nation, from Woden, brought over a reinforcement from Germany in

50 ſhips, which arrived at Flamborough, and enabled the Northumbrians to carry on their conqueſts over the Britons. He entirely ſubdued the country, now called Northumberland, the biſhopric of Durham, as well as the counties of the Merſe and the three Lothians, or the whole eaſtern coaſt of the ancient Roman province of Valentia; and aſſumed the crown under the title of king of Bernicia. About the ſame time, Ælla, another Saxon prince, having conquered Lancaſhire, and the greater part of Yorkſhire, or all the country between the Humber and the Tyne, founded another little ſtate in theſe parts, which was called the kingdom of "Deira," or "Deiri." Theſe two kingdoms were united, not long after, in the perſon of Ethelfrid, grandſon of Ida, who married Acca, the daughter of Ælla; and expelling her brother Edwin, eſtabliſhed one of the moſt powerful of the Saxon kingdoms, by the title of *Northumberland*, which ſee. See alſo HEPTARCHY.

BERNICLE, in *Conchology*. See BARNACLE.

BERNICLE, in *Ornithology*. See BARNACLE *goose*.

BERNIER, FRANCIS, in *Biography*, called the *Mogul*, from his long reſidence in the court of that prince, was born at Angers in France, about the year 1630. After receiving a liberal education, and taking his degree of doctor in medicine at Montpelier, he went, in 1654, to Paleſtine, and thence to Egypt. At Cairo he reſided about twelve months, and having examined the pyramids, and every thing there deſerving attention, he embarked at Suez for the kingdom of the Mogul, and was engaged by Aurengzebe as his phyſician, in which office he continued, attending that prince in his expeditions for the ſpace of 12 years. Deſirous at length of reviſiting his native country, and obtaining leave of the Mogul, he returned to France in 1670. He now employed himſelf in digeſting and arranging the obſervations he had made in his travels, and publiſhed in ſucceſſion, in French, the hiſtory of the laſt revolution of the ſtates of the great Mogul, a letter on the ſtate of Hindoſtan, and memoirs and particular obſervations. Theſe were collected and publiſhed together, in 1699, at Amſterdam, under the title of "Voyages de Franſois Bernier, contenant la Deſcription des etats du grand Mogul, de l'Hindouſtan, du royaume de Kachemire, &c." 2 vols. 12mo. They are eſteemed the moſt perfect account of thoſe countries extant. Captive princes here, ſays he, deſtined to die, were compelled to take daily a preparation of poppy, which kept them in a conſtant ſtate of drowſineſs, until life was gradually and quietly extinguiſhed. To the abſtemious life of the Indians, he attributes their freedom from gout, ſtone, catarrh, and quartan fever. Even the lues venereal is here, he ſays, leſs malignant than in Europe.

He alſo publiſhed an abridgment of the philoſophy of Gaſſendi, and other tracts, contained in various periodical publications. In 1685, he came to England, and after a ſhort reſidence here, returned to Paris, where he died, Sept. 22, 1688. Haller. Bib. Med. New Gen. Biog. Dict.

BERNIER, JOHN, born at Blois, received the degree of doctor in medicine at Montpelier, in 1647. Not ſucceeding in his practice, and finding perſons whom he eſteemed leſs qualified, in full employment, his writings are filled with ſatyrical reflections on his more fortunate brethren. His principal work is, "Eſſais de Medicine, ou il eſt traité de l'Hiſtoire de Medicine, et des Medicines, &c." Paris, 1689, 4to. to which he added a ſupplement in 1695. He alſo publiſhed "Hiſtoire de Blois;" which is not much eſteemed. Alſo, "Antimenagiana, ſdes Reflections, Penſees, Bons Mots, et Anecdotes," which he ſigns by the name of Poppincourt, and a critique on the works of Rabelais, whom he ſeverely cenſures. Eloy. Dict. Hiſt.

BERNIER, NICHOLAS, an eminent French muſician, was born at Mantes-ſur-Seine, and became muſic-maſter of the holy chapel at Paris, and afterwards of the chapel royal. He was much eſteemed and patronized by the duke of Orleans, who ſubmitted his own compoſitions to his judgment. By his five books of cantatas, for one and two voices, with the words in part by Rouſſeau and Fuſelier, he acquired great reputation. He alſo publiſhed "Les Nuits des Sceaux," and a number of motets, which are ſtill admired. He died in 1734. Nouv. Dict. Hiſt.

BERNIN, in *Geography*, a town of France, in the department of the Iſere, and chief place of a canton, in the diſtrict of Grenoble, 8 miles north of Grenoble.

BERNINI, JOHN LAWRENCE, in *Biography*, a celebrated ſculptor and architect, was the ſon of a ſculptor, and born at Naples, in 1598. At a very early age, he manifeſted the inclination of his genius; for upon the removal of his family to Rome, when he had attained only the age of 10 years, he ſhut himſelf up from morning till night in the Vatican, for the purpoſe of copying the maſter pieces which it contained. Having about this period wrought a head in marble, that excited great admiration, he was ſent for by pope Paul V. who deſired him to ſketch with a pen the head of St. Paul, in his preſence; upon which the young artiſt deſigned it ſo well, that the pontiff recommended him to the care of cardinal Maffei Barberini, as one who might become the Michael Angelo of his age. Stimulated by the encouragement he had received, his application was indefatigable, and his perſeverance invincible. To this purpoſe, it is related concerning him, that after having finiſhed with much attention and aſſiduity a buſt of Scipio Borgheſe, the pope's nephew, he diſcovered a defect of the marble in the forehead. Upon this he immediately procured another block, and in the interval of 15 nights he executed another to his ſatisfaction. When the firſt was exhibited to Borgheſe, he could not avoid manifeſting his chagrin; but he was agreeably ſurpriſed when the ſecond was expoſed to his view. Both theſe are preſerved in the villa Borgheſe. Among the productions of his youth, we may mention his ſtatues of St. Laurence, and of Æneas carrying off his father at the ſiege of Troy; and more particularly his David and Goliah, which ſome have reckoned among his beſt works. His group of Apollo and Daphne, cut from a ſingle block of marble, and the ſecond not more than half a foot from the firſt, executed for cardinal Borgheſe, at the age of 18 years, has been regarded as the chef d'œuvre of ſculpture. It is ſaid, that when Bernini ſaw theſe performances of his youth 40 years afterwards, he lamented the little improvement he had made in ſculpture during this long courſe of years. In the pontificate of Gregory XV. Bernini was created a knight of the order of Chriſt; whence he has been commonly diſtinguiſhed by the appellation of the "Chevalier Bernini." Upon the acceſſion of his patron Barberini to the pontifical chair, under the title of Urban VIII. Bernini was engaged in executing the projects which he had formed for the embelliſhment of Rome. The decoration of the place called the "Confeſſion," in St. Peter's, employed him for 9 years, and for this exerciſe of his art he was liberally rewarded. He alſo conſtructed a fountain, diſplaying the richneſs of his invention, in the piazza d'Eſpagna; decorated the great niches of the pillars, which ſupport the dome of St. Peter's; and conſtructed a grand mauſoleum for the pope, which is one of the fineſt ornaments of that cathedral. So much did this pope intereſt himſelf in the welfare of Bernini, that he urged him to marry; accordingly, in 1639, he commenced a matrimonial union, which laſted 35 years, and produced a numerous family. Bernini's reputation was not confined to Rome; but Charles I. of England, hearing of his fame, ſent over

over a fine picture of Vandyke, from which he made three buſts of the king in different aſpects, which gave great ſatisfaction, and were munificently rewarded. A buſt of the queen was intended, but on account of the troubles which occurred in England, was never executed. Bernini was invited to Paris by Lewis XIII. juſt before the death of Urban VIII., and allured by very lucrative propoſals; but the pope, upon being conſulted, ſaid, "that he was made for Rome, and Rome for him;" and this determined his ſtay. The grand fountain of the piazza Navona, conſtructed under the pontificate of Innocent X. is reckoned among his maſter-pieces. The fine portico of St. Peter's was erected by this artiſt, under the pontificate of Alexander VII. and about this time queen Chriſtina viſited Rome, and treated him with ſingular reſpect. In 1664, he was conſulted by Lewis XIV. of France, in conſequence of the recommendation of Colbert, concerning the improvement of the Louvre; and at the age of 68 years yielded to an urgent invitation to viſit Paris for this purpoſe. In his journey thither, he was honoured in various places through which he paſſed, by the moſt reſpectful attention; and after his arrival, he began with making a buſt of the king, and while he was ſketching his portrait, turned back his curls for a better diſcovery of his forehead, obſerving at the ſame time, with the politeneſs of a courtier, "that he was a king who might freely ſhew his face to the whole world." This, it is ſaid, gave riſe to a French faſhion, denominated "friſure à la Bernin." His deſign for the completion of the Louvre was not executed. He returned to Rome before winter, and as an acknowledgment of his obligations, for the civility and munificence with which he was treated by Lewis, formed a coloſſal equeſtrian ſtatue, repreſenting the king as ſupported by a rock. Upon its removal to Paris, Girarden changed it, on account of its want of ſufficient reſemblance to the monarch, into a Curtius leaping into the fiery gulf. Among the remaining works in which he employed himſelf, the moſt conſiderable was the tomb of Alexander VII. in St. Peter's. Whilſt he was repairing the old chancery palace, by order of Innocent XI. he was ſeized with a fever, which terminated in an apoplexy, that cloſed his life in 1680, in the 82d year of his age. His funeral proceſſion to the church of St. Maria Maggiore was attended by all the nobility of Rome.

The genius of Bernini was ſingularly fertile and comprehenſive; and on a medal ſtruck in honour of him by Lewis XIV. he is characterized as "ſingularis in ſingulis, in omnibus unicus," i. e. ſingular in each, ſole in all. Several of his pictures, painted for his amuſement, amidſt his other occupations, and ſufficiently indicating his talents in this department of the arts, are preſerved in the Florentine gallery, and the Barberini and Chigi palaces. In architecture he diſplayed a fine taſte and rich imagination, though he is ſaid to have departed from the rules and proportions obſerved by the ancients. But he owed his higheſt and moſt diſtinguiſhing reputation to ſculpture. D'Argenville, however, obſerves, in his "Vies des Architectes et des Sculpteurs," that, whilſt he wrought marble with a ſurpriſing ſuppleneſs, admirable taſte, and ſingular graces, he often deviated from truth, and was much of a manneriſt; that he abandoned the ſimple drapery of the Grecian ſtatuaries; and that he enveloped his figures with ſuch an aſſemblage of folds and doublings as to diſguiſe and partly conceal them by the flutter and ſeeming agitation of their dreſs. Some of his ſingle buſts, or portraits after nature, are much admired, and are ſaid to retain the whole ſpirit and character of the original. His St. Thereſa in ecſtaſy is thought to ſurpaſs all his other works for expreſſion. His own talents he eſtimated with modeſty; but by an enthuſiaſtic attachment to his art, and unwearied aſſiduity in the exerciſe of it, he arrived at that eminence for which he was diſtinguiſhed, and multiplied his works to ſuch a degree as to occaſion its being ſaid, that poſterity would be apt to ſuppoſe as many Berninis as Herculeſes. Encyclop. Beaux Arts, t. ii. p. 1. p. 282. Gen. Biog.

BERNINO, in *Geography*, a mountain of Swiſſerland, being a branch of the Rhetian Alps, about 26 miles N. E. of Chiavenna.

BERNO, in *Biography*, abbot of Richenon, in the dioceſe of Conſtance, flouriſhed about the year 1008, and is celebrated as a poet, rhetorician, muſician, philoſopher, and divine. Of his works, the principal are his treatiſes "De Inſtrumentis Muſicalibus;" "De Menſura Monochordi;" and "De Muſica ſeu Tonis;" containing a ſummary of the doctrines of Boethius, an explanation of the eccleſiaſtical tones, intermixed with pious exhortations, and the application of the muſic to religious purpoſes. His learning and piety recommended him to the ſpecial favour of the emperor Henry II. and his endeavours to promote literature were ſo much encouraged, that his abbey of Richenon was as famous in his time as thoſe of St. Gal, or Cluni, then the moſt celebrated in France. He died in 1048, and was buried in the church of his monaſtery.

BERNON, in *Geography*, a town of France, in the department of the Aube, and chief place of a canton, in the diſtrict of Ervy; 4 miles S. E. of Ervy.

BERNOUILLI, James, in *Biography*, a celebrated mathematician, was born at Baſil, December 27, 1654. His father, who was a man of rank and learning, intended him for the profeſſion of a miniſter, and paid great attention to his education. Having paſſed through the uſual courſe of preparatory ſtudies, and taken his degrees in the univerſity of Baſil, he applied, in deference to his father's wiſhes, to divinity; but his inclination leading him to mathematics, he made great proficiency in geometry, without any collateral aſſiſtance either of teachers or of books, from the uſe of which his father rigorouſly reſtrained him. In reference to this reſtraint, he took for his device Phaeton driving the chariot of the ſun, with this motto, "Invito patre ſidera verſo," i. e. I traverſe the ſtars againſt my father's inclination. Notwithſtanding the diſadvantages under which he laboured, he made ſuch progreſs in mathematical ſtudies, that he was able, before the age of 18 years, to ſolve a difficult problem in chronology, or to find the year of the Julian period, when the year of the cycle of the ſun, the golden number, and the indiction, are given. In 1676, he began his travels, and at Geneva taught a blind girl to write; and at Bourdeaux compoſed univerſal gnomonic tables. Upon his return to his own country, in 1680, he derived great pleaſure from the peruſal of Malbranche's "Search after Truth," and Deſcartes's philoſophy: and predicted the return of a comet, of which he gave an account, in a ſhort treatiſe written in his own language. He ſoon afterwards travelled into Holland, Flanders, and England; and having completed his peregrinations, he ſettled at Baſil, in 1682, and commenced a courſe of public experiments in natural philoſophy and mathematics. In this year he publiſhed, at Amſterdam, in Latin, his "Eſſay of a New Syſtem of Comets, in order to calculate their Motions and to foretel their Appearances," 8vo. and in the following year, at the ſame place, his "Diſſertations upon the Weight of the Air;" Lat. 8vo. In 1684, he accepted the profeſſorſhip of mathematics at Heidelberg, and devoting himſelf to the aſſiduous ſtudy of theſe ſciences, he took occaſion about this time to inveſtigate the analytical ſyſtem of Leibnitz, contained in ſome eſſays on the "Calculus differentialis," or "Infinimens petits;" publiſhed in the "Acta Eruditorum;" the extent and beauty

beauty of which he admired, the principles of which he developed, and the utility of which he diſcovered, and promoted to ſuch a degree, that this great philoſopher, whilſt he claimed the honour of the original invention, acknowledged that J. Bernouilli and his brother had a great ſhare in the advantage which the public derived from it, and that no perſon had made a greater uſe of this invention than they, and the marquis de l'Hoſpital. In 1687, he was unanimouſly choſen to ſucceed Peter Megerlin, as profeſſor of mathematics at Baſil, and he diſcharged the duties of his office with ſuch reputation, that he greatly contributed to the credit of the univerſity, and to the increaſe of the number of ſtudents. In 1699, he was elected a foreign member of the academy of ſciences at Paris, and in 1701, of the academy of Berlin. The memoirs of both theſe ſocieties were enriched by many of his communications. Several of his pieces were alſo publiſhed in the Acta Eruditorum, and the Journal des Scavans. The gout, brought on by unremitting application, produced a fever, which terminated his life, Auguſt 16, 1705, in the 51ſt year of his age. He ordered a logarithmic ſpiral to be engraved on his tomb, with this motto, "Eadem mutata reſurgo," I riſe the ſame, though changed. He was married at the age of 30; and left one ſon and a daughter. By the exerciſe of extraordinary powers of invention, and perſevering application, he made many valuable diſcoveries, which improved the method of analyſis, the doctrine of infinite ſeries, and the higher department of mathematical inveſtigation; ſuch as the quadrature of the parabola, and the geometry of curve lines, of ſpirals, cycloids and epicycloids. His works, with their reſpective titles, are enumerated in the General Dictionary, to which we refer; and they were collected and publiſhed in 2 vols. 4to. at Geneva, in 1744. The "Ars conjectandi," or the art of forming probable conjectures concerning events that depend on chance, in which he was engaged at the time of his death, and which is not included in the above collection, was printed at Baſil, in 1713, 4to. To this is added a treatiſe concerning infinite ſeries. An extract from this valuable treatiſe, containing the beſt demonſtration that has yet been given of Sir Iſaac Newton's famous binomial theorem, in the firſt and ſimpleſt caſe of it, or that of the integral and affirmative powers of the binomial quantity $a + b$, left by its great inventor without a demonſtration, is included in the 3d volume of the "Scriptores Logarithmici," for which we are indebted to baron Maſeres.

Bernouilli, John, the brother of the preceding, and no leſs celebrated as a mathematician, was born at Baſil, July 27, 1667. At the age of 15, he commenced the ſtudy of philoſophy, and ſoon after he was ſent to Neufchatel to learn the French language, and the principles of commerce; but preferring intellectual purſuits to a mercantile profeſſion, he returned home at the cloſe of the year, for the proſecution of his ſtudies, and received the degree of doctor in philoſophy in 1685. Inſtructed by his elder brother in the firſt rudiments of mathematics, he afterwards, viz. in 1684, when he was only 17 years of age, concurred with him in inveſtigating and explaining the principles of Leibnitz's differential calculus. He alſo was one of the three mathematicians, the two others being Huygens and Leibnitz, who ſolved the problem of the catenary curve, propoſed by his brother James. In 1690, he ſet out on his travels; and in the progreſs of them communicated the diſcoveries of the new analyſis to Daniel le Clerc, and Fatio de Duillier, at Geneva, and to the marquis de l'Hoſpital at Paris. On his return to own country, in 1692, he commenced a correſpondence with Leibnitz, which laſted during the life of the latter. Having declined the profeſſorſhip of mathematics at Wolfenbuttle, which was offered him in 1693, he undertook, in 1695, a courſe of philoſophical experiments at Groningen, and was furniſhed by the curators of the univerſity with the neceſſary apparatus. About this time he diſcovered, what has been called the mercurial phoſphorus, occaſioned, as it is now known, by the friction of mercury againſt glaſs, in a partial vacuum; for which Frederic I. king of Pruſſia, honoured him with a gold medal, and with the rank of member of the academy of ſciences at Berlin. He was alſo a member of the royal ſociety of London, and of other learned bodies. He ſucceeded his brother James at Baſil, in 1705, on which occaſion he delivered a diſcourſe, "De Fatis Novæ Analyſeos, et Geometriæ Sublimis," and continued till his death in this ſituation, though he was ſolicited to remove to Leyden, Padua, and Groningen. He collected his works in 1743, and printed them at Lauſanne, in 4 vols. 4to. His correſpondence was extenſive, and he was much engaged in a controverſy with the Engliſh mathematicians concerning the invention of fluxions; in another with Renau, concerning the manœuvring of ſhips; and in another on mathematical ſubjects, with Jurin, Brook Taylor, Keil, Pemberton, Herman, and Riccati. In 1730, he gained a prize of the academy of ſciences for a memoir on the elliptic figure of the planets, and the motion of their aphelia; and in 1734, he received the half prize, jointly with his ſon Daniel, from the ſame academy, for a memoir on the phyſical cauſe of the inclination of the planetary orbits. Bernouilli died January 1, 1748, in the 81ſt year of his age, and left four daughters and five ſons, three of whom were mathematicians. Fontenelle's Eloges. Moreri.

Bernouilli, John, ſon of the preceding, was born at Baſil, January 17, 1695, and died at Peterſburgh, July 26, 1726. He was licentiate of law, profeſſor of law at Berne; afterwards profeſſor of Mathematics at Peterſburgh, and member of the inſtitute of Bologna.

Bernouilli, Nicholas, nephew of the two preceding, profeſſor of mathematics at Padua, afterwards of logic, and then of law at Baſil, member of the academy of ſciences and belles lettres at Berlin, and alſo of the royal ſociety of London, and of the inſtitute at Bologna, was born at Baſil, October 10, 1687, and died there, November 29, 1759.

Bernouilli, Daniel, M.D. ſon of John Bernouilli, was born at Groninger, Feb. 9, 1700. Preferring mathematical to commercial purſuits, he paſſed the earlier part of his life in Italy, and at the age of 24, declined the preſidency of an academy about to be eſtabliſhed at Genoa, and in the following year accepted an invitation to Peterſburgh, where he ſpent ſeveral years. On his return to Baſil, in 1733, he was ſucceſſively profeſſor of anatomy and botany, and of natural and experimental philoſophy; and had the honour of being a member of the academies of Peterſburgh, Paris, and Berlin, and of the royal ſociety of London. In 1724, he publiſhed his "Exercitationes Mathematicæ;" and, in 1738, his "Hydronamica." Many other pieces have been publiſhed in the memoirs of the academy of ſciences at Paris, and in thoſe of other ſocieties. He gained and divided ten prizes from the Pariſian academy; and on the diviſion of the prize reſpecting the inclination of the planetary orbits, his father expreſſed diſſatisfaction; more eſpecially as Daniel had embraced the Newtonian philoſophy in preference to that of Deſcartes, to which he himſelf maintained his attachment as long as he lived. In 1740, he divided the prize on the tides with Euler and Maclaurin. At Baſil he was much reſpected, not only as a man of diſtinguiſhed talents, but for his ſimple and modeſt manners. Although he paid external reſpect to the religion of his country, he was charged by his paſtors with an exceſſive freedom of opinion,

which he incautiouſly divulged. At the age of 80, he retained his mental powers in their full vigour; but from this time they began to decay. He died March 17, 1782. Nouv. Dict. Hiſt.

Bernouilli, John, L. L. D. brother of the preceding, was born at Baſil, May 18, 1710, and died there, July 17, 1790. He was profeſſor of eloquence, and afterwards of mathematics at Baſil, and member of the academies of Paris and Berlin.

Bernouilli, James, licentiate of law, member of the phyſical ſociety at Baſil, and correſpondent of the royal academy of ſciences at Turin, was the ſon of John Bernouilli laſt mentioned, and born at Baſil, October 17, 1759. His natural talents, for which he was diſtinguiſhed at an early period, were improved by long aſſiduous application. On his return from Neufchatel, whither he was ſent to ſtudy the French language, he was admitted to the degree of maſter of arts, and devoted himſelf to the ſtudy of the law. In 1780, he made the tour of ſeveral cantons of Swiſſerland, of which an account was publiſhed in the third volume of the collection of travels, publiſhed at Berlin by John Bernouilli. The ſtudy of the law, however, did not divert his hereditary inclination for the mathematics; and in theſe ſciences he made ſuch rapid progreſs, that in 1780, he was thought qualified to ſupply the place of his uncle, whoſe age and infirmities rendered him incapable of continuing his lectures on experimental philoſophy, though he did not ſucceed him in the vacant chair of profeſſor after his death. He had alſo experienced a ſimilar diſappointment in his views with regard to the chair of eloquence in 1780; on which occaſion he publiſhed his "Theſes on the Sublime." After theſe diſappointments, he determined to indulge his taſte for travelling, and accepted the office of ſecretary to count de Breuner, miniſter of the imperial court of Vienna to the republic of Venice. He ſtill retained his attachment to the mathematical ſciences, of which he exhibited proofs to the public in the memoirs of the royal academy of ſciences and belles lettres at Berlin, and in thoſe of the royal ſociety of Turin; and as he wiſhed to occupy a ſtation in which he might make uſe of the knowledge he had acquired, he was recommended by his countryman Mr. Fuſs to the princeſs of Daſhkof; and by her influence he was elected adjunct in the academy at Peterſburgh, with a ſalary of 600 rubles, and the promiſe of being promoted in the courſe of a year. Accordingly, he quitted Venice in 1786, and removed to Peterſburgh. Here he applied with unintermitting activity to phyſical mathematics, and was ſoon honoured with the title of ordinary academician. In the interval of about 2 years, he preſented eight memoirs, which were inſerted in the ſix firſt volumes of the "Nova Acta Academiæ Scientiarum Imperialis Petropolitanæ;" which diſplay ſingular acuteneſs in analytical calculations. In 1788, he was appointed one of the profeſſors, who inſtruct the imperial corps of noble land cadets, and to the office of teaching algebra to the two firſt claſſes he devoted himſelf with great zeal and aſſiduity. In 1789, he married the youngeſt daughter of Mr. John Albert Euler; but being always of a weak and delicate conſtitution, he was ſeized with a fit of the apoplexy whilſt he was bathing, on the 3d of July in the ſame year, which ſpeedily terminated his life, in the 29th. year of his age, very much to the regret of thoſe who knew and valued him on account of his ſcientific talents, and modeſt, amiable diſpoſition. Beſides a variety of mathematical and philoſophical pieces, which were publiſhed in the "Nova Acta, &c." "Rozier's Journal;" "Mem. de l'Acad. Royale de Berlin, Ann. 1781;" "Mem. des Correſp. de l'Acad. Royale de Turin, Ann. 1784, 1785;" "Nova Acta Helvetica, tom. i." and "Leipſick Magaz. &c. Part i, 1786;" and ſome diſtinct treatiſes; he alſo tranſlated "Merian's Philoſophical Memoirs," from the French into German, 2 vols. Nova Acta Acad. Scient. Imper. Petropol. vol. x.

BERNOVITZKOE, in *Geography*, a town of Ruſſia, in the government of Smolenſko; 40 miles north of Smolenſk.

BERNSTADT, a town of Sileſia, in the principality of Oels, on the river Weyda.

BERNSTEIN, a town of Germany, in the circle of Upper Saxony, and new mark of Brandenburg; 4 miles N. E. of Berlinchen.—Alſo, a town and caſtle of Germany in the circle of Bavaria; 2 miles W. S. W. of Gravenau.

BERNSTORF, John Hartwig Ernest, Count Von, in *Biography*, an eminent ſtateſman, was born at Hanover, May 13, 1712, and poſſeſſed diſtinguiſhed talents, which were cultivated by ſtudy at the high ſchool of Tubingen, which he entered in 1727, and by travelling through various parts of Europe, under the learned Keyſler. Upon paying a viſit to Denmark, Bernſtorf was taken into the ſervice of Chriſtian VI. and employed in affairs of ſtate from the year 1732 till the year 1737. In 1742, he was envoy to the diet of that year, and to the court of the emperor Charles VII. and from the year 1744 to 1750, he was ambaſſador to France. In November 1736, he received the chamberlain's key; in June 1746, he was made a knight of the order of Dannebrog; and in October 1749, he was appointed a privy-counſellor. After his recal from France, in 1750, he formed an intimacy with the prince of Wales at Hanover, who wiſhed him to employ his talents in his ſervice; but by the death of the prince, in 1751, he was releaſed from his engagements; and upon this event he was immediately introduced into the privy-council, and entered on the office of miniſter for foreign affairs, and firſt ſecretary of the German chancery, and in 1752, was admitted into the order of the elephant. To Bernſtorf were owing the conduct and execution of thoſe beneficial meaſures which diſtinguiſhed the reign of Frederick V. Upon a plan ſuggeſted by him, was eſtabliſhed, in 1753, the hoſpital in Copenhagen, for the education of poor boys; and he was appointed preſident and governor of this patriotic and uſeful inſtitution, to which he gave a donation of 4000 rix-dollars.

In 1754, he adviſed the crown to purchaſe from the Eaſt-India company all their poſſeſſions, privileges, and merchandize; and by this act he promoted the proſperity of the Daniſh Weſt India iſlands, which had ſuffered from the excluſive right of the company. He alſo diſtinguiſhed himſelf by his activity and zeal in promoting the manufactures of the kingdom, which the king entruſted to his management in 1752, and he thus contributed to encreaſe the population, and to excite a ſpirit of induſtry and emulation. He concurred in the deſigns that were formed for the abolition of ſlavery in Denmark, by the extinction of commons, and by freeing the farmers from the burthen of perſonal ſervice. He was alſo one of the firſt perſons in Denmark who counteracted the general prejudice againſt inoculation for the ſmall-pox, and who endeavoured to reconcile the people to the practice. Bernſtorf was likewiſe indefatigable in his exertions for promoting the inſtruction of the poor; and he projected a fund for the encouragement and recompence of meritorious, but poor, ſchoolmaſters; nor was he leſs ſolicitous to extend the benefits of education, ſo as to furniſh a ſupply of competent teachers, for which purpoſe he propoſed to eſtabliſh a ſeminary at Altona, in connection with the orphan-houſe of that city; but adverſe circumſtances prevented the completion of his deſign. He alſo diſtinguiſhed himſelf by the protection which he afforded to ſcience, and

to men of letters. With this view, having been one of the firſt who diſcovered the beauties of the "Meſſiah," he invited the young author, Klopſtock, who then reſided in Swiſſerland, to Denmark, and for ſeveral years entertained him in his own houſe. By his influence, Oeder was appointed profeſſor of botany; a botanical garden was eſtabliſhed, and the profeſſor was ſent on a tour through the Daniſh provinces, the reſult of which was the "Flora Danica," publiſhed at the king's expence. Cramer, Mallet, Sehleger, and Baſedow, were alſo much indebted to his patronage. To Bernſtorf Denmark owes the eſtabliſhment of two uſeful ſocieties; one, the ſociety of the Daniſh language and fine arts, founded in 1760; and the other, the royal agricultural and economical ſociety, eſtabliſhed in 1769, of which the count himſelf was preſident. To him it was principally owing, that a ſociety of learned men were ſent, in 1761, to travel in Arabia and the eaſt, at the king's expence, for the purpoſe of making uſeful diſcoveries. In conſequence of the important ſervices which he rendered, in various ways, to his ſovereign and the ſtate, he was created, in 1767, a Daniſh count; and he was the only miniſter who had the honour of attending the king, in 1768, on his tour to England. After their return, however, the count was obliged to reſign all his employments, in January 1770, and the king, in acknowledgment of his paſt ſervices, ſettled on him an annual penſion of 6000 rix-dollars. On this occaſion he found it neceſſary to leave a country to which he had devoted the ſervice of 38 years of his life; and, accompanied by his counteſs and Mr. Klopſtock, he repaired, in October 1771, to Hamburgh, where he ſpent the winter. Here he ſpent his time in ſocial intercourſe with his friends, but in the beginning of the year 1772, ſome rheumatic affections, under which he had laboured for ſeveral years, returned with an alarming violence, and terminated in a threatening fever. This fever was ſucceeded by a fit of apoplexy, which carried him off in a few minutes, on the 18th of February. His remains were interred, without pomp, agreeably to the inſtructions of his will, at the church of Siebeneichen, on one of his paternal eſtates. Two medals were afterwards ſtruck in honour of him, by two ſocieties of patriots. Bernſtorf poſſeſſed a retentive memory, great penetration, and a ſound judgment. Learned and accompliſhed himſelf, he was the liberal patron of literature and the arts. He was well acquainted with the Italian, French, and Engliſh languages; intimately converſant with the laws of nations in general, and attached to the rights of mankind; well informed in the ancient and modern hiſtory of different ſtates; and not unintereſted in the concerns of religion and the church. He correſponded with many learned men of different countries, and collected a valuable library of ſelect books. His political meaſures were founded on truth and juſtice; in his tranſactions with foreign ſtates he was upright and ſincere; and he combined, with a vigilant attention to the privileges of the crown, a conſtant regard to the rights and liberty of the ſubject. Gen. Biog.

Bernstorf, Andrew Peter, Count Von, the nephew of the former, was born at Gartow in Lunenburg, Auguſt 28, 1735, and at an early period acquired the knowledge of ancient and modern hiſtory, as well as of geography, mathematics, natural hiſtory, and the ancient languages. His ſtudies were completed at Gottingen. Several of his juvenile years were ſpent in travelling through England, Swiſſerland, France, and Italy. Having occupied, after his return, ſome ſubordinate ſtations, he was made a member of the privy-council in 1769; but ſoon diſmiſſed along with his uncle. Towards the end of the year 1772, after the fall of Struenſee, he was recalled; and about the cloſe of the following year, he obtained the foreign department, and was at the ſame time appointed miniſter of ſtate, and director of the German chancery; and he was employed in negotiating with Ruſſia the exchange of the Gottorf part of Holſtein for Oldenburg and Delmenhorſt. In 1776, he was made a knight of the order of the elephant; and in 1780, during the American war, when an order was iſſued by the Britiſh government for intercepting all veſſels belonging to neutral powers, laden with naval ſtores, and bound to any of the enemy's ports, he had an opportunity of exerciſing his diplomatic talents; and in a note ſubmitted by him to the courts of the belligerent powers, the Baltic was declared a mare clauſum; and it was further ſtated, that the king of Denmark had determined not to grant a paſſage through the Sound to armed ſhips belonging to the powers at war. It was alſo added, that the other northern powers had adopted and profeſſed the ſame ſyſtem. In a ſubſequent note, tranſmitted to the three belligerent powers, England, France, and Spain, Bernſtorf expreſſed himſelf in the following terms: "An independent and neutral power never loſes, by others being at war, the rights which it had before that war, ſince peace exiſts for it with all the belligerent powers without its having to receive or follow the laws of any of them. It is authoriſed to carry on trade, contraband excepted, in all places, where it would have a right to do ſo, if peace exiſted throughout all Europe, as it actually exiſts in regard to it." Soon after, Denmark and Ruſſia entered into a treaty for the protection of their trade, to which Sweden, Pruſſia, and other ſtates acceded; and the reſult was that league formed againſt Great Britain, known under the title of the "armed neutrality." Towards the end of the year 1780, Bernſtorf reſigned all his employments, and retired to his eſtates in Mecklenburg, where he reſided till 1784, when he was recalled, and reſumed his diplomatic functions; and to his exerciſe of theſe, Denmark owed the preſervation of peace, when hoſtilities broke out between Sweden and Ruſſia in 1788. In 1791, Bernſtorf interpoſed his mediation when the Britiſh miniſtry were preparing to aſſiſt the Turks againſt the Ruſſians, to reſtore and promote tranquillity. In conſequence of the French revolution, his Daniſh majeſty was invited by the courts of Pruſſia and Vienna to join in the treaty which had been concluded between them. To this propoſal Bernſtorf replied, in 1792, with conſiderable addreſs; and in 1793, when his Britannic majeſty's envoy extraordinary at Copenhagen preſented a note to that court, in conſequence of the plan concerted by the allied powers for blockading the ports of France, Bernſtorf returned an anſwer, which was alluded to by the marquis of Landſdown in the houſe of lords, February 17, 1794, in the following terms: "The reply of count Bernſtorf to our remonſtrances was one of the boldeſt, wiſeſt, and moſt honourable replies I have ever read. It is a ſtate paper which ſhould be kept as a model by every cabinet of Europe." The conduct of Bernſtorf was highly ſatisfactory to his fellow-citizens; various inſtitutions were diſtinguiſhed by his name; and medals were ſtruck to perpetuate the remembrance of his ſervices. At length, he fell a victim to the gout, to which he had been ſubject for many years, and which baffled all remedies, on the 21ſt of July, 1797; and his remains were interred with great pomp, and amidſt numerous attendants, who lamented the loſs of him, in Frederic's church at Chriſtianſhaven.

His figure was agreeable, and his manners were engaging, his diſpoſition lively, and his eloquence natural. In buſineſs he was active and indefatigable; in converſation communicative and conciſe; averſe from flattery, and yet reſpectful in his behaviour; ſparing of profeſſions and promiſes, and

punctual in performing them; prudent in his plans, and firm and zealous in executing them. His memory was tenacious, his benevolence extenſive, his reverence of the Deity unfeigned, and his attachment to the Chriſtian religion unwavering. Gen. Biog.

BERNUS, in *Geography*, a mountain of European Turkey in Macedonia; 10 miles S. E. of Saloniki.

BERNY, a town of France, 2 leagues ſouth of Paris.

BEROALDO, Philip the *Elder*, in *Biography*, was born at Bologna in 1453, and at the age of 19, became profeſſor of the belles lettres in his native city. He alſo read lectures at Parma, Milan, and Paris, and at the latter place, or, as ſome ſuppoſe, Perugia, he held a public ſchool of eloquence. But, recalled by his countrymen, he renewed his ſcholaſtic labours at Bologna with ſuch reputation, that he had 600 hearers at a time. To the ſtudy of polite literature, he added thoſe of philoſophy, medicine, and juriſprudence; and he alſo engaged in public employments aſſigned to him by his country. His diſpoſition was convivial, and his conduct not exempt from the charge of licentiouſneſs, before his marriage in 1498. By his good humour he eſcaped or conciliated literary conteſts, and maintained an uninterrupted intercourſe with the greateſt number of learned perſons of the age in which he lived. He died in 1505. His commentaries and notes extended to all the Latin writers of eminence; and are more diſtinguiſhed by their erudition, than their elegant taſte and ſound criticiſm. With the more obſcure authors of antiquity, he was particularly converſant, and he took pleaſure in reviving the uſe of words that were barbarous or obſolete. Beſides his commentary on the "Golden Aſs of Apuleius," printed in 1501, and affording a ſpecimen of his manner, he publiſhed a great number of his own orations, letters, poems, and other works, of which a collection was printed at Baſil in 1513. Moſt of his obſervations on authors are contained in Gruter's Theſaurus Criticus. Moreri. Gen. Biog.

Beroaldo, Philip, the *Younger*, nephew of the former, was a native of Bologna, and profeſſor of belles lettres in the univerſity of that city, and afterwards at the Sapienza in Rome. In 1516, he was appointed librarian of the Vatican by Leo X., but about two years after, before he took regular poſſeſſion of the office, with its emoluments, he died, at the age of about 40 years. His Latin poems, by which he acquired great reputation, are publiſhed with thoſe of his uncle, to which they are prefixed, in the firſt volume of the "Deliciæ Poetarum Italorum." A collection of his elegies and epigrams, in 3 books, was publiſhed at Rome in 1530. His Latin verſion of an oration of Iſocrates, and notes on the firſt five books of the Annals of Tacitus, were publiſhed by order of Leo X. Nouv. Dict. Hiſt.

BEROE, in *Entomology*, the name aſſigned by Cramer, to the ſpecies of Papilio *Europa* of Fabricius and Gmelin.

Beroe, in *Natural Hiſtory*, the name of a ſpecies, Medusa (*Pileus*) in Act. Helv. Beroë with an octagonal body, and very long tentaeula, Gronovius.—Beroë is alſo the name under which *meduſa infundibulum* (Müll. and Fabr.) is figured and deſcribed in Brown's Hiſt. Jam. — Linnæus, in the tenth edition of his "Syſtema Naturæ," calls it *meduſa beroë*, and in the twelfth, *volvox* (Beroë) *ovatus, angulis ciliatis novem.*

Beroe, in *Mythology*, one of the nymphs, who, according to Virgil, was companion to Cyrene, the mother of Ariſtæus. Beroë was alſo the name of the nurſe of Semele.

BERŒA, Berrhœa, or Beræa, in *Ancient Geography*, *Cera-veria*, a large and populous city of Macedonia, ſouth-weſt of Ægæ or Edeſſa, north-weſt of Pella, and eaſt of Cyrrhus, at the foot of mount Bermius. Under the Greek Chriſtian empires, it became the ſee of a biſhop. This was the city to which Paul and Silas fled from Theſſalonica, where they found a ſynagogue of Jews and proſelytes, who are commended for their unprejudiced and impartial inveſtigation of divine truth, and where, in conſequence of this diſpoſition, they gained many converts to Chriſtianity. Acts, xvii. The medals of this city are bronze, gold, and ſilver. —Alſo, a town of Syria, between Antioch and Hierapolis, which ſome have ſuppoſed to be the modern Aleppo, anciently called Chalep. (See Aleppo.) In the collection of Dr. Hunter, there was a bronze medal of this city, with a legend and a dolphin twiſted about a trident. At this city there were ſtruck Imperial Greek medals in honour of Trajan, Antoninus, and Adrian.

BEROLHEIM, in *Geography*, a town of Germany, in the circle of Franconia, and principality of Anſpach, ſeated on the Altmuhl, with 2 churches, 5 miles weſt of Weiſſenburg.

BEROLINENSIS, in *Entomology*, a ſpecies of Cantharis, of a black colour: baſe of the antennæ, and wing-caſes yelloviſh; tip of the laſt black; legs ferruginous. Herbſt.

Berolinensis, a ſpecies of Curculio that inhabits Europe. It is whitiſh, varied beneath; thorax rugoſe, black, ſides variegated; on the wing-caſes, two undulated black bands. Herbſt.

Berolinensis, a ſpecies of Cryptocephalus, (*Crioceris*) found in the vicinity of Berlin. The head and thorax are ſcarlet and gloſſy; wing-caſes granulated, black; eyes of the ſame colour; legs fulvous. Herbſt.

BEROSUS, in *Biography*, a famous ancient hiſtorian, was a native of Babylon, and prieſt of the temple of Belus, and flouriſhed about the time of Alexander. Tatian informs us, that he dedicated his work to Antiochus Theos, the third king after Alexander. While the Macedonians were maſters of Babylon, he learned of them the Greek language, and paſſing from Babylon to Greece, ſettled in the iſland of Cos, and there opened a ſchool, in which he taught aſtronomy and aſtrology. From Cos he removed to Athens, where he acquired ſuch reputation by his aſtrological predictions, that the Athenians erected to him a ſtatue in their gymnaſium, with a golden tongue. (Vitruvius, lib. ix. c. 7.) The ancients cite three books of his hiſtory of the Chaldæans of Babylon, of which Joſephus, Alexander Polyhiſtor, and Euſebius, have preſerved ſome fragments, that are uſeful in forming the ſeries of Babylonian kings. Joſephus ſays, that he agreed with Moſes in his accounts of the deluge, the fall of man, and the ark, in which the reſtorer of mankind was ſaved; and adds, that he mentions the deſcendants of Noah and their reſpective ages, to Nabulaſſer, king of Babylon; and that, relating the actions of that prince, he ſpeaks of the taking and burning of Jeruſalem by his ſon Nebuchadonoſor, on which occaſion, ſays he, the Jews were carried captives to Babylon, whence enſued the deſolation of that city for 70 years, till the time of Cyrus. He is quoted by Pliny, Tatian, Clement of Alexander, Tertullian, Vitruvius, and Euſebius; whence we may infer, that he was eſteemed a writer of authority. In the ſeries he gives us of the ten kings, whom he ſuppoſes to have reigned at Babylon before the flood, there are ſome ſmall variations in the authors who have tranſcribed that hiſtorian. Theſe ten ſucceſſions exactly anſwer to the ten generations from the creation to the flood: the firſt king, by name Olorus or Alones, has been ſuppoſed by ſome to be the ſame with Adam, by others Nimrod, as Xiſuthrus, the laſt in the ſeries, plainly

plainly appears to be Noah. Pliny (H. N. l. vi. c. 55. l. vii. c. 31 and 37.) informs us, that his book contained the aſtronomical obſervations of 480 years, commencing from the æra of Nabonaſſar. Annius, a monk of Viterbo, publiſhed a work under the name of this hiſtorian, full of fables, which obtained ſome credit among the learned, but was ſoon recognized to be a forgery. Beroſus is ſaid to have had a daughter who uttered predictions like himſelf, and became the Cumæan ſibyl. Brucker's Hiſt. Phil. by Enfield, vol. i. p. 34. Bryant's Analyſis, vol. iii. p. 25, &c. Fabricius, Bib. Græc. vol. xiv. p. 175.

Berosus, in *Ancient Geography*, a mountain of the Tauric Cherſoneſus, ſouth of mount Trapezus. This chain of mountains comprehends, according to M. Peyſſonnel, the mountains now called "Tehadir-dagi," the higheſt of the whole peninſula, and thoſe of "Balyklava," and "Cabarta."

BEROTH. See Beeroth.

BEROTHA, or Beroth, a city ſituated on the northern frontiers of Paleſtine; ſuppoſed to be the ſame with "Berothai," one of the cities of Hadadezer, which David took, and in which he found much braſs. (2 Sam. viii. 8.) According to ſome, this was Beroc of Syria, according to others, Berytus of Phenicia, or the ſame that is mentioned by Ezekiel (ch. xlvii. 16.) between Hethalon and Emeſa.

BERQUET, in *Commerce*, a weight of 173 pounds, by which hemp and other goods are ſold in Ruſſia.

BERQUIN, Louis de, in *Biography*, was born in Artois about 1490, and was much eſteemed at the court of France, where he obtained the title of king's counſellor. Although he does not appear to have left the Catholic church, or joined the Lutherans, he followed the example of Eraſmus, in declaiming againſt the ignorance and ſuperſtition of the clergy. Having incurred the charge of hereſy by his publications, which were chiefly books of Eraſmus, and extracts from his works and thoſe of others, with his own notes, he was twice proſecuted; but in the firſt inſtance acquitted, and in the ſecond condemned, unleſs he retracted his errors, and gave ſatisfaction, to be burnt. His ſpirit was reſolute, and he demurred againſt ſubmiſſion; his judges, however, deſirous of ſaving him, deferred the execution of the ſentence; and upon the return of Francis I. from Spain, he was ſet at liberty. But Berquin, though diſſuaded from it by Eraſmus, publicly accuſed his enemies, Noel, Beda, and others, of irreligion; and upon a third proſecution, he was ſentenced to make a public recantation, and to ſuffer perpetual impriſonment. Refuſing to acquieſce in this ſentence, becauſe it implied an acknowledgment on his part, that his ſentiments were erroneous, he was condemned as an obſtinate heretic, and accordingly ſtrangled on the Greve, a public place near the Seine, appropriated to bonfires and the execution of criminals, and afterwards burnt. He ſuffered death with great conſtancy in April 1529; and though the monk who attended him intimated that he diſcovered ſome ſigns of abjuration at the ſtake, Eraſmus aſcribes the ſuggeſtion to the fraud and falſehood uſually practiſed on ſuch occaſions. Berquin was a perſon of great abilities, invincible fortitude, and irreproachable character. Gen. Dict. Jortin's Life of Eraſmus, vol. ii. p. 476—478.

BERRA. See Beria.

BERRE, in *Geography*, a town of France, in the department of the mouths of the Rhone, and chief place of a canton, in the diſtrict of Aix, ſituated at the mouth of a river, running into the lake of Martigues, called "the lake of Berre," in an unhealthy climate. It was formerly one of the ſtrongeſt towns of Provence. It was taken after a long ſiege, in 1591, by Charles Emanuel, duke of Savoy, during the wars of the league; and when the reſt of the province ſubmitted to Henry IV., he could not drive the Savoyards from Berre, till it was given up in 1598, in conſequence of the peace of Vervais; 4½ leagues S.W. of Aix. The population of the town is eſtimated at 1800, and of the canton at 6769 perſons. The territory comprehends 257½ keliometres, and ſix communes.

BERREA, in *Ancient Geography*, *Bra*, a town of Bulgaria, 10 or 12 leagues from Philippopolis, upon the river Braeſa.

BERRETINI, Peter, commonly called *Pietro da Cortona*, in *Biography*, an eminent painter of hiſtory and landſcape, was born at Cortona, in Tuſcany, in 1596; and acquired the firſt rudiments of his art under Andrea Commodi, and Baccio Ciarpi. At Rome, whither he went in his youth, he ſtudied the antiques, in the works of Raphael, Buonaroti, and Polidoro, with ſuch diligence, that he attained to great excellence as an artiſt. At this early period, he was patronized and employed by the marquis Sacchetti; and in his palace, he painted the "rape of the Sabines," and the "battle of Alexander," which were much admired for invention, diſpoſition, elevation of thought, and an excellent tone of colour, and deemed to be equal to the performances of the beſt maſters. His fame was completely eſtabliſhed at Rome, by the ſaloon of the Barberini palace, and by ſeveral works in the Vatican, and in ſome of the principal churches of the city. For further improvement, he travelled through Lombardy and Venice; and returning by way of Florence, he was employed by the grand duke Ferdinand II. in decorating ſome rooms in the Pitti palace, with pictures of virtuous and heroic actions from ancient hiſtory. At Rome, where he afterwards reſided, he adorned the gallery of the palace of Innocent X. on the piazza Navona, with various ſubjects from the Æneid: and as an architect, in which profeſſion he excelled, he gave deſigns for a number of churches, palaces, chapels and monuments. To the church of St. Martina, which was of his own conſtruction, he left a large ſum for the erection of a grand altar-piece of bronze, and of his own mauſoleum. Pope Alexander VII. was ſo well ſatisfied with the portico he built for the church of Peace, that he made him a knight of the golden ſpur, and gave him a rich croſs, appendant to a gold chain. In his more affluent and more humble condition, Berretini diſplayed the ſame equanimity, and uniformly maintained a reſpectable character. The gout, to which he was ſubject, diſabled him, towards the cloſe of life, from undertaking any great works, and at length confined him to his bed. He died at Rome in 1669. "As an artiſt, his character was richneſs of invention, with grace, beauty, and facility of execution. His diſpoſitions are fine, his management of lights good, and his ornaments and back-grounds charming; but his drawing is incorrect, his figures defective in expreſſion, and too much alike. His freſco paintings were uncommonly brilliant and clear. He ſucceeded better in great compoſitions than in ſmall. An Italian writer has ſaid of him, that "he had fire in his colours, vehemence in his hands, and fury in his pencil." Beſides his capital works in the palazzo Sacchietti, the Barberini palace, and the palazzo Pitti at Florence, there is, in the palace of the king of Sardinia at Turin, a ſmall ſketch repreſenting the "Annunciation of the Virgin," which is touched with exquiſite ſkill and ſpirit, and in the palace of the prince della Torre, at Naples, there is an incomparable picture of the "Flight into Egypt." The deſign is correct; the heads are wonderfully graceful; the compoſition is extremely fine, and the colouring is excellent. Many of his works have been engraved by the beſt artiſts. D'Argenville Vies des Peintres. Pilkington.

BERRETONI, Nicolo, an hiſtorical painter, was born at

at Macerata in 1617, and under Carlo Maratti, whofe difciple he was, he ftudied defign and colouring for fome years, and became fo diftinguifhed as a painter, that he excited the jealoufy and envy even of his maſter. His early works, after he quitted the ſchool of Maratti, were in the ſtyle and taſte of Guido; a circumſtance, which of itſelf, highly recommends them. He died in 1682. Pilkington.

BERRHŒA, in *Ancient Geography*. See Beroea.

Berrhoea, a town of Thrace, between Nicopolis of Mœſia, and Philippopolis of Thrace. Ammianus Marcellinus ſpeaks of it as a large city.

BERRIMAN, William, in *Biography*, a learned Engliſh divine, was born in London in 1688, and from Merchant Taylors' ſchool was removed, at the age of 18, to Oriel college, Oxford, where he proſecuted his ſtudies with great aſſiduity and ſucceſs. With a view to the critical examination of the ſcriptures, he combined with ſkill, in the Greek tongue, the ſtudy of the Hebrew, together with the Chaldee, Syriac, and Arabic; and in explaining the ſacred writings, he had recourſe to the rules of grammar, criticiſm, logic, and the analogy of faith. The articles of doctrine and diſcipline, which he deduced from the ſcriptures, he traced through the primitive church, and confirmed by the evidence of the fathers, and the deciſions of the more generally received councils. After he left the univerſity, where he was graduated M. A. in 1711, he ſerved two churches in London. His firſt appearance in print, was on occaſion of the Trinitarian controverſy, in 1719, when he publiſhed "A ſeaſonable Review of Mr. Whiſton's Account of Primitive Doxologies," which was followed in the ſame year by "A ſecond Review." Theſe performances recommended him to the patronage of Dr. Robinſon, biſhop of London, who, beſides conferring upon him a living in the city, and appointing him his chaplain, left him at his death the fifth part of his large and valuable library. In 1722, he accumulated, at Oxford, the degrees of bachelor and doctor in divinity. In the years 1723 and 1724, he was appointed to preach lady Moyer's lecture in defence of the commonly received doctrine of the Trinity, and his eight ſermons, delivered on this occaſion, were publiſhed, in 1725, under the title of "An Hiſtorical Account of the Trinitarian Controverſy." In conſequence of this ſervice, he was elected, in 1727, a fellow of Eton college. His "Hiſtorical Account" contained ſome obſervations relating to miracles, and drew upon him the animadverſions of Dr. Conyers Middleton; in anſwer to which, he publiſhed, in 1731, "A Defence of ſome paſſages in the Hiſtorical Account." By his "Brief Remarks on Mr. Chandler's Introduction to the Hiſtory of the Inquiſition," printed in 1733, and followed by a "Review of the Remarks," he incurred the charge of favouring the principles of intolerance, and in this controverſy he incurred the ſevere ſtrictures of that acute and learned nonconformiſt. His next publication was his courſe of ſermons at Boyle's lecture, preached in the years 1730, 1731, and 1732, and given to the world in 2 vols. 8vo. in 1733. In this work he ſtates the evidence of our religion from the O. T.; vindicates the Chriſtian interpretation of the ancient prophecies; and points out the hiſtorical chain and connection of theſe prophecies. In the preface, he aſſerts the authority of Moſes, as an inſpired hiſtorian and lawgiver. Beſides the writings already enumerated, Dr. Berriman printed a number of occaſional ſermons. He departed this life at his houſe in London, on the 5th of February 1749—50, in the 62d year of his age, and in his funeral ſermon, preached by Mr. Ridley, a great character is given of him, both as a miniſter of his pariſh, and as a private Chriſtian. His piety was unaffected and ſincere; and his benevolence extenſive. In the year of his deceaſe, two volumes of his ſermons were publiſhed in 8vo., under the title of "Chriſtian Doctrines and Duties explained and recommended;" and in 1763, 19 ſermons appeared in one volume, under the ſame title. "With reſpect to Dr. Berriman's practical diſcourſes, it is allowed that they are grave, weighty, and uſeful, and well fitted to promote pious and virtuous diſpoſitions; but when he treats on the power, rights, and dignity of the prieſthood, or on doctrines which have been greatly diſputed, different opinions will be formed, according to the different ſentiments of his readers." Biog. Brit.

BERRY, *Bacca*, a grain, fruit, or ſeed, produced by ſeveral herbs, trees, and ſhrubs, thence called "bacciferous," for the conſervation and reproduction of their kind. Some define berries as a fruit ſmaller than apples, growing in bunches, but not ſo thick or cloſe as grapes. Others, a ſoft, fleſhy, ſucculent fruit, having ſtones or kernels within them. Such are the fruits of laurels, olives, currants, and the like. The berry, or bacca, in a ſtrict ſenſe, denotes a pulpy pericardium without valves, in which the ſeeds are naked. See Bacca.

Berries are of various ſizes, forms, properties, and uſes, according to the plants whereon they grow.—Some are uſed in medicine, as juniper-berries, buckthorn-berries, &c. —Others in dying, as French or yellow berries, &c. The yellow berry-waſh may be thus prepared: take a pound of the French berries, and put them to a gallon of water, with half an ounce of alum; boil them an hour in a pewter veſſel, and filter off the fluid; put them again into the boiler, and evaporate the fluid till the colour appear of the required ſtrength.

Berry-*Bearing Alder*. See Rhamnus Frangula.

Berry, *Avignon*. See Avignon.

Berry, *Ale*. See Ale.

Berry, in *Geography*, a province of France, before the revolution, now comprehended under the departments of Indre and Cher, of which Bourges was the capital; bounded on the north by Orleannois, on the ſouth by Bourbonnois and Marche, on the eaſt by Nivernois, and on the weſt by Poitou. Berry was divided into the Upper and the Lower, and extended about 90 miles from north to ſouth, and 73 from eaſt to weſt; it is watered by ſeveral rivers, as the Loire, Creuſe, Cher, Indre, &c. enjoys a temperate air; is fertile in corn, fruit, wine, hemp, flax, and paſturage; and contains ſeveral ſtone quarries, and ſome mines of ſilver, iron, and ochre. Beſides the trade in wine, carried on at Bourges, the principal commerce of this province conſiſts in fat cattle ſent to Paris, and the great number of ſheep, which produce fine wool, manufactured in this and other parts of the kingdom. In Berry there are two kinds of manufactures; one for cloths and ſerges, and the other for knit and wove ſtockings.

Berry *Haven*, lies about a mile ſouth of the entrance into Donnegal haven, on the weſt coaſt of Ireland, and 5 miles N.N.E. from the haven of Ballyſhannon.

Berry *Head*, a noted promontory on the ſouth coaſt of Devon, being the ſouth-weſt limit of Torbay, and running far out ſouth into the ſea. Off this head, out of the way of the entrance into the bay, is a rock, called Berry-rock.

Berry's *Iſlands*, a ſmall cluſter of iſlands on the north-weſt point of the great Bahama bank, in the channel of Providence. N. lat. 25° 30'. W. long. 75° 40'.

BERSABA, in *Ancient Geography*. See Beer-Sheba.

BERSABORA, a large, ſtrong, and populous town of Perſia.

BER-

BERSARII, in *Writers of the Middle Age*, a kind of hunters, or ſportſmen, who purſued wild beaſts in foreſts and chaſes. The word ſeems derived from the barbarous Latin *berſare*, "to ſhoot with a bow." On which principle it ſhould properly denote archers only, or bowmen. Or it might be derived from *berſa*, the "fence or pales of a park." In which view, it ſhould primarily import thoſe who hunt or poach in parks or foreſts.

Hincmar ſpeaks of a kind of inferior officers in the court of Charlemagne, under the denomination of *berſarii*, *veltrarii*, and *beverarii*. Spelman takes the firſt to denote thoſe who hunted the wolf; the ſecond, thoſe who had the ſuperintendency of the hounds for that uſe; and the third, thoſe who hunted the beaver.

BERSCHETZ, or Berscheszh, in *Geography*, a little town of Carniola, ſeated on a high rock near the Adriatic ſea, and containing a ſmall harbour. In this place is produced a thick and ſweet wine, of a black red colour.

BERSELLO, or Brisello, a town of Italy, in the duchy of Modena, ſeated on the Po. It was taken by the imperial troops under prince Eugene in 1702, and by the French under the duke of Vendome in the following year. The emperor Otho died here, after his defeat by the army of Vitellius. The town is ſmall, but fortified; 27 miles north-weſt of Modena. N. lat. 44° 55′. E. long. 10° 30′.

BERSHEK, a mountain of Perſia, on the north-weſt ſide of the lake of Zurra, noted for a fire-temple, the reſort of the Guebres.

BERSIMA, in *Ancient Geography*, a town of Aſia, in Meſopotamia, ſeated on the left bank of the Euphrates, ſouth-weſt of Nicephorium.

BERSKOI, in *Geography*, a town of Siberia, 20 miles north-eaſt of Kolivan.

BERSTADT, a ſmall town of Moravia, in the circle of Olmutz.

BERT. See Brit.

BERTAUT, John, in *Biography*, an early French poet of reputation, was born either at Caen, or at Condé, in Perche, in 1552; and being known at court by his wit, was appointed firſt almoner to Catherine de Medicis, private ſecretary and reader to Henry III. and was much eſteemed by Henry IV. in whoſe converſion he was eminently inſtrumental. In 1594, he was made abbot of Aulnai, and, in 1606, biſhop of Seez. After his advancement to this ſee, his conduct was irreproachable, though ſome blame attached to him, becauſe, inſtead of ſuppreſſing the free poems of his youth, he publiſhed them with the pious pieces of his advanced age. He died in 1611. As a poet, he is ſtated to have been more natural and clear than Ronſard, more forcible than Deſportes, and more ingenious and poliſhed than either of his contemporaries. Some of his ſtanzas are ſaid to poſſeſs the eaſe and elegance of a more refined period. His fondneſs for point, with which his pieces abound, he ſeems to have derived from his attachment to Seneca. His "Poetic Works" were printed in 1620, Paris, 8vo. He left alſo a tranſlation of ſome books of St. Ambroſe, controverſial tracts, ſermons, and a funeral oration for Henry IV. Nouv. Dict. Hiſt. Gen. Biog.

BERTH, in *Sea Language*. See Birth.

BERTHEAU, Charles, in *Biography*, an eminent French proteſtant divine, was born at Montpelier, in 1660, and after having ſtudied philoſophy and divinity, partly in France, and partly in Holland, was admitted a miniſter in the ſynod of Vigan in 1681. His firſt ſettlement was as paſtor to the church at Montpelier, whence he removed to be miniſter of the church at Paris, which met at Charenton. Upon the revocation of the edict of Nantes, he came over to England, and in 1686, was choſen one of the miniſters of the Walloon church in Threadneedle-ſtreet, London, in which capacity he officiated, with very general applauſe, for 44 years. He died, much regretted, in December 1732. He was diſtinguiſhed by ſound judgment, by a retentive memory, ſo that he is ſaid never to have forgotten any thing which he had ſeen, read, or heard, by his accurate and extenſive acquaintance with eccleſiaſtical hiſtory, and by his eloquence as a preacher. Two volumes of his ſermons have been printed in French; the firſt in 1712, and the ſecond at Amſterdam, where the former was reprinted, in 1730. Gen. Dict.

BERTHEAUME Point, in *Geography*, the weſt limit of the bay ſo called, about 1½ league eaſt from St. Matthew's point, without the entrance into the road of Breſt. Within the point, on the weſt ſide of the bay, are the caſtle and rock of Bertheaume.

BERTHEVIN, St., a town of France, in the department of the Mayenne, and chief place of a canton, in the diſtrict of Laval, ¾ of a league weſt of Laval.

BERTHING, in the *Sea Language*, denotes the raiſing or bringing up of ſhip-ſides. Thus they ſay, a clincker hath her ſides berthed up before any beam is put into her.

BERTHOLZ, in *Geography*, a town of Germany, in the archduchy of Auſtria, 5 miles W.N.W. of Zwelt.

BERTHONCELLES, a town of France, in the department of the Orne, and chief place of a canton, in the diſtrict of Belleſme, 13 miles north-caſt of Belleſme.

BERTI, John-Laurence, in *Biography*, an Auguſtin monk, was born in 1696 at Seravezza, a village in Tuſcany, and upon being called to Rome by his ſuperiors, was appointed aſſiſtant general of his order in Italy, and prefect of the angelic library. In a great work, entitled "De Diſciplinis Theologicis," printed at Rome, in 8 vols. 4to. he appears to have adopted the ſentiments of St. Auguſtin, which involved him in a controverſy with the Jeſuits, and cauſed him to be denounced to pope Benedict XIV. as a diſciple of Baius and Janſenius. Againſt this charge he defended himſelf in a learned apology, comprehending 2 vols. 4to. He afterwards compoſed in Latin an "Eccleſiaſtical Hiſtory," in 7 vols. 4to., which was afterwards abridged in one volume, 8vo. In this work he repreſents the pope as ſupreme monarch and arbiter of all kingdoms and empires. He alſo wrote many other works, ſome of which are Italian poems, all of which were publiſhed together at Venice in folio. He was invited by Francis I. grand-duke of Tuſcany, to Piſa, and received a conſiderable penſion, with a profeſſorſhip in the univerſity, under the title of "Imperial theologiſt," and here he died, in 1766, much lamented by his colleagues. Nouv. Dict. Hiſt.

BERTIE, in *Geography*, a maritime county of America, in North Carolina, and Edenton diſtrict, having for its ſouth boundary the Roanoke, and on the eaſt Albemarle ſound. In this county is ſituated the ancient Indian tower of Tuſcarora. It contains 12,606 perſons, of whom 5141 are ſlaves.

BERTIERA, in *Botany*, derives its name from M. Bertier of France, and was ſo called in honour of him, by M. Aublet. Lin. gen. Schreb. n. 304. Aubl. 69. Juſſ. 200. Claſs and order, *pentandria monogynia*. Nat. Ord. *Contortæ*, Lin.; *Rubiaceæ*, Juſſ. Gen. Char. *Calyx*, perianth turbinate, five-toothed. *Cor.* one petalled; tube ſhort; mouth villoſe; border five-cleft; clefts ovate, acute, ſpreading. *Stam.* filaments five, very ſhort, inſerted into the tube beneath the orifice; anthers linear, erect. *Piſt.* germ roundiſh, inferior, crowned by a gland; ſtyle ſiliform; ſtigma two-plaited. *Per.* berry globoſe, crowned by the teeth of the calyx, two-

two-celled. *Seeds* very many, roundiſh, affixed to the diſſepiment.

Eſſ. Char. *Cal.* turbinate, five-toothed. *Cor.* tube ſhort, with a villoſe mouth; *berry* globoſe, inferior, two-celled, many-ſeeded.

Species, 1. B. *guianenſis.* Aublet. Guian. 180. t. 69. This is a ſhrub ſix or ſeven feet high, and the thickneſs of the human arm; branches oppoſite, knotty, tomentoſe; leaves oppoſite, ovate, acuminate, and tomentoſe underneath; petioles ſhort, convex beneath, channelled above; ſtipules ſtem-claſping, two lobed; flowers in terminating racemes; corolla white. Found by Aublet in the wood of Aroura, in Guiana, flowering and fruiting in the month of June. Martyn.

BERTIN, Nicholas, in *Biography*, an hiſtorical painter, was born at Paris in 1667; and after ſtudying under ſome of the principal artiſts, and gaining, at the age of 18 years, the prize of merit in the academy, was ſent to Rome for further improvement, where he acquired a good taſte for compoſition, and in Lombardy he completed his knowledge of colouring. Some time after his return to Paris, he was made academician in 1703, and profeſſor in 1705. His drawing was correct; his invention ready in all ſorts of ſubjects; and he painted in a ſtrong, pleaſing, and finiſhed ſtyle. He was much employed by Lewis XIV.; and his performances were valued and ſought after by foreigners. He excelled more in ſmall works than great ones; and from this circumſtance, and ſome others, he was referred only to the ſecond rank of artiſts. Among his moſt conſiderable performances we may reckon the cieling at the chatean of Pleſſis St. Pierre, the ſubject of which was the adoration of the Magi, and an hiſtorical compoſition, repreſenting the baptiſm of the eunuch of the queen of Candace, by St. Philip. His temper was reſerved, and he was much addicted to religion. He died at Paris in 1736. Pilkington. Gen. Biog.

BERTIN, Joseph, Exupere, was born at Tremblay, in the department of Rennes, June 28th 1712. Having gone through the uſual courſe of ſtudy, in anatomy, phyſiology, and theraupeutics, he was created doctor in medicine at Paris, in 1740. The following year he publiſhed "Non datur imaginationis maternæ in fœtum actio," combating an opinion, which had long prevailed, that the imagination of the mother had the power of marking and diſfiguring the fœtus in utero. His next production, which is much commended by Haller, is a treatiſe on "Oſteology," in 4 vols. 12mo. The bones of the head are deſcribed more exactly and minutely, Haller ſays, than in any other work extant. About the ſame time, he had a long, but not very intereſting diſpute, with Monſ. Ferrein, on the formation of the voice. In the year 1764, he joined Meſſrs. Le Bas, Petit, and others, in defending the cauſe of Madame Renné, who had been delivered of a male child ten months and twenty days after the deceaſe of her huſband, and who wiſhed to get the child acknowledged as his. Bertin, with his coadjutors, endeavoured to eſtabliſh as a principle, that there is no fixed term for the birth of the child, and that, according as the conſtitution of the parents was more or leſs vigorous, a greater or leſs portion of time might be required for the perfection of the fœtus. A child might be ripe, and fit for the birth, they maintained, at the end of the ſeventh month, if the parties enjoyed great ſtrength of conſtitution; or in an oppoſite ſtate of them, it might require ten, eleven, twelve, or more months, to fit it for excluſion. This doctrine was attempted to be eſtabliſhed by recurring to a great number of caſes and obſervations, and to the deciſions of the courts, of which they produced ſeveral, legitimating children, ſuppoſed to have been born in the eleventh or twelfth month after conception. Recourſe was alſo had to the hiſtories of monſtrous births, to ſhew the aberrations of nature. Theſe arguments and caſes were ably and judiciouſly oppoſed by M. Louis. The caſes adduced by his antagoniſts were ſhewn to be defective in evidence, and though he admitted that the time of geſtation in women, as well as in animals, might be protracted for a few days, yet he much doubted whether, in any inſtance, it had been extended to the end of the tenth month, or at the moſt to more than two or three days beyond that term. In ſupport of this opinion, he cited the authority of ſome of the ableſt philoſophers, phyſicians, and lawyers; and the court, according to this determination, declared the child to be illegitimate. Though the court in this deciſion were probably influenced by the peculiar circumſtances of the caſe, the huſband being 76 years of age at the time of his death, and for the laſt month in ſuch a ſtate as to be incapable of performing the conjugal rites, yet the arguments and authorities adduced by M. Louis, muſt have had great weight with them, and well deſerve to be had recourſe to in deciding on general principles, what is the utmoſt term to which a woman may carry a living child. M. Bertin was author of ſeveral diſſertations, principally on anatomical ſubjects, which were publiſhed in the Memoirs of the Royal Academy of Sciences, and other philoſophical and medical journals and tranſactions; the titles and accounts of which are given by Haller, in his Bib. Anatom.

BERTINORO, in *Geography*, a town of Italy, in the ſtate of the church, the ſee of a biſhop, ſuffragan of Ravenna; ſeated on a hill, and defended by a citadel, 15 miles ſouth of Ravenna.

BERTIUS, Peter, in *Biography*, an eminent geographer, was born at Berveren, a village in Flanders, in 1565, and acquired the knowledge of the learned languages in England. Having travelled through Germany, and other countries, he ſettled at Leyden, where he became profeſſor of philoſophy; but after occupying this poſt for 26 years, he was expelled for joining the Arminian party. Upon his expulſion, he migrated to Paris, where he abjured the proteſtant religion in 1620, and was made coſmographer to the king, and profeſſor-royal extraordinary of mathematics. He died in 1629. His principal works are "Theatrum Geographiæ Veteris," Amſt. 2 vols. fol. 1618, 1619; which is a collection of the works of almoſt all the ancient geographers, illuſtrated by notes, and eſteemed a valuable publication; "Introductio in univerſam Geographiam;" "Comment. Rerum Germanic. lib. iii." Amſt. 12mo. 1635, containing a good deſcription of Germany, and a map of the empire of Charlemagne; "Notitia Epiſcopatuum Galliæ," Par. fol. 1625; "De Aggeribus et Pontibus," Par. 8vo. 1629. The works above enumerated are held in high eſtimation by geographers. We may add "Illuſtr. Virorum Epiſt. Select. ſuperiori ſæculo ſcript. vel a Belgis vel ad Belgas," 8vo. 1617. Bertius alſo wrote ſeveral pieces in the controverſy between the Gomariſts and Arminians, and publiſhed diſcourſes on various occaſions. Nouv. Dict. Hiſt.

BERTON Road, in *Geography*, lies within Dalkey iſland, at the ſouth point of the entrance into Dublin bay, Ireland.

BERTONA, Bertonia, Berthona, Barton, or Berton, properly denotes that part of a country farm where the barns and other inferior offices ſtand, and wherein the cattle are foddered, and other buſineſs is managed. *Berton* is alſo uſed to ſignify a farm, as diſtinct from a manor. Du-Cange. In ſome parts of the weſt of England, they call a great farm a *berton*, and a ſmall one a *living*. Hence alſo *bertonarii* was anciently uſed for thoſe we now call farmers, or tenants of bertons.

BERTON-

BERTONCOURT, in *Geography*, a town of France, in the department of the Moſelle, and chief place of a canton, in the diſtrict of Bouray, 10 miles north-eaſt of Metz.

BERTRAM, Cornelius Bonaventure, in *Biography*, a learned orientaliſt, was born at Thouars, in Poitou, in 1531, and became profeſſor of Hebrew at Geneva, and afterwards at Lauſanne, where he died in 1594. His works are "A Diſſertation on the Republic of the Hebrews," 8vo. Geneva, 1580, and Leyd. 1641; "A Reviſion of the French Bible of Geneva," Gen. 1588, which is more correct and liberal than the other, and is uſed by the Calviniſts at the preſent time; "A new edition of Pagnin's Treaſure of the Sacred Tongue;" "Parallel of the Hebrew and Syriac Languages;" and "Lucubrationes Frankendalenſes," Frank. 1586. He contributed alſo to the edition of Mercerus's comment on the book of Job. Gen. Dict. Nouv. Dict. Hiſt.

BERTRAND, Gabriel, a ſurgeon of eminence at Paris, publiſhed, in 1610, in 8vo. "A Refutation of the Errors contained in Guillemeau's deſcription of the muſcles of the human body," which is much commmended by Portal; alſo "Les Verités Anatomiques et Chirurgicales des Organes de la Reſpiration, et des artificieux moyens dont la nature ſe ſert pour la preparation de l'air," Paris, 1629, 12mo. He had obſerved pus formed in the cheſt to be abſorbed and conveyed out of the body with the urine. Haller. Bib. Anatom.

Bertrand, John Baptist, born at Antigues, July 12th 1670, was member of the academy at Marſeilles, where he alſo practiſed medicine with reputation and ſucceſs. He publiſhed "An Hiſtorical Account of the Plague," which deſolated that city in the year 1719, of which he was witneſs; alſo "Letters addreſſed to M. Deidier on the cauſes of muſcular motion;" and "Diſſertations on the effects of ſea air." He died September 10, 1752, aged 82 years. Eloy. Dict. Hiſtor.

Bertrand *de Comminges*, *St.* in *Geography*, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the diſtrict of St. Gaudens. Before the revolution it was the ſee of the biſhop of Comminges; diſtant 3 miles ſouth-weſt of St. Gaudens. Its population is eſtimated at 639, and that of the canton at 8165 perſons. Its territory comprehends 137½ kiliometres, and 18 communes.

BERTRANDI, Ambrose, in *Biography*, a celebrated anatomiſt and ſurgeon of Turin, where he was born, October 8, 1733. Shewing early marks of an uncommon genius and talents for his profeſſion, he was ſent by his ſovereign to Paris, and afterwards to London, to acquire a knowledge of the improvements making in theſe places. At London, he was for ſix months under the direction of Mr. Bromfield, then at the head of his profeſſion. Having employed three years in his travels, in 1754 he returned to Turin, where he was preferred to the offices of profeſſor extraordinary, and principal ſurgeon to the king. In 1748, he publiſhed, in 8vo. "Diſſertationes duæ anatomicæ, de hepate, et de oculo," which have conſiderable merit. But his principal work was publiſhed at Nice in 1763, 8vo. under the title of "Trattato della operazioni di chirurgia," in which he has deſcribed the manner of performing the principal operations in ſurgery. The work was tranſlated into French by M. Sober, and publiſhed at Paris, in 1769, with engravings. He died in 1765, in the 43d year of his age. Hall. Bib. Chir. Eloy. Dict. Hiſt.

BERTROMONTIER, in *Geography*, a town of France, in the department of the Voſges, and chief place of a canton, in the diſtrict of St. Dié, 4 miles eaſt of St. Dié.

BERVA, a diſtrict of Africa, in the ſouthern part of the country called "Kiaſerak" by the Arabians, and by us "Cafraria." See Brava.

BERVAN, a town of Aſia, in Tartary, in the kingdom of Thibet, near the lake Bervan, which lake is ſaid to be 40 leagues long and between 30 and 34 broad.

BERVIE, or Inverbervie, in *Geography*, a royal burgh in the county of Kincardine, Scotland. N. lat. 56° 44'. W. long. 2° 4'. It is ſeated on the eaſtern coaſt, at the mouth of the river Bervie, called *Bervie bay*, which forms a ſmall harbour for fiſhing-boats. This town was conſtituted a royal burgh in 1342, by charter from king David, who, being at ſea, was forced in here by ſtreſs of weather, and kindly received and entertained by the inhabitants. The place where he landed is ſtill called *craig David*. In 1595, James VI. renewed the charter, with all its former privileges and immunities. This town has loſt nearly the whole of its trade and commerce, and many of its houſes are fallen to decay. Moſt of the fiſhermen who frequented this port, are removed to Gourdon, a village about 2 miles ſouth, where they enjoy a more eligible ſituation. Freſh water has lately been brought into the town by means of pipes, and a new bridge has been recently thrown acroſs the river Bervie. The population of the borough is about 607 perſons.

BERVINE, a river of the Netherlands, which paſſes by Dalem, and runs into the Meuſe, near Viſet.

BERVISCH, in *Ichthyology*, the name by which the Hollanders call the lump-fiſh; *cyclopterus lumpus* of Linnæus.

BERULLE, Peter de, in *Biography*, cardinal and founder of the congregation of the fathers of the oratory in France, was born at Serilly near Troyes, in 1575, and educated with a view to the eccleſiaſtical profeſſion, firſt among the Jeſuits, and afterwards in the univerſity of Paris, where he was diſtinguiſhed by his proficiency in literature, and by the amiableneſs of his diſpoſition. Such were his attainments in doctrinal and controverſial divinity, that he bore a principal part in the conference at Fontainbleau, in 1600, between cardinal du Perron on behalf of the catholics, and du Pleſſis Mornay on the ſide of the proteſtants. At this time he was almoner to king Henry IV.: and in 1604, he was employed in bringing over a colony of Carmelites from Spain, and ſettling them at Paris; of this order he was conſtituted ſuperior-general. The firſt foundations of the congregation of the oratory of Jeſus were laid by him in 1611, and from this inſtitution he derived the greateſt honour. See Oratory. After the death of Henry IV., Berulle was chief of the council of the queen mother, Mary of Medicis, and he took an active part in promoting conciliatory meaſures between the contending parties during the minority of Lewis XIII. In 1624, he was deputed on a commiſſion to Rome, to ſolicit a diſpenſation for the marriage of the princeſs Henrietta Maria, to Charles I. of England; he was appointed her confeſſor, and accompanied her to take poſſeſſion of the throne. But as he ſtrenuouſly and inflexibly maintained her ſtipulated rights, he contributed in ſome meaſure to the miſchief that reſulted from this impolitic union, and at length incurred the reproach of a diſmiſſal. The duke of Buckingham, as he ſays, complained of him to the king of having conſpired againſt his life and fortune. On his return to France, he was active in urging the proceedings againſt the Calviniſts at Rochelle. Having refuſed ſeveral rich benefices and biſhoprics, he was nominated cardinal by Urban VIII., without his knowledge, in 1627; but he continued his abſtemious and mortified mode of living; and at length, exhauſted by his labours and auſterities, he died during the celebration of maſs, Oct. 2, 1629. His numerous pieces in controverſial theology were collected and publiſhed in one volume folio, in 1644, and have ſince appeared in two other editions. Gen. Dict.

BERUS, in *Geography*, a town of France, in the department of the Moſelle, and chief place of a canton, in the diſtrict of Sar-Louis, 4 miles S.S.W. of Sar-Louis.

Berus, in *Zoology*. *Coluber berus* is the common European viper. Linnæus, who, in deſcribing the *amphibia ſerpentes*, conceived it quite ſufficient to diſtinguiſh all the ſpecies of the ſeveral genera included in that order, by the number of abdominal ſcuta, or plates on the belly, and the ſcales on the tail, ſtates them at 146—39. Fn. Suec. Amoen. Acad. &c. The opinion entertained in this reſpect by that eminent naturaliſt, we perceive from later obſervations on the ſpecies he deſcribes, was not perfectly correct. This is exemplified for inſtance in the common viper, in which both the abdominal plates and caudal ſcales are liable to vary in point of number; one writer ſpeaks of the viper having 148—42, Weigel, &c.; another (Scopoli) mentions 177—68, &c. Notwithſtanding therefore the example of Linnæus to the contrary, we cannot but approve of characters taken rather from the various marks, ſpots, and other ſtriking particulars in the general appearance of the ſpecies in this order, as Linnæus has done himſelf in the reptile tribe. Dr. Shaw ſeems alſo to prefer the latter, conſidering the number of plates on the belly, and ſcales on the tail, in a ſecondary point of view. He thus deſcribes the common viper: *Coluber* cinereus, maculis capitis biloba, vitta dorſali atra dentato reparida. *Cinereous viper*, with a bilobate ſpot, and a black flexuous zigzag bend down the back.

Gmelin, in the Syſtema Naturæ, has four varieties of coluber berus; namely, (β.) a native of India, in which the ſpots along the back are roundiſh and confluent, ſo as to form almoſt one continued ſtripe; thoſe ſpots near the tail are diſpoſed tranſverſely. In the iſland of St. Euſtace, another variety (γ.) is alſo found, of a ſubruſous colour, with the head variegated, and the neck ſlender. (δ.) This inhabits India, and is diſtinguiſhed by having the arch of the occiput, or hind head, intercepting a white ſpot. The fourth ſort (ε.) has an aggregated ſpot of many parts on the head; and is a native of the Celebes. Figures of all theſe varieties of *coluber berus* are to be found in the magnificent work of Seba.

The common viper of Europe and northern Aſia is the ſame as that found in this country. With us, the viper ſeldom exceeds the length of eighteen inches or two feet. Pennant tells us, he once ſaw a female viper almoſt three feet in length, obſerving at the ſame time, that the females are uſually one third larger than the males. The colour, generally ſpeaking, is of a ſilvery greyiſh, or tawny brown, paler or more vivid in different individuals, and ſometimes blackiſh all over; but in all theſe varieties the ſpots are pretty nearly the ſame, the back being marked with a chain or ſeries of rhomboidal ſpots connected with each other, and forming one continued indented ſtripe from the head to the extremity of the tail. A ſeries of dark or duſky ſpots extends likewiſe along each ſide of the body; other ſpots appear again on the belly, which in moſt ſpecimens is almoſt entirely black, and finely gloſſed with purple. The ſituation of the fangs proves the viper to be one of the poiſonous kinds of ſerpents; they are ſituated on each ſide of the fore-part of the upper jaw, and are commonly two in number, with a few ſmaller ones near them. Petiver deſcribes a black viper, *vipera Anglica nigrans*, which is thought to be nothing more than a dark variety of the common kind, *berus*. This, however, is not certain, and we ſhould heſitate in admitting it as a variety only, ſince Linnæus conſidered it, from the deſcription which Petiver has given, as the *coluber preſter* of his Fauna Suecica. For a further account of *coluber berus*, ſee Viper.

BERWICK, North, in *Geography*, a royal borough of Eaſt Lothian, in the county of Haddington, in Scotland. This town is of very remote antiquity, and has been a ſcene of conſiderable manufacture and commerce, but is now reduced to poverty, its harbour being in ruins, and a few cargoes of grain are the only exports from its quay. Its original charter was loſt or deſtroyed, and James VI. granted it a new one, under which it has ſince been governed. The pariſh extends about three miles along the ſea-coaſt, and conſiſts wholly of arable land, except a fine conical hill called *North Berwick Law*. This riſes immediately above the town, and forms a conſpicuous landmark to the ſailors who navigate the frith of Forth. The ancient caſtle of Tamtallan ſtands about two miles from this town, and is elevated on a high rock, three of whoſe ſides are laved by the ſurge of the ſea, and the fourth guarded by a deep foſſe and drawbridge. See Bass. N. lat. 56° 40′. W. long. 2°.

Berwick, commonly called *Berwick-upon-Tweed*, is a large reſpectable town, ſituated between England and Scotland. From its having been a frontier garriſon town, long before the glorious æra of the union, and from its ſituation on the ſhore of the ocean and on the bank of an unfordable river, it was conſidered, when in poſſeſſion of the Engliſh, as a key to England, and when in poſſeſſion of the Scots, as a key to their own country. This peculiarity of ſituation rendered it a ſcene of repeated ſiege and devaſtation. Berwick is pleaſantly ſituated on the northern bank of the river Tweed, within half a mile of the German ocean; 336 miles north-weſt from London; and 54 miles ſouth-eaſt from Edinburgh. N. lat. 55° 48′. W. long. 1° 45′. The ground, on which the town ſtands, riſes gently from the river, and from its ſouthern aſpect, is rendered cheerful by the ſun. Its circumference, within the preſent walls, is about one mile and three quarters, but the circumference of the old walls extended two miles two hundred and eighty-two yards. The town of Berwick is mentioned as a place of ſtrength in the reign of Oſbert, one of the laſt kings of Northumberland, who died in the beginning of the ninth century. It was ſucceſſively conquered and poſſeſſed by the Saxons and Danes, until the Scottiſh king Gregory, who was cotemporary with Alfred the Great, took it by aſſault. It continued part of the Scotch dominions till about the year 1098, when it was given by Edgar to the ſee of Durham, but was again reſtored to the Scots. During the repeated wars between England and Scotland, this town and its caſtle were frequently taken and retaken by the armies of each kingdom, and in each direful conflict ſuffered materially. In one of theſe, between Alexander of Scotland and John of England, the greater part was deſtroyed by the latter, who made it a practice to conſume the houſe every morning in which he had lodged the preceding night. On the 2d of Auguſt 1291, the ſtates of England and Scotland, with Edward I., aſſembled at Berwick, to ſettle the claims of Robert Bruce and John Baliol to the Scottiſh crown, when the latter was appointed on the 17th of the following November. During theſe reigns Berwick was beſieged and conquered by Edward I.; and the conflict was ſo great, that Matthew of Weſtminſter ſtates the loſs of the Scots to amount to 60,000 perſons. An Engliſh parliament was ſummoned here in 1296, when the Scotch nobility paid homage to king Edward. In the following reign, Robert Bruce collected an army of 30,000 combatants, with which he entirely routed and diſcomfited Edward II. and his army near Stirling caſtle. This battle, commencing on Midſummer day, 1314, continued ſeveral days, and it is acknowledged by moſt authors, that the Engliſh ſuffered more in this conteſt than in any other ſince the time of William the conqueror. It was in this battle that

that the privy ſeal was loſt; and Edward iſſued a proclamation from Berwick, informing his ſubjects of the circumſtance. Berwick was afterwards a ſcene of great revelry and rejoicings. The marriage of Joan, ſiſter to Edward III., with David of Scotland, was performed at this place with great pomp and oſtentatious ſolemnity. In ſpite of this family alliance, the two kingdoms ſoon returned to their former hoſtilities, and Berwick became the ſeat of many battles and deſtructive ſieges. It was ſeveral times afterwards in the poſſeſſion of each country, and never relinquiſhed by either without a vigorous and obſtinate reſiſtance. In the reign of Richard III. of England, and James III. of Scotland, commiſſioners were appointed by each crown to aſcertain the limits of Berwick; and it was agreed, that the ground in diſpute ſhould remain uncultivated, unbuilt, and uninhabited. But in 1502, this agreement was annulled by another, which ſtipulated that the town and caſtle ſhould be "preſerved in perpetual peace, friendſhip, league, and confederacy." In the ſame year was ſolemnized the marriage of Margaret, eldeſt daughter of Henry VII., with James IV. king of Scotland; but this circumſtance did not terminate the jealouſies and animoſities between the two kingdoms, as Edward VI. marched to Berwick with a large force, which was augmented by a fleet of 34 ſhips, 30 tranſports, and a galley. Theſe lay encamped here for ſome time, and were deſtined to invade Scotland. This monarch, and Mary queen of Scotland, by treaty, made Berwick a county town, and declared it independent of both ſtates. Queen Elizabeth fortified and inveſted it with a ſtrong and expenſive military eſtabliſhment, conſiſting of 980 men, whoſe annual ſalaries amounted to 12,734l. 19s. 2d. All this was abrogated, and the place rendered peaceable by James VI. of Scotland, who was proclaimed at Berwick, in the year 1603, king of England, France, and Ireland. The union of the two kingdoms, in 1707, terminated the long ſeries of hoſtilities, which had proved ſo deſtructive to the commerce, population and agriculture of the borders, and to this place in particular.

Berwick, though originally a Scots town, was erected into an Engliſh borough, at a very early period, and its laſt charter was granted by James I.; under which the burgeſſes claim their various privileges, immunities, &c. as well as ſome large territorial poſſeſſions and domains. It has an exempt juriſdiction, and is independent of the adjoining counties of Durham and Northumberland, yet it is not a county in itſelf. Since the union, it has been partly ſubject to the Engliſh laws, but is locally regulated by its own code. The town is governed by a mayor, recorder, four bailiffs, and an indefinite number of aldermen. The firſt is annually elected, and receives 100l. during his mayoralty. Two members of parliament are returned from this town, and the number of electors amounts to nearly one thouſand, though not more than ſeven hundred have been known to vote at one election. Several manufactures are eſtabliſhed here; the principal of which are for making of damaſk and diaper, ſacking, ſail-cloth, cotton and muſlins, ſtockings, carpets, felts, hats, boots, ſhoes; beſides ſeveral others connected with the ſhipping. The coaſting trade and foreign commerce of Berwick are very conſiderable, though about ſixty years ſince, only two ſmall veſſels of fifty tons each were employed between this place and London. Now about 40 veſſels belong to this port, whoſe principal lading conſiſts of ſalmon and eggs. The firſt are moſtly caught in the river Tweed, whoſe fiſheries afford a great revenue to the proprietors, and give employ to about 300 men. The ſalmon fiſhing continues from the 10th of January till the 10th of October, during which time above 40,000 kits of theſe fiſh, beſides a vaſt quantity of ſalmon trout, have been ſent to London. The latter are often conveyed alive in the holds of the veſſels. About 80 boats are employed on the Tweed; and the yearly rentals of all the fiſhing waters amount to nearly 10,000l. The article of eggs is alſo a curious and lucrative branch of trade: they are brought to this town in carts and panniers from all parts of the adjoining country, and moſtly bartered for grocery goods. From the 10th of October 1797 to the 10th of October 1798, 5254 cheſts of eggs were ſent hence to London. The vaſt increaſe of trade at this port may be eſtimated from the cuſtom-houſe revenue, which has riſen in the laſt 20 years from 1000l. to 6000l. a year.

It was the univerſal practice, till within theſe few years, to boil all the ſalmon before it was packed up in the kits; but in 1788, a new mode was adopted, and has continued ever ſince. This conſiſts in packing it with ice, which being wanted in great quantities, induced the merchants to conſtruct ſeveral ice-houſes near the town. In the year 1798, the two companies of Berwick laid in 7600 cart loads, which coſt them about 450l. There are 32 ſalmon coopers in this town. Four modes of catching ſalmon are practiſed here; the ſweep, the ſtill, the bobb, and the hanging nets. (See SALMON.) Beſides the ſalmon-fiſhery, the herring and lobſter fiſhery employs ſeveral hands. The latter are caught cruives, which are three feet in length and one and a half in height. Theſe have a hole at each end, where the lobſters are tempted to enter for the incloſed baits.

The *Public Buildings* are the governor's houſe, the barracks, the ordnance-houſe, the main-guard, the town-hall, reſervoir, church, vicar's houſe, and the bridge; all theſe are conſtructed with ſtone, and the two firſt were built in 1719. The town hall is a handſome building of three ſtories, with an ornamental tower and ſpire at one end. It was built from the deſigns of Joſeph Dodds, and finiſhed in 1754. The church was built, in 1652, under the direction of colonel George Fenwicke; but it has neither tower nor bells: theſe are annexed to the town hall. The bridge over the Tweed is conſtructed with fine hewn ſtone, and has fifteen ſpacious arches. It extends 1164 feet in length, and 17 in width, and was finiſhed building October 12, 1634, after a period of 24 years, 4 months, and 4 days, from the commencement.

Here are a charity ſchool, and ſix free-ſchools, alſo a cuſtom-houſe and exciſe-office. Berwick is ſtill ſurrounded with fortified walls, which are mounted with 54 guns. It has four principal gates, and has a complete garriſon eſtabliſhment, to which Holy iſland is an appendage. Among the antiquities of the town, are the remains of its ancient caſtle, and a pentagonal bell tower near it, a ſquare fort in Magdalane fields, entrenchments on the top of Hallydown hill, and an old pier called queen Elizabeth's pier.

Here is one weekly market on Saturdays, and one annual fair; but the corporation has eſtabliſhed three annual markets, called High markets, for the hiring of ſervants, and ſelling of horſes, cattle, &c. Fuller's Hiſtory of Berwick-upon-Tweed, 8vo. 1799.

BERWICK, or *Abbotſtown*, a neat town of America, in York county, Pennſylvania, at the head of Conewago creek, 103 miles W. by S. of Philadelphia, 13 miles W. of York, and 26 miles S.S.W. of Harriſburg. This town is regularly laid out, and contains about 100 houſes, and a German Lutheran, and Calviniſt church. N. lat. 39° 54'.

BERWICK, or *New Berwick*, a ſmall town of Northumberland county in Pennſylvania, on the north-weſtern ſide of the eaſt branch of Sſquehannah river, oppoſite Neſcopeck falls and Neſcopeck creek, 32½ miles north-eaſt from Nor-

thumberland and Sunbury, at the junction of the eaſt with the weſt branch of the Suſquehannah, and 160 north-weſt of Philadelphia. N. lat. 41° 3'.

Berwick, a townſhip of York county, and diſtrict of Maine, containing 3894 inhabitants. It has an incorporated academy, and lies on the eaſt ſide of Salmon Fall river, 7 miles N. W. of York, and 86 E. by N. from Boſton.

BERWICKSHIRE, a county of Scotland, famous in the hiſtorical annals of Britain for the many deſperate battles fought between the Engliſh and Scots within its boundaries. This county formerly conſtituted about half of the earldom of Dunbar or March, and is generally called by the country people *Merſe*. It is nominally divided into three diſtricts, reſpectively called Lauderdale, Lammermuir, and Merſe, or Marſh. The latter comprehends the moſt beautiful ſubdiviſion, and follows the courſe of the Tweed, from the foot of the Elden hills to within a few miles of Berwick. Lauderdale is the valley which accompanies the river Leader, or Lauder, whoſe waters are celebrated in Scottiſh ſong. Lammermuir comprehends the ridge of hills, which ſeparates this county from eaſt Lothian, and is chiefly appropriated to the feeding of ſheep and black cattle. This county is bounded on the north by Haddingtonſhire, on the eaſt by the German ocean, on the ſouth by the river Tweed, which divides it from Northumberland in England, and on the weſt by the counties of Roxbury, Peebles, and Midlothian. Its length is eſtimated at 32 miles, and breadth at 17 miles. It is divided into 32 parochial diſtricts; and beſides the royal borough of Lauder, has the towns of Greenlaw, Dunſe, Coldſtream, Coldingham, Ayton, and Eyemouth, within its limits. The chief rivers of the county are the Tweed, the Leader, the Eye, the Whiteadder, and the Blackadder. The ſtate of agriculture in this county is highly improved within the laſt twenty years; and many parts that were then uncultivated, are now incloſed and rendered profitable to the landlord and the huſbandman. By way of agricultural pre-eminence, this county is often called the Norfolk of Scotland. Many farms now let at 300l. and 400l. per annum, which at no very diſtant period were ſcarcely deſerving of notice. This increaſe of proſperity enables the county to export from the ports of Berwick and Eyemouth "above 80,000 bolls of victual annually;" and nearly the ſame quantity is conveyed to the markets of Edinburgh, Dalkeith, Haddington, and Dunbar. The minerals of this diſtrict hitherto diſcovered are few, and theſe not very valuable. Coal is found in ſmall quantities near Eyemouth; freeſtone is abundant; and rock and ſhell marl are found in different places. Copper has been obtained in the vicinity of Lauder; and ſome few years paſt a mine of the ſame ore was diſcovered in the pariſh of Bonkle. A ſmall quantity of iron ſtone is found in the pariſh of Mordington. The rocks, which compoſe the Lammermuir hills, are moſtly ſchiſtus, with alternate ſtrata of ſandſtone. At Eyemouth is a rock of Puddingſtone, which is found to contain fragments of porphyry, granite, and limeſtone. In the pariſh of Chirnſide, is a ſpecies of gypſum, which is advantageouſly uſed to manure certain lands. Near Dunſe is a celebrated mineral ſpring, which is much reſorted to. Its water, ſomewhat ſimilar to that of Tunbridge wells, contains iron diſſolved in fixed air, with a little ſea ſalt and bittern; and its effects prove rather diuretic and corroborant. Among the gentlemen's manſions of the county, thoſe of Hirſel, the ſeat of the earl of Home, and of Marchmont, the ſeat of the earl of Marchmont, are the moſt conſiderable; though there are ſome other handſome manſions. Beſides the caſtle and fortifications of Berwick, there are ſeveral others in different parts of the county, particularly at Lauder, Cockburn path, Home, and Chapel on Beach. There were alſo ſeven numeries, two hoſpitals, and one Dominican convent. Among the eminent natives of this county, the following names occur: James Thomſon, the poet; John Scott, or Duns Scotus, who was born at Dunſe. Of the ſame place, was John Brown, author of the Brunonian ſyſtem of phyſic; Thomas the Rhymer, or ſir Thomas Lermont, is diſtinguiſhed in the hiſtory of metrical romance. The real landrent of this county is eſtimated at 118,8col. ſterling. Home's Agricultural Report of Berwickſhire. Sir John Sinclair's Statiſtical Account of Scotland. Fuller's Hiſtory of Berwick.

BERWIN, or Berouin, a conſiderable range of mountains, which paſſes through parts of the counties of Montgomery, Merioneth, and Denbigh, in North Wales. The proſpect from different ſpots on the ſummit of this ridge ſtrikes the mind with awful aſtoniſhment. "Nature," ſays lord Lyttelton (Works, vol. iii. p. 337.), "is in all her majeſty there; but it is the majeſty of a tyrant frowning over the ruins and deſolation of a country. The enormous mountains, or rather rocks, of Merionethſhire, incloſed us all around. There is not upon theſe mountains a tree, or ſhrub, or blade of graſs; nor did we ſee any marks of habitations or culture in the whole place. Between them is a ſolitude fit for deſpair to inhabit; whereas all we had ſeen before in Wales, ſeemed to inſpire the meditations of love."

BERY, Beria, or Berie, was anciently the name of the vill or ſite of the habitation of a nobleman, or of a dwelling or manſion-houſe, being the chief of a manor; formed of the Saxon "beorg," which denotes a hill or caſtle; for noblemen's ſeats were formerly caſtles, ſituate on hills, of which there are ſtill ſome remains. It was anciently taken for a ſanctuary. See Beria.

BERYL, or Beryll, βήρυλλος, *Aquamarine of Siberia*, *Berill*, Germ.; *Emeraude*, *vert bleuâtre*, Hauy; *ſilex ſmaragdus beryllus*, Werner.

The colour of the beryll is a bluiſh green, paſſing into mountain apple, or aſparagus green, and honey yellow on one ſide, and light ſky blue on the other. It is almoſt always found cryſtallized in rectangular ſix-ſided priſms, ſometimes truncated on the edges and angles; the ſides of the priſm are occaſionally alternately broad and narrow, and ſometimes convex, which gives the whole cryſtal a cylindric form. It is not unfrequent for the priſms to have the appearance of having been broken acroſs and imperfectly cemented together. Sometimes, inſtead of having plane ſurfaces at their extremities, they are convex or concave, like articulated baſaltes. The ſize of the cryſtals varies conſiderably, the ſmalleſt being always the longeſt in proportion to their diameter: ſome are of no greater magnitude than a hair, while others have been found a foot long and three or four inches in diameter. The beryll has many points of reſemblance with the emerald; and in particular the cryſtals of both are diviſible parallel to the ſides and extremities of a regular hexahedral priſm; on which account M. Hauy has comprehended them both under one ſpecies.

The beryll is externally ſhining, or little-ſhining, with a vitreous luſtre. Its parallel fracture is minute-conchoidal; the croſs fracture is completely conchoidal. It is generally tranſparent, but ſometimes is only ſemi-tranſparent or tranſlucid. It is ſufficiently hard to ſcratch quartz, though with ſome difficulty. Specific gravity of the light blue variety 2.67; of the bluiſh green 2.75; of the mountain green 2.65.

This mineral appears to have been firſt analyſed by Vauquelin, and afterwards by Roſe and Schaub, with the following reſults:

Silex,

	Vau.	R.	S.
Silex,	69	69.5	66.5
Alumine,	13	14	16.75
Glucine,	16	14	15
Lime,	0.5		
Oxyd of iron,	1	1	1
	99.5	98.5	99.25

In a common fire the beryll undergoes fcarcely any change of colour, but it loſes its tranſparency, and flies to pieces. At a more intenſe heat it becomes opaque and milk white, but ſhows no ſigns of fuſion; by the aſſiſtance, however, of oxygen gas, it melts without much difficulty. Borax is a perfect flux for it.

The beryll is found in Dauria, upon the borders of China, near Nertſchinſk, alſo in the granitic ridge between the rivers Onon and Ononborſa. It is found in rivers, accompanying rock-cryſtal, indurated clay, mica, fluor, wolfram, and arſenical pyrites.

The beryll, when cut and poliſhed, has a conſiderable luſtre; but its colour is for the moſt part but indifferent. It is ranked among the gems, but its value is trifling when compared with the ruby, ſapphire, topaz, &c. Hauy. Emmerling. Widenmann.

Beryll, *Oriental*. See Corundum.

Beryll, *Braſilian*. See Tourmalin.

Beryll, Beryllus, is alſo a name given to a kind of cryſtal looking-glaſs, ſuperſtitiouſly conſecrated to the purpoſes of conjuring and divination. Hence alſo the term *berylliſtica*, uſed for the myſterious art of ſeeing future or diſtant events in ſuch glaſſes.

BERYLLINA, in *Entomology*, a ſpecies of Chrysis, found in Europe. The head is greeniſh blue; thorax blue, greeniſh in front, behind bidentated; abdomen green, changeable to ruſous and blue; legs blue, with teſtaceous dots. Linnæus, &c.

BERYLLINUS, a ſpecies of Cimex (*Spinoſus*); thorax obtuſely ſpined, and dentated on the ſides; tips of the ſpines and bifid ſhield of the head greeniſh blue. Linn.

BERYLLUS, in *Biography*, a learned and pious biſhop of Boſtra, or Bozrah, in Arabia, flouriſhed about the year 230, and taught that Chriſt had no proper ſubſiſtence or divinity diſtinct from that of the father, before his birth of Mary; or that Chriſt did not exiſt before Mary, but that a ſpirit iſſuing from God himſelf, and therefore ſuperior to all human ſouls, as being a portion of the divine nature, was united to him at the time of his birth. Many conferences were held with Beryllus on this opinion; and at laſt it was ſo completely refuted by Origen, and ſo much to the ſatisfaction of Beryllus himſelf, that he gave up the cauſe, and returned into the boſom of the church. The acts of theſe conferences were long preſerved, and the dialogue between Origen and Beryllus was extant in the time of Jerom. Euſebius alſo refers to them. Eccl. Hiſt. l. vi. c. 33. Cave's Hiſt. Lit. vol. i. p. 121. Moſh. Eccl. Hiſt. vol. i. p. 306.

Beryllus, in *Entomology*, a ſpecies of Cimex (*Rotundatus*), that inhabits India. It is of the middle ſize; pale; border of the thorax orange; wing-caſes with a ferruginous ſpot, and marginal black lines. Fabricius.

BERYTIS, in *Ancient Geography*, a town of Aſia Minor, in the Troade. Steph. Byz.

BERYTUS, Bairout, Berout, or Beirut, a town of Phœnicia, ſituated about 24 miles ſouth of Byblus. Stephanus Byz. ſays, that it was ſo called on account of its waters. Others deduce its name from Beröe, as it was ſometimes called by the poets, who was a nymph of the ocean, and the nurſe of Semele. Bryant ſuppoſes it to have been derived from Baris, Barit, or Barith, the ancient name of the ark, but properly ſignifying a covenant; and that it was the city of the ark, where the Canaanite or Phœnician deity Baal-Berith had a temple, and where the rites of his worſhip were performed. This city is not much inferior to Byblus in antiquity, ſince it is ſaid to have exiſted in the time of Cronus. The kings of Egypt had poſſeſſion of it; but when Antiochus the Great ſubdued this province, it became ſubject to the kings of Syria, and remained under the ſucceſſors of this prince till the time of Diodotus, denominated "Tryphon," who entirely deſtroyed it about 140 years before the Chriſtian æra. The Romans, after the conqueſt of Syria, rebuilt it near the ſpot where the ancient city had ſtood. Agrippa, the grandſon of Herod the Great, decorated it at an immenſe expence with a theatre and amphitheatre, baths, and porticoes, and eſtabliſhed in it magnificent games, mentioned by Joſephus in his "Antiquities." It was in this city that Herod the Great, by permiſſion of Auguſtus, held an aſſembly which condemned to death his ſons Alexander and Ariſtobulus, under the falſe accuſation of Antipater, their eldeſt brother, for having conſpired againſt the life of their father. Titus, the ſon of Veſpaſian, came to Berytus, after the capture of Jeruſalem, to celebrate the feaſt of the birth of his father; according to Joſephus "De Bello." Berytus enjoyed the privilege of the "jus Italicum," according to a law of the Digeſt. Pliny (H. N. l. v. c. 20.) and Joſephus (De Bell. Jud.) informs us, that it was a Roman colony. Under the Roman emperors, Berytus was no leſs famous for the ſtudy of the law in the eaſt, than Rome was in the weſt; and hence it was ſtyled by the emperor Juſtinian "the mother and nurſe of the laws." The civil law was taught here in Greek, as it was at Rome in Latin. It is not certainly known by whom the academy was founded; but that it flouriſhed long before the reign of the emperor Diocleſian, is manifeſt from a decree of that prince. According to Heineccius (Jur. Rom. Hiſt. p. 351—356.), the ſplendour of this ſchool may be computed to have laſted from the third to the middle of the ſixth century; and its inſtitution has been aſcribed to Alexander Severus. From this academy the two famous civilians Dorotheus and Anatolius were called by Juſtinian, that they, in concurrence with others, might be employed in comparing the Digeſts; and that prince would allow of no other academies, but thoſe of Rome, Berytus, and Conſtantinople, to explain the laws. This city was overthrown by an earthquake in the 25th year of Juſtinian, A. D. 551, July 9; and as the ſchools of Berytus were filled with the riſing ſpirits of the age, many youths were probably loſt on this diſaſtrous occaſion, who might have lived to be the ſcourges or guardians of their country. The metals of this city are bronze, gold, and ſilver. After it became a Roman colony, its medals had a legend, Col. Fel. Ber. i. e. "Colonia felix Berytus," and were ſtruck in honour of Cæſar, Auguſtus, Tiberius, Claudius, and other Roman emperors. For the preſent ſtate of Berytus, ſee Bairout. The ſuburbs are almoſt as large as the city itſelf, conſiſting of gardens, with a houſe for the owner in each; and theſe, interſperſed among the numerous fruit-trees, particularly olives and figs, which this fertile ſoil ſupports, give the whole a picturesque and beautiful appearance. European veſſels, in the ſummer, anchor near a ſmall point of land, which runs into the ſea before the city, and is called "Beirût point;" but in the winter, they caſt anchor to the north, in a kind of gulf, which is ſheltered from the north and eaſt wind by the mountain, and is ſaid to be very ſerene. The ſtaple commodity of the country is raw ſilk, which is carried to Cairo, Damaſcus, and Aleppo, and

part

part of it to Europe. They alſo fabricate a kind of jars and jugs of earthen ware, which, from the peculiar nature of the clay in the adjacent country, are highly eſteemed, and carried to all parts of the coaſt. Brown's Travels in Africa, p. 377.

Berytus, a town of Arabia, formerly called Dioſpolis. Steph. Byz.

BERZETIN, in *Geography*, a town of Hungary, in the diſtrict of Gomor, not far from the river Sajo, and formerly noted as the reſidence of many noble families.

BERZETTO, a town and abbey of Italy, in the duchy of Parma.

BERZOWITZ, a town of Hungary, 12 miles N.N.E. of Leutſch.

BES, or Bessis, an ancient Roman weight, containing two thirds of the *as*, that is, eight *unciæ*. See As.

The bes originally weighed two aſſes; whence the origin of the word *quaſi binus as*. Though Scaliger conjectures it to have been formed from *dues*; as *bellum* from *duellum*, or *bonum* from *duonum*. *Bes* was alſo a linear meaſure of the ancient Romans. *Bes* was alſo a meaſure of capacity.

Bes was alſo uſed in the menſuration of lands, to denote two thirds of a *jugerum*, or acre. See Measure.

Bes was alſo a money of account, and a current coin among the ancient Romans. See Coin, and Money.

BESA, in *Ancient Geography*, an ancient city of the Thebaide upon the Nile, conſecrated to a god of that name, but formed into a new city by Adrian, who built a temple in it in honour of Antinous, and called it *Antinoe* or *Antinopolis*; which ſee.

Besa, in *Mythology*, a deity belonging to the city of Abydus in the Thebaide, mentioned by Ammianus Marcellinus in his Hiſtory, lib. xix. The mode of conſulting the oracle of this deity was by writing the ſubjects of inquiry on ſealed billets, which the prieſts carried into the ſanctuary of the god, and to which they brought back the anſwers. Iſaac Caſaubon has ſuggeſted, in conſequence of a paſſage occurring in the Bibliotheca of Photius (Cod. 279.), that this deity was adored at *Antinoe*, or *Antinopolis*; which ſee.

BESAILE, or Besayle, Fr. denoting the father of the grandfather, in the *Common Law*, a writ that lies where the great-grandfather or great-grandmother was ſeiſed the day that he or ſhe died, of any lands or tenements in fee-ſimple; and after his or her death, a ſtranger entered the ſame day upon him or her, and keeps out the heir.

BESALU, in *Geography*, a town of Spain, in Catalonia, at the foot of the Pyrenées, erected by pope Benedict VIII. into an archbiſhopric, but ſoon after ſuppreſſed; 7 leagues from the Mediterranean, and 5 north from Gerona.

BESANçON, a city of France, and before the revolution the ſee of an archbiſhop, and capital now of Franche Compte, of the department of the Doubs. This city is ſurrounded by mountains, and ſeated on the river Doubs, which divides it into the upper and lower town, joined by a handſome bridge. Of the former, nothing remains except the caſtle, or citadel, which is a long ſquare built on a ſharp rock, and commanding the city, which is defended by a wall flanked with eight towers like baſtions. The latter has three long and handſome ſtreets, which are adorned with houſes built of free ſtone, and covered with ſlate; chiefly about the ſquare called "Battan," which is ornamented with a fountain, whoſe water proceeds from the ſtatue of Bacchus. The metropolitan church is built at the bottom of St. Stephen's hill, and is a handſome ſtructure, with a high tower ſteeple. In the middle of the choir is the great altar, on which they expoſe at certain times, relics in ſilver ſhrines enriched with gold and jewels. Near the church of Notre Dame is a triumphal arch, erected in honour of the emperor Aurelian, on which are ſeen ſeveral mutilated figures of men and animals. This ſerves as a gate to the cloiſter of St. John the Great. The great hoſpital of the order of St. Eſprit, for foundlings, is a ſtructure worthy of notice. The priſon is remarkable for its excellent economy, and the humane attention paid to its unhappy occupiers. The town-houſe is a large edifice with four wings, having in its front the ſtatue of Charles V. in bronze, with a globe in one hand, and a ſword in the other. The imperial eagle is raiſed over a large baſon, and ſpouts out water by both its beaks. The governor's palace is magnificent; and beyond it is a fountain, adorned with the figure of a naked woman diſcharging water at her nipples. Under the Romans, this was one of the moſt magnificent places which they had in Gaul, and many remains of their ſuperb buildings are yet viſible. After the death of Julian, it was almoſt deſtroyed by the Germans, and a ſecond time by Attila. It afterwards became an imperial city, till the time of Lewis XIV., who, in 1674, made himſelf maſter of it, repaired its fortifications, and united it to France. The univerſity of this city is an ancient and celebrated foundation; and in the year 1752 a literary and military ſociety was inſtituted in this place. It contains 8 pariſhes; and the number of inhabitants, which was formerly eſtimated at 40,000, is now ſuppoſed to be reduced to 30,000. The canton of north Beſançon is ſaid to contain 15,618, and that of ſouth Beſançon 16,662 perſons. The territorial extent of Beſançon comprehends 97½ kiliometres; the former canton includes 3, and the latter 4 communes. N. lat. 47° 13′ 45″. E. long. 6° 2′ 40″.

About 20 miles from Beſançon, near the abbey of "Grace Dieu," there is a natural ice-cellar, in a very romantic ſituation. On the higheſt part of a mountain, covered with a thick grove of lofty trees, is the opening of the cavern, which reſembles by its depth, ſaid to be above 220 feet, and by the ſolemn gloom of the ſurrounding wood, what poets have feigned of the deſcent into the infernal regions. The cavern itſelf is 60 feet in length and height, and 40 in breadth; the bottom is covered with ice, of which vaſt pyramids riſe from it, while others appear ſuſpended from the arched roof, with their points oppoſite to thoſe of the former. Within the cave is a hole or well, always full of water, and never frozen; and, at the entrance, ſome mould, which ſeems to have been accidentally thrown there, and adorned with primroſes and other wild flowers. The ice, which in the cavern appears of a beautiful azure, is, when ſeen by day-light, remarkably white. From this natural repoſitory, the ice-houſes in Beſançon are ſupplied, when the winters are too mild to freeze water in the open air. This cavern has been the ſubject of repeated inveſtigation, the reſult of which may be ſeen in the "Memoirs of the Academy," for 1712 and 1726.

BESANT, or Bezant, Bizant, or Byzant, a ſort of coin, ſtruck at Byzantium, in the time of the Chriſtian emperors, and well known in England, and indeed all over Europe, for ſome ages before the Norman conqueſt. Few coins ever had a longer or more univerſal currency than theſe beſants or byzantines; having been current from the very beginning to the end of the eaſtern empire, not only in all its provinces, but alſo in all thoſe countries which had been provinces of the weſtern empire, and amongſt others in Britain. With us gold and ſilver beſants were received in payments. But though they are frequently mentioned by all the hiſtorians of the cruſades, they are rarely ſpoken of by ours. Neither are they named in Domeſday book, nor in the public acts of Henry I. or Stephen, nor in the laſt will of king Henry II. However, ſome mention is made of them in private deeds and leaſes, and alſo in the Exchequer rolls under

Henry II. The gold befant was pure, or twenty-four carats fine; but writers are not generally agreed with refpect to its value. Out of the Greek pound of gold, which was the fame with our Tower pound, 72 byzantines were coined, each weighing 73 troy grains, and worth 40 Saxon pennies, 8 Saxon fhillings, and 9 fhillings and four pence halfpenny of our prefent money. (Henry's Hift. vol. iv. p. 275.) The filver befant, in the 12th century, was rated at two fhillings Engliſh. (Lyttelton's Hift. of Henry II. vol. i. p. 411.) Hence the gold offered by the king at the altar, on feftivals, is ſtill called befant, or bifant. Thirteen befants, or bifantins, were preſented at the mafs at the coronation of the kings of France. Henry II. had that number coined on purpoſe.

Besants, in *Heraldry*. See Bezants.

BESARABA, in *Geography*, a town of European Turkey, in the province of Bulgaria, 48 miles north of Ternova.

BESBICUS, in *Ancient Geography*, a ſmall iſland of the Propontis, now the ſea of Marmora, ſituate between Cyzicum and the mouth of the Rhyndacus. This, according to Pliny (N. H. l. ii. c. 8.), is one of thoſe iſlands which, being firſt joined to the continent, were ſeparated from it by the violence of the ſea, or by earthquakes.

BESBOROUGH, in *Geography*, an iſland in Norton ſound, on the weſt coaſt of North America. N. lat. 64° 10′. W. long. 161° 15′.

BESBRE, a river of France, in Nivernois.

BESERG Henlu, a town of Aſiatic Turkey, in the province of Caramania; 24 miles north of Akſerai.

BESHARRAI, a village of Syria, ſituate among the mountains in the pachalic of Tripoli, on the road to the Cedars, and diſtant from them 3 leagues, which is frequented by the Europeans, and where the miſſionaries have a houſe. During the winter, many of the inhabitants leave their houſes under the ſnow, with ſome perſon to guard them, and remove to the ſea-coaſt.

BESHETZK, or Bezetzk, a diſtrict in the government of Tver in the Ruſſian empire, ſituate on the Mologa. N. lat. 58° 30′. E. long. 34° 44′.

BESIEGERS, and Besieged, in the *Military Art*, denote thoſe who lay ſiege to a fortified place, and thoſe who defend it. See Siege.

BESISHEIM, in *Geography*. See Bessigheim.

BESILLUS, in *Ancient Geography*, a river of Spain in Bætica.

BESISTAN, or Berstein, a name given to thoſe places at Conſtantinople, Adrianople, and ſome other towns in the dominions of the Grand Seignior, where the merchants have their ſhops, and expoſe their goods to ſale. A particular beſiſtan belongs to each claſs of merchants and workmen. Theſe beſiſtans are commonly large galleries vaulted over, whoſe gates are ſhut every night. The wardens, or keepers, will ſometimes be anſwerable for the merchandiſe, on being paid a moderate perquiſite for each ſhop. See Bazar.

BESLER, Jerom, in *Biography*, born at Nuremberg, Sept. 29th 1566, and created doctor in medicine at Baſle in 1592, was in ſuch reputation for his learning, and ability in his profeſſion, that he was ſeven times appointed dean of the college at Nuremberg, and inſpector of the medicines uſed by the apothecaries there. He died November 1632.

Besler, Basil, brother to Jerom, was born at Nuremberg in 1561, where he ſettled as an apothecary. Applying to the ſtudy of botany, he ſoon became conſpicuous in that branch of natural hiſtory. In 1613, he publiſhed "Hortus eyſtettenſis, ſive diligens et accurata omnium plantarum ex variis orbis terræ partibus, ſingulari ſtudio collectarum, quæ in celeberrimis viridariis arcem epiſcopalem ibidem cingentibus, hoc tempore conſpiciuntur, delineatio, et ad vivum repreſentatio," Nuremb. 1613, in 4 vols, Atlas folio. The moſt ſplendid botanical work, Haller ſays, that had then appeared. The plates, 356 in number, and delineating 1533 plants were engraved at the expence of Conrad, biſhop of the dioceſe. The work is unequal in its execution, as beſides the errors committed in the deſcription of many of the plants, ſome of the delineations are fictitious, taken from fancy, or from the rude accounts of ignorant travellers. But the far greater part of them are correctly drawn, and beautifully executed. As Baſil was ignorant of the Latin language, his brother Jerom furniſhed the preface. He alſo publiſhed "Faſciculus rariorum, et adſpecta dignorum varii generis, quæ ceri incidi curavit," Norib. 1616, 4to. Max. containing ſome marine plants and fruits; alſo, "Icones florum et herbarum, &c." fol. 1622. It is a continuation of the hortus eyſtettenſis, which have been ſeveral times reprinted. The time of his death is not known. Haller. Bib. Bot.

Besler, Michael Rupert, ſon of Baſil, was born in 1607. Having paſſed ſome years at Altdorf, where he was admitted doctor in medicine, he returned to Nuremberg, and was advanced to the ſame offices that had been enjoyed by his uncle. In 1631, he publiſhed, in 4to. "De ſanguine ſecundum et præter naturam;" and in 1640, folio, "Admirandæ fabricæ humanæ muliebris partium generationi potiſſimum inſervientium, et fœtus fidelis quinque tabulis hactenus nunquam viſa delineatio." The work is ingenious, but the plates, which are copied from Fabricius, are ill executed. This work was followed, in 1642, by "Gazophylacium rerum naturalium ex regno vegetabili, animali et minerali de promptarum fidelis repreſentatio," fol. and the ſame year, by "Obſervatio medica ſingularis, mulieris tres filios enixæ," 4to.

BESLERIA, in *Botany*, ſo named by Plumier after Baſil Beſler, an apothecary at Nuremberg, editor, with the aſſiſtance of Jungermann, of a ſumptuous work, entitled "Hortus eyſtettenſis," 1613. Lin. gen. n. 755. Reich. 813. Schreb. 1012. Plum. 5. Jacq. Amer. 187. Juſſ. 121. Gærtn. t. 52. Claſs and Order, *didynamia angioſpermia*. Nat. Ord. *perſonatæ*. *Schrophulariæ*, Juſſ. Gen. Char. *Cal.* perianth one-leafed, five-parted, acuminate, erect, looſe, with reflected tops. *Cor.* monopetalous, ringent; tube the length of the calyx, roundiſh, gibbous on one ſide at the baſe, and at the top; border five-cleft, diviſions roundiſh, the lowermoſt largeſt, and the two upper leſs divided. *Stam.* filaments four, within the tube of the corolla, of which two are a little ſhorter; anthers oblong, twin, hanging down on each ſide. *Piſt.* germ globular, ſitting on a glandulous body, which embraces it, and is permanent, cordate where the corolla is gibbous; ſtyle ſubulate, erect; ſtigma bifid, obtuſe. *Per.* berry ſubglobular, one-celled; partition, two oppoſite ſemi-ovate laminas, not cohering. G. *Seeds*, numerous, round, very ſmall, neſtling, fixed to the inner ſurface of the berry.

Eſſ. Char. *Cal.* five-parted; *berry* ſubglobular, many-ſeeded.

Species, 1. B. *melittifolia*. "Peduncles branching; leaves ovate." It has a ſmooth, woody, jointed ſtalk; with two ovate nerved leaves oppoſite at each joint, which are crenate at their edges; the flowers proceeding from the wings of the leaves upon ſhort branching footſtalks, each ſuſtaining ſix or eight flowers. A native of South America. 2. B. *lutea*. Eriphia, Brown, Jam. 270. *β*. B. &c. ſ. luteo, major, Plum. gen. 29. "Peduncles ſimple, crowded; leaves lanceolate." Riſing with a ligneous ſtem, ſix or ſeven feet high, divided towards the top into many irregular branches, with ſpear-ſhaped ſerrate leaves, having many tranſverſe veins; the flowers iſſuing at the wings of the leaves in large cluſters, each

on

on a ſeparate foot-ſtalk, and ſmall, tubulous, of a pale yellow colour. A native of Martinico, Jamaica, &c. 3. B. *criſtata*. "Peduncles ſimple, ſolitary; calyxes ſerrate-creſted." A ſhrubby plant, different in its habit from the foregoing, climbing up trees, and adhering to them by roots iſſuing from the joints; the twigs round, hirſute, and long; the leaves ovate, acute, ſerrate, hirſute, wrinkled, veined, petioled, oppoſite, two inches long; peduncles one-flowered, axillary, bent down, almoſt as long as the leaves; calyx bright ſcarlet; corolla yellow; ſtamens proceeding from a common membrane, faſtened to the tube of the corolla, and cleft longitudinally at its gibbous part. Before the diſperſion of the pollen, the filaments are upright; afterwards interwoven as in Martynia. A yellow conſpicuous gland embraces the germ. A native of Martinico, in moiſt mountainous woods. 4. B. *bivalvis*. "Calyxes bivalve, torn." Stem herbaceous, long, creeping, hairy, round; leaves oppoſite, petioled, veined, hairy, nerved, a hand's breadth long; peduncles lateral, oppoſite, ſhorter than the leaves, two from each axil, one-flowered; berry oval, with a hard two-celled nucleus; reſembling the third ſpecies in the leaves and calyx, but very different in the fruit, and in wanting the five leaved perianth. Obſerved at Surinam by Dahlberg. 5. B. *biflora*. Cyrtandra biflora, Forſt. gen. 3. n. 1. "Peduncles two-flowered; involucre caducous, inflated; leaves ovate, quite entire." A native of the iſland of Otaheite. 6. B. *cymoſa*. "Peduncles cymed; pedicels with little bractes; leaves ovate, crenate." A native of the iſland of Tanna.

Propagation and Culture. Theſe plants grow naturally in the warm parts of America. The ſeeds ſhould be ſown on a hot-bed early in the ſpring, and the plants, when half an inch high, tranſplanted each into a ſmall pot filled with light freſh earth, and plunged into a hot-bed of tanner's bark, watered and ſhaded till they have taken root; afterwards according to the warmth of the ſeaſon, and of the bed in which they are placed. When the plants have filled theſe ſmall pots with their roots, they ſhould be ſhaken out, and their roots trimmed and put into large pots filled with light freſh earth, and plunged again into the hot-bed, where they ſhould have much air in warm weather, and be frequently watered. Thus managed, the plants will thrive in ſummer, but in winter they muſt be removed into the ſtove, and often, but ſparingly, watered. In the ſecond year theſe plants will flower; they ſometimes perfect their ſeeds in this country; but as they will not live in the open air, they muſt be conſtantly preſerved in the ſtove. Martyn.

BESONS Rocks, in *Geography*, are two ſmall rocks off the weſtern point of Cornwall, bearing W.S.W. from cape Cornwall, and N.N.E. from the Long ſhips. Ships may ſail within them without danger.

BESORCH, in *Commerce*, a coin of tin, or of ſome alloyed metal, current at Ormus, at the rate of about $\frac{7}{40}$ parts of a farthing ſterling.

BESOS, or Betulus, in *Geography*, a river of Spain in Catalonia, which runs into the ſea not far from Barcelona

BESSAPARA, in *Ancient Geography*, a town of Thrace, ſituate 12 miles from Philippopolis.

BESSARA, a town of Aſia in Aſſyria, ſeated near the Tigris. Ptolemy.

BESSARABIA, Budziac, or Boodjak, in *Geography*, is a ſmall country of Turkey in Europe, ſituate between the north branch of the Danube and the river Dneiſter, and bounded on the weſt by Moldavia, on the ſouth by the Danube, on the eaſt by the Black ſea, and on the north by Ruſſia. It was anciently the country of the Getæ and Peucini; but it is now inhabited by the independent Tartars, of whom ſome have fixed habitations in their villages, and others lead a kind of wandering life, ſubſiſting on the fleſh of their oxen and horſes, and on the milk of mares, and the cheeſe which is made of it. In their religion, manners, and cuſtoms, they reſemble the Crim Tartars. When an army is ſent to attack them, they retire into inacceſſible mountains, on the coaſt of the Black ſea, whence it is impoſſible to expel them, on account of the moraſſes and defiles. The chief towns are Bender, Akerman, Kilia, and Iſmail. This country, and alſo Walachia, on which it borders towards the ſouth-eaſt, contain ſome lakes of conſiderable extent, as thoſe round Iſmail, and that to the eaſt of Surza, which communicates with the Danube, and forms a part of that river.

BESSARION, Cardinal, in *Biography*, was born at Trebiſond in 1395, and educated at Conſtantinople, under ſome of the moſt learned Greeks of that period. In the courſe of his education, he adopted the principles of the Platonic philoſophy, and was more confirmed in them by the lectures of George Gemiſtus Plethio, on whom he attended in the Morea. Theſe principles he combined with his ſyſtem of Chriſtian theology. Having taken the religious habit of St. Baſil, he was ſoon advanced to the biſhopric of Nicæa, and employed by the Greek church to attend on their behalf at the council held under pope Eugenius IV. firſt at Ferrara, and afterwards at Florence, in 1439; with a view of effecting an union between the Latin and Greek churches. But he incurred the diſpleaſure of the Greeks by inclining to the party of the Latins, and propoſing an union of the two nations, to the prejudice of the former, who were required unequivocally to declare that the Roman pontiff was the ſupreme head of the univerſal church. Beſſarion became unpopular in his own country, nor could he venture to reviſit Conſtantinople; but remaining at Rome, and ſubſcribing the articles of the Latin church, he was recompenſed, in 1439, by a cardinal's hat, and he was alſo created titular patriarch of Conſtantinople. Having perfected himſelf in an acquaintance with the Latin language, he was from this time employed by the popes in ſeveral concerns of moment. Nicholas V. after naming him to the biſhopric, firſt of Sabina, and afterwards of Fraſcati, ſent him as legate to Bologna, where he reſided from the year 1450 to 1455, and contributed to revive and increaſe the reputation of the univerſity. Upon the death of Nicholas, the cardinals had an intention of advancing him to the papal ſee; but when they waited upon him with this view, they were prevented from ſeeing him by one of his attendants, who would not allow him to be diſturbed in his ſtudies; upon which Beſſarion, when he was informed of the fact, ſaid to him, "Perot, thy incivility has coſt thee a hat, and me the tiara." Beſſarion was employed by the popes Calixtus III. and Pius II. in negociating the wiſhed-for league againſt the Turks, and deputed for this purpoſe to Alphonſo, king of Naples, and the emperor Frederic. During the pontificate of Paul II. he lived at Rome, and diſtinguiſhed himſelf in the promotion of literature, by opening an academy in his palace for the ſtudy of philoſophy, and for gaining a critical knowledge of the Greek and Latin languages: nor was he leſs liberal and active in encouraging every other branch of ſcience, by countenancing with his preſence and patronage thoſe aſſemblies that were frequented by the Greeks and Italians for the purpoſe of mental improvement. His library, which contained many Greek MSS., is ſaid to have coſt him 30,000 crowns; and this he preſented, in 1468, to the republic of Venice, where it became the chief foundation of the library of St. Mark. Having received from pope Sixtus IV. the appointment of legate to France for the purpoſe of reconciling king Lewis XI. and the duke of Burgundy, he paid his firſt viſit to the duke, and thus offended Lewis to ſuch a degree, that he treated him with rudeneſs, and diſmiſſed him

without entering on the buſineſs for which he was deputed. This kind of reception affected him ſo much, that on his return he fell ſick at Turin, and died at Ravenna in 1472. He was regarded as a perſon of unparalleled genius and erudition; and he was the author of many works, both in Greek and Latin, ſome of which were printed, and others left in MS. The chief of theſe was his defence of Plato, againſt George of Trebiſond, in a treatiſe entitled, "In calumniatorem Platonis, lib. iv.," firſt printed without a date at Rome in 1470, and re-edited at Venice in 1503 and 1516, folio. In this publication he examines Plato's opinions, particularly with regard to morals, and ſhews that they approach much nearer to the doctrines of Chriſtianity than thoſe of Ariſtotle. Others of his printed works are letters, orations, and tranſlations of Xenophon's Memorabilia, the metaphyſic of Ariſtotle, and that, falſely aſcribed to Theophraſtus. According to Brucker, theſe tranſlations are very obſcure; but Huet commends Beſſarion as the model of all good tranſlators. Brucker's Hiſt. Philoſ. by Enfield, vol. ii. p. 407. Fabr. Bib. Græc. l. v. c. 43. § 9. tom. 10. p. 401.

BESSARIONOVA Cape, in *Geography*, is the weſt point of a bay in the ſea of Azof, of which the eaſt point is cape Berdinſkaya. N. lat. 46° 35'. E. long. 36° 46'.

BESSA-STADER, or Basse-sted, a place of Iceland, (N. lat. 64° 6'.) the reſidence of the king's prefect. In this place is a woollen manufactory, with a fulling mill belonging to it.

BESSAY, a town of France, in the department of the Allier, and chief place of a canton in the diſtrict of Moulins, 8 miles ſouth of Moulins.

BESSE, John, in *Biography*, of Peyruſſe, in the Rouergue, was educated under M. Chirac, at Montpellier, whoſe theory of fermentation he adopted. He then went to Paris, where he publiſhed, in 1702, "Recherches analytiques ſur la ſtructure du corps humain," 8vo. He derives all the functions of the body, and even the formation of the fœtus, from a due mixture of acid and alkali. He does not allow the imagination of the mother to have the power of marking or diſfiguring the fœtus in utero. The following year he was created doctor of phyſic by the faculty at Paris, and ſoon after was made phyſician to the queen dowager of Spain. In 1723, he publiſhed "Lettre critique, contre l'idee generale de l'œconomie animale, et les obſervations ſur la petite verole," in 12mo. In this work, the firſt part of which was written to oppoſe the principles laid down by Helvetius, he gives an account of a malignant ſpecies of ſmall-pox, which raged in the year 1716, and ſpeaks of the benefit accruing in theſe caſes from bleeding, and adminiſtering purges, on the attack of the ſecondary fever, a doctrine approved by Drs. Mead and Friend. He commends the diſſection of dead bodies, with the view of diſcovering the cauſes of diſeaſes, which he frequently practiſed, and mentions his having found 13 calculi in the gall-bladder of a perſon who died of jaundice. For other ſmaller pieces by this writer, ſee Haller's Bib. Med. Pract. He died, we are told, at Paris, at an advanced age.

Besse, in *Commerce*, a Perſian copper coin, in value 1½d ſterling.

Besse, in *Geography*, a town of France, and principal place of a diſtrict in the department of the Puy de Dôme, 6 leagues ſouth of Clermont. The town contains 1913, and the canton 11,016 perſons. Its extent comprehends 445 kiliometres and 12 communes. N. lat. 45° 31'. E. long. 2° 52'.—Alſo, a town of France, in the department of the Var, and chief place of a canton in the diſtrict of Brignols, 6 miles S.E. of Brignols. The town includes 1578, and the canton 8165 perſons. The territory contains 347½ kiliometres and 7 communes.—Alſo, a town of France, in the department of the Sarte, and chief place of a canton in the diſtrict of St. Calais, on the river Braye, 5 miles ſouth of St. Calais.

BESSENAY, a town of France, in the department of the Rhone and Loire, and chief place of a canton in the diſtrict of Camp-de-Lyon, 4 leagues weſt of Lyons.

BESSENBACH, a town of Germany, in the circle of the Lower Rhine, and archbiſhopric of Mentz; 6 miles eaſt of Aſchaffenburg.

BESSERNE, a ſmall iſland of Denmark, 2 miles S.E. of Veyeroe.

BESSI, in *Ancient Geography*, a people who inhabited a diſtrict of Thrace, near mount Hæmus, called *Beſſica*. They lived in huts, and maintained themſelves by plundering their neighbours. They were the moſt ſavage and inhuman of all the Thracians, according to the account given of them by St. Jerom, Paulinus of Nola, Eutropius, and Ovid. Their chief city, Uſcudama, is now known by the name of Adrianople. They lived under their own kings, undiſturbed by the neighbouring princes, till the conſulate of M. Licinius Lucullus and C. Caſſius Varus. Lucullus invaded their country; after a ſignal victory took poſſeſſion of it, and ſubjected the whole nation to the Roman laws. The Romans afterwards allowed them to live under their own kings: but Piſo, while he governed Macedon as proconſul, having treacherouſly ſeized Rabocentus, whom Strabo calls prince of the Beſſi, cauſed him to be publicly beheaded; and this affront ſo exaſperated the whole nation, that they ſhook off the Roman yoke; however, they were vanquiſhed in a conſiderable battle by Octavius, the father of Auguſtus. During the civil wars of Rome, they again attempted to recover their liberty, but were ſubdued by the famous M. Brutus, junior. In the reign of Auguſtus, one Vologeſes, a native of the country and prieſt of Bacchus, having, under pretence of religion, aſſembled a numerous body of people, made himſelf maſter of the whole country, and, entering the Cherſoneſus, committed moſt dreadful ravages; but was at laſt overcome by L. Piſo, who obliged the ſavage inhabitants to lay down their arms, and ſubmit to ſuch conditions as he was pleaſed to impoſe. From this time the Beſſi continued ſubject to the Romans, without making any further attempts to recover their ancient liberty. Eutrop. l. ii. Oroſ. l. iv. c. 3. Flor. l. iv. c. 12. Sueton. in Octav. Dio Caſſ. l. xlvii.

BESSIERES, in *Geography*, a town of France, in the department of the Upper Garonne, 5 leagues N.E. of Toulouſe.

BESSIGBEIM, a town of Germany, in the circle of Swabia, and duchy of Wurtemberg, near the conflux of the Ens and Necker, 8 miles ſouth of the Heilbron, and 13 north of Stuttgart. The diſtrict of the ſame name is a good wine country.

BESSIN, the name, before the revolution, of a ſmall country of France, in Lower Normandy, near the ſea-coaſt.

BESSINES, a town of France, in the department of the Upper Vienne, and chief place of a canton in the diſtrict of Bellac, ſituate in a deep, narrow, rocky valley, 6 leagues north of Limoges. The town contains 2511, and the canton 9352 perſons. Its territory includes 180 kiliometres, and 7 communes.

BESSIS. See Bes.

Bessis *Centeſimæ*, denotes two thirds of centeſimal intereſt, or uſury at eight per cent.

BESSONIE, La, in *Geography*, a town of France, in the department of the Tarn, and chief place of a canton in the diſtrict of Caſtres, 3 leagues N.N.E. of Caſtres.

BESSY BELL, a mountain of Ireland, in the county of Tyrone, 10 miles ſouth of Strabane.

BESTAAD, a town of Norway, 36 miles N.N.E. of Drontheim.

BESTAGNO, a town of Italy, in the duchy of Montferrat, on the Bormida, 18 miles eaſt of Alba.

BESTAIL, or BESTIAL, in *Ancient Statutes*, is uſed for all kinds of cattle. 4 Edw. III. c. 3. It has been appropriated more anciently particularly to thoſe that were purveyed for the king's proviſion.

BESTARCHA, a dignity in the courts of the emperors of Conſtantinople, ſuppoſed to anſwer to that of the *maſter of the wardrobe* among us.

The word beſtarcha ſeems to have been formed from *veſtarcha*, by a change of the *v* into *b*.

BESTERTZE. See BISTRITZ.

BESTIARII, among the *Ancient Romans*, thoſe who were hired to combat with beaſts, or thoſe who were expoſed to them, by ſentence of law.

We uſually diſtinguiſh two kinds of beſtiarii: the firſt were thoſe condemned to the beaſts; either as being enemies taken priſoners, or as being ſlaves, and guilty of ſome enormous crime.—Theſe were all expoſed naked, and without defence, to the beaſts; nor did it aught avail to conquer and kill the beaſt, freſh ones being continually let looſe on them, till they were dead. But it ſeldom happened that two were required for the ſame man; on the contrary, one beaſt frequently diſpatched ſeveral men. Cicero mentions a lion, which alone diſpatched two hundred beſtiarii.—Thoſe who ſucceeded the firſt were called τριδρομοι, and the laſt σχαλοι; among the Romans, *meridiani*.

The Chriſtians were beſtiarii of this kind, even ſome of them who were Roman citizens; though it was the legal right of ſuch to be exempt from it.

The ſecond kind of beſtiarii, Seneca obſerves, conſiſted of young men, who, to become expert in managing their arms, fought ſometimes againſt beaſts, and ſometimes againſt one another; and of bravoes, who, to ſhew their courage and dexterity, expoſed themſelves to this dangerous combat. Auguſtus encouraged this practice in young men of the firſt rank; Nero expoſed himſelf to it; and it was for the killing beaſts in the amphitheatre, that Commodus acquired the title of the Roman Hercules.

Vigenere to theſe adds two kinds of beſtiarii more: the firſt were thoſe who made a trade of it, and fought for money; the ſecond was where ſeveral beſtiarii, armed, were let looſe at once, againſt a number of beaſts.

BESTOROZIN, or BESZERMENY, in *Geography*, a town of Hungary, 8 miles N.N.W. of Debreczin.

BESTRITZA, or BISTRICRA, a large town of Lower Hungary, on the Wag, with a caſtle facing it, ſeated on a high rock on the oppoſite ſide of the river.

BETA, deriving its name from the form of the letter Βητα, which it has when ſwelled with ſeed, in *Botany*. Lin. gen. 310. Reich. 338. Schreb. 436. Tourn. 286. Gærtn. t. 75. Juſſ. 85. Claſs and Order, *pentandria digynia*. Nat. Ord. *Holoraceæ*. *Atriplices*, Juſſ. Gen. Char. *Cal.* perianth five-leaved, concave, permanent; diviſions ovate-oblong, obtuſe. *Cor.* none. *Stam.* filaments five, ſubulate, oppoſite to the leaves of the calyx, and of the ſame length with them; anthers roundiſh. *Piſt.* germ, in a manner below the receptacle; ſtyles two, very ſhort, erect; ſtigmas acute. *Per.* capſule within the bottom of the calyx, one-celled, deciduous. *Seed* ſingle, kidney-form, compreſſed, involved in the calyx.

Eſſ. Char. *Cal.* five-leaved. *Cor.* none. *Seed* kidney-form, within the ſubſtance of the baſe of the calyx.

Species, 1. B. *vulgaris*, red garden beet. Varieties α. B. rubra vulgaris, Bauh. pin. 118. Raii hiſt. 204. n. 2. Ger. emac. 318. n. 2. Park. theatr. 751. f. 3. Common red beet. β. B. rubra major. Bauh. pin. 118. Blackw. t. 235. Ger. 251. n. 3. emac. 392. B. italica. Park. par. 490. Raii hiſt. 205. Great red beet. γ. B. rubra, radice rapæ, Bauh. pin. 118. Raii hiſt. 204. n. 4.—romana rubra, rapoſa dicta. Park. par. 489. Turnep-rooted red beet. δ. B. lutea major. Bauh. pin. 118. Raii hiſt. 204. n. 5.—ſyriaca. Park. theatr. 752. n. 3. Yellow-rooted beet. ε. B. pallide virens major. Bauh. pin. 118. Green-leaved red beet. "Flowers heaped; leaflets of the calyx toothed at the baſe." This ſpecies has large, thick, ſucculent leaves, generally of a dark red or purple colour. The roots are large and deep red, on which their goodneſs depends; for the larger they grow, the more tender they will be, and the deeper their colour, the more are they eſteemed. A native of the ſea-coaſt of the ſouthern parts of Europe. The variety α. has the leaves ſhorter than in the white beet, more or leſs red, and ſometimes ſo dark, as to be called black beet; its root white. β. has leaves large and red, as is the whole of the plant, as well root as ſtalk, and flowers full of a purple juice, tending to redneſs; the midribs of the leaves are very broad and thick, like the cabbage leaf, and equal in goodneſs when boiled. Gerard ſays, that it grew with him in 1596, to the height of eight cubits, and brought forth its rough ſeeds very plentifully. Theſe, though taken from a plant of one colour, produce plants of many and variable colours. γ. Stem higher than the common red beet; root thick, within and without of a high blood colour. δ. Leaves paler than thoſe of the white beet, of a greeniſh yellow colour; the root of a fine high yellow, ſweet and well-taſted. All theſe are mere ſeminal varieties. The beet is ſubject to change, and to degenerate, at leaſt in our climate. It has been ſuppoſed, that the B. *cicla* is not ſpecifically different from the *vulgaris*, and that both are derived from the *maritima*, cultivated on a rich ſoil, in ſouthern climes. The beet is ſaid to be prejudicial to the ſtomach, and to yield little nouriſhment. Taken in quantity, it tends to looſen the belly. The juice of the root and leaves is ſaid to be a powerful errhine, and to occaſion a copious diſcharge of mucus, without provoking ſneezing. A good ſugar may be obtained from the juice of the freſh roots. This ſpecies was cultivated in 1656 by Mr. John Tradeſcant, jun. 2. B. *cicla*, white garden beet. B. hortenſis. Mill. Dict. n. 2. B. vulgaris, ζ, n. Lin. Spec. 322. B. alba. Ger. 251. n. 1. emac. 318. n. 1. Raii hiſt. 204. B. communis alba. Park. par 489. 1. B. alba vel palleſcens, quæ cicla offic. Bauh. pin. 118. and B. communis viridis *ejuſd.* "Flowers three-fold; leaflets of the calyx unarmed at the baſe." The root of this ſort ſeldom grows larger than a man's thumb; the ſtalks grow erect, and have oblong, ſpear-ſhaped leaves growing cloſe to the ſtalk; the ſpikes of flowers are axillary, long, and have narrow leaves placed between the flowers; the lower leaves are thick and ſucculent, and their footſtalks broad; and for the ſake of theſe it is cultivated. A large variety of this has been lately introduced from abroad, under the titles of "Racine de diſette," "Root of Scarcity," and "Mangel Wurzel." The ancients called the white beet *Cicla*, or rather *Sicla*, by contraction from *Sicula*, Sicilian beet; as we call the Savoy-cabbage, *Savoys*. Mr. Miller mentions three varieties of this, viz. the white, the green, and the Swiſs or chard beet; by the laſt of which he probably intended the ſame as the modern "Mangel Wurzel." He ſays that they vary from one to another in culture, but that they never alter to the firſt or the third. 3. B. *maritima*, ſea-beet. Lin. ſpec. 322. ſyſt. 262. Reich. 623. Hudſ. 108. Withe. 277. Eng. Bot. t. 285. Smith. Flor. Brit. 115. B. ſylveſtris maritima. Bauh. pin. 118. Park. theatr. 750. 2. Raii ſyn. 157. hiſt. 204. Ger. emac. 318. 2. Sea-Beet. Pet. H. Brit. t. 8. f. 9. "Flowers double or twin; ſtalks decumbent; leaflets of the calyx even, not toothed." It differs from the others, according to Linnæus, in flowering the firſt year; in having oblique or vertical leaves; and in the leaflets of the calyx being equal, not toothed; accord-

ing to Ray, in having a perennial root. This is probably the original parent of all the garden beets. A native of Holland and Great Britain, on the ſea-coaſt, and in ſalt marſhes: it is alſo found plentifully about Nottingham. It is perennial, and flowers in Auguſt. 4 B. *patula*, ſpreading beet. Ait. hort. kew. i. 315. "Flowers heaped; all the leaves linear-lanceolate; branches divaricated. "Stem ſhort, hardly a foot high, very branching; branches long, divaricate; calycine leaflets at the baſe, but not toothed." Flowers in Auguſt. A native of the iſland of Madeira. Introduced in 1788. Martyn.

Beta, in *Gardening*, comprehends ſeveral different uſeful eſculent roots and culinary herbs of the hardy kind. as the B. *cicla*, or common culinary beet, which has a ſmall, oblong, white root, producing from its crown many large, oblong, ſucculent leaves, on broad footſtalks, and erect branching ſeed; ſtems two or three feet high, garniſhed with cloſe-ſetting leaves, and long ſpikes of greeniſh flowers, which are ſucceeded by plenty of ripe ſeed in autumn. The varieties of which are the *common green-leaved beet; large white beet; chard*, or *great Swiſs beet*, having very broad leaves, with thick foot-ſtalks and ribs. Theſe often vary from one to the other, the ſeed of one frequently producing ſome of each ſort, though by proper care in ſaving it, the difference may be preſerved.

The B. *major*, or great *German beet*, commonly called *mangel wurzel*, has a large, long, reddiſh, or ſometimes whitiſh-red root; and very large, oblong, thick, ſucculent leaves. The varieties of which are—the dark-green leaved—light green-leaved—red-veined leaved. This ſpecies has been very much recommended, on account of its vaſt growth and great utility both in its root and leaves; experience has, however, ſhewn the former to have little claim to eſteem for domeſtic uſes, as it is of an inſipid and unpalatable taſte: but the leaves being large and ſucculent, are good to uſe occaſionally, in the manner of common beet, and particularly to boil as ſpinach, or put into ſoups; and the ſtalks and midrib of the leaf to be ſtewed and eaten as aſparagus. Dr. Lettſom, who took much pains to introduce the mangel wurzel, informs us, that on his own land, which was not favourable to its growth, the roots, upon an average, weighed full ten pounds; and if the leaves were calculated at half that weight, the whole product would be fifteen pounds of nutritious aliment, upon every ſquare of 18 inches.

The B. *rubra*, or red beet, has a large, red, eatable root, crowned by many large, oblong, reddiſh-dark-purple leaves; and when it ſhoots, ſends up erect ſtalks and branches, terminated by long ſpikes, of flowers and ſeed. The varieties of which are *common red beet*, with a large, longiſh, dark-red root; turnep-rooted red beet, with a ſhort, large, dark-red root; with a red root and green leaves; with a yellow root; but the firſt of theſe varieties is moſtly preferred for general culture, though the ſecond is equally good, but the root is not of ſo good a ſhape as that of the former; the other two are not proper to cultivate for a crop.

Methods of Culture of the common Beet. All the varieties are propagated by ſeed ſown annually in the ſpring, in February, March, or April, in the places where the plants are to remain, in order to attain proper growth for uſe in ſummer and autumn. They will continue till ſpring, when they ſhoot for ſeed. If the ſowing be neglected in the ſpring, ſome ſeed may occaſionally be ſown in ſummer, any time till the beginning of Auguſt, in a moiſt ſituation, but the ſpring is the moſt eligible ſeaſon for obtaining a good crop. They may be ſown in any common ſoil, allowing each ſort a ſeparate plat or bed. The ground ſhould be dug one ſpade deep in the uſual way; the ſeed then either ſown broad-caſt on the ſurface, and raked in; or, as it is a large ſeed, ſhallow drills may be drawn, at the diſtance of ſix inches for the common green and white varieties, but almoſt double that for the large white and chard beet, ſowing the ſeeds thinly, and raking the earth over them, about an inch deep; then trimming the ſurface ſmooth. The plants come up in about a month, and when they have leaves an inch or two broad, they ſhould be hoed, to thin and deſtroy weeds, cutting out the common green and white ſorts to about ſix inches diſtance; but the chard beet ſhould be allowed ten or twelve inches room every way, that their large ſucculent leaves may have full ſcope to ſpread. They are commonly in perfection in June and July, and it is neceſſary to obſerve, in gathering them, to take the large outward leaves, the others coming in for uſe in their turn, an abundant ſucceſſive ſupply riſing from the root. A ſucceſſion crop muſt be raiſed every year from ſeed in the ſpring, &c. for although the ſame crop might be occaſionally continued two years, by cutting down the ſeed-ſtems of the year-old plants, according as they advance in ſpring and ſummer; the roots abiding, produce a ſupply of leaves, but which are much inferior in ſubſtance to thoſe of the annually-raiſed ſeedling plants; it is better, therefore, to ſow every year, in order to have a good production. The large white and great chard beet are in much eſteem, for the ſtalks and ribs of the large leaves, being diveſted of the leafy part and peeled, are great improvers of ſoup, and uſeful alſo for ſtewing, and to be dreſſed and eaten like aſparagus, and the leaves themſelves are fine pot-herbs; for all which uſes, the ſeveral varieties of this ſpecies may, as has been ſeen, be obtained almoſt the year round.

The Mangel Wurzel Beet. This ſort has generally been reckoned a variety of the B. *cicla*; but ſome botaniſts have made it a diſtinct ſpecies, under the title of B. *altiſſima*. It is raiſed from ſeed ſown annually in the ſpring, the ſame as the other ſorts, in any open ſituation, but ſhould generally be ſown thinner, either in drills one or two feet aſunder, or broad-caſt on the general ſurface, and raked in; and when the plants are come up one, two, or three inches in growth, they ſhould be thinned to a proportionable diſtance, to give room for the full expanſion of their large leaves. Some, however, adviſe tranſplanting, when the young plants are of two or three inches growth, ſetting them in rows one or two feet aſunder; this ſeems, however, unneceſſary; eſpecially, as they have long, downright, tap roots, which generally are the moſt ſucceſsful when they remain where ſown; the method may, however, be practiſed occaſionally by way of experiment. The plants generally continue to produce leaves the greateſt part of the year, and the roots attain perfection for uſe in autumn and winter, till ſpring; but when it is required to have a principal crop of full-ſized roots, ſome ſhould be allotted for that purpoſe, without cutting or gathering the leaves. This ſort is valued moſt generally for its leaves, for which it principally merits culture in the gardens; as we cannot much recommend the root, which, although it grows very large, ſometimes of ſeveral pounds weight, is greatly inferior in uſe, both to the red beet, and that of moſt others of our eſculent roots, for any domeſtic purpoſes. It is ſometimes dreſſed in the manner of carrots and parſneps, &c. ſliced, and ſerved up with butter, but is generally of a mawkiſh, unpalatable reliſh.

The leaves, however, which, if the plants have large ſcope of room, grow twelve or fifteen inches broad or more, and of proportionable length, are exceedingly good, when young, to uſe as the common white and green beet; and the young, thick, fleſhy ſtalks, diveſted of the leafy part, peeled or

ſcraped, then boiled and ſerved up with butter, are tender and agreeably taſted; alſo the leaves to boil occaſionally as ſpinach and other ſmall greens; and of which the root is remarkably productive in quick growth, to afford frequent ſucceſſional gatherings all ſummer and autumn, either cutting them off cloſe, or gathering only the larger outward ones, as in either method they ſoon ſhoot up again in plentiful ſucceſſion.

The Red Beet. This is raiſed from ſeed ſown annually in March or April, in the place where the plants are to remain, being careful to procure that of the beſt dark red ſort. It ſhould be allowed a light, rich, deep ſoil, in an open expoſure. The market gardeners often ſow this ſort thinly among their crops of onions, carrots, &c. that are to be drawn off while young; ſo that when theſe are gone, the beet commences a full crop.

It is, however, a better practice to ſow the principal crop ſeparate. The ground ſhould be dug one ſpade deep at leaſt, and well broken, the ſeed ſown directly, which may either be broad-caſt on the ſurface, or raked well into the ground; or, as obſerved of the firſt ſort, in drills drawn an inch deep, and at the diſtance of ten or twelve inches; or you may dot or prick it, as is often practiſed, with a blunt dibber, in lines at the above diſtance, making the holes an inch deep, and eight or ten aſunder in the rows, dropping two or three ſeeds in each hole, though only one good plant ſhould be left in each place. In May or June, when the plants have leaves an inch or two broad, they require thinning and cleaning from weeds, which may be performed either by hand-weeding or ſmall hoeing; the latter is the moſt expeditious for large crops, and it looſens the ſurface of the earth, to the great advantage of the young plants; carefully eradicate all weeds, and thin the plants to ten or twelve inches diſtance. Some of the roots will be fit to take up for uſe about the end of Auguſt, though they will not attain full perfection until October. In November, a quantity of the roots ſhould be taken up, their tops trimmed off, not too cloſe, and then laid in ſand or dry earth, under ſhelter, to be ready for winter uſe.

This ſort of beet is highly valued for its large red root, which in the common variety, often grows twelve or fifteen inches long, and three or four inches thick or more; but that of the turnep-rooted ſort is much ſhorter, and generally thicker, and of equal goodneſs in every reſpect for uſe; and in both of which, thoſe that are of the largeſt growth and darkeſt red colour, are the moſt valuable: theſe roots being tender, ſweet, and palatable, are boiled, ſliced, and eaten cold, &c. are alſo ſheed and ſcraped in ſallads, both as an eatable ingredient, and by way of garniſh; ſlices of the root are alſo in requeſt not only as garniſh to diſhes, but as a pickle: the other varieties are never cultivated for any principal crop.

Saving of Seed. In order to ſave ſeed from any of the varieties, either mark ſome of the beſt plants in ſpring, to be left to run up, or tranſplant ſome of them in February or March into a convenient place, to have ſhelter from winds; they ſhoot up ſtalks in May; in June they muſt be ſupported with ſtakes; and the ſeed will ripen in September.

That a great quantity of ſugar might be obtained from white beet, has been long known. The famous chemiſt Margraaf made ſome experiments, half a century ago (publiſhed in the year 1747) for determining the quantity of ſugar contained in various European plants. He found that the white beet produced a much greater quantity than any of the other plants. The beet has of late been much cultivated, particularly in Germany, with a view to the ſugar that is obtained from the root. M. Achard of Berlin, firſt introduced this ſubject into general notice, and recommended that the ſugar ſhould be procured by boiling the beet-roots, when taken out of the earth; that they be ſliced when cold; that afterwards the ſaccharine juice be preſſed out; and that it be filtered, evaporated, and, after evaporation, the ſugar be procured by cryſtallization and preſſure. He has publiſhed his method at full length, in "Ausfuhrliche Beſchreiburg," Berlin 1799, 8vo. He lays much ſtreſs on the mode of culture, and obſerves, that crude ſugar can be produced at about three pence a pound. His peculiar mode of culture conſiſts chiefly in planting the ſeeds at a certain diſtance from each other, and in not tranſplanting the roots. M. Achard reckons three varieties of the beet-root; but he prefers that which has the ſkin of a reddiſh colour, and the fleſh white. The kinds of beets which have been uſed for this purpoſe, are varieties of the B. *vulgaris*. Mr. John Taylor of Leipſig has given a particular account of the method of cultivating the common beet, and of preparing ſugar from its root, in a letter addreſſed to his father, the ſecretary of the ſociety for the Encouragement of Arts, &c. and publiſhed in the 18th volume of their Tranſactions. He obſerves, that the ſoil ſhould be a good black earth, not too moiſt; and that it ſhould be prepared, like that deſigned for cabbages, by dunging it in autumn with ſhort rotten dung, and ploughing it, and by turning it again in ſpring, and ploughing it a third time to a greater depth than before. After the third ploughing, ſays M. Achard, it ſhould be carefully harrowed, to render it ſmooth and even, and to break all the lumps of earth which may happen to be in it. The ſeeds are uſually placed at the diſtance of from 12 to 18 inches from one another, from 9 to 12 inches according to M. Achard, and at the depth of one inch in the earth. One ſeed is laid in each hole, and immediately covered with earth. In four or five weeks time the ground muſt be weeded, and afterwards hoed. Some prefer tranſplanting the roots, to ſowing the ſeed in the ground where the plants are intended to remain. M. Achard forbids all tranſplanting; and one of his reaſons for this prohibition is, that the lower part or points of the roots are liable to be thus broken off, which part, he ſays, gives more ſugar than the upper part. After they have been ſome time in the ground, the earth ſhould be looſened with a hoe, and the weeds deſtroyed. The method invented by profeſſor Gotthing for ſeparating the ſugar from the beet-roots, is eaſily practicable, and adapted to this country. It is as follows:—He recommends the taking of the beet-roots out of the ground from the middle of September to the middle of October, that the weather may be favourable for drying them, which ſhould be done carefully, leſt, as M. Achard obſerves, they ſhould be damaged, and any of the juice which oozes out be loſt; and waſhing them as ſpeedily as poſſible from the earth that adheres to them, and cutting off their ſmall fibres as well as ſuch part of the root as had riſen, whilſt they were growing, above the ſurface of the earth. The roots are afterwards wiped with a cloth, and laid upon a dry floor; the heads are cut off and given to the cattle; and the roots are ſliced lengthways, along the middle, each half being cut again into ſlices, and looſely hung, not too near each other, leſt they ſhould ſpoil, on ſtrong thread, ſuſpended on nails, in an airy chamber or place ſecure from the rain. In the courſe of two or three weeks, with proper attention, they will be ſufficiently dry for the extraction of their ſugar. If the drying ſeaſon is far advanced, or a froſt expected, the beet-roots ſhould not be expoſed to the outward air; they ſhould be dried in the kitchen or warm rooms, either on ſtrings or netted frames, reſembling the flakes uſed in Yorkſhire for drying oat-cakes; or they may be dried in ſtove-rooms by

artificial heat, taking care to prevent their being ſmoaked or burnt. If an opportunity does not occur for ſlicing the roots immediately after being taken out of the earth, they ſhould be placed in cellars, and covered with ſtraw, or put into holes in dry ſandy earth, and preſerved till they are wanted.

M. Achard ſays, that after the roots are waſhed and cleaned, they ſhould be ſliced by means of a machine, or ground in a ſort of mill, conſiſting of a cylinder furniſhed with points, like a raſp, which turns round in a box. The roots are put in this box, and preſſed, by means of a weight, againſt the cylinder, which, upon being turned round, ſoon reduces them to a kind of pulp. When the beet-roots are dry, they are ready for the extraction of their ſugar. For this purpoſe, three wooden tubs, wide, but not deep, made of oak, aſh, or willow, ſhould be provided, or, for family uſe, earthen mugs. Near the bottom of the tubs, cocks or ſpiggots ſhould be fixed, and the tubs ſhould be placed in a cool ſituation of about 52° of Fahrenheit, upon a ſtillage near each other, and at ſuch a height from the ground, that ſmaller veſſels may ſtand below them for receiving the liquor when drawn off, and clear water ſhould be at hand ſo as to be pumped into the higher veſſels. When the beet-roots, thoroughly dried, have been ſifted, ſo as to be free from the duſt and looſe fibres, one of the higher tubs ſhould be half filled with them, and clear cold water poured upon them, about one-third in height above the roots. In this ſtate they ſhould remain for about three hours, ſtirring them at different times with a wooden paddle. At the end of this time, the ſame number of clean dried roots ſhould be put into the ſecond tub; and the ſweet liquor drawn from the firſt tub into the veſſel under it, ſhould be poured upon the roots in the ſecond; and the firſt tub ſhould be ſupplied with freſh water in ſuch quantity as juſt to cover the roots, and the tubs ſhould remain three hours more, and the roots be repeatedly ſtirred, as before. The liquor which had been poured from the firſt tub to the ſecond, will be now much abſorbed by the roots in the latter tub. After ſtanding again for three hours, the ſweet liqour from the ſecond tub muſt be drawn off, which, if the roots were of the red and white ſort, will be of an agreeable red colour. It muſt then be paſſed through a ſieve, or filtered through a flannel, and thus be rendered fit for boiling down for ſugar. After this, draw the liquor from the firſt tub, pour it on the ſecond, and put into the firſt tub more freſh water, and let it ſtand three hours longer. Then put into the third tub the uſual quantity of dry roots, and pour on them the liquor drawn from the ſecond tub; remove the liquor from the firſt to the ſecond; and the roots in the firſt tub being now deprived of their ſaccharine matter, may be uſed for feeding hogs or cattle. After three hours more, the liquor ſhould be drawn from the third tub and filtered as before, and then boiled down for ſugar. Then draw off the liquor of the ſecond veſſel, and pour it into the third; add freſh water to the ſecond veſſel, and let it remain three hours more, the roots being occaſionally ſtirred. During this time, cleanſe out the firſt tub, and add freſh roots, as before. After three hours, draw the liquor from the third tub, and pour it upon the freſh roots in the firſt; then draw the liquor from the ſecond tub, and pour it on the third. The roots of the ſecond tub will be now exhauſted, and may be given to the cattle. After three hours, draw off the liquor from the firſt tub, filter it, and it will be ready for boiling down. On the contents of the firſt, pour the liquor of the third, and put freſh water in the third tub; let it remain three hours, and ſtirred as uſual; during which time clean out the ſecond tub, and let the roots be given to the cattle. In the ſecond tub, place again freſh roots; and proceed by extracting the ſaccharine matter, as before; and continue the operation, till all the dried roots have been thus freed from their ſugar. By this management, the liquor becomes more charged with ſaccharine matter, than when the juice is preſſed out of the roots, and a conſiderable quantity of fuel is ſpared. The roots from which the liquor has been extracted will have ſwelled much in the operation, and have loſt their ſweetneſs; their farinaceous reſiduum will, however, afford good food for cattle. Whenever there is a ſufficient quantity of dried roots ready, the proceſs of extracting the ſaccharine liquor ſhould be continued day and night, as it is not proper to let the liquor remain longer than three, or at moſt four hours, before you boil it, leſt a diſſolution of the mucilaginous particles of the roots ſhould take place. If it be not convenient to boil down all the ſaccharine liquor at once to a ſtate of cryſtallization, yet it ſhould be daily boiled down to the conſiſtence of a ſyrup, in order to prevent its fermentation. In boiling the liquor, the ſcum that ariſes ſhould be carefully taken off.

The proceſs of boiling, cryſtallizing, &c. the beet ſugars is as follows. Firſt boil the extracted ſaccharine liquors down to the conſiſtence of a ſyrup; then put it into a copper, of which one-third at leaſt is empty, and let it boil away by a moderate fire, until a phial, which holds one ounce of water, will contain eleven drams of the ſyrup, or until the ſyrup pours ſomewhat broad from the ladle. The ſcum or froth ſhould be taken off as it ariſes. When the ſyrup is arrived at the ſtate above mentioned, by gentle boiling, the fire muſt be removed from underneath the copper, and the ſyrup gradually run through a clean woollen cloth, placed over a wooden or ſtone veſſel. The ſyrup muſt not cool too much before this filtration, or elſe it becomes ropy. When the filtered ſyrup is ſomewhat cool, it ſhould be laded into ſhallow wooden or ſtone veſſels, to cryſtallize; for this purpoſe, ſhallow earthen veſſels, ſuch as are uſed to produce cream, or veſſels made of tin, are proper. Theſe veſſels, filled with ſyrup, muſt be placed in a room heated to about 68° of Fahrenheit, and care muſt be taken to keep them free from flies and duſt. If the ſyrup has been of a proper conſiſtence, cryſtals will ſoon begin to form at the bottom of the veſſels; and in an interval of 18 or 21 days the cryſtallization will be completed. The maſs muſt then be put into a ſtrong linen ſack, well ſecured, and placed under a preſs, to ſqueeze out the liquid from the ſugar which remains in the bag. The liquid matter may be ſet to cryſtallize a ſecond or third time, and will yield ſugar of a coarſer quality. A cheeſe-preſs, or long lever, will ſerve for the purpoſe of preſſure. The ſugar firſt obtained, may be rendered purer by mixing with it a ſmall quantity of clear ſpring water, and placing it again under the preſs; the coloured ſyrup will then run out, and leave the ſugar in the bag in a much purer ſtate than before. By repeating the operation, it is ſo far improved, that, when dried and rubbed, it becomes a fine white powder ſugar. The ſeparated ſyrups ſhould be again carefully boiled, and more ſugar will be obtained from them by cryſtallization. If the ſugar procured by the firſt preſſure be diſſolved in as much clear water as will form a ſyrup, and placed again in a warm room to cryſtallize, it will yield a much purer and harder ſugar: the ſyrup may then be ſeparated without preſſure from the ſugar, merely by inclining the veſſel, and allowing the ſyrup to run off from the cryſtals. All the ſyrups thus prepared, are fit for family uſe, and are much ſuperior in taſte to thoſe prepared from the preſſure of the raw or boiled roots. The remaining thick ſyrups may be uſed as treacle or molaſſes, and will ſerve to diſtil for rum or ſpirits. From the experiments of

of profeſſor Lampadius of Freyberg, near Dreſden, it appears, that beet-roots contain water, fibrous matter, ſugar, mucilage, glair, ſtarch, colouring matter, ſcented matter, and a bitter ſubſtance. The water is in the proportion of from one-half to two-thirds of the weight of the roots; the fibrous matter of the roots differs, and it is conſiderably more in poor than in rich land; the ſaccharine particles vary from two to five per cent.; the mucilage is from three to five per cent.; and the glair, or matter reſembling white of egg, is about one per cent.; the ſtarch is in very ſmall quantity, being only about two or three ounces in a hundred weight; the colouring matter undergoes ſeveral changes by expoſure to the air, as yellowiſh, brown and red, and may be precipitated by acetite of lead; the ſcented matter is volatile, riſing in diſtillation of the root with water, combining cloſely with ſpirits of wine, and occaſioning a peculiar contraction in the organs of taſte. By boiling the beet-roots, the ſmell and taſte are very much leſſened. The bitter ſubſtance is ſoluble in water, and remains behind in the firſt ſyrup after the cryſtallization of the ſugar. From other experiments of the ſame profeſſor, it appears, that 110lbs. of beet-roots, the beta cicla of Linnæus, or white Engliſh beet, waſhed, peeled, cleaned, and then grated, gave a maſs which weighed 87 pounds; out of which were preſſed 41½ pounds of juice, which was boiled with 20½ ounces of charcoal powder. This, when filtered and evaporated down until cryſtallized, produced full five pounds of a browniſh yellow-grained ſugar, and alſo five ounces of brown ſyrup. The above brown ſugar, after being diſſolved in ſix pounds of lime-water, mixed with one pound of blood, then boiled, filtered, and afterwards evaporated, yielded four pounds 5½ ounces of purified brown ſugar, and 6½ ounces of ſyrup. The four pounds 5½ ounces of ſugar, thus prepared, were again diſſolved in ſix pounds of lime-water, mixed with one pound of milk, and then boiled for a quarter of an hour; during the boiling, a ſmall quantity of white wine vinegar, and a little more milk, were added; the ſaccharine matter was filtered, and treated as before; the product was four pounds of well-grained white powder ſugar. The reſiduum after preſſure, the brown ſyrups of the two firſt proceſſes, and the remains of the filtrations, weighed, when collected, 40 pounds; they were mixed with one quart of yeaſt, and 80 quarts of water, heated to 112° of Fahrenheit's, and after fermenting 48 hours, were diſtilled. They furniſhed, at the firſt diſtillation, 15 quarts of weak ſpirit, which, on a ſecond diſtillation, gave eight quarts of a better; from which, when rectified, were produced 3½ quarts of ſpirits reſembling rum. From the reſult of this ſeries of experiments it appeared, that after paying the farmer for the roots, and diſcharging all incidental expences whatever, a profit was yielded of nearly cent. per cent. on valuing the four pounds of white powder ſugar at one ſhilling per pound, and the three quarts and a half of rum at one ſhilling per quart. The produce of beet-roots and their quality for yielding ſugar, have, however, been variable; and of courſe the profit accruing from them. From M. Achard's account we learn, that 24 meaſures of roots, each of which weighs about 90 pounds, (in all 2160 pounds) and coſts about 6d Engliſh, produce 100 pounds of raw ſugar; that is, 20 pounds of roots produce nearly one pound of ſugar. One hundred pounds of raw ſugar give 55 pounds of refined ſugar, and 25 pounds of molaſſes. Another ſtatement informs us, that 14 pounds of raw ſugar gave 1¾ pound of lump-ſugar, 1⅛ pound of white powder ſugar, and 1⅛ of darker-coloured powder ſugar, and eight pounds of brown ſyrup; from which more ſugar might have been obtained. It is computed, in M. Achard's account, that a German ſquare mile of land, (that is, 16 ſquare miles, Engliſh), properly cultivated, would produce white beet ſufficient to furniſh the whole Pruſſian dominions with ſugar.

BETANCOS, Betanzos, or Bitanze, in *Geography*, a town of Spain, in Galicia, 3 leagues from Corunna, 9 from Compoſtella, and 7 from Ferrol. It has a good harbour in the mouth of the river Mandeo. N. lat. 43° 15'. W. long. 7° 56'.

BETEL, in *Botany*, an Indian plant, in great uſe and eſteem throughout the Eaſt, where it makes a conſiderable article of commerce. See Piper.

The betel bears ſome reſemblance to the pepper-tree. It grows like ivy, and twiſts round other trees. Its leaves are long and ſharp-pointed, but broad towards the ſtalk, and of a pale green colour. They are like thoſe of ivy, only ſofter, and full of red juice, which, among the Orientals, is reputed of wonderful virtue for fortifying the teeth, and rendering the breath ſweet. The Indians are continually chewing theſe leaves, which renders their lips ſo red, and teeth black, a colour by them vaſtly preferred to the whiteneſs affected by the Europeans.

The conſumption of betel leaves is incredible; no body, rich or poor, being without their box of betel, which they preſent to each other by way of civility, as we do ſnuff. In many places they chew the areca nut, either alone or mixt with the betel leaf and lime, and the leaves of this plant are ſometimes chewed alone; but they are too ſharp, and uſually injure the teeth, and it is not uncommon to find men of 25 wholly toothleſs in this part of the world, merely from their having chewed this plant to an exceſſive degree. The prepared betel is a very common preſent among the poorer ſort; and on taking leave of a friend, it is always the cuſtom to make him a preſent of a purſe of the leaves prepared for uſe. When the poorer ſort are to appear before the rich, they always chew a large quantity of betel, to give them a ſweet breath; and the women, on certain occaſions, never fail to take largely of it as a provocative. On all viſits, the company is regaled with prepared betel. The principal time of uſing it is after dinner, at which time, they ſay, it prevents ſickneſs at the ſtomach; and they never abſtain from it, except on the ſolemn occaſions of the funerals of their relations, and their days of faſting. Moderately uſed, it is ſaid to ſtrengthen the gums, corroborate the heart and ſtomach, diſcuſs flatulencies, purge both the ſtomach and brain, and prevent the ſcurvy. If chewed after breakfaſt, it makes the breath ſweet for the whole day. The Portugueſe women are as fond of the betel as the Indians themſelves, and cannot live a day without it. It is ſaid, however, that few Europeans can accuſtom themſelves to the uſe of it. On many occaſions it produces ſickneſs, and ſometimes intoxication, of no long continuance. The Chineſe alſo uſe the leaves of betel, covered with quick lime, and wrapped round the nut areca, which in ſhape much reſembles a nutmeg. They chew theſe leaves continually, and pretend that they ſtrengthen the gums, comfort the brain, expel bile, nouriſh the glands of the throat, and ſerve as a preſervative againſt the aſthma; a diſeaſe, which, from the heat of the climate, is very common in the ſouthern provinces. They carry betel and areca (ſee Areca) in boxes, and preſent it when they meet one another.

BETELGEULE, or Bedelgaeze, in *Aſtronomy*, a fixed ſtar of the firſt magnitude in Orion's hind ſhoulder.

BETESKOE, in *Geography*, a town of Siberia, on the weſt ſide of the Irtiſh, 230 miles S.E. of Tobolſk.

BETH,

BETH, in *Literary Hiſtory*, makes the title of a multitude of books in the Hebrew language; e. gr. "beth avoth," or, the houſe of the fathers; "beth Elohim," or, the houſe of God; "beth Iſrael," or, the houſe of Iſrael, &c.

BETHABARA, i. e. *the houſe of paſſage*, in *Ancient Geography*, is ſuppoſed by many to be the place to which men paſſed over Jordan, over againſt Jericho, at the common ford of this river where the Iſraelites paſſed it under Joſhua. Ch. iii. 16. Lightfoot refers it to the paſſage at Scythopolis, out of the precincts of Judæa, where the Jews dwelt among the Syro-Græcians, over againſt Galilee. Cellarius places it between theſe two, obſerving that there were many paſſages over Jordan. At this place, beyond Jordan, John is ſaid to have baptized. Chap. i. 28. Origen found, as he tells us, in almoſt all his MSS. or, if we may judge from what follows, in every one of them, without exception, this verſe thus written, "Theſe things were done in Bethany beyond Jordan, where John was baptizing." But he rejects this reading for the following reaſon: "As I have been in that country, in order to trace the footſteps of Chriſt and his apoſtles, I am perſuaded that we ought not to read Bethany in this paſſage, but Bethabara. For Bethany, as the evangeliſt himſelf relates, was the birth-place of Lazarus, Martha, and Mary, and only 15 ſtadia from Jeruſalem; but the Jordan was at leaſt, to ſpeak in round numbers, 190 ſtadia from that city. Nor is there any city whatſoever of the name of Bethany near to that river. But there is a city of the name of Bethabara on the banks of the Jordan, where, it is ſaid, John baptized." To this alteration it has been objected, that Origen grounds the reading, which he has ſubſtituted for Bethany, on no other authority than the relation of ſuch perſons as conduct travellers to the places in Paleſtine, which are mentioned in the ſacred writings. Theſe perſons either had no inclination to conduct Origen to the Bethany, which lay on the other ſide of the Jordan, as the journey might have been attended with danger, on account of the tribes of wandering Arabs, who infeſt that country; or they were wholly ignorant of the place. Not to loſe, therefore, their profits ariſing from conducting ſtrangers, they ſhewed Bethabara to Origen, as the place where John baptized, and the learned father was credulous enough to believe them. Beſides, if the text itſelf be examined, Origen's objections to the common reading will vaniſh. He ſays, that Bethany lay near to Jeruſalem, and therefore at a diſtance from the Jordan. But it may be aſked, whether there was not more than one city of that name, and whether we muſt neceſſarily ſuppoſe, that the city in queſtion was the place where Lazarus reſided. It appears, even from the expreſſion uſed by St. John, that, whether we read Bethany, or Bethabara, there was more than one city of the name, which he mentioned. St. John mentions a circumſtance by way of diſtinguiſhing it, and when he ſpeaks of Bethany beyond Jordan, we are led to ſuppoſe, that there were two cities of that name, and that the city which he meant was different from that which was ſituate on the mount of Olives. But Origen ſays, that there was no town of the name of Bethany on any part of the Jordan. To this it might be replied, that Origen hardly viſited all the towns on the bank of the Jordan, as he probably took the route pointed out by his guides, or that the wars between the Jews and the Romans had ſo deſolated, or altered the face of the country, that many towns might have exiſted in the time of John the baptiſt, of which no traces remained in the days of Origen. But this mode of reply is needleſs, becauſe the evangeliſt uſes a very indeterminate expreſſion, when he ſays, that the place, where John baptized, was on the other ſide of the Jordan; an expreſſion which by no means implies that the town lay on the banks of that river: for it might have been ſituated either on the Jabbok, or on ſome other ſtream conſiderably to the eaſtward, where John had a ſufficient ſupply of water for the purpoſe of baptizing. The alteration, therefore, made by Origen, and which upon his authority, and that of Chryſoſtom and Epiphanius, is introduced into our copies, was wholly without foundation. See Michaelis's Introd. to the N. T. by Marſh, vol. ii. p. 400.

Bethabara, in *Geography*, the firſt ſettlement of the Moravians in America, in the lands of Wachovia, in North Carolina, begun in 1753, 6 miles N. of Salem, ſituate on the weſt ſide of Graffy creek, which unites with the Gargales, and ſeveral others, and falls into the Yadkin, and containing a church of the United Brethren, and about 50 dwelling houſes.

BETH-ACHARA, or Beth-haccerim, (Jer. vi. 1.) i. e. *houſe of the vineyard*, a city ſeated on an eminence, between Jeruſalem and Tekoa. See Nehem. iii. 14.

BETHAGLA, or Beth-hagla, a town of the tribe of Benjamin, (Joſh. xviii. 21.) on the northern boundary of the tribe of Judah. In the time of Jerome and Euſebius there was a village in this ſituation of the name of Agla, diſtant 10 miles from Eleutheropolis, towards Gaza.

BETHA-GABRIS, now Bait-Djibrim, a village of Syria, about ¾ of a league to the ſouth of El-Tell; ſituated between Jeruſalem and Aſcalon.

BETH-ANATH, *houſe of a ſong*, of *an anſwer*, or *of affliction*, a city of Naphtali. Joſh. xix. 38.

BETHANO, Cape, in *Geography*, lies on the coaſt of Chinan, or Quinam, off which is Pulo, or Iſland Canton, which is about 9 or 10 miles from the coaſt. N. lat. 16°. E. long. 108° 30'.

BETHANY, in *Ancient Geography*, a village at the foot of the mount of Olives, eaſt of Jeruſalem, in the way to Jericho. It took its name from a part of ground ſo called from "Athene," which ſignifies the dates of palm-trees, which grew there plentifully. The town of Bethany, where Lazarus and his ſiſters dwelt (John xi. 1.) and where he was raiſed from the dead, was 15 furlongs, or about 2 miles diſtant from Jeruſalem, (John xi. 18.); but the diſtrict, or tract of ground, that bore that name, reached within 8 furlongs from Jeruſalem, it being only a ſabbath-day's journey from it (John xxiv. 50. Acts i. 12.); and then commenced the tract called "Bethphage," from the "phagi," i. e. the green figs which grow upon it, extending ſo near to Jeruſalem, that the outermoſt ſtreet within the walls was called by that name. A charge of ſelf-contradiction has been alledged againſt the evangeliſt Luke, from the paſſage above cited. In the Goſpel he tells us, that Jeſus aſcended into heaven from Bethany, and in the Acts of the Apoſtles, of which he is the reputed author, he informs us, that he aſcended from Mount Olivet. This charge is founded on an ignorance of ancient geography, or muſt proceed from an unwarrantable prejudice againſt Chriſtianity; becauſe Bethany, as we have above obſerved, was not only the name of a town, but of a diſtrict of Mount Olivet adjoining to the town. See Bethabara.

Bethany, or *Bethania*, in *Geography*, a Moravian ſettlement and poſt town of America, in the lands of Wachovia, in North Carolina, begun in 1760, 9 miles N. W. of Salem; containing about 60 houſes and a church.

BETH-ARABAH, in *Ancient Geography*, a city of Judah (Joſh. xv. 6.), afterwards given to Benjamin (Joſh. xviii. 22.)

BETHARAMPHTHA, a town of Galilee, on the right bank

bank of the Jordan, on the weſtern ſide of the lake Genneſareth, at the influx of the Jordan into that lake. Lightfoot places it on the left bank of the Jordan in Peræa. It was fortified and ornamented by Herod the tetrarch, and called "Julias," in honour of Julia, the daughter of Auguſtus, and wife of Tiberius. See BETHSAIDA.

BETHARAN, or BETHARA, a town of the Peræa beyond Jordan, called alſo, by the Syrians "Betharamphtha," and by Herod "Libias," or "Livias" in honour of Livia, the wife of Auguſtus. Joſephus calls it Julias, and confounds it with the Betharamphtha of the preceding article: but it lay more to the ſouth, nearly, according to Ptolemy, in the ſame latitude with Jeruſalem, in the vicinity of the Dead ſea, and of the mountains Abarim, Nebo, and Piſgah, and of the city Heſhbon.

BETHAVEN, *the houſe of iniquity*, a name given to "Bethel" by way of deriſion, after the introduction of idolatry into it by Jeroboam. (Hoſea iv. 15. x. 5). Bethaven was alſo the name of a diſtinct town near Bethel, and ſouth-eaſt of it, belonging to the tribe of Benjamin. Joſh. vii. 2. xviii. 12. 1 Sam. xiii. 5.

BETH-BASI, a city of Judah, fortified by the two Maccabees, Simon and Jonathan. 1 Maccab. ix. 62. 64.

BETH-DAGON, a city of Aſher (Joſh. xix. 27.)—Alſo, a city of Judah (Joſh. xv. 51.) ſo called, becauſe it had probably a temple of Dagon, before the Iſraelites took poſſeſſion of it.

BETHEL, *the houſe of God*, a name given to that town, which was before called Luz, on account of Jacob's viſion. (Gen. xxviii. 19.). They ſeem, however, to be diſtinguiſhed in Joſhua xvi. 2. though they were contiguous places; and the name Luz might probably be loſt in that of Bethel. It was a city of Samaria, on the confines of the tribes of Benjamin and Ephraim. Euſebius ſays, that it was 12 miles from Jeruſalem in the way to Sichem. It obtained among the prophets the name of Bethaven, on account of its idolatry.

The Mahometans believe their temple of Mecca to be founded on the ſtone, on which the patriarch Jacob ſlept at Bethel, and hold it in great veneration. Some have ſuppoſed that the ſuperſtitious reſpect manifeſted by the ancients to their Bætyli, or ſtones anointed and conſecrated to great men, after their death, derived its origin from Jacob's pouring oil on the ſtone of Bethel. See BÆTYLOS.

BETHEL, in *Geography*, a ſmall Moravian ſettlement in America, on the Swetara river, in Pennſylvania, 14 miles from Mount Joy.—A townſhip in Dauphin county.—Alſo, a townſhip in Windſor county, Vermont, containing 473 inhabitants, N. N. W. of, and bounded by Stockbridge, and about 67 miles N. N. eaſterly of Bennington. Hence riſes a ſmall branch of White-river.—Alſo, a townſhip in Delaware county, Pennſylvania.

BETHENCOURT, JOHN DE, in *Biography*, a Norman baron, in the beginning of the 15th century, obtained a grant from Henry III. of Caſtile, of the Canary iſlands, erected into a kingdom in 1344, by pope Clement VI. Having viſited theſe iſlands in 1402, Bethencourt returned to them, and by aſſiſtance from Henry, conquered them, held them under the title of king, as a fief of the crown of Caſtile, and tranſmitted the poſſeſſion of them to his family for ſome generations. His poſterity ſettled in Spain. Although his conqueſt of theſe iſlands was not complete, Bethencourt is reckoned the firſt Chriſtian who ſubdued the Canary iſles, which before his time had been occaſionally viſited by freebooters. Robertſon's Hiſt. Amer. vol. i. p. 54.

BETHENCOURT, JAMES DE, phyſician at Rouen, where he practiſed with much reputation, towards the end of the 15th and the beginning of the 16th centuries, is now only known by his treatiſe on the venereal diſeaſe, publiſhed in the year 1527, under the ſingular title of "Nova Penitentialis Quadrigeſima, nec non Purgatorium, in Morbum Gallicum, ſeu Venereum, una cum Dialogo aquæ argenti, et ligni guiaci luctantium ſuper dicti morbi prelatura. Opus fructiferum." Paris, 8vo. By his penitence, he means the ſtrict regimen enjoined thoſe who underwent the guiacum, or ſweating proceſs, for the cure of the lues, and by the purgatory, the pains and torments endured while under the ſalivation by mercury, for the ſame purpoſe. Though he treats of the method of curing by the guiacums, as well as that of mercury, yet he manifeſtly gives the preference to the latter mode, which is laid down by him, Aſtruc ſays, in a more judicious manner, than it had been by any preceding writer. He ſays the diſeaſe was unknown to the ancients, and that it made its firſt appearance, or was firſt noticed in Europe, about the year 1495. He does not conſider it as imported from America, or the Weſt Indies, by the Spaniards, but as procured from cauſes ſimilar to thoſe that occaſion the plague, and other infectious diſeaſes. Aſtruc commends the work, but it has not obtained a place in Luiſinus's collection of treatiſes on the complaint. Aſtruc de Morb. Gall. Haller. Bib. Med.

BETHENNABRIS, in *Ancient Geography*, a town of Peræa, into which the Jews, who fled from Gadara after it was taken by Veſpaſian, retired, and which was forced by the tribune Placidus, before his complete reduction of Peræa.

BETHER, MOUNTAINS OF, are mentioned in the Song of Solomon, ch. viii. 14. Some ſuppoſe Bether to be Bethoron, called Bether by Euſebius, and Bethara by Joſephus. Bether was taken by the emperor Adrian, in the rebellion of Barchochebas. (See BARCHOCHEBAS.) Others will have it to be Betharis, between Cæſarea and Dioſpolis; and others again Bether, mentioned in the LXX (Joſ. xv. 60.) among the cities of Judah. Calmet ſuppoſes it to be Upper Bethoron, or Bethora, between Dioſpolis and Cæſarea. Euſebius ſpeaks of Betharim near Dioſpolis, and when he mentions Bether, which was taken by Adrian, he ſays, it was in the neighbourhood of Jeruſalem. Ec. Hiſt. l. iv. c. 6.

BETHESDA, the name of a pool at Jeruſalem, of which we have an account in the Goſpel by St. John, ch. v. 1—7. It was called in the Greek κολυμβηθρα προβατικη, and in the vulgate "Piſcina probatica," becauſe, as ſome have ſuppoſed, the ſheep of the ſacrifices, called in Greek προβατικα, were waſhed in it; or, according to others, becauſe the blood of the ſacrifices ran into it. But neither of theſe ſuppoſitions is ſatisfactorily proved. The ſheep were probably waſhed as ſoon as they were bought in the adjoining market, from which they were driven into this pool, which always contained a ſufficient quantity of water for this purpoſe. The latter ſuppoſition could not poſſibly have been realized; ſince, in that caſe, the blood muſt firſt have deſcended, and afterwards aſcended to this pool, as there was a drain or ditch between the pool and the temple, and a bridge over it for paſſing into the temple. Hence Dr. Pococke, who adopted the idea of the blood's running into the pool, was obliged to ſeek for lower ground on the other ſide of the temple, and to place it in a ſituation where it did not exiſt, as any one may ſatisfy himſelf by adverting to the plan of the temple at Jeruſalem. The ſituation of the ſheep-gate, near which this pool, or bath, ſtood, was on the ſouth-eaſt wall of Jeruſalem, and therefore a great part of the city lay between that and the temple, as the acurate Dr. Lightfoot has ſhewn in his "Harmony of the Evangeliſts," p. 666. The appellation "Betheſda" has therefore been erroneouſly derived from בית אשרח, *domus effuſionis*, the ſink-houſe, or drain.
